C1709	RH inner	C4012-2	VMP16 (YE/GY)

- **Is the resistance greater than 10,000 ohms?**

  YES : If all of the parking aid sensors recorded DTCs, go to B5.

  If one or more parking aid sensor(s) recorded DTCs, INSTALL a new sensor(s) for the one in question. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

B5 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **Parking Aid Module (PAM)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTCs C1699, C1702, C1705 And C1708 - Sensor Circuit Short To Vbat

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Parking Aid for schematic and connector

information.

Normal Operation

Voltage is supplied to the parking aid sensors from the parking aid module (PAM) on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH). The PAM receives a signal from the parking aid sensors on circuits VMP14 (WH/OG), VMP15 (YE/GN), VMP16 (YE/GY) and VMP17 (YE/OG).

DTC Description	Fault Trigger Conditions
C1699 - Left Rear Sensor Circuit Short to Vbat	A continuous and on-demand DTC that sets when the left rear parking aid sensor signal line is shorted to voltage.
C1702 - Right Rear Sensor Circuit Short to Vbat	A continuous and on-demand DTC that sets when the right rear parking aid sensor signal line is shorted to voltage.
C1705 - Left Rear Center Sensor Circuit Short to Vbat	A continuous and on-demand DTC that sets when the left rear center parking aid sensor signal line is shorted to voltage.
C1708 - Right Rear Center Sensor Circuit Short to Vbat	A continuous and on-demand DTC that sets when the right rear center parking aid sensor signal line is shorted to voltage.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking aid sensor(s)
- Parking aid bumper harness
- PAM

PINPOINT TEST C: DTCs C1699, C1702, C1705 AND C1708 - SENSOR CIRCUIT SHORT TO VBAT

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

C1 RETRIEVE THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS

- Check the PAM DTCs from the continuous and on-demand self-tests.
- **Are multiple DTCs recorded?**

  YES : Go to C2.

  NO : For DTCs C1699, C1702, C1705 or C1708, go to C3.

  For all other DTCs, REFER to **DTC Charts**.

C2 CHECK THE BUMPER WIRING HARNESS

- Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion.
- **Is the bumper wiring harness OK?**

  YES : Go to C3.

  NO : REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. REPEAT the self-test.

C3 CHECK THE SENSOR CIRCUITRY FOR SHORTS TO VOLTAGE

- Key in OFF position.
- Disconnect: Suspect Parking Aid Sensor C4009, C4010, C4011 or C4012
- Disconnect: PAM C4014
- Key in ON position.
- Measure the voltage between the suspect parking aid sensor, harness side and ground as follows:

DTC	Rear Sensor	Connector-Pin	Circuit
C1699	LH outer	C4009-2	VMP15 (YE/GN)
C1702	RH outer	C4011-2	VMP17 (YE/OG)
C1705	LH inner	C4010-2	VMP14 (WH/OG)
C1708	RH inner	C4012-2	VMP16 (YE/GY)

- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to C4.

C4 CHECK THE PARKING AID SENSORS

- Install a known good parking aid sensor(s) for each of the suspect parking aid sensor(s).
- Clear the DTCs. Repeat the self-test.
- Test the system for normal operation.
- **Is the concern still present?**

  YES : If all of the parking aid sensors recorded DTCs, go to C5.

  If one or more parking aid sensor(s) recorded DTCs, INSTALL a new sensor(s) for the one in question. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C5 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion

  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **Parking Aid Module (PAM)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTCs C1701, C1704, C1707 And C1710 - Sensor Circuit Fault

Normal Operation

The parking aid system is enabled when the ignition switch is in the RUN position and the REVERSE (R) gear is selected. The parking aid module (PAM) calculates the distance to an object by the use of 4 ultrasonic sensors mounted in the rear bumper. The parking aid sensors can detect obstructions in the path behind the vehicle.

DTC Description	Fault Trigger Conditions
C1701 - Left Rear Sensor Circuit Fault	A continuous and on-demand DTC that sets when the left rear parking aid sensor has internally failed or has an incorrect attenuation time.
C1704 - Right Rear Sensor Circuit Fault	A continuous and on-demand DTC that sets when the right rear parking aid sensor has internally failed or has an incorrect attenuation time.
C1707 - Left Rear Center Sensor Circuit Fault	A continuous and on-demand DTC that sets when the left rear center parking aid sensor has internally failed or has an incorrect attenuation time.
C1710 - Right Rear Center Sensor Circuit Fault	A continuous and on-demand DTC that sets when the right rear center parking aid sensor has internally failed or has an incorrect attenuation time.

This pinpoint test is intended to diagnose the following:

- Dirty or obstructed parking aid sensor
- Parking aid sensor
- Parking aid bumper harness
- PAM

PINPOINT TEST D: DTCs C1701, C1704, C1707 AND C1710 - SENSOR CIRCUIT FAULT

D1 CHECK THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND PAM SELF-TESTS

- Check the PAM DTCs from the continuous and on-demand self-tests.
- **Are parking aid DTCs other than C1701, C1704, C1707 or C1710 recorded?**

  YES : DIAGNOSE the other DTCs first. REFER to **DTC Charts**.

  NO : Go to D2.

D2 CHECK THE PARKING AID SENSOR OPERATION

NOTE: Make sure the area around the vehicle is clear of anything that might activate the parking aid system.

- Clean the rear bumper and sensors with high-pressure water.
- Carry out the azimuth system check. Refer to **Azimuth System Check**.
- Carry out the elevation system check. Refer to **Elevation System Check**.
- **Does the parking aid system pass both system checks?**

  YES : The system is operating correctly at this time. The concern may have been caused by a dirty or blocked parking aid sensor. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to D3.

D3 CHECK THE PARKING AID SENSOR DISTANCE PIDs

- Make sure the suspect parking aid sensor(s) is flush-mounted in the bezel.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: PAM DataLogger
- With the brake pedal applied, shift the transmission into REVERSE (R) and monitor the parking aid sensor distance PID. The PID will read 255 cm (100 in) on a correctly functioning sensor.
- **Does the PID read 255 cm (100 in)?**

  YES : Go to D4.

  NO : Go to D5.

D4 CHECK THE PARKING AID SENSOR ATTENUATION PIDs

- Check the parking aid sensor attenuation PIDs.
- **Do the attenuation PIDs read between 0 and 16?**

  YES : Go to D6.

  NO : Go to D5.

D5 INSTALL A KNOWN GOOD SENSOR

- Install a known good sensor for the suspect parking aid sensor.
- Key in ON position.
- Clear the DTCs. Repeat the self-test. Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : Go to D6.

  NO : INSTALL a new parking aid sensor. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

D6 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **Parking Aid Module (PAM)**. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test E: DTC B1299 - Power Supply Sensor Circuit Short To Ground

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Parking Aid for schematic and connector information.

Normal Operation

Voltage is supplied to the parking aid sensors from the parking aid module (PAM) on circuit LMP07 (BU/WH). The PAM supplies ground to the parking aid sensors on circuit RMP07 (GN/WH).

- DTC B1299 (Power Supply Sensor Circuit Short to Ground) - sets when the sensor power supply circuit is shorted to ground or to circuit RMP07 (GN/WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Parking aid sensor(s)
- Parking aid bumper harness
- PAM

PINPOINT TEST E: DTC B1299 - POWER SUPPLY SENSOR CIRCUIT SHORT TO GROUND

NOTE:	**Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

E1 CHECK THE BUMPER WIRING HARNESS

- Inspect the bumper wiring harness for opens, shorts, grounds, or corrosion.
- **Is the bumper wiring harness OK?**

  YES : Go to E2.

  NO : REPAIR or INSTALL a new bumper wiring harness. CLEAR the DTCs. REPEAT the self-

test.

E2 CHECK THE LH OUTER SENSOR FOR AN INTERNAL SHORT

- Key in OFF position.
- Disconnect: Parking Aid Sensor C4009
- Key in ON position.
- Clear the DTCs. Repeat the on-demand self-test.
- **Is DTC B1299 still present?**

YES : Go to E3.

NO : INSTALL a new LH outer parking aid sensor. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

E3 CHECK THE RH OUTER SENSOR FOR AN INTERNAL SHORT

- Key in OFF position.
- Disconnect: Parking Aid Sensor C4011
- Key in ON position.
- Clear the DTCs. Repeat the on-demand self-test.
- **Is DTC B1299 still present?**

YES : Go to E4.

NO : INSTALL a new RH outer parking aid sensor. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

E4 CHECK THE LH INNER SENSOR FOR AN INTERNAL SHORT

- Key in OFF position.
- Disconnect: Parking Aid Sensor C4010
- Key in ON position.
- Clear the DTCs. Repeat the on-demand self-test.
- **Is DTC B1299 still present?**

YES : Go to E5.

NO : INSTALL a new LH inner parking aid sensor. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

E5 CHECK THE RH INNER SENSOR FOR AN INTERNAL SHORT

- Key in OFF position.
- Disconnect: Parking Aid Sensor C4012
- Key in ON position.
- Clear the DTCs. Repeat the on-demand self-test.
- **Is DTC B1299 still present?**

YES : Go to E6.

NO : INSTALL a new RH inner parking aid sensor. REFER to **Parking Aid Sensor**. CLEAR the DTCs. REPEAT the self-test.

E6 CHECK CIRCUIT LMP07 (BU/WH) FOR A SHORT TO GROUND

- Key in OFF position.

- Disconnect: Parking Aid Module C4014

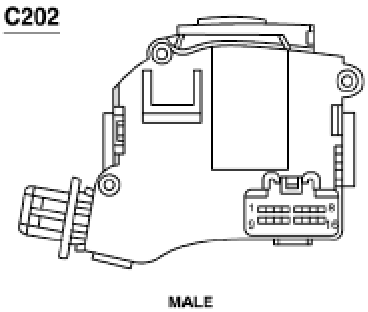

Fig. 1: Checking Circuit LMP07 (BU/WH) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PAM C4014-9, circuit LMP07 (BU/WH), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to E7.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E7 CHECK CIRCUIT LMP07 (BU/WH) FOR A SHORT TO CIRCUIT RMP07 (GN/WH)

- Key in OFF position.

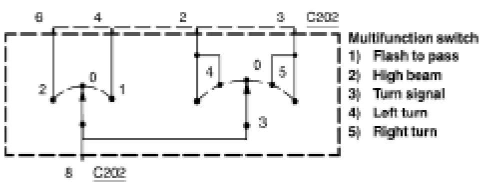

Fig. 2: Checking Circuit LMP07 (BU/WH) For A Short To Circuit RMP07 (GN/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the parking aid module C4014-9, circuit LMP07 (BU/WH), harness side and the PAM C4014-12, circuit RMP07 (GN/WH).
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to E8.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E8 CHECK FOR CORRECT PAM OPERATION

- Disconnect the parking aid module connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the parking aid module connector and make sure it seats correctly.

- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new parking aid module. REFER to **Parking Aid Module (PAM)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: DTC C1742 And C1743 - Rear Sounder Circuit Short To Voltage & Rear Sounder Circuit Failure

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Parking Aid for schematic and connector information.

Normal Operation

A 750 Hz variable warning tone is generated from a parking aid speaker. The parking aid speaker increases the warning tone rate as the vehicle gets closer to an obstacle. Circuits CMP09 (BN/BU) and RMP09 (BU/GN) provide the connection between the parking aid module (PAM) and speaker.

- DTC C1742 (Rear Sounder Circuit Failure) - sets when the sounder circuit is open or shorted to ground.
- DTC C1743 (Rear Sounder Circuit Short to Vbat) - sets when the sounder circuit is shorted to voltage.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAM
- Parking aid speaker

PINPOINT TEST F: DTC C1742 - REAR SOUNDER CIRCUIT FAILURE AND DTC C1743 - REAR SOUNDER CIRCUIT SHORT TO VOLTAGE

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

F1 RETRIEVE THE DTCs FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS

- Key in ON position.
- Retrieve the parking aid module DTCs from the continuous and on-demand self-tests.
- **Is DTC C1742 or C1743 present?**

  YES : Go to F2.

  NO : For all other DTCs, REFER to **DTC Charts**.

F2 MEASURE THE PARKING AID SPEAKER RESISTANCE

- Disconnect: Parking Aid Speaker C4015

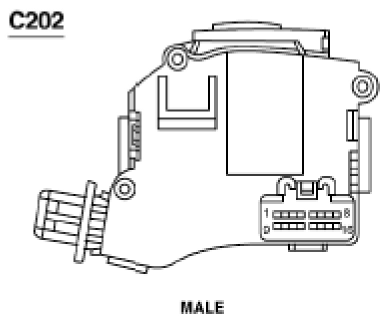

Fig. 3: Measuring Parking Aid Speaker Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the parking aid speaker pin 1, component side and the parking aid speaker pin 2, component side.
- **Is the resistance between 40 and 60 ohms?**

  YES : If DTC C1742 was recorded, go to F3.

  If DTC C1743 was recorded, go to F7.

  NO : INSTALL a new parking aid speaker. REFER to **Parking Aid Speaker**. CLEAR the DTCs. REPEAT the self-test.

F3 CHECK CIRCUIT CMP09 (BN/BU) FOR A SHORT TO GROUND

- Connect: Parking Aid Speaker C4015
- Disconnect: Parking Aid Module C4014
- Measure the resistance between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to F5.

  NO : Go to F4.

F4 CHECK CIRCUIT CMP09 (BN/BU) FOR A SHORT TO GROUND WITH THE PARKING AID SPEAKER DISCONNECTED

- Disconnect: Parking Aid Speaker C4015
- Measure the resistance between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuit RMP09 (BU/GN). CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR circuit CMP09 (BN/BU). CLEAR the DTCs. REPEAT the self-test.

F5 CHECK CIRCUIT CMP09 (BN/BU) FOR AN OPEN

- Disconnect: Parking Aid Speaker C4015

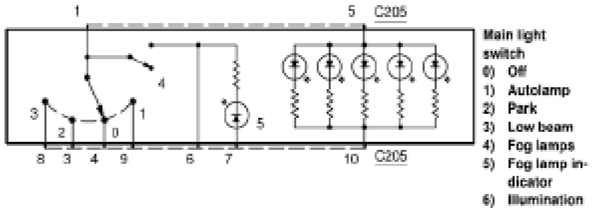

Fig. 4: Checking Circuit CMP09 (BN/BU) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and the parking aid speaker C4015-2, circuit CMP09 (BN/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to F6.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

F6 CHECK CIRCUIT RMP09 (BU/GN) FOR AN OPEN

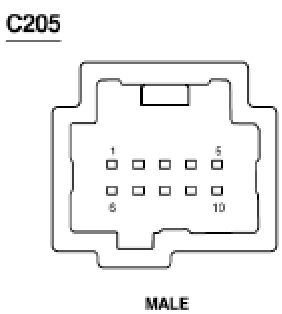

Fig. 5: Checking Circuit RMP09 (BU/GN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PAM C4014-6, circuit RMP09 (BU/GN), harness side and the parking aid speaker C4015-1, circuit RMP09 (BU/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to F8.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

F7 CHECK THE PARKING AID SPEAKER CIRCUITRY FOR SHORTS TO VOLTAGE

- Key in ON position.

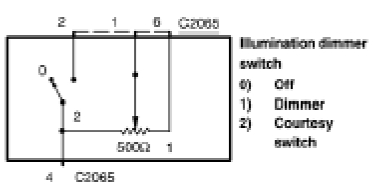

Fig. 6: Checking Parking Aid Speaker Circuitry For Shorts To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the PAM C4014-2, circuit CMP09 (BN/BU), harness side and ground; and between the PAM C4014-6, circuit RMP09 (BU/GN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to F8.

F8 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. The PAM and speaker are serviced as one assembly. REFER to **Parking Aid Module (PAM)**. CLEAR the DTCs. REPEAT the self-test. CARRY OUT the scan tool data link test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: DTC U0140 - Ignition Switch Position Missing

Normal Operation

The parking aid module (PAM) receives the ignition switch state from the smart junction box (SJB) as a network message.

- DTC U0140 (Lost Communication With Body Control Module [GEM])- is a continuous and on-demand DTC that sets in the parking aid module when ignition switch state messages are not received from the SJB.

This pinpoint test is intended to diagnose the following:

- SJB
- Networked data fault

PINPOINT TEST G: DTC U0140 - IGNITION SWITCH POSITION MISSING

G1 CONFIRM THE DTC WILL SET IN CONTINUOUS MEMORY

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Parking Aid Module (PAM) Continuous DTCs
- Clear the DTCs. Operate the system and determine if the concern is still present.

- Retrieve continuous PAM DTCs.
- **Is DTC U0140 present?**

  YES : Go to G2.

  NO : System is operating normally at this time.

G2 CHECK THE IGNITION SWITCH VOLTAGE PID

- Enter the following diagnostic mode on the diagnostic tool: PAM DataLogger
- Check the PAM ignition switch voltage PID (IGN_V).
- **Does the PID match the ignition switch position?**

  YES : REFER to **STEERING COLUMN SWITCHES** article.

  NO : Go to G3.

G3 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: DTC U0155 - PRNDL Missing

Normal Operation

The parking aid module (PAM) receives the transmission selector (PRNDL) state from the instrument cluster (IC) as a gateway message from the TCM.

- DTC U0155 (Lost Communication With IC) - is a continuous and on-demand DTC that sets in the parking aid module (PAM) when PRNDL messages are not received from the IC.

This pinpoint test is intended to diagnose the following:

- IC
- Networked data fault

PINPOINT TEST H: DTC U0155 - PRNDL MISSING

H1 CONFIRM THE DTC WILL SET IN CONTINUOUS MEMORY

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: PAM Continuous DTCs
- Clear the DTCs. Operate the system and determine if the concern is still present.
- Retrieve continuous PAM DTCs.
- **Is DTC U0155 present?**

  YES : Go to H2.

  NO : System is operating normally at this time.

H2 VERIFY THE IC PRNDL DISPLAY FUNCTIONS CORRECTLY

- Monitor the IC PRNDL display while moving the gearshift lever through the range of positions.
- **Does the PRNDL match all range positions?**

  YES : Go to H3.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnose the PRNDL.

H3 CHECK FOR CORRECT IC OPERATION

- Disconnect the IC connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the IC connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test I: The Audio Volume Cutback Command Is Inoperative

Normal Operation

With the ignition switch in the RUN position and the gear selector in REVERSE (R), the parking aid system calculates the distance to an object by the use of a radar sensor. A 750 Hz variable warning tone is generated by the parking aid sounder. A volume cutback request message is sent to the audio unit from parking aid module (PAM) over the medium speed controller area network (MS-CAN) to decrease the volume of the audio unit. The sounder increases its warning tone rate as the vehicle gets closer to an obstacle. When an object is detected within 46 cm (18 in) of the vehicle, the warning tone becomes continuous.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAM

- Audio Unit

PINPOINT TEST I: THE AUDIO VOLUME CUTBACK COMMAND IS INOPERATIVE

I1 VERIFY THE PAM COMMUNICATES WITH THE INSTRUMENT CLUSTER (IC) MESSAGE CENTER DISPLAY.

- Apply the parking brake.
- Key in ON position.
- Apply the brake pedal and place the gear selector in REVERSE (R).
- Disable/enable the parking aid system by pressing the reset button on the message center switch.
- **Can the PAM be disabled/enabled in the IC message center display?**

  YES : Go to I3.

  NO : Go to I2.

I2 VERIFY THE CORRECT PAM IS INSTALLED

- Check to make sure the correct PAM is installed.
- **Has the PAM been replaced prior?**

  YES : VERIFY the correct PAM is installed. If correct, go to I3.

  NO : INSTALL the correct PAM. REFER to **Parking Aid Module (PAM)**. TEST the system for normal operation.

I3 CHECK FOR CORRECT PAM OPERATION

- Disconnect the PAM connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the PAM connector and make sure it seats correctly.
- Operate the system and determine if the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PAM. REFER to **Parking Aid Module (PAM)**. TEST the system for normal operation.

  NO : The system is operating correctly at this time.

GENERAL PROCEDURES

AZIMUTH SYSTEM CHECK

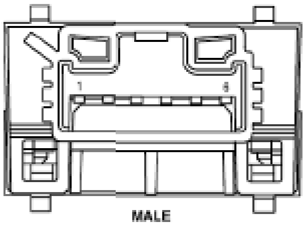

Fig. 7: Minimum Detectable Object Locations
Courtesy of FORD MOTOR CO.

NOTE:	**The object used in this system check can be fabricated from 9 cm O.D. (3 in I.D) plastic pipe 100 cm (39 in) in length (available as PVC pipe, or similar from a hardware or plumbing supply).**

NOTE:	**The following system check should be carried out with the vehicle on a level surface. The specified object locations are approximate, not absolute**

NOTE:	**The parking aid system will default to on when the ignition key is cycled from OFF to ON.**

NOTE:	**The scan tool may be used to monitor distance PIDs. The distance PIDs read between 0 and 255 cm (0 and 8 ft) on a correctly functioning system.**

1. Turn the ignition to the ON position, engine off.
2. Set the parking brake on.
3. Place the gear shift in REVERSE (R).
4. Verify that the parking aid system detects the specified object when placed within the 5 specified locations (P1, P2, P3, P4, P5). The pipe should be inside of these locations.
   - The speaker should beep slowly when objects are detected on the outer edges of the detection zone, and increase as the object is moved closer to the vehicle.

     When the object is within 46 cm (18 in) of the rear bumper, the sounder should be on continuously.

ELEVATION SYSTEM CHECK

NOTE:	**The following system check should be carried out with the vehicle on a 3.0 m wide by 4.5 m deep (10 ft wide by 15 ft deep) smooth concrete surface, free of all obstacles and noise from fan and pneumatic tools.**

1. Turn the ignition to the ON position, engine off.

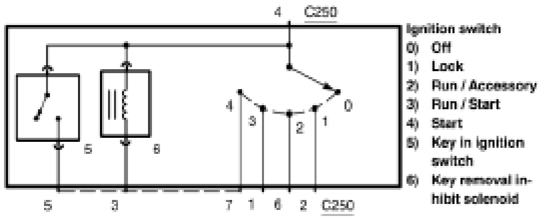

Fig. 8: Checking Parking Aid System
Courtesy of FORD MOTOR CO.

2. Set the parking brake.
3. Place the gear shift in REVERSE (R).
4. Verify that no audible alerts are heard. If audible alerts are heard, check to make sure the bumper is correctly installed and is not tilted downward so that the sensor is pointing at the ground.

REMOVAL AND INSTALLATION

PARKING AID MODULE (PAM)

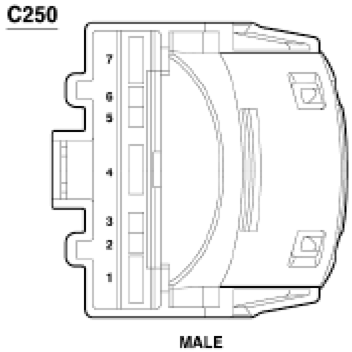

Fig. 9: Exploded View Of Parking Aid Module (PAM)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	15K866	Parking aid module (PAM)
2	W706350	PAM screws (2 required)
3	-	PAM electrical connectors (part of 13A412)

REMOVAL AND INSTALLATION

1. Remove the LH side C-pillar trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the LH rear seat bolster. For additional information, refer to **SEATING** article.
3. Remove the 2 screws and the parking aid module (PAM).

- Disconnect the PAM electrical connectors.

4. To install, reverse the removal procedure.

PARKING AID SPEAKER

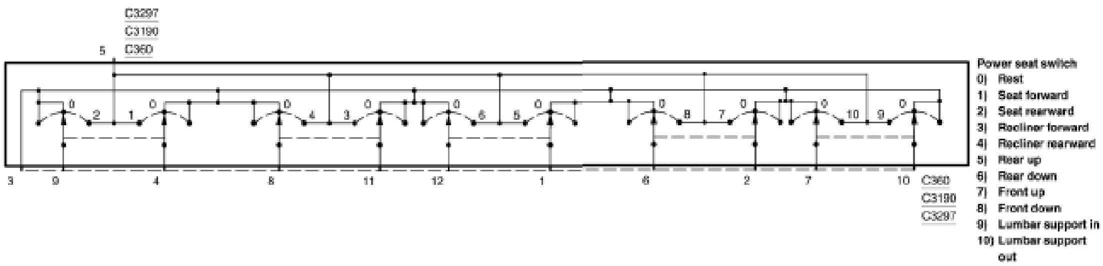

Fig. 10: Exploded View Of Parking Aid Speaker
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W713167	Parking aid speaker push pins (2 required)
2	15K864	Parking aid speaker
3	-	Parking aid speaker electrical connector (part of 14A005)

REMOVAL AND INSTALLATION

1. Remove the parcel shelf. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the 2 push pins and the parking aid speaker.
    - Disconnect the parking aid speaker electrical connector.
3. To install, reverse the removal procedure.

PARKING AID SENSOR

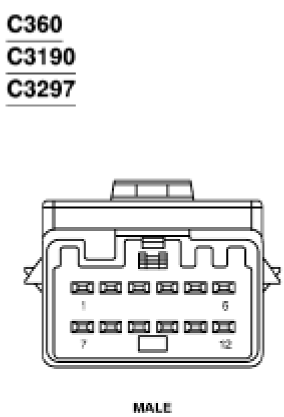

Fig. 11: Exploded View Of Parking Aid Sensor

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14489	Parking aid sensor(s)
2	-	Parking aid sensor electrical connectors (part of 14N139)

1. Remove the rear bumper cover. For additional information, refer to **BUMPERS** article.
2. Disconnect the parking aid sensor(s) electrical connector(s).
3. Press the retaining tabs and remove the parking aid sensor(s).
4. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

PARKING BRAKE

The parking brake system consists of the following components:

- Parking brake control
- Parking brake warning indicator switch
- Rear parking brake cable assembly

The parking brake system is a mechanical system that activates a self-adjusting brake system within the rear brake caliper.

The parking brake system is cable-actuated and controlled by an independent handle-operated parking brake control. The parking brake control applies tension to rear brake pads through the front parking brake cable and conduit and the LH and RH rear parking brake cables. The parking brake warning indicator is located in the instrument cluster. It illuminates to signal the driver that the parking brake is applied or to signal a low brake fluid condition. The warning indicator system is diagnosed in **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

DIAGNOSTIC TESTS

PARKING BRAKE

Principles of Operation

Parking Brake System - The parking brake system is cable-actuated and controlled by an independent hand-operated parking brake control that is not self adjusting. The parking brake system is actuated when the parking brake control is pulled up. When the parking brake control is pulled, tension is applied to the front parking

brake cable. This tension pulls on both rear parking brake cables, which are attached to the brake caliper parking brake actuators and apply the brake pads. When the parking brake release button is pressed and the brake control is released, the return springs on the brake calipers and the parking brake control return the system to the released position.

Inspection and Verification

NOTE: Prior to carrying out any diagnosis, make sure the red brake warning indicator is functional. Refer to INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES article.

The first indication that something may be wrong in the brake system is a change in the feeling through the parking brake control. The parking brake not holding on an incline or dragging after being released are also indicators of system concerns.

Check the operation of the parking brake system with the vehicle on a hoist and the parking brake control fully released. Check for any damaged cables and install new components as necessary. Carry out the brake system diagnosis.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

VISUAL INSPECTION CHART

Mechanical
• Front parking brake cable and conduit • Parking brake control • Parking brake equalizer • Rear brake calipers • Rear parking brake cables and conduits

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and Go to **Symptom Chart**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The red brake warning indicator is always/never on	• Brake fluid level switch • Parking brake switch • Wiring, terminals and connectors • Instrument cluster	• REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnose the red brake warning indicator.

	• Smart junction box (SJB)	
• Rear brakes drag	• Parking brake cables out of adjustment • Parking brake component(s) • Rear brake caliper guide pins • Brake caliper • Brake booster • Brake master cylinder	• ADJUST the parking brake cables. REFER to **Parking Brake Cable Adjustment**. • INSPECT the parking brake system for corrosion, rust or kinked cables. REPAIR or INSTALL new parking brake components as necessary. • INSPECT the brake caliper guide pins. REFER to Brake Caliper Guide Pins in **BRAKE SYSTEM - GENERAL INFORMATION** article. • INSPECT the brake caliper. REFER to Brake Caliper in **BRAKE SYSTEM - GENERAL INFORMATION** article. • CARRY OUT the Brake Booster Component Test. REFER to Diagnosis and Testing in **BRAKE SYSTEM - GENERAL INFORMATION** article. • CARRY OUT the Brake Master Cylinder Component Test. REFER to Diagnosis and Testing in **BRAKE SYSTEM - GENERAL INFORMATION** article.
• The parking brake will not apply	• Parking brake control • Parking brake cables • Parking brake rear wheel components	• Go to **Pinpoint Test A**.
• The parking brake will not release	• Parking brake cables • Parking brake control • Parking brake rear wheel components	• Go to **Pinpoint Test B**.

Pinpoint Tests

Pinpoint Test A: The Parking Brake Will Not Apply

Normal Operation

The parking brake system is cable-actuated and controlled by an independent hand-operated parking brake control that is not self adjusting, The parking brake system is actuated when the parking brake control is pulled up. When the parking brake control is pulled, tension is applied to the front parking brake cable. This tension pulls on both rear parking brake cables, which are attached to the brake caliper parking brake actuators and apply the brake pads.

This pinpoint test is intended to diagnose the following:

- Parking brake control
- Parking brake cables
- Rear brake calipers

PINPOINT TEST A: THE PARKING BRAKE WILL NOT APPLY

A1 CHECK THE PARKING BRAKE CONTROL

- Apply the parking brake control.
- **Does the parking brake control move?**

  YES : Go to A2.

  NO : Go to A3.

A2 CHECK FOR BROKEN CABLES

NOTE: Have an assistant apply and release the parking brake control to help isolate disconnected cables or cables that do not move.

- Inspect the following items for damage and correct connections:
  - Parking brake control
  - Front cable
  - Equalizer
  - LH rear cable
  - RH rear cable
  - Rear brake caliper actuators
- **Is any damage found or are any components disconnected?**

  YES : CONNECT the component(s) or INSTALL a new parking brake component(s) as necessary. TEST the system for normal operation.

  NO : VERIFY that the rear pads are within thickness specifications. REFER to Specifications in **BRAKE SYSTEM - GENERAL INFORMATION** article. If the rear pads are OK, INSTALL new rear brake calipers. REFER to **REAR DISC BRAKE** article.

A3 ISOLATE THE PARKING BRAKE CONTROL AND FRONT PARKING BRAKE CABLE

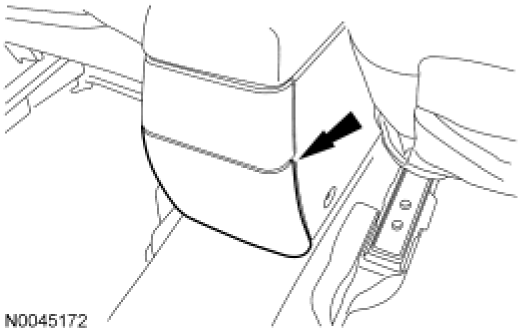

Fig. 1: Locating Floor Console Rear Access Panel
Courtesy of FORD MOTOR CO.

- Remove the floor console rear access panel.
- Loosen the parking brake adjustment nut and disconnect the rear cables from the equalizer.
- Apply the parking brake control.
- **Does the parking brake control move?**

  YES : Go to A4.

  NO : INSTALL a new parking brake control. REFER to **Parking Brake Control**. TEST the system for normal operation.

A4 ISOLATE THE REAR PARKING BRAKE CABLES

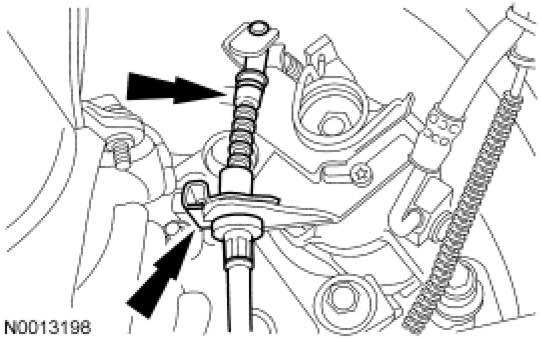

Fig. 2: Locating Parking Brake Cable Retaining Clip
Courtesy of FORD MOTOR CO.

- Disconnect the LH and RH parking brake cables from the brake calipers.
- While holding the cable conduit, attempt to slide the cable inside the conduit.
- **Does the cable slide freely inside the conduit?**

  YES : INSTALL new rear brake calipers. REFER to **REAR DISC BRAKE** article. ADJUST the parking brake cable. REFER to **Parking Brake Cable Adjustment** in this section.

  NO : INSTALL a new rear brake cable(s). REFER to **Parking Brake Cable - Rear**. TEST the system for normal operation.

Pinpoint Test B: The Parking Brake Will Not Release

Normal Operation

When the parking brake release button is pressed and the brake control is released, the return springs on the brake calipers and the parking brake control return the system to the released position.

This pinpoint test is intended to diagnose the following:

- Parking brake cables
- Parking brake control
- Parking brake rear wheel components

PINPOINT TEST B: THE PARKING BRAKE WILL NOT RELEASE

B1 CHECK THE PARKING BRAKE CONTROL

- Press the release button on the parking brake control and release the handle.
- **Does the parking brake control move?**

  YES : Go to B2.

  NO : INSTALL a new parking brake control. REFER to **Parking Brake Control**. TEST the system for normal operation.

B2 CHECK THE REAR PARKING BRAKE CABLES

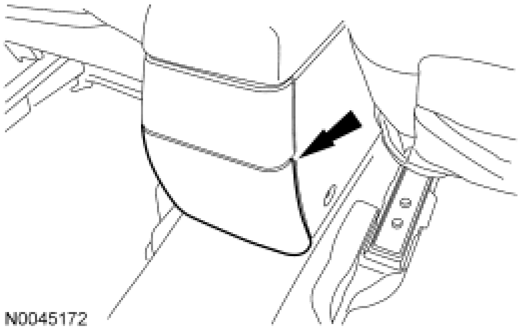

Fig. 3: Locating Floor Console Rear Access Panel
Courtesy of FORD MOTOR CO.

- Remove the floor console rear access panel.
- Loosen the parking brake adjustment nut and disconnect the rear cables from the equalizer.

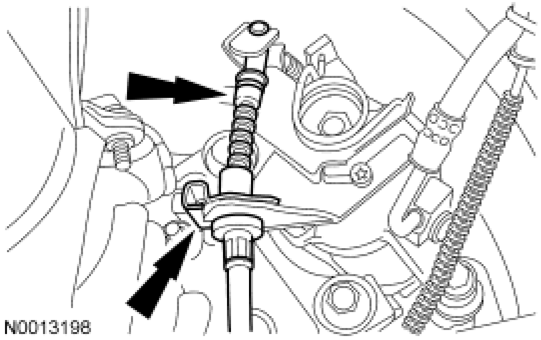

Fig. 4: Locating Parking Brake Cable Retaining Clip

Courtesy of FORD MOTOR CO.

- Disconnect the LH and RH parking brake cables from the brake calipers.
- While holding the rear cable conduit, attempt to slide the rear cable inside the conduit.
- **Does the cable slide freely inside the conduit?**

  YES : INSTALL new rear brake calipers. REFER to **REAR DISC BRAKE** article. ADJUST the parking brake cable. REFER to **Parking Brake Cable Adjustment** in this section.

  NO : INSTALL new rear brake cable(s). REFER to **Parking Brake Cable - Rear**. TEST the system for normal operation.

GENERAL PROCEDURES

PARKING BRAKE CABLE ADJUSTMENT

NOTE: **Do not pry at the floor console rear access panel with a screwdriver or damage to the panel may occur.**

1. Remove the floor console rear access panel.

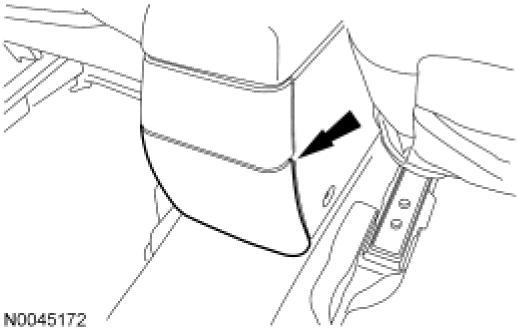

Fig. 5: Locating Floor Console Rear Access Panel
Courtesy of FORD MOTOR CO.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

NOTE: **The dimension will vary depending on the amount of cable stretch. New cables require cycling the parking brake control 5-10 times to remove the cable slack.**

3. Adjust the parking brake adjustment nut as shown.

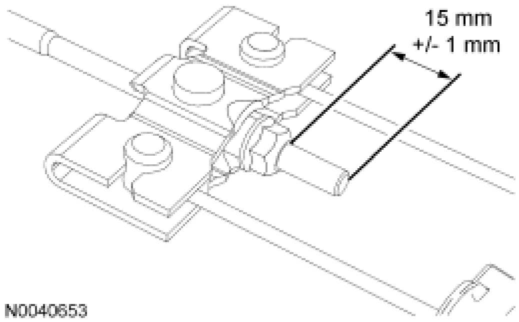

Fig. 6: Identifying Parking Brake Adjustment Nut Dimension
Courtesy of FORD MOTOR CO.

4. Verify correct operation of the parking brake system.
   - At 2 clicks of the parking brake control, slight drag at the rear wheels should be present.
   - At 5 clicks of the parking brake control, no movement at the rear wheels should be present.
5. Install the floor console rear access panel.

REMOVAL AND INSTALLATION

PARKING BRAKE WARNING INDICATOR SWITCH

NOTE: Park brake control cover removed for clarity.

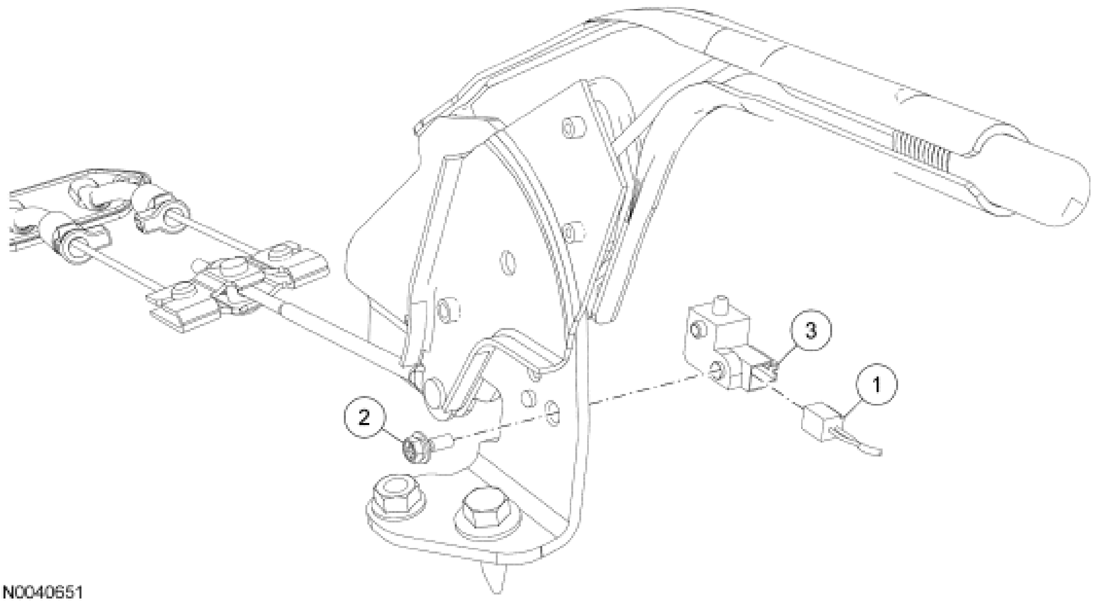

Fig. 7: Exploded View Of Parking Brake Warning Indicator Switch

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Parking brake warning indicator switch electrical connector
2	-	Parking brake warning indicator switch screw
3	-	Parking brake warning indicator switch

REMOVAL AND INSTALLATION

1. Remove the floor console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
2. Disconnect the parking brake warning indicator switch electrical connector.
3. Remove the parking brake warning indicator switch screw.
4. Remove the parking brake warning indicator switch.
5. To install, reverse the removal procedure.

PARKING BRAKE CONTROL

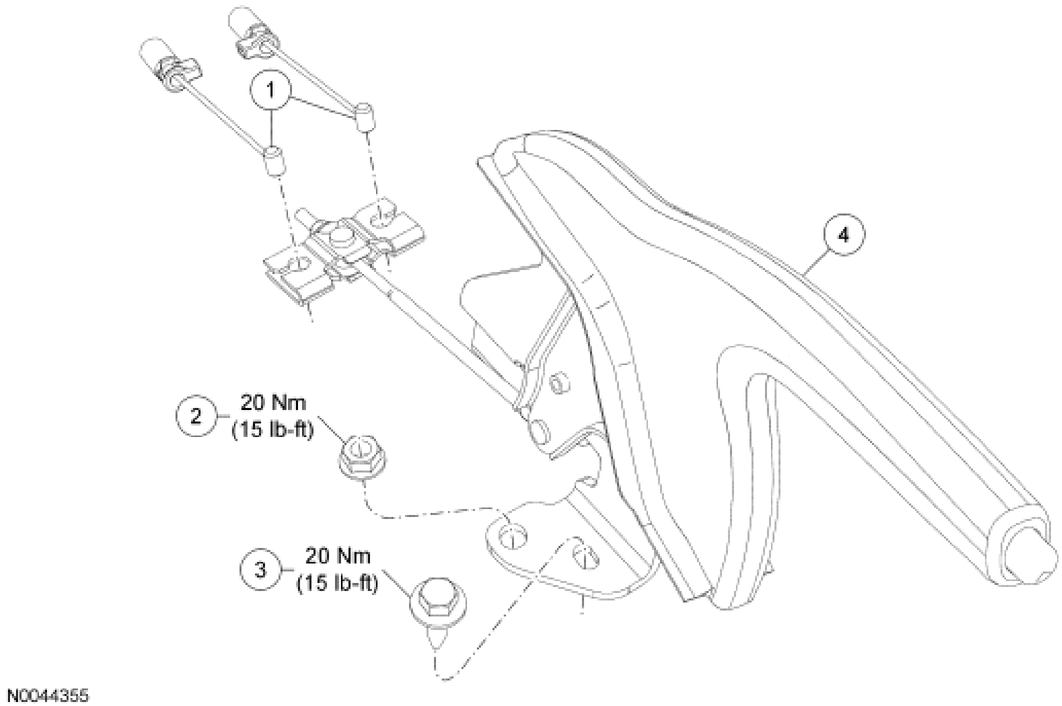

Fig. 8: Exploded View Of Parking Brake Control With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2A815	Rear parking brake cables

2	W520413	Parking brake control nut (2 required)
3	W706246	Parking brake control bolt
4	2780	Parking brake control

REMOVAL AND INSTALLATION

1. Remove the floor console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
2. Make sure the parking brake control is in the released position.
3. Disconnect the warning indicator switch electrical connector.
4. Loosen the parking brake control adjusting nut.
5. Remove the 2 parking brake control nuts.
    - To install, tighten to 20 Nm (15 lb-ft).
6. Remove the parking brake control bolt and the parking brake control.
    - To install, tighten to 20 Nm (15 lb-ft).
7. To install, reverse the removal procedure.
    - Adjust the parking brake cable. For additional information, refer to **Parking Brake Cable Adjustment**.

PARKING BRAKE CABLE - REAR

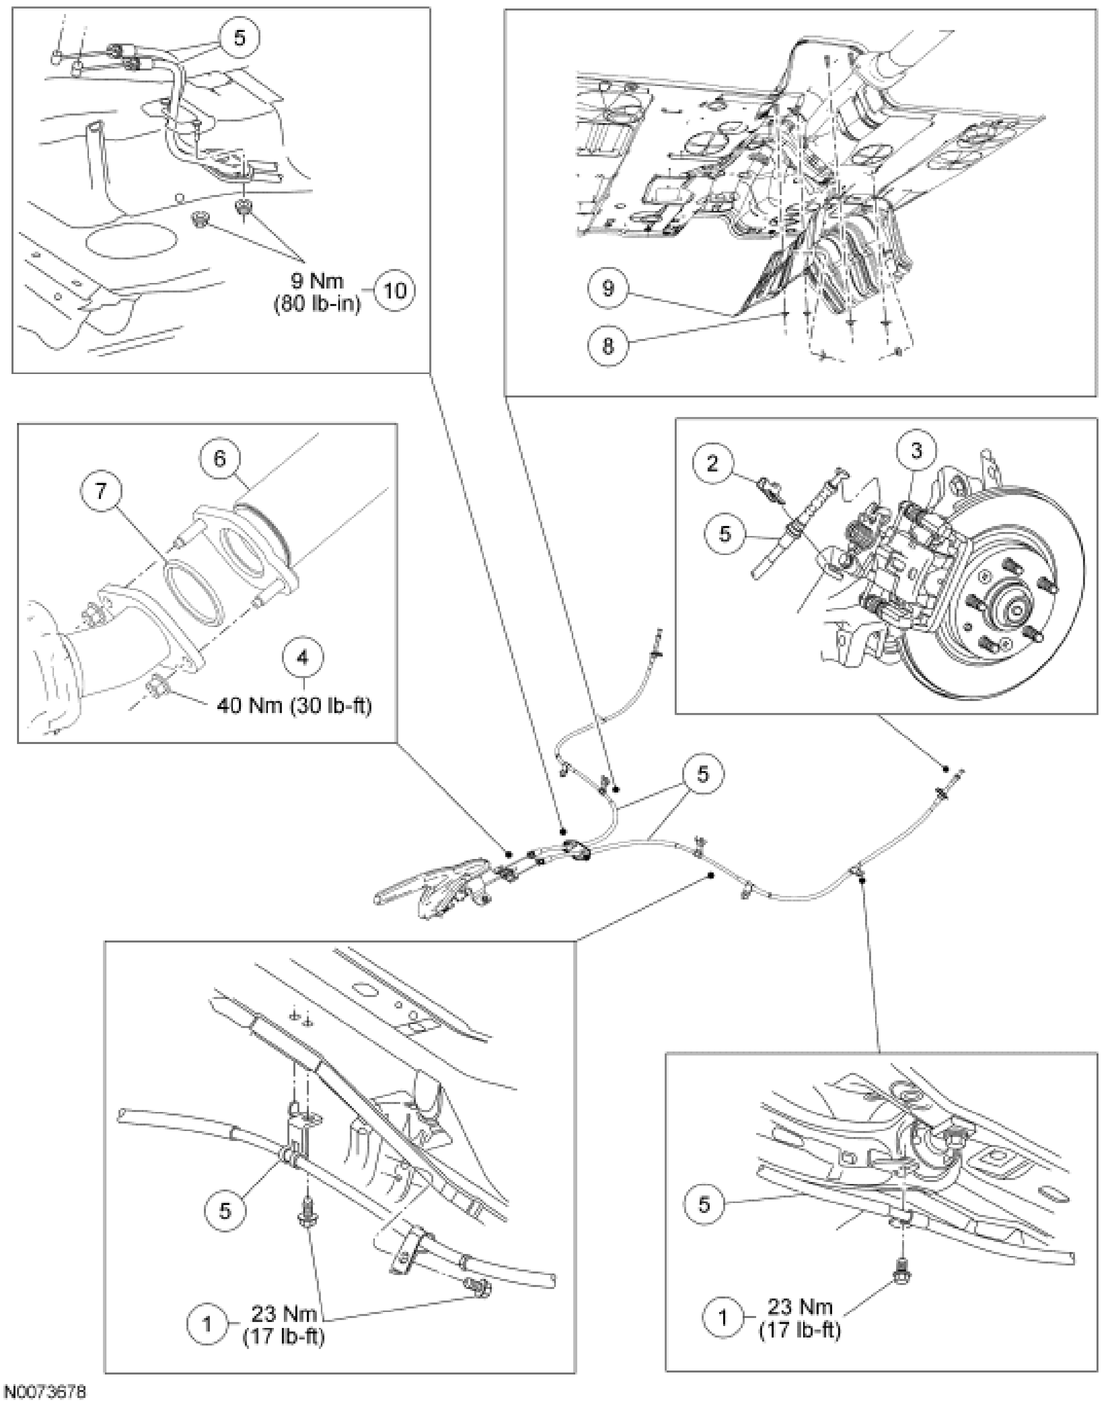

Fig. 9: Exploded View Of Rear Parking Brake Cable With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W505263	Parking brake cable routing bracket bolts (6 required)
2	2860	Parking brake cable routing clip (2 required)
3	2552 LH/ 2553 RH	Brake caliper

4	W705443	Catalytic converter-to-exhaust flexible pipe nut (2 required)
5	2A815	Rear parking brake cable assembly
6	5G203	Exhaust flexible pipe
7	9451	Gasket
8	W709729	Heat shield nut (6 required)
9	114B04	Heat shield
10	W707142	Parking brake cable routing bracket nuts (2 required)

REMOVAL AND INSTALLATION

NOTE: **Do not use oil or grease-based lubricants on the isolators. They may cause deterioration of the rubber.**

NOTE: **Oil or grease-based lubricants on the isolators may cause the exhaust hanger isolator to separate from the exhaust hanger bracket during vehicle operation.**

1. Remove the floor console. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
2. Loosen the parking brake control adjusting nut.
3. Disconnect the rear parking brake cables from the equalizer.
4. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
5. Support the muffler and tailpipe with a suitable jackstand.
6. Separate the 2 muffler and tailpipe isolators from the vehicle.
7. Remove and discard the 2 catalytic converter-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe and the catalytic converter.
   - Discard the gasket.
   - To install, tighten new nuts to 40 Nm (30 lb-ft).
8. Remove the heat shield.
   - Remove the 6 nuts, the 2 pin-type retainers and the heat shield.
9. Remove the 2 parking brake cable routing bracket nuts.
   - To install, tighten to 9 Nm (80 lb-in).
10. Remove the 6 parking brake cable routing bracket bolts.
    - To install, tighten to 23 Nm (17 lb-ft).
11. Remove the 2 parking brake cable routing clips.
12. Disconnect the rear parking brake cables from the calipers and remove the cables.
13. To install, reverse the removal procedure.
    - Adjust the parking brake cable. For additional information, refer to **Parking Brake Cable Adjustment**.

DIAGNOSTIC TROUBLE CODES

DIAGNOSTIC TROUBLE CODE DESCRIPTIONS

DTC	Description
B1213	Less than 2 (or 3 if equipped w/Valet key) keys programmed to the system.
B1232/B2103	Transceiver internal antenna damaged. Replace transceiver.
B1342	ECU is defective (EEPROM in PCM is not working - replace PCM). PATS related when stored in PCM only.
B1600	Non-PATS Key or damaged key.
B1601	Unprogrammed encoded ignition key detected (leave ignition on for 20 seconds before trying a programmed key, in Anti-Scan Mode).
B1602	Partial detection of encoded ignition key.
B1681	Transceiver signal not detected.
B2141	Non-Volatile Memory (NVM) configuration failure - No PCM ID stored in PATS.
B2139/U2510	PCM ID does not match between the PCM and PATS control (PATS/ICM/VIC/HEC/SCIL).
B2431	Key program failure (defective key or transceiver).
U1147/U1262	Communications issue, SCP (J1850), between PCM and PATS control (PATS/ICM/ VIC/HEC/SCIL).
U1900/U0100 Or U2511/B2009	Communications issue, CAN (J2284), between PCM and PATS control (ICM).
P1260	PCM disabled the vehicle because of a PATS concern. Retrieve DTCs from applicable PATS control function (PATS/ICM/VIC/HEC/SCIL).

NON-PATS ISSUES

The following are NOT Passive Anti-Theft System issues: :

- The "Service Engine Soon" light is illuminated. (Investigate PCM system).
- There is no communication with PCM: PCM will always communicate on the diagnostic link regardless of theft status. (Investigate PCM system).
- Engine stalls on road: Once the engine runs for one second, PATS CANNOT disable the engine. Running stalls are not PATS related issues.
- Remote Entry/Keyless Entry problems: PATS is completely separate from the Remote Entry/Keyless Entry systems.
- There is a no-crank problem on vehicles without PATS Starter disable. Check chart, on reverse side, for presence of Starter Interrupt.
- PATS Theft Indicator flashes every 2 seconds at Ignition OFF. This is normal operation for PATS to act as a visual theft deterrent. See **PASSIVE ANTI-THEFT SYSTEM (PATS) SPECIFICATIONS** for applicable system.
- PATS Theft Indicator stays on for 2 or 3 seconds (depending on system type) at Ignition RUN or START and then off: This is normal operation for PATS proveout on all vehicles except LS and Thunderbird.

THINGS TO DO:

- Review Service Procedures and Technical Service Bulletins (TSBs) for latest information.
- Disconnect the diagnostic tool for 20 seconds before cycling ignition to OFF, ACC, or RUN.
- When replacing ignition keys, make sure the owner throws out **ALL** old keys.
- Disconnect battery cables when replacing PATS module, ICM, VIC, HEC, SCIL, PCM, or EEC.
- Look for fault codes in PATS. The PATS function will store fault codes when the PCM records a P1260.
- Be certain of the vehicle model year. Use only parts and keys specified for the appropriate model year.
- Check to make sure the issue is not with multiple PATS keys, small electronic devices that can be used to purchase gasoline, or other items on same key ring.
- Check to ensure vehicle does not have an aftermarket remote starter. Disable any Remote Starter equipment, especially anything nearby the PATS Transceiver. Ford FCSD Dealer installed Remote Starter systems are approved for use in Ford vehicles.
- Check to ensure vehicle does not have an aftermarket engine immobilizer. The Ford FCSD aftermarket remote entry system comes with a starter interrupt that should be disabled on PATS equipped vehicles.
- If the Alarm sounds when the ignition is turned to RUN or START, refer to the appropriate PERIMETER ALARM article.

THINGS NOT TO DO:

- Do not use aftermarket keys that are **NOT** Ford qualified.
- Do not reprogram keys unless a defective key or control function has been replaced. Reprogramming keys does not fix any known problem by itself.
- Do not perform more Security Access functions than required: Perform only the functions specified in the appropriate service information for this repair. Selection of extra functions may continue the no-crank condition.

PROGRAMMING PROCEDURES

NOTE: **To determine appropriate procedure, refer to PASSIVE ANTI-THEFT SYSTEM (PATS) SPECIFICATIONS.**

KEY PROGRAMMING USING DIAGNOSTIC TOOLS

PROCEDURE #1

1 key required. Cycle key to RUN. Enter "Ignition Key Code Erase." Disconnect Tool and leave key in RUN for 20 seconds. Cycle key to OFF and then RUN.

PROCEDURE #2

2 keys required. Cycle key 1 to RUN. **Enter Security Access on the PATS control function module.** Select "Ignition Key Code Erase." Disconnect Tool and leave key in RUN for 20 seconds. Cycle key 1 to OFF, then RUN, and back to OFF. Cycle key 2 to RUN.

PROCEDURE #3

2 keys required. Cycle key 1 to RUN. Select "Ignition Key Code Erase." Disconnect Tool and leave key in RUN for 20 seconds. Cycle key 1 to OFF, then RUN, and back to OFF. Cycle key 2 to RUN.

SPARE KEY PROGRAMMING USING DIAGNOSTIC TOOLS

PROCEDURE #4

Cycle an unprogrammed key in ignition to RUN. **Enter Security Access on the PATS control function module.** Select "Ignition Key Code Program." Disconnect Tool and leave key in RUN for 20 seconds.

SPARE KEY PROGRAMMING USING PROGRAMMED KEYS

PROCEDURE #5

1 key required. Cycle key 1 to RUN, then OFF. Cycle new key to RUN.

PROCEDURE #6

2 keys required. Cycle key 1 to RUN, then OFF. Cycle key 2 to RUN, then OFF. Cycle new key to RUN.

REPLACING PATS CONTROL MODULE OR PCM

PROCEDURE #7

Cycle a key in ignition to RUN. **Enter Security Access on the PATS control function module.** Select "Parameter Reset" and then Exit Security Access. Perform a PCM Keep Alive Memory (KAM).

PROCEDURE #8

Cycle a key in the ignition to RUN. **Enter Security Access on the PATS control function module.** Select "ICM/**PCM** Parameter Reset." Select "PCM/**TCM** Parameter Reset" and then Exit Security Access **(type F)** .

2008 BRAKES

Power Brake Actuation - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Brake booster nuts	23	17	-
Ground cable bolt	12	-	106
Push rod jam nut	17	-	150
Transmission fluid level indicator tube bolt	8	-	71

DESCRIPTION AND OPERATION

BRAKE BOOSTER

The power brake actuation system consists of the following components:

- Brake booster
- Brake booster check valve
- Brake booster vacuum supply hose

The brake booster uses engine vacuum from the intake manifold to create a partial vacuum inside the vacuum booster on both sides of the diaphragm. When the brake pedal is pressed, the booster rod opens a valve, allowing air to enter the booster on one side of the diaphragm while sealing off the opposite side. This increases pressure on that side of the diaphragm so that it helps push the rod, which in turn pushes the piston in the master cylinder. As the brake pedal is released, the valve seals off the outside air supply while opening the vacuum valve. This restores vacuum to both sides of the diaphragm, allowing everything to return to its original position.

DIAGNOSTIC TESTS

POWER BRAKE SYSTEM

Refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

BRAKE BOOSTER

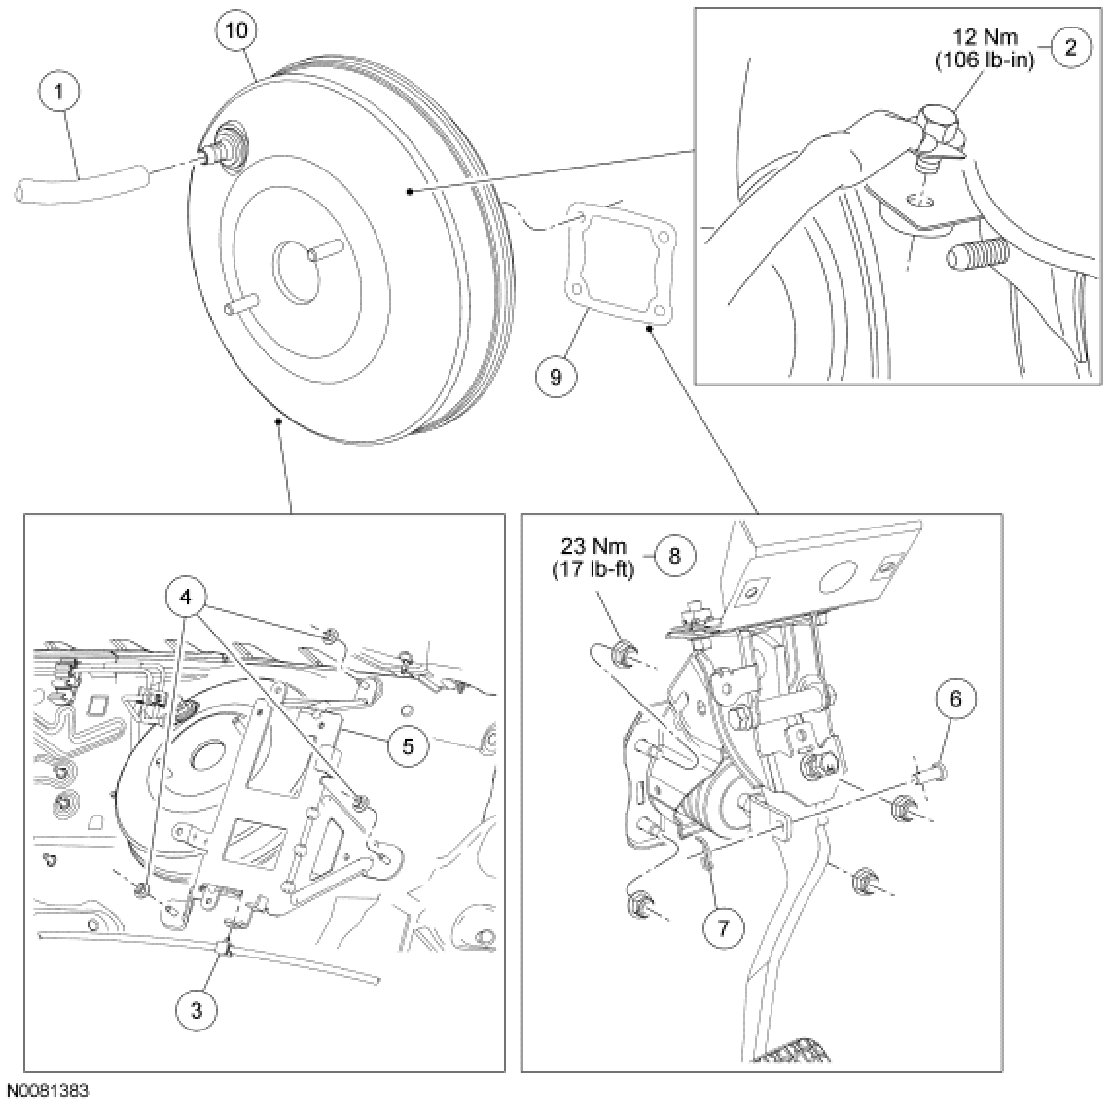

Fig. 1: Exploded View Of Brake Booster Components With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	9C840	Vacuum hose/aspirator assembly
2	W705936	Ground cable bolt
3	-	Harness fastener (part of 14290)
4	N804795	PCM bracket nuts
5	12A659	PCM bracket
6	2N513	Brake booster push rod pin
7	7B096	Brake booster push rod clip
8	W520212	Brake booster nut (4 required)
9	2B022	Brake booster-to-cowl gasket
10	2B195	Brake booster with check valve

REMOVAL AND INSTALLATION

All vehicles

1. Remove the brake master cylinder. For additional information, refer to **HYDRAULIC BRAKE ACTUATION** article.
2. Remove the PCM. For additional information, refer to **ELECTRONIC ENGINE CONTROLS - 2.3L** article or **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article.
3. Remove the battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
4. Remove the bolt and disconnect the ground cable.
   - To install, tighten to 12 Nm (106 lb-in).
5. Disconnect the harness fastener and remove the 3 nuts and the PCM bracket.

NOTE: **Make sure that the aspirator tube is routed correctly and that the clamps are positioned so they do not make contact with surrounding components or damage to the tube may occur.**

6. Disconnect the vacuum hose/check valve assembly from the brake booster.

Automatic transmission vehicles

NOTE: **It is not necessary to remove the fluid level indicator tube from the transmission. The tube can be positioned aside with only the bolt removed.**

7. Remove the transmission fluid level indicator tube bolt and position the tube aside.
   - To install, tighten to 8 Nm (71 lb-in).

All vehicles

8. Remove the brake booster push rod pin and clip and disconnect the push rod from the brake pedal.
9. Remove the 4 nuts and the brake booster.
   - To install, tighten the nuts in a criss-cross pattern to 23 Nm (17 lb-ft).

NOTE: **Prior to installation, make sure that the distance between the booster mating surface and the push rod center point is as shown or reduced brake assist may occur.**

10. To install, reverse the removal procedure.
    - Check for correct booster push rod distance and adjust as necessary.
      - Tighten the booster push rod jam nut to 17 Nm (150 lb-in).

DESCRIPTION AND OPERATION

POWER STEERING

The power steering system consists of the following components:

- Power steering pump
- Power steering fluid reservoir
- Power steering pressure and return lines/hoses
- Power steering fluid cooler
- Power steering gear
- Inner tie rod

The power steering system uses a vane-type pump to move the fluid from the reservoir to the steering gear and through the rest of the steering hydraulic system. The power steering pump is mounted to the engine and driven by the engine accessory drive belt. Power steering fluid flows into the pump from the reservoir. The power steering fluid is then trapped between the pump vanes and moved to the high-pressure side of the pump creating a flow of fluid. The restriction of this flow by the steering gear creates the pressure that provides the steering assist. A combined pressure relief/flow valve is built into the pump to control the maximum pressure and flow provided to the steering system. This action prevents damage to the system and provides the correct level of assist during all engine speeds. While under pressure, the power steering fluid flows through the high-pressure power steering line to the steering gear. The fluid exits the gear and flows through the return line, cooler and finally to the reservoir. The reservoir slows the fluid, allows air to escape and filters the fluid before returning it to the pump.

DIAGNOSTIC TESTS

POWER STEERING

Refer to **STEERING SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

POWER STEERING FLUID RESERVOIR - 3.0L

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

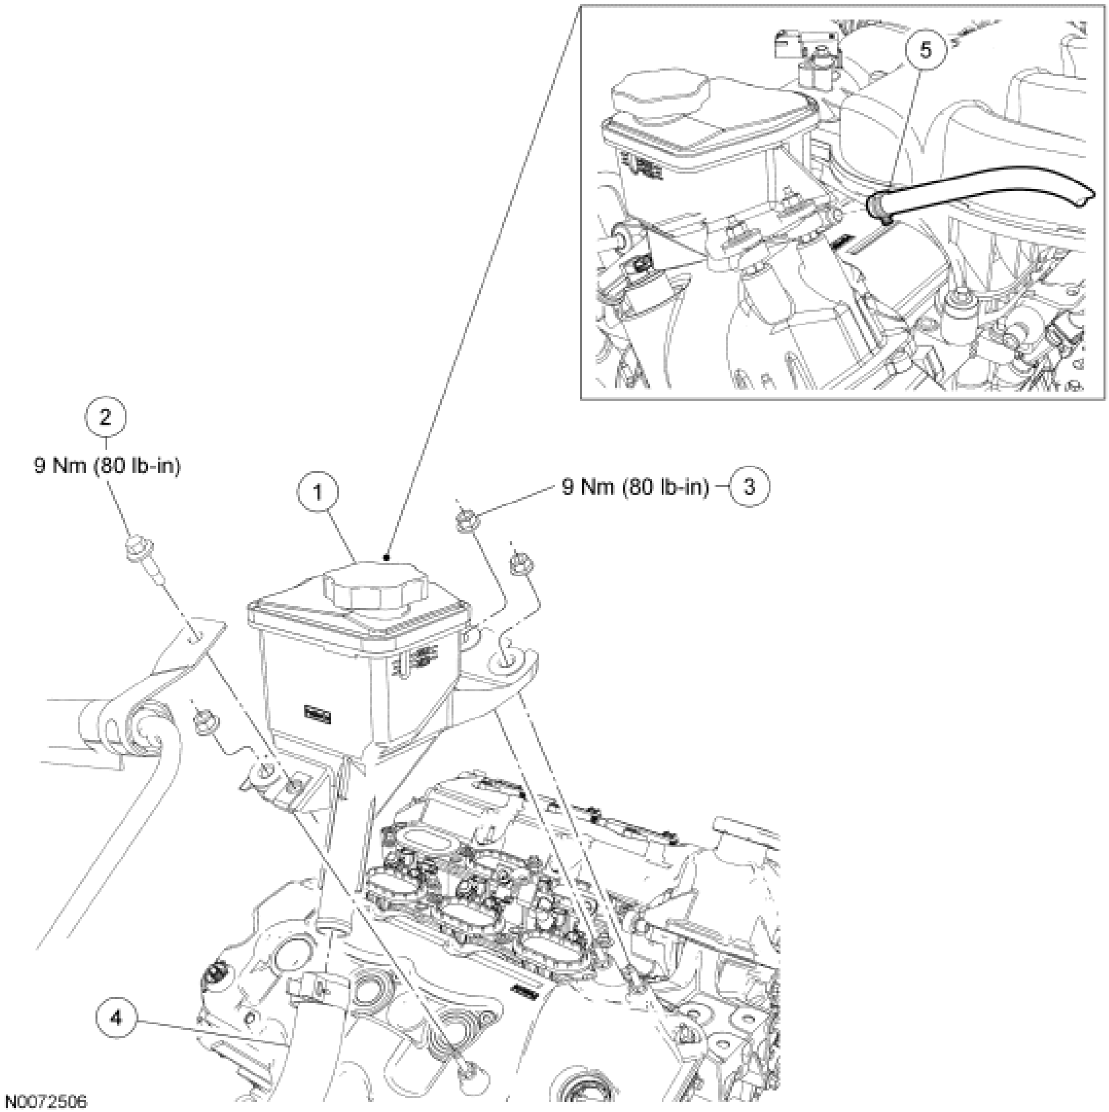

Fig. 1: Exploded View Of Power Steering Fluid Reservoir With Torque Specifications - 3.0L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3R700	Power steering fluid reservoir
2	W506413	Pressure line bracket-to-power steering fluid reservoir bolt
3	W520111	Power steering fluid reservoir nut (3 required)
4	3691	Power steering pump supply hose
5	3A713A	Power steering return hose

REMOVAL AND INSTALLATION

NOTE: **While repairing the power steering system, care should be taken to prevent the**

entry of foreign material or failure of the power steering components may result.

1. Using a suitable suction device, remove the power steering fluid from the fluid reservoir.
2. Release the clamp and disconnect the power steering return hose from the power steering fluid reservoir.
3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

NOTE: **It is easier to access the power steering pump supply hose clamp from underneath the vehicle at the power steering pump.**

4. Release the clamp and disconnect the power steering pump supply hose from the power steering pump.

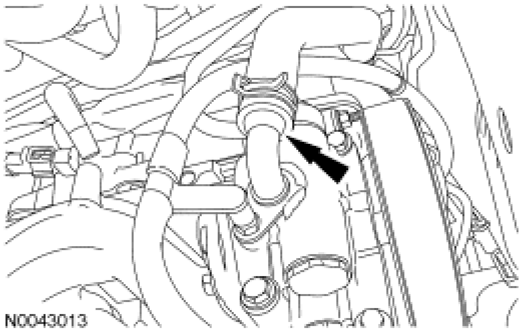

Fig. 2: Locating Power Steering Reservoir Supply Hose
Courtesy of FORD MOTOR CO.

5. Remove the pressure line bracket-to-power steering fluid reservoir bolt and position the bracket aside.
   - To install, tighten to 9 Nm (80 lb-in).
6. Remove the 3 power steering fluid reservoir nuts and remove the reservoir.
   - To install, tighten to 9 Nm (80 lb-in).
7. To install, reverse the removal procedure.
   - Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.

POWER STEERING FLUID RESERVOIR - 3.5L

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

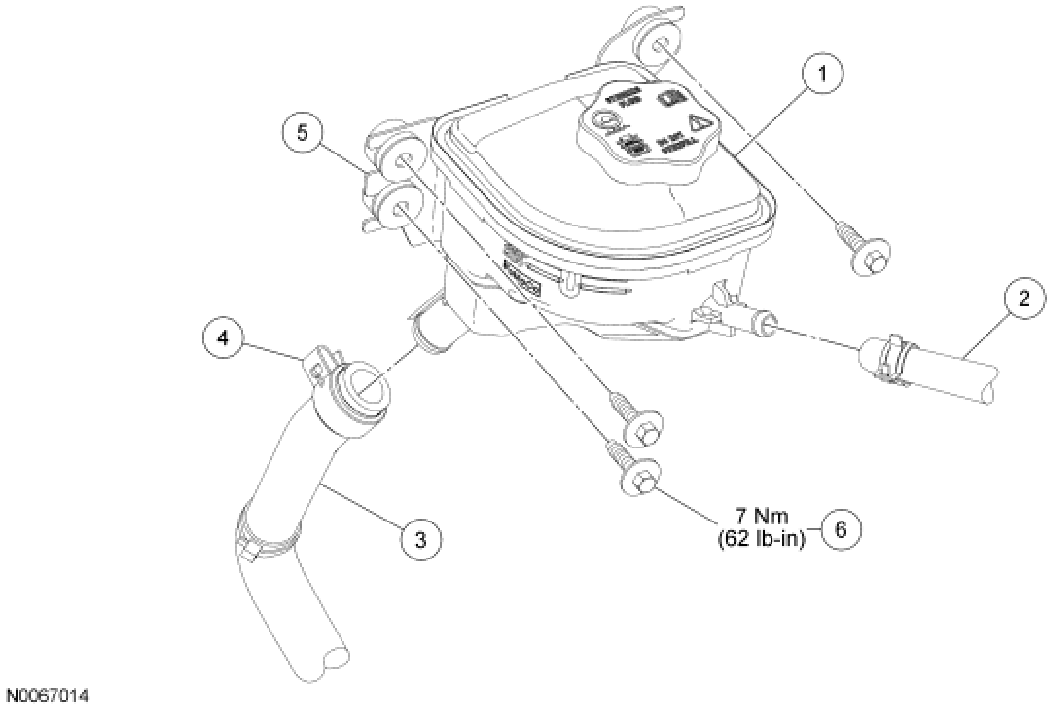

Fig. 3: Exploded View Of Power Steering Fluid Reservoir With Torque Specification - 3.5L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3A697	Power steering fluid reservoir
2	3A713A	Power steering return hose and clamp
3	3691	Power steering pump supply hose
4	-	Power steering pump supply hose clamp (part of 3691)
5	3490	Power steering fluid reservoir bracket
6	W712963	Power steering fluid reservoir bracket bolt (3 required)

REMOVAL AND INSTALLATION

NOTE: When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

1. Using a suitable suction device, remove the power steering fluid from the fluid reservoir.
2. Release the clamp and disconnect the power steering return hose from the power steering fluid reservoir.
3. Remove the 3 power steering fluid reservoir bracket bolts.
    - To install, tighten to 7 Nm (62 lb-in).
4. Release the power steering pump supply hose clamp and disconnect the supply hose from the reservoir.

NOTE: **If a new power steering fluid reservoir is being installed, a new reservoir mounting bracket must also be installed.**

5. Remove the power steering fluid reservoir and bracket as an assembly.
6. To install, reverse removal procedure.
   - Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.

POWER STEERING PUMP - 2.3L

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

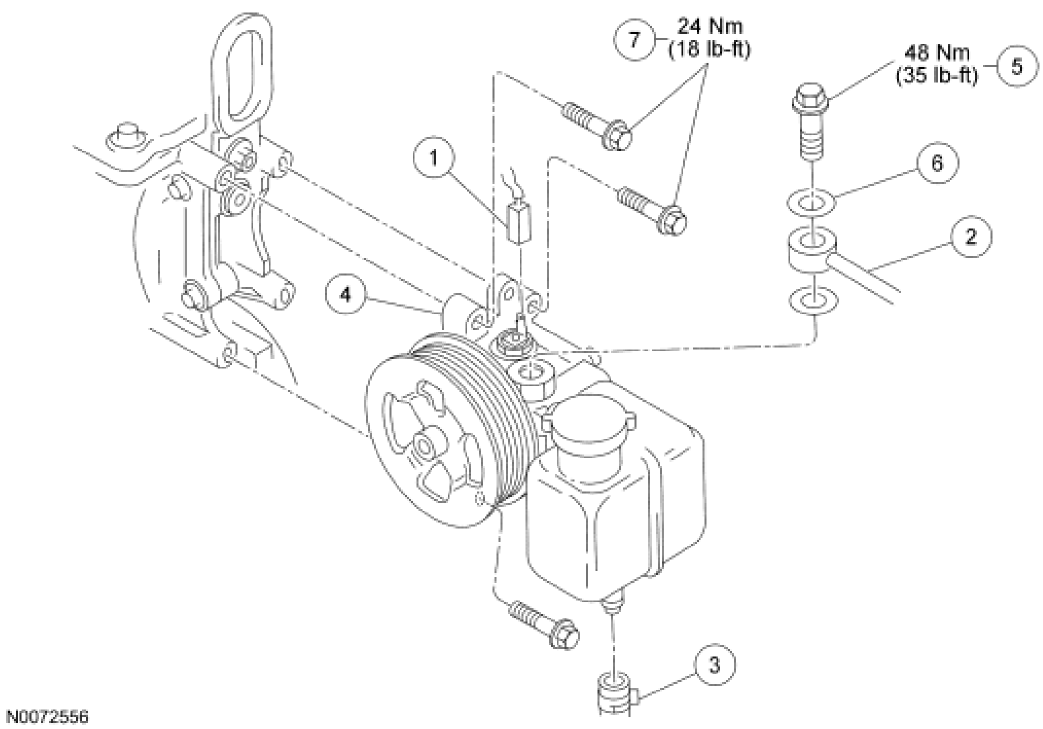

Fig. 4: Exploded View Of Power Steering Pump With Torque Specifications - 2.3L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Power steering pressure switch electrical connector
2	-	Power steering pressure line (part of 3A719)
3	3R807	Power steering return hose

4	3D639	Power steering pump
5	-	Pressure line-to-power steering pump banjo bolt (part of 3A705)
6	-	Power steering pressure line seal (part of 3A705)
7	W500111	Power steering pump bolts (3 required)

REMOVAL AND INSTALLATION

NOTE: While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

1. Using a suitable suction device, remove the power steering fluid from the fluid reservoir.
2. Remove the accessory drive belt. For additional information, refer to **ACCESSORY DRIVE - 2.3L** article.
3. Release the clamp and disconnect the power steering return hose from the power steering fluid reservoir.
4. Disconnect the power steering pressure switch electrical connector.
5. Remove the pressure line-to-power steering pump banjo bolt and disconnect the line from the power steering pump.
    - Discard the bolt and 2 seals.
    - To install, tighten the new bolt to 48 Nm (35 lb-ft).
6. Remove the 3 power steering pump bolts and the power steering pump.
    - To install, tighten to 24 Nm (18 lb-ft).

    NOTE: A new bolt and new seals must be installed any time the power steering pressure line is disconnected from the power steering pump or a fluid leak may occur.

7. To install, reverse the removal procedure.
8. Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.

POWER STEERING PUMP - 3.0L, 3.5L

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

2	-	Power steering pressure line (part of 3A719)
3	-	Power steering pressure line seals (part of 3A705)
4	3691	Power steering pump supply hose
5	W701526	Power steering pump bolts (2 required)
6	W701234	Power steering pump bolt
7	-	Power steering pressure switch electrical connector

8	3N824	Power steering pressure switch
9	3A696	Power steering pump

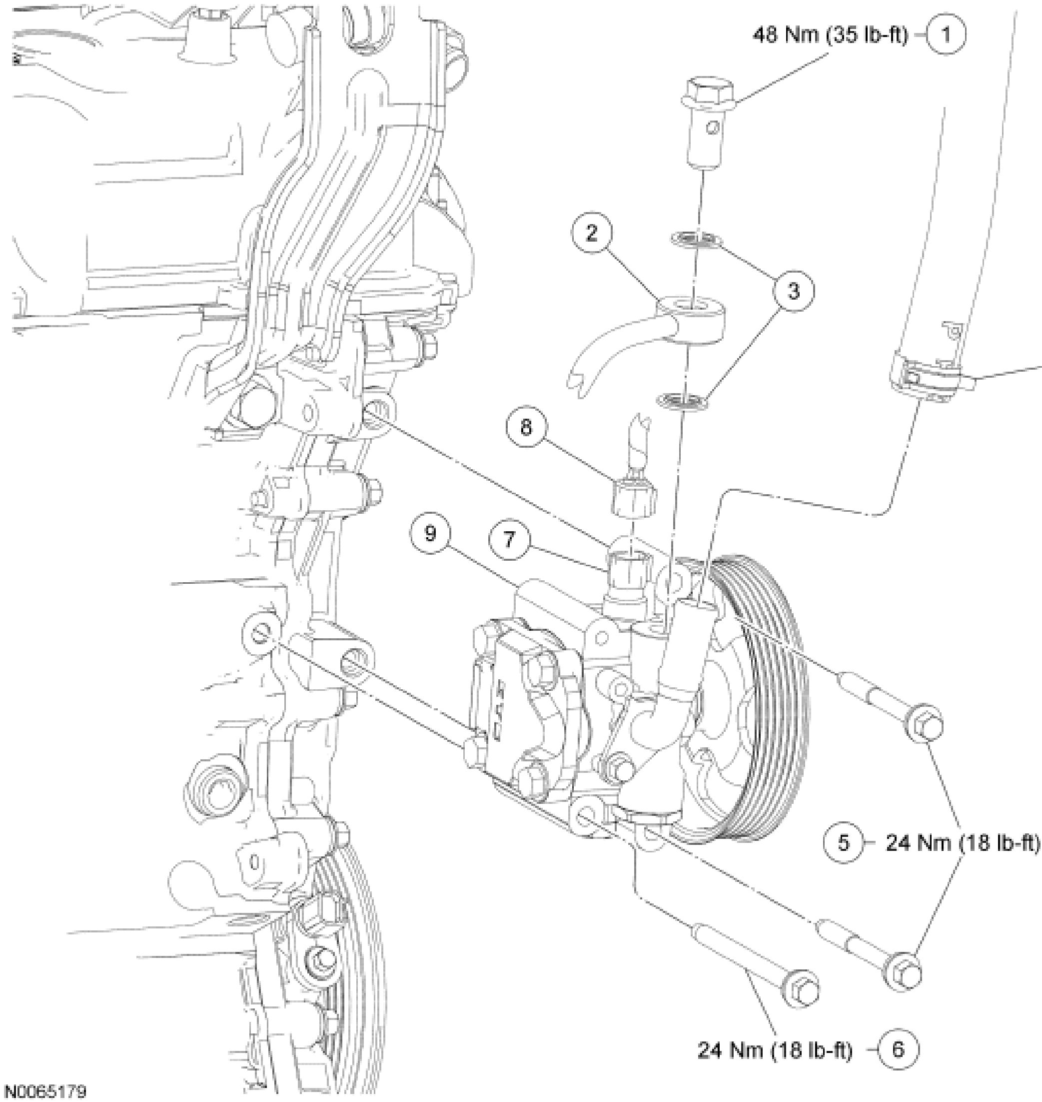

Fig. 6: Exploded View Of Power Steering Pump With Torque Specifications - 3.5L Engine
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Pressure line-to-power steering pump banjo bolt (part of 3A705)
2	-	Power steering pressure line (part of 3A719)
3	-	Power steering pressure line seals (part of 3A705)
4	3691	Power steering pump supply hose

5	W701526	Power steering pump bolts (2 required)
6	W701234	Power steering pump bolt
7	-	Power steering pressure switch electrical connector
8	3N824	Power steering pressure switch
9	3A696	Power steering pump

REMOVAL AND INSTALLATION

NOTE: When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

3.0L engine

1. Using a suitable suction device, remove the power steering fluid from the fluid reservoir.
2. Remove the accessory drive belt. For additional information, refer to **ACCESSORY DRIVE - 3.0L (4V)** article.
3. Release the clamp and disconnect the power steering pump supply hose.

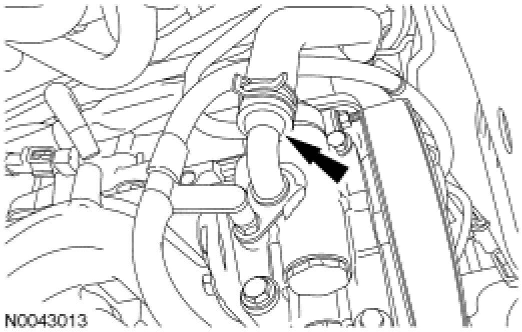

Fig. 7: Locating Power Steering Reservoir Supply Hose
Courtesy of FORD MOTOR CO.

4. Detach the electrical harness from the stud on the power steering pump.

3.5L engine

5. Remove the power steering fluid reservoir. For additional information, refer to **Power Steering Fluid Reservoir - 3.5L**.
6. Remove the power steering pump belt. For additional information, refer to **ACCESSORY DRIVE - 3.5L** article.

3.0L and 3.5L engines

7. Disconnect the power steering pressure switch electrical connector.

8. If equipped, detach the engine block heater electrical harness from the power steering pressure line.
9. Remove the pressure line-to-power steering pump banjo bolt and disconnect the line from the power steering pump.
   - Discard the bolt and 2 seals.
   - To install, tighten the new bolt to 48 Nm (35 lb-ft).
10. Remove the 3 bolts and the power steering pump.
    - To install, tighten to 24 Nm (18 lb-ft).

NOTE: **A new banjo bolt and new seals must be installed any time the power steering pressure line is disconnected from the power steering pump or a fluid leak may occur.**

11. To install, reverse the removal procedure.
12. Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.

6	-	Pressure line-to-steering gear banjo bolt (part of 3A719)
7	W712115	Pressure line bracket-to-steering gear bolt
8	-	Power steering pressure line seals (part of 3A719)

REMOVAL AND INSTALLATION

NOTE: When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

All engines

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

2.3L engine

2. Remove the pressure line-to-power steering pump banjo bolt.
   - Discard the bolt and the 2 seals.
   - To install, tighten the new bolt to 48 Nm (35 lb-ft).
3. Remove the 4 screws and position the RH fender splash shield aside.

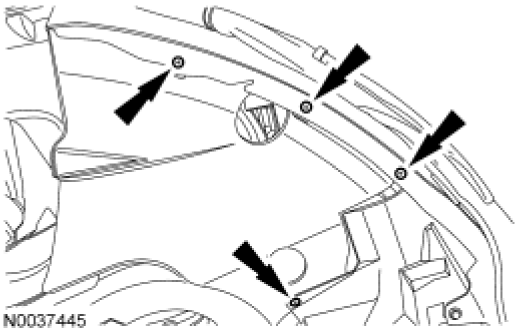

Fig. 11: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

4. Remove the 6 pin-type retainers (4 shown) and the RH splash shield.

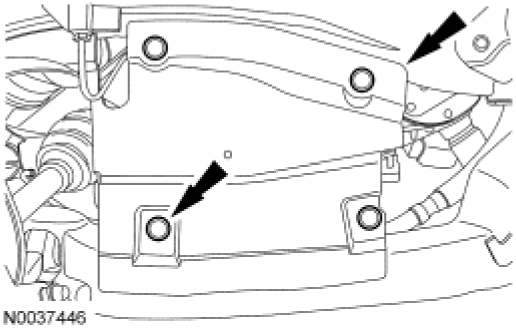

Fig. 12: Locating Splash Shield Pin-Type Retainers
Courtesy of FORD MOTOR CO.

3.0L and 3.5L engines

5. Remove the battery and battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

3.0L engine

6. Remove the pressure line bracket-to-power steering fluid reservoir bolt.
   - Detach the electrical harness retainer from the pressure line bracket.
   - To install, tighten to 9 Nm (80 lb-in).
7. Remove the 2 pressure line bracket-to-engine bolts.
   - Detach the electrical harness retainer from the pressure line bracket.
   - To install, tighten to 9 Nm (80 lb-in).

3.5L engine

8. Remove the pressure line clip from the RH cylinder head engine lift hook.
9. Remove the pressure line bracket-to-RH valve cover stud nut.
   - Detach the electrical harness retainer from the pressure line bracket.
     - To install, tighten to 9 Nm (80 lb-in).
10. Remove the pressure line bracket-to-engine bolt.
    - Detach the electrical harness retainer from the pressure line bracket.
    - To install, tighten to 9 Nm (80 lb-in).

2.3L engine

11. Remove the pressure line bracket-to-subframe bolt.
    - To install, tighten to 9 Nm (80 lb-in).
12. Remove the pressure line bracket-to-steering gear bolt.

- To install, tighten to 9 Nm (80 lb-in).

3.0L and 3.5L engines

13. Remove the pressure line-to-power steering pump banjo bolt.
    - Discard the bolt and the 2 seals.
    - To install, tighten the new bolt to 48 Nm (35 lb-ft).
14. Remove the pressure line bracket-to-steering gear bolt.
    - To install, tighten to 15 Nm (133 lb-in).

All engines

15. If equipped, detach the engine block heater harness from the power steering pressure line.
16. Remove the pressure line-to-steering gear banjo bolt and remove the pressure line.
    - Discard the bolt and the 2 seals.
    - To install, tighten the new bolt to 55 Nm (41 lb-ft).

NOTE: New banjo bolts and new seals must be installed any time the power steering pressure line is disconnected from the power steering pump and/or the power steering gear or a fluid leak may occur.

17. To install, reverse removal procedure.
18. Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.

POWER STEERING PUMP TO STEERING GEAR PRESSURE LINE - ALL WHEEL DRIVE (AWD)

8	-	Power steering pressure line seals (part of 3A719)

REMOVAL AND INSTALLATION

NOTE: When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.

3.0L and 3.5L engines

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the battery and battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

   NOTE: Battery mounting bracket removed for clarity.

3. Disconnect the electrical connectors from the PCM.
   - Detach the wiring harness retainer from the PCM bracket, position harness aside.

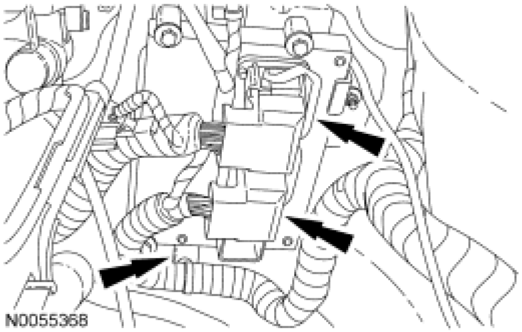

Fig. 15: Identifying Electrical Connectors From Power Control Module (PCM)
Courtesy of FORD MOTOR CO.

4. Remove the lower cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.

3.0L engine

5. Remove the pressure line bracket-to-power steering fluid reservoir bolt.
   - Detach the electrical harness retainer from the pressure line bracket.
   - To install, tighten to 9 Nm (80 lb-in).
6. Remove the 2 pressure line bracket-to-engine bolts.
   - Detach the electrical harness retainer from the pressure line bracket.
   - To install, tighten to 9 Nm (80 lb-in).

3.5L engine

7. Remove the pressure line bracket-to-RH valve cover stud nut.
   - Detach the electrical harness retainer from the pressure line bracket.
   - To install, tighten to 9 Nm (80 lb-in).

3.0L and 3.5L engines

8. If equipped detach the engine block heater harness from the power steering pressure line.
9. Remove the pressure line bracket-to-steering gear bolt.
   - To install, tighten to 15 Nm (133 lb-in).
10. Remove the pressure line-to-power steering pump banjo bolt.
    - Discard the bolt and the 2 seals.
    - To install, tighten the new bolt to 48 Nm (35 lb-ft).
11. Remove the pressure line-to-steering gear banjo bolt and remove the power steering pressure line.
    - Discard the bolt and the 2 seals.
    - To install, tighten the new bolt to 55 Nm (41 lb-ft).

NOTE: New banjo bolts and new seals must be installed any time the power steering pressure line is disconnected from the power steering pump and/or the power steering gear or a fluid leak may occur.

12. To install, reverse removal procedure.
13. Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.

POWER STEERING FLUID COOLER

NOTE: The power steering fluid cooler is integral to the A/C condenser core. Refer to the CLIMATE CONTROL article.

STEERING GEAR - FRONT WHEEL DRIVE (FWD)

17	W520416	Subframe nut (2 required)

REMOVAL

NOTE: **When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

All engines

1. Turn the steering wheel to the straight-ahead position and turn the ignition switch to the OFF position.
   - Remove the key.
2. Remove the wheels and tires. For additional information, refer to **WHEELS AND TIRES** article.
3. Remove the 2 lower steering column shaft joint cover nuts and the cover.

   NOTE: **Make sure to correctly index-mark the steering gear-to-steering column shaft position or unequal right-to-left turns may occur, causing tire contact with the body and/or clockspring damage.**

4. Index-mark the steering column shaft-to-steering gear position for reference during installation.

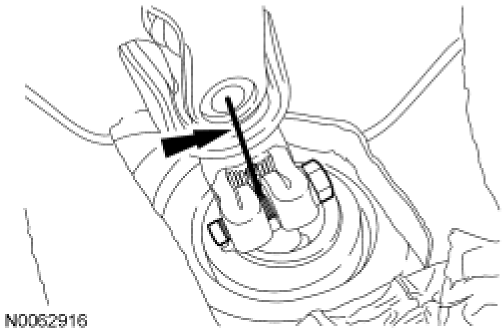

Fig. 17: Locating Steering Column Shaft-To-Steering Gear Position Index-Mark
Courtesy of FORD MOTOR CO.

NOTE: **Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to SUPPLEMENTAL RESTRAINT SYSTEM article.**

5. Remove the bolt and disconnect the steering column shaft from the steering gear.
   - Discard the bolt.

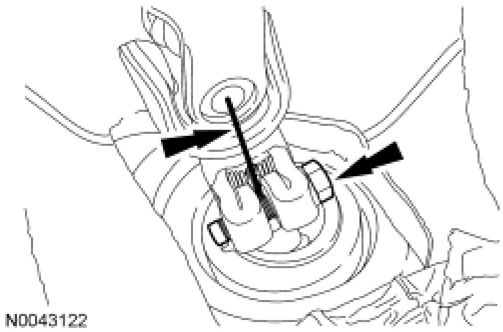

Fig. 18: Locating Steering Column Shaft Index Mark And Bolt
Courtesy of FORD MOTOR CO.

NOTE: **Remove the steering gear/dash seal or damage to the seal may occur.**

6. Remove the steering gear/dash seal.

NOTE: **RH side shown, LH side similar.**

7. Remove 4 screws from each side and position the RH and LH fender splash shield aside.

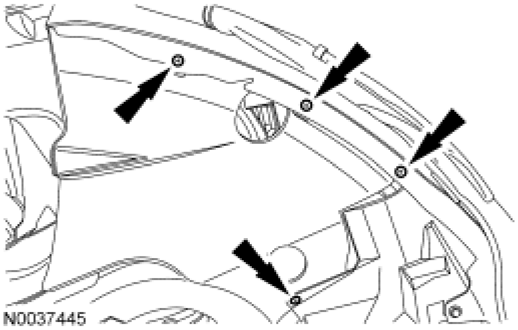

Fig. 19: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

NOTE: RH side shown, LH side similar.

8. Remove the 6 pin-type retainers (4 shown) from the LH and RH splash shield.

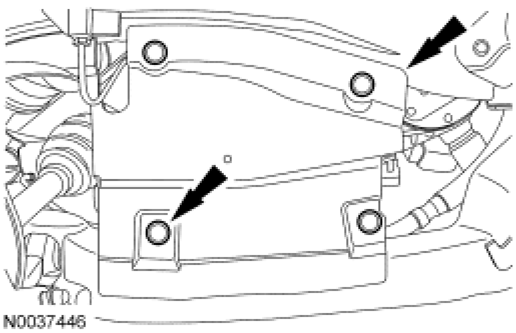

Fig. 20: Locating Splash Shield Pin-Type Retainers
Courtesy of FORD MOTOR CO.

9. If equipped, remove the bolts and the underbody splash shield.
10. Remove the 2 outer tie-rod end cotter pins and nuts.
    - Discard the cotter pins.

NOTE: Do not use a hammer to separate the outer tie-rod end from the wheel knuckle or damage to the wheel knuckle may result.

11. Using the Tie-Rod End Remover, separate the outer tie-rod ends from the knuckle.

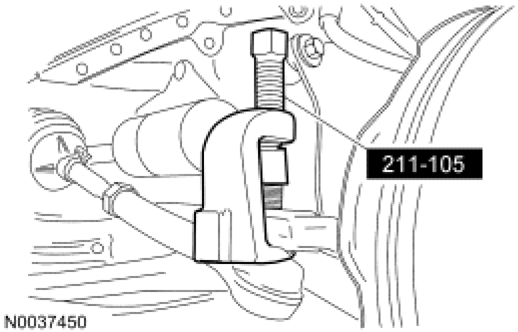

Fig. 21: Separating Tie-Rod Ends From Wheel Knuckles Using Special Tool (211-105)
Courtesy of FORD MOTOR CO.

NOTE: Always install new fasteners and gaskets. Clean flange faces prior to new gasket installation to make sure of proper sealing.

12. Remove and discard the 2 catalytic converter-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe.

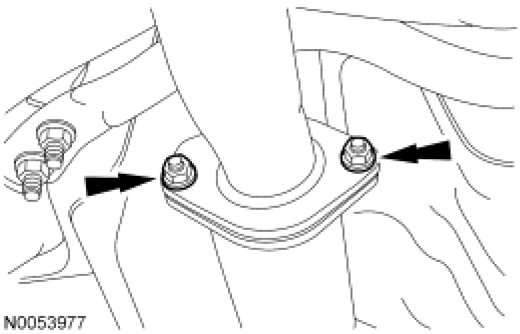

Fig. 22: Identifying Catalytic Converter-To-Exhaust Flexible Pipe Nuts
Courtesy of FORD MOTOR CO.

13. Remove the 2 bolts and the steering gear heat shield.

2.3L engine

14. Remove the pressure line bracket-to-steering gear bolt.

3.0L and 3.5L engines

15. Remove the pressure line bracket-to-steering gear bolt.

All engines

16. Remove the pressure line-to-steering gear banjo bolt.
    - Discard the bolt and 2 seals.
17. Support the rear of the subframe with a suitable jack and remove the 4 rear subframe bolts and 2 rear

subframe nuts.

18. Lower the rear of the front subframe 76.2 mm (3 in) with the support of the jack.
19. Release the clamp and disconnect the steering gear-to-fluid cooler return hose.
20. Remove the 3 steering gear bolts.
21. Remove the steering gear from the LH side of the vehicle.

INSTALLATION

All engines

NOTE: **While repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

1. From the LH side of the vehicle, install the steering gear.
2. Install the 3 steering gear bolts.
   - Tighten to 107 Nm (79 lb-ft).
3. Release the clamp and connect the steering gear-to-fluid cooler return hose.
4. Using a suitable jack, raise the rear of the front subframe.
5. Install the 4 rear subframe bolts and 2 rear subframe nuts.
   - To install, tighten the bolts and nuts in 2 stages.
     - Stage 1: Tighten the nuts to 150 Nm (111 lb-ft).
     - Stage 2: Tighten the bolts to 103 Nm (76 lb-ft).

NOTE: **New banjo bolts and new seals must be installed any time the power steering pressure line is disconnected from the power steering pump and/or the steering gear or a fluid leak may occur.**

6. Install the new pressure line-to-steering gear banjo bolt.
   - Install 2 new seals.
   - Tighten to 55 Nm (41 lb-ft).

3.0L and 3.5L engines

7. Install the pressure line bracket-to-steering gear bolt.
   - Tighten to 15 Nm (133 lb-in).

2.3L engines

8. Install the pressure line bracket-to-steering gear bolt.
   - Tighten to 9 Nm (80 lb-in).

All engines

9. Install the steering gear heat shield and the 2 bolts.
   - To install, tighten to 15 Nm (133 lb-in).

NOTE: Always install new fasteners and gaskets. Clean flange faces prior to new gasket installation to make sure of proper sealing.

10. Position the exhaust flexible pipe and install 2 new catalytic converter-to-exhaust flexible pipe nuts.
    - Tighten to 40 Nm (30 lb-ft).

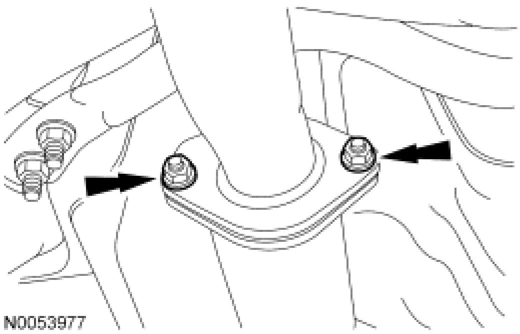

Fig. 23: Identifying Catalytic Converter-To-Exhaust Flexible Pipe Nuts
Courtesy of FORD MOTOR CO.

11. Install the 2 outer tie-rod end nuts.
    - Tighten to 48 Nm (35 lb-ft).
    - Install 2 new cotter pins.
12. If equipped, install the underbody splash shield and bolts.
    - Tighten to 7 Nm (62 lb-in).

NOTE: RH side shown, LH side similar.

13. Install the LH and RH splash shield and the 6 pin-type retainers (4 shown).

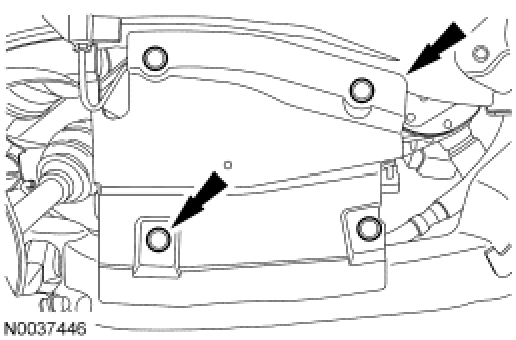

Fig. 24: Locating Splash Shield Pin-Type Retainers
Courtesy of FORD MOTOR CO.

NOTE: RH side shown, LH side similar.

14. Install the RH and LH fender splash shield and the 4 screws from each side.

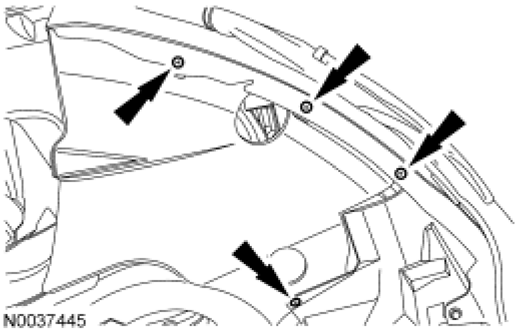

Fig. 25: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

NOTE: The steering gear/dash seal must be fully seated in the steering gear valve tower groove before the retaining clips are fully engaged into the body. If the steering gear/dash seal is not seated to the steering gear valve tower groove and the clips are not fully engaged to the body, water and foreign material may enter the passenger compartment, and damage the vehicle interior.

15. Applying hand force to the center of the seal, install the steering gear/dash seal onto the steering gear valve tower until the seal is fully seated in the valve tower groove.

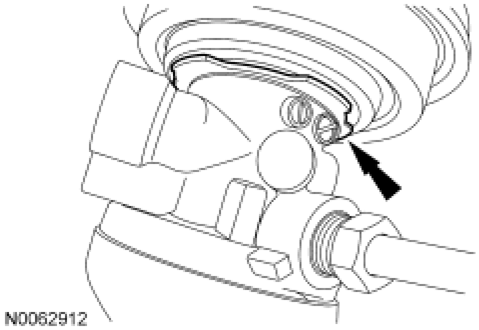

Fig. 26: Locating Valve Tower Groove
Courtesy of FORD MOTOR CO.

16. Install the steering gear/dash seal until the retaining clips are fully engaged into the body.

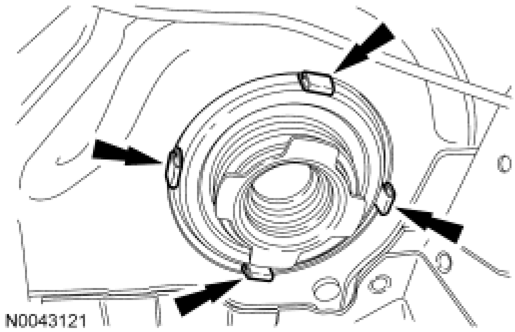

Fig. 27: Locating Steering Column Shaft-To-Dash Seal
Courtesy of FORD MOTOR CO.

NOTE: **Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to SUPPLEMENTAL RESTRAINT SYSTEM article.**

NOTE: **Make sure to correctly align the index marks when installing the steering gear-to-steering column shaft or unequal right-to-left turns may occur, causing tire contact with the body and/or clockspring damage.**

17. With the index marks properly aligned, connect the steering column shaft to the steering gear and install the new bolt.
    - Tighten to 25 Nm (18 lb-ft).

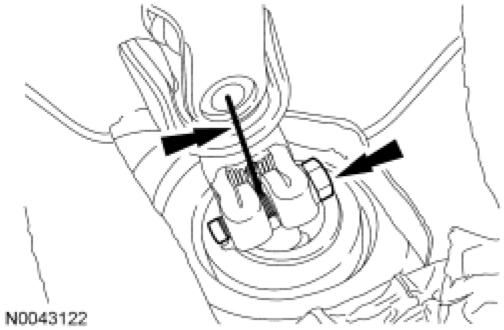

Fig. 28: Locating Steering Column Shaft Index Mark And Bolt
Courtesy of FORD MOTOR CO.

18. Install the lower steering column shaft joint cover and the 2 nuts.
19. Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.
20. Check and, if necessary, adjust the front toe. For additional information, refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

REMOVAL

NOTE: **When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

All engines

1. Place the steering wheel in the straight-ahead position and the ignition key in the OFF position.
2. Remove the front wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
3. Remove the 2 lower steering column shaft joint cover nuts and the cover.

   NOTE: **Make sure to correctly index-mark the steering gear to steering column shaft position or unequal right-to-left turns may occur, causing tire contact with the body and/or clockspring damage.**

4. Index-mark the steering column shaft-to-steering gear position for reference during installation.

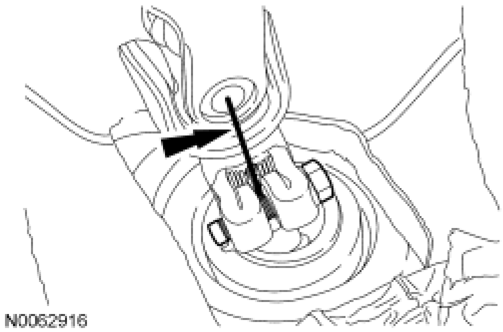

Fig. 30: Locating Steering Column Shaft-To-Steering Gear Position Index-Mark
Courtesy of FORD MOTOR CO.

NOTE: **Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to SUPPLEMENTAL RESTRAINT SYSTEM article.**

5. Remove the bolt and disconnect the steering column shaft from the steering gear.
    - Discard the bolt.

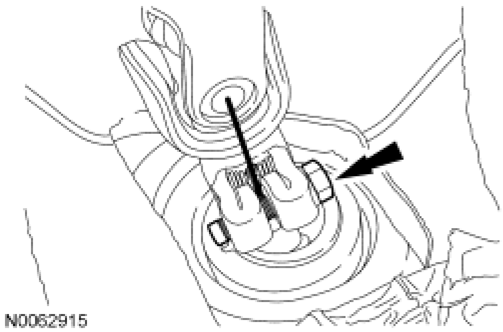

Fig. 31: Locating Steering Column Shaft Bolt
Courtesy of FORD MOTOR CO.

NOTE: **Remove the steering gear/dash seal or damage to the seal may occur.**

6. Remove the steering gear/dash seal.
7. Remove the battery and battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

NOTE: **Battery mounting bracket removed for clarity.**

8. Disconnect the electrical connectors from the PCM.
    - Detach the wiring harness retainer from the PCM bracket and position the harness aside.

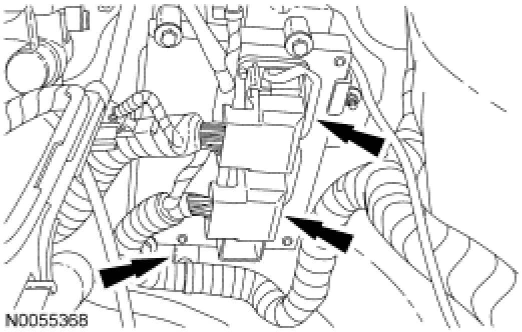

Fig. 32: Identifying Electrical Connectors From Power Control Module (PCM)
Courtesy of FORD MOTOR CO.

9. Remove the pressure line-to-steering gear banjo bolt.
   - Discard the bolt and 2 seals.
10. Remove the pressure line bracket-to-steering gear bolt.

NOTE: RH side shown, LH side similar.

11. Remove 4 screws from each side and position the RH and LH fender splash shield aside.

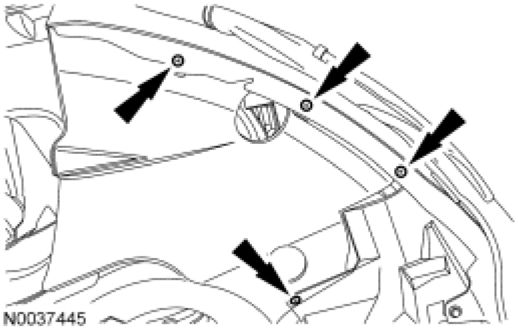

Fig. 33: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

NOTE: RH side shown, LH side similar.

12. Remove the 6 pin-type retainers (4 shown) from the LH and RH splash shield.

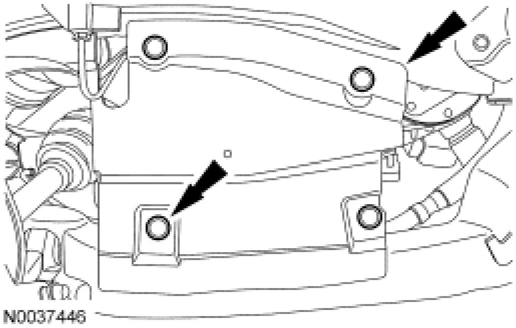

Fig. 34: Locating Splash Shield Pin-Type Retainers
Courtesy of FORD MOTOR CO.

13. If equipped, remove the bolts and the underbody splash shield.
14. Remove the 2 outer tie-rod end cotter pins and nuts.
    - Discard the cotter pins.

NOTE:	**Do not use a hammer to separate the outer tie-rod end from the wheel knuckle or damage to the wheel knuckle may result.**

15. Using the Tie-Rod End Remover, separate the outer tie-rod ends from the knuckle.

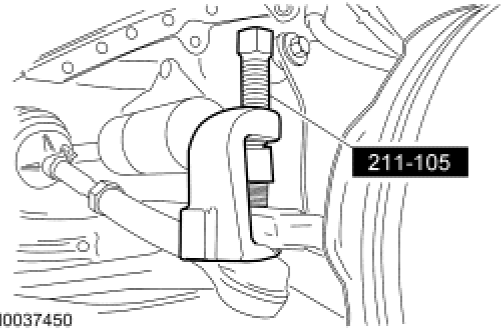

Fig. 35: Separating Tie-Rod Ends From Wheel Knuckles Using Special Tool (211-105)
Courtesy of FORD MOTOR CO.

NOTE:	**Always install new fasteners and gaskets. Clean flange faces prior to new gasket installation to make sure of proper sealing.**

16. Remove and discard the 2 catalytic converter-to-exhaust flexible pipe nuts and separate the exhaust flexible pipe.

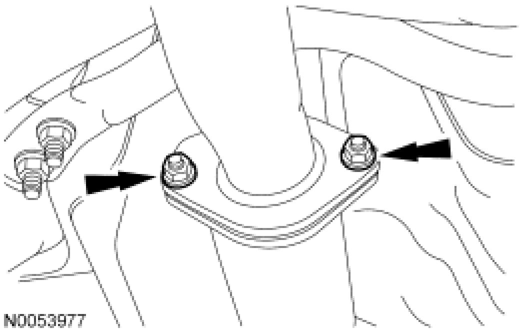

Fig. 36: Identifying Catalytic Converter-To-Exhaust Flexible Pipe Nuts
Courtesy of FORD MOTOR CO.

17. Remove the 2 bolts and the steering gear heat shield.
18. Support the rear of the subframe with a suitable jack and remove the 4 rear subframe bolts and 2 rear subframe nuts.
19. Lower the rear of the front subframe 76.2 mm (3 in) with the support of the jack.

3.5L engine

20. Remove the pressure line bracket-to-steering gear bolt.

All engines

21. Release the clamp and disconnect the steering gear-to-fluid cooler return hose.
22. Remove the 3 steering gear bolts.
23. Remove the steering gear from the LH side of the vehicle.

INSTALLATION

NOTE:	**When installing the steering gear, it is important to have the steering gear in the centered position or unequal right-to-left turns may occur, causing tire contact with the body and/or clockspring damage. A new steering gear is centered and ready for installation.**

NOTE:	**When repairing the power steering system, care should be taken to prevent the entry of foreign material or failure of the power steering components may result.**

1. From the LH side of the vehicle, install the steering gear.
2. Install the 3 steering gear bolts.
    - Tighten to 107 Nm (79 lb-ft).
3. Connect the steering gear-to-fluid cooler return hose and connect the clamp.
4. Using a suitable jack, raise the rear of the front subframe.
5. Install the 4 rear subframe bolts and 2 rear subframe nuts.

- To install, tighten the bolts and nuts in 2 stages.
    - Stage 1: Tighten the nuts to 150 Nm (111 lb-ft).
    - Stage 2: Tighten the bolts to 103 Nm (76 lb-ft).

6. Install the steering gear heat shield and the 2 bolts.
    - To install, tighten to 15 Nm (133 lb-in).

NOTE: Always install new fasteners and gaskets. Clean flange faces prior to new gasket installation to make sure of correct sealing.

7. Position the exhaust flexible pipe and install the 2 new catalytic converter-to-exhaust flexible pipe nuts.
    - Tighten to 40 Nm (30 lb-ft).

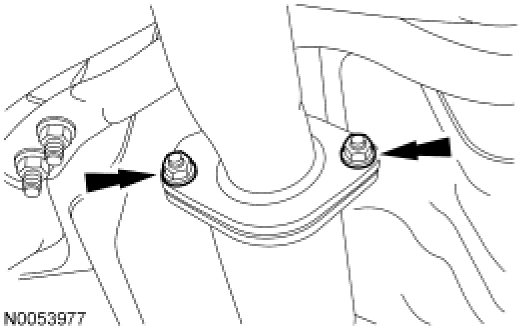

Fig. 37: Identifying Catalytic Converter-To-Exhaust Flexible Pipe Nuts
Courtesy of FORD MOTOR CO.

8. Install the 2 outer tie-rod end nuts.
    - Tighten to 48 Nm (35 lb-ft).
    - Install 2 new cotter pins.
9. If equipped, install the underbody splash shield and bolts.
    - Tighten to 7 Nm (62 lb-in).

NOTE: RH side shown, LH side similar.

10. Install the LH and RH splash shield and the 6 pin-type retainers (4 shown).

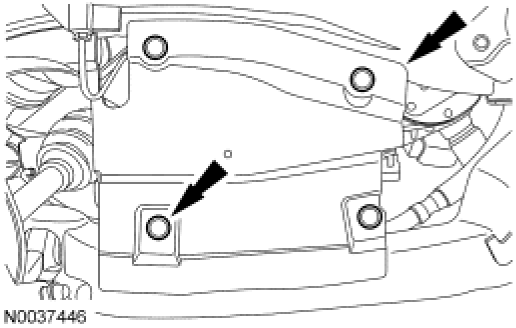

Fig. 38: Locating Splash Shield Pin-Type Retainers
Courtesy of FORD MOTOR CO.

NOTE: RH side shown, LH side similar.

11. Install the RH and LH fender splash shield and the 4 screws from each side.

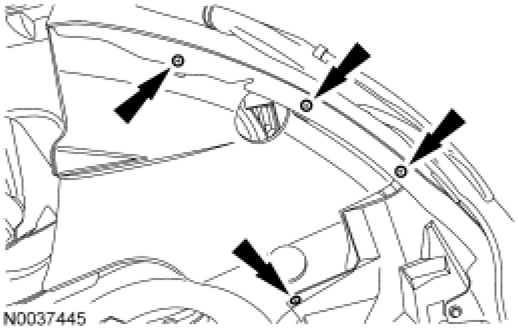

Fig. 39: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

12. Install the pressure line bracket-to-steering gear bolt.
    - Tighten to 15 Nm (133 lb-in).

NOTE: New banjo bolts and new seals must be installed any time the power steering pressure line is disconnected from the power steering pump and/or the steering gear or a fluid leak may occur.

13. Install the new pressure line-to-steering gear banjo bolt and seals.
    - Tighten to 55 Nm (41 lb-ft).

NOTE: Battery mounting bracket removed for clarity.

14. Connect the electrical connectors to the PCM.
    - Attach the wiring harness retainer to the PCM bracket.

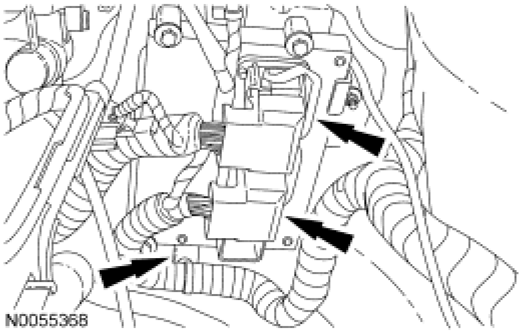

Fig. 40: Identifying Electrical Connectors From Power Control Module (PCM)

Courtesy of FORD MOTOR CO.

15. Install the battery tray and battery. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

NOTE: The steering gear/dash seal must be fully seated in the steering gear valve tower groove before the retaining clips are fully engaged into the body. If the steering gear/dash seal is not seated to the steering gear valve tower groove and the clips are not fully engaged to the body, water and foreign material may enter the passenger compartment and damage the vehicle interior.

16. Applying hand force to the center of the seal, install the steering gear/dash seal onto the steering gear valve tower until the seal is fully seated in the valve tower groove.

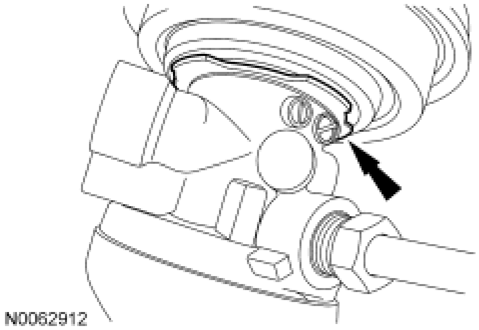

Fig. 41: Locating Valve Tower Groove
Courtesy of FORD MOTOR CO.

17. Install the steering gear/dash seal until the retaining clips are fully engaged into the body.

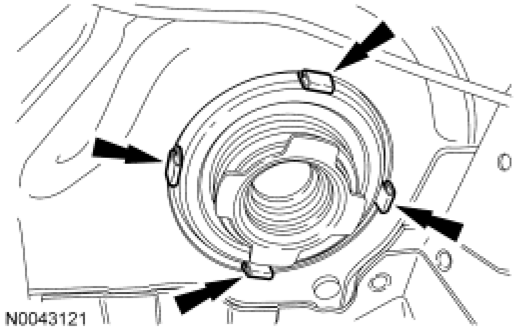

Fig. 42: Locating Steering Column Shaft-To-Dash Seal
Courtesy of FORD MOTOR CO.

NOTE: Do not allow the steering column to rotate while the steering column shaft is disconnected from the steering gear or damage to the clockspring may occur. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information,

refer to SUPPLEMENTAL RESTRAINT SYSTEM article.

NOTE:	**Make sure to correctly align the index marks when installing the steering gear to steering column shaft or unequal right-to-left turns may occur, causing tire contact with the body and/or clockspring damage.**

18. With the index marks correctly aligned, connect the steering column shaft to the steering gear and install the new bolt.
    - Tighten to 25 Nm (18 lb-ft).

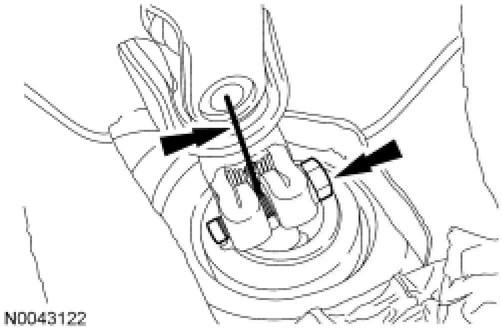

Fig. 43: Locating Steering Column Shaft Index Mark And Bolt
Courtesy of FORD MOTOR CO.

19. Install the lower steering column shaft joint cover and the 2 nuts.
20. Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.
21. Check and, if necessary, adjust the front toe. For additional information, refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

TIE ROD - INNER

NOTE:	**Left side shown, right side similar.**

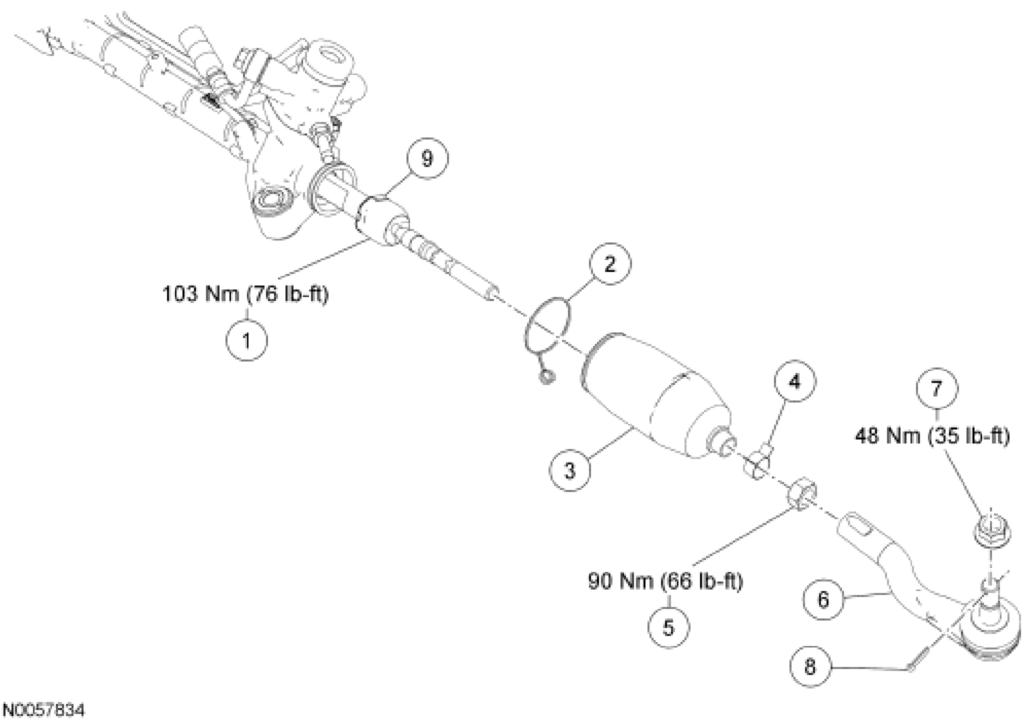

Fig. 44: Exploded View Of Inner Tie Rod With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3280	Inner tie-rod end
2	3C650A	Inner bellows boot clamp
3	3K668	Bellows boot
4	3C650	Outer bellows boot clamp
5	-	Tie-rod jam nut
6	3290	Outer tie-rod end
7	6E5C	Outer tie-rod end nut
8	-	Cotter pin
9	32132	Rock washer

REMOVAL AND INSTALLATION

1. Remove the steering gear. For additional information, refer to **Steering Gear - All Wheel Drive (AWD)** or **Steering Gear - Front Wheel Drive (FWD)**.
2. Mark the pinion shaft and the steering gear housing for correct reference during installation.

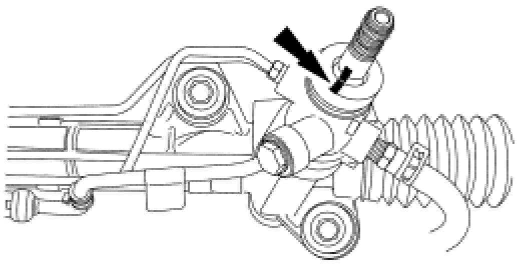

Fig. 45: Locating Pinion Shaft And Steering Gear Mark
Courtesy of FORD MOTOR CO.

NOTE: **Position the steering gear in a soft-jaw vise or damage to the steering gear may occur.**

3. Loosen the tie-rod jam nut and remove the outer tie-rod end.
   - To install, tighten to 90 Nm (66 lb-ft).

NOTE: **It is necessary to remove both bellows boots when removing the RH inner tie-rod end.**

4. Remove the 4 bellow clamps and the 2 steering gear bellows boots.
5. Using a suitable wrench, hold the piston shaft.
6. Using a suitable wrench, remove the inner tie-rod end.
   - To install, tighten to 103 Nm (76 lb-ft).

NOTE: **Using a suitable wrench, hold the piston shaft while tightening the inner tie rod.**

NOTE: **The new rock washer must be crimped after tightening the inner tie rod end.**

7. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

REAR DISC BRAKE

The rear disc brake system consists of the following components:

- Brake caliper anchor plate
- Brake caliper
- Brake disc
- Brake flexible hose
- Brake pads

When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the disc brake calipers and transferred to the brake pads. The brake pads are then forced against the brake friction surfaces by the brake caliper pistons. The friction of the brake pads on the brake disc causes the slowing or stopping of wheel rotation and the vehicle.

DIAGNOSTIC TESTS

REAR DISC BRAKE

Refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

BRAKE PADS

Special Tools

Illustration	Tool Name	Tool Number
 ST1112-A	Adapter, Rear Brake Caliper Piston Adjuster	206-026 (T87P-2588-A) or equivalent

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

NOTE: Front wheel drive (FWD) shown, all wheel drive (AWD) similar.

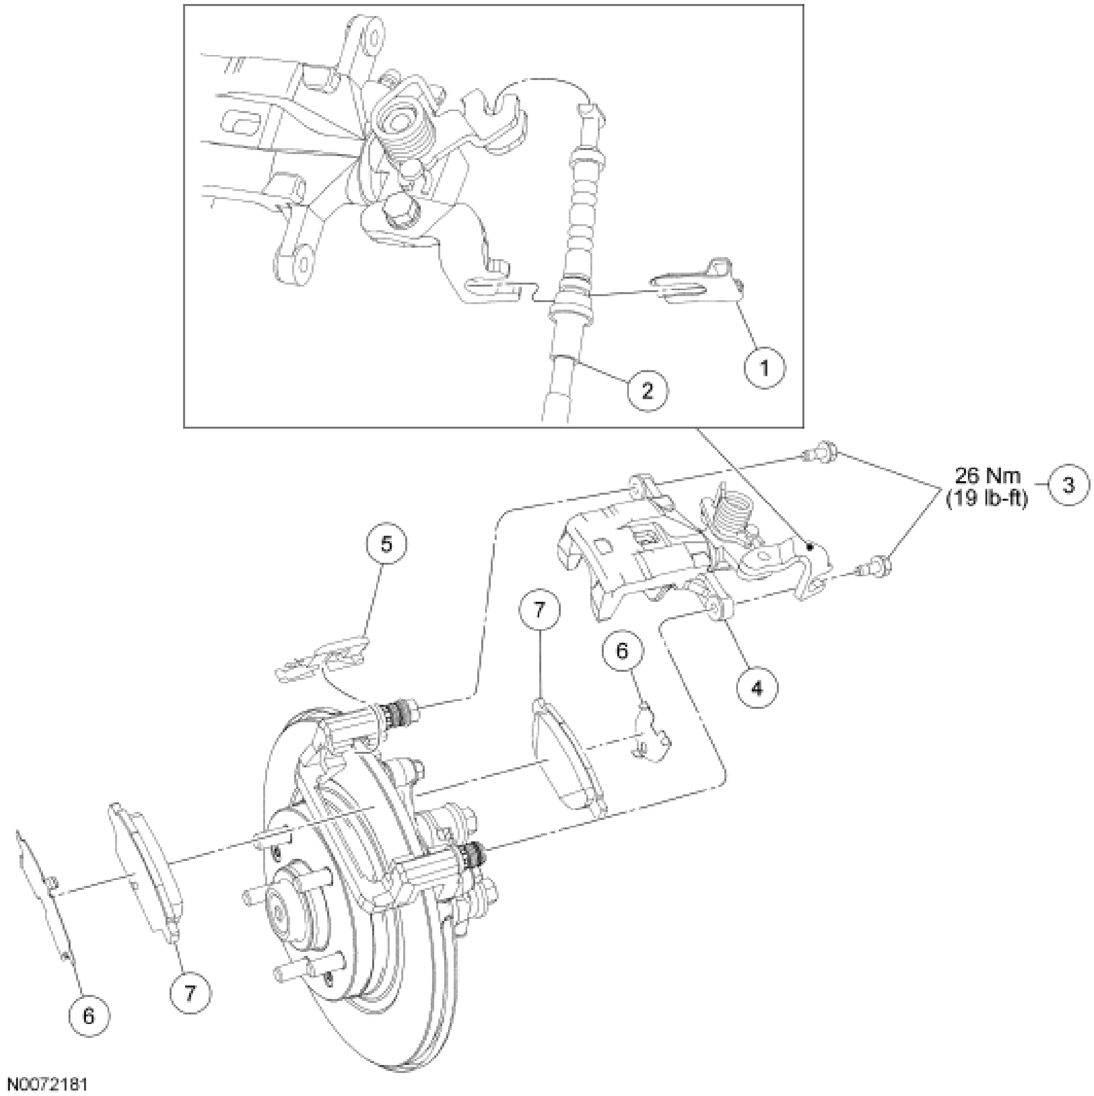

Fig. 1: Exploded View Of Brake Pads With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2860	Parking brake cable conduit retaining clip
2	2A815	Parking brake cable
3	-	Brake caliper guide pin bolts (2 required) (part of 2386)
4	2552 LH/ 2553 RH	Brake caliper
5	-	Brake pad slide clip (2 required) (part of 2200)
6	-	Brake pad shims (2 required) (part of 2200)
7	2200	Brake pads (2 required)

REMOVAL

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always install new brake shoes or pads at both ends of an axle to reduce the possibility of brakes pulling vehicle to one side. Failure to follow this instruction may result in uneven braking and serious personal injury.**

NOTE: Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.

1. Check the brake fluid level in the brake master cylinder reservoir.
    - If required, remove the fluid until the brake master cylinder reservoir is 1/2 full.
2. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
3. Disconnect the parking brake cable from the brake caliper.
    - Pull back the parking brake lever.
    - Disconnect the cable from the parking brake lever.
    - Remove the cable conduit retaining clip.
    - Disconnect the cable from the brake caliper.

NOTE: Do not pry in the caliper sight hole to retract the pistons, as this can damage the pistons and boots.

NOTE: Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.

4. Remove the 2 brake caliper guide pin bolts and position the caliper aside.
    - Support the caliper using mechanic's wire.
5. Remove the 2 brake pads, shims and retraction clips. Inspect the brake pads and shims for wear, damage or contamination.
    - Discard the slide clips.
    - Inspect the brake pads for wear and contamination.

INSTALLATION

NOTE: Make sure the caliper piston boot is clean and free of foreign material.

1. Using the Rear Brake Caliper Piston Adjuster Adapter, compress the brake caliper piston into the brake caliper bore.

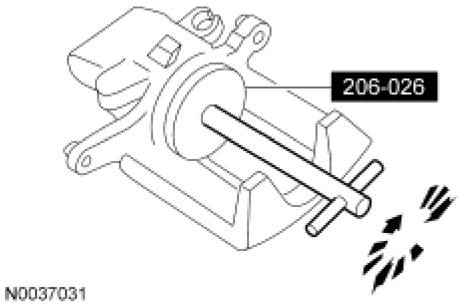

Fig. 2: Compressing Brake Caliper Piston Into Caliper
Courtesy of FORD MOTOR CO.

2. Position the notch in the caliper piston so that it will correctly align with the pin on the backside of the inboard brake pad.

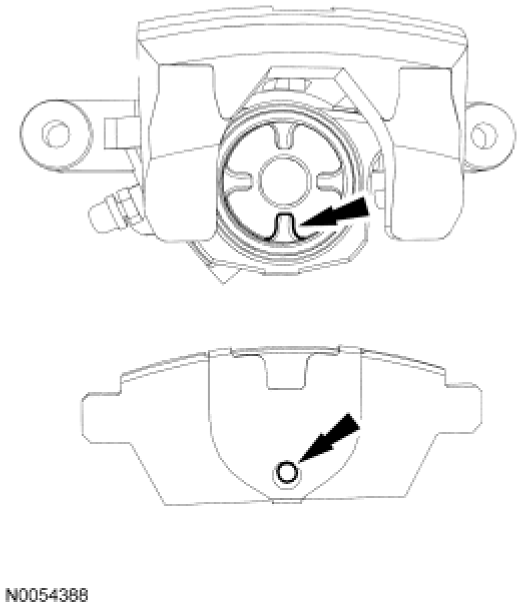

Fig. 3: Positioning Notch In Caliper Piston So That It Will Correctly Align With Pin On Backside Of Inboard Brake Pad
Courtesy of FORD MOTOR CO.

NOTE: If installing new brake pads, install all new hardware as supplied with the

brake pad kit.

3. Install the 2 brake pads, shims and slide clips to the brake caliper anchor plate.

NOTE: Make sure that the brake caliper hose is not twisted.

4. Position the brake caliper on the anchor plate and install the 2 bolts.
    - Tighten to 26 Nm (19 lb-ft).
5. Install the parking brake cable to the brake caliper.
    - Pull back the parking brake lever.
    - Connect the cable to the parking brake lever.
    - Install the cable conduit retaining clip.
6. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
7. Fill the brake master cylinder reservoir with clean, specified brake fluid.
8. Cycle the park brake several times to verify normal operation. For additional information on parking brake adjustment, refer to **PARKING BRAKE AND ACTUATION** article.
    - Apply brakes several times to verify correct brake operation.

BRAKE CALIPER

4	99562	Copper washers (2 required)
5	2282	Brake hose
6	-	Brake caliper guide pin bolt (2 required) (part of 2386)
7	2552 LH/ 2553 RH	Brake caliper
8	2426	Brake caliper bleeder screw cap

REMOVAL

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

NOTE: Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
2. Disconnect the parking brake cable from the brake caliper.
   - Pull back the parking brake lever.
   - Disconnect the cable from the parking brake lever.
   - Remove the cable conduit retaining clip.
   - Disconnect the cable from the brake caliper.
3. Remove the brake caliper flow bolt and position the brake hose aside.
   - Discard the 2 copper washers.
4. Remove the 2 brake caliper guide pin bolts and the brake caliper.
   - If a leaking or damaged caliper piston boot is found, install a new disc brake caliper.

INSTALLATION

1. Position the notch in the caliper piston so that it will correctly align with the pin on the backside of the inboard brake pad.

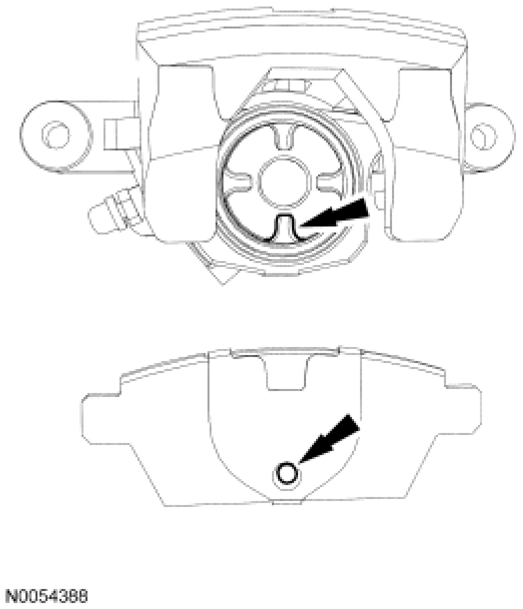

Fig. 5: Positioning Notch In Caliper Piston So That It Will Correctly Align With Pin On Backside Of Inboard Brake Pad
Courtesy of FORD MOTOR CO.

NOTE: Make sure that the brake caliper hose is not twisted.

2. Position the brake caliper onto the anchor plate.
3. Install the 2 brake caliper guide pin bolts.
   - To install, tighten to 26 Nm (19 lb-ft).
4. Using 2 new copper washers, position the brake hose and install the brake caliper flow bolt.
   - Tighten to 25 Nm (18 lb-ft).
5. Install the parking brake cable to the brake caliper.
   - Pull back the parking brake lever.
   - Connect the cable to the parking brake lever.
   - Install the cable conduit retaining clip.
6. Bleed the brake caliper. For additional information, refer to **BRAKE SYSTEM - GENERAL INFORMATION** article Component Bleeding.
7. Cycle the park brake several times to verify normal operation.

BRAKE CALIPER ANCHOR PLATE

NOTE: Front wheel drive (FWD) shown, all wheel drive (AWD) similar.

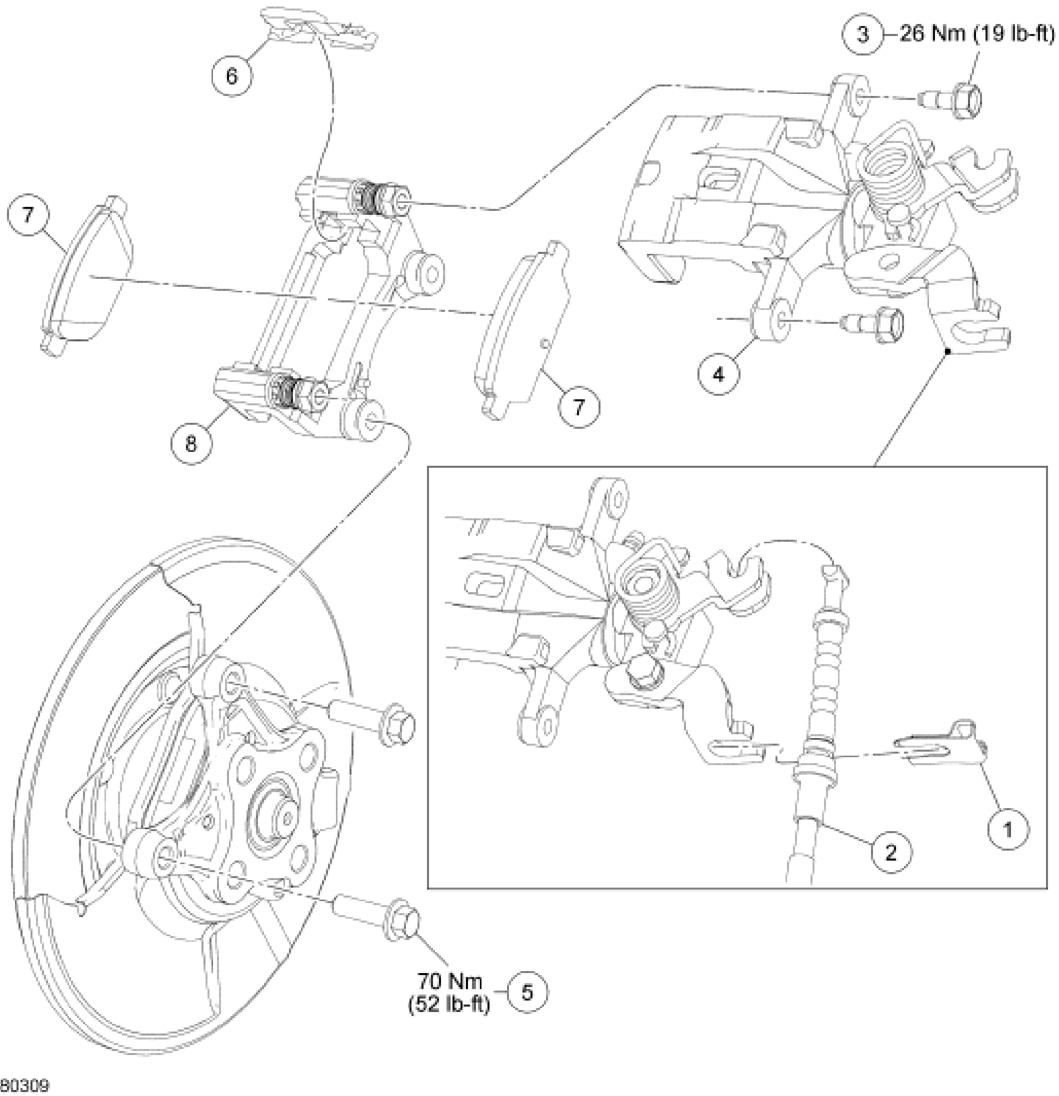

Fig. 6: Exploded View Of Brake Caliper Anchor Plate With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	**Part Number**	**Description**
1	2860	Parking brake cable conduit retaining clip
2	2A815	Parking brake cable
3	-	Brake caliper guide pin bolt (2 required) (part of 2386)
4	2552 LH/ 2553 RH	Brake caliper
5	W711240	Brake caliper anchor plate bolt (2 required)
6	-	Brake pad retraction clip (2 required) (part of 2200)
7	2200	Brake pads (2 required)
8	2B512 LH/ 2B511 RH	Brake caliper anchor plate

REMOVAL

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
2. Disconnect the parking brake cable from the brake caliper.
   - Pull back the parking brake lever.
   - Disconnect the cable from the parking brake lever.
   - Remove the cable conduit retaining clip.
   - Disconnect the cable from the brake caliper.

NOTE: Do not pry in the caliper sight hole to retract the pistons, as this can damage the pistons and boots.

NOTE: Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.

3. Remove the 2 brake caliper guide pin bolts and position the caliper aside.
   - Support the caliper using mechanic's wire.
4. Remove the 2 brake pads, shims and slide clips.
5. Remove the 2 brake caliper anchor plate bolts and the anchor plate.

INSTALLATION

1. Install the brake caliper anchor plate and the 2 brake caliper anchor plate bolts.
   - Tighten to 70 Nm (52 lb-ft).
2. Install the 2 brake pads and slide clips to the brake caliper anchor plate.

NOTE: Make sure that the brake caliper hose is not twisted.

3. Position the brake caliper on the anchor plate and install the 2 guide pin bolts.
   - Tighten to 26 Nm (19 lb-ft).
4. Install the parking brake cable to the brake caliper.
   - Pull back the parking brake lever.
   - Connect the cable to the parking brake lever.
   - Install the cable conduit retaining clip.
5. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
6. Cycle the park brake several times to verify normal operation.
   - Apply brakes several times to verify correct brake operation.

BRAKE DISC

Material

Item	Specification

High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-

NOTE: Front wheel drive (FWD) shown, all wheel drive (AWD) similar.

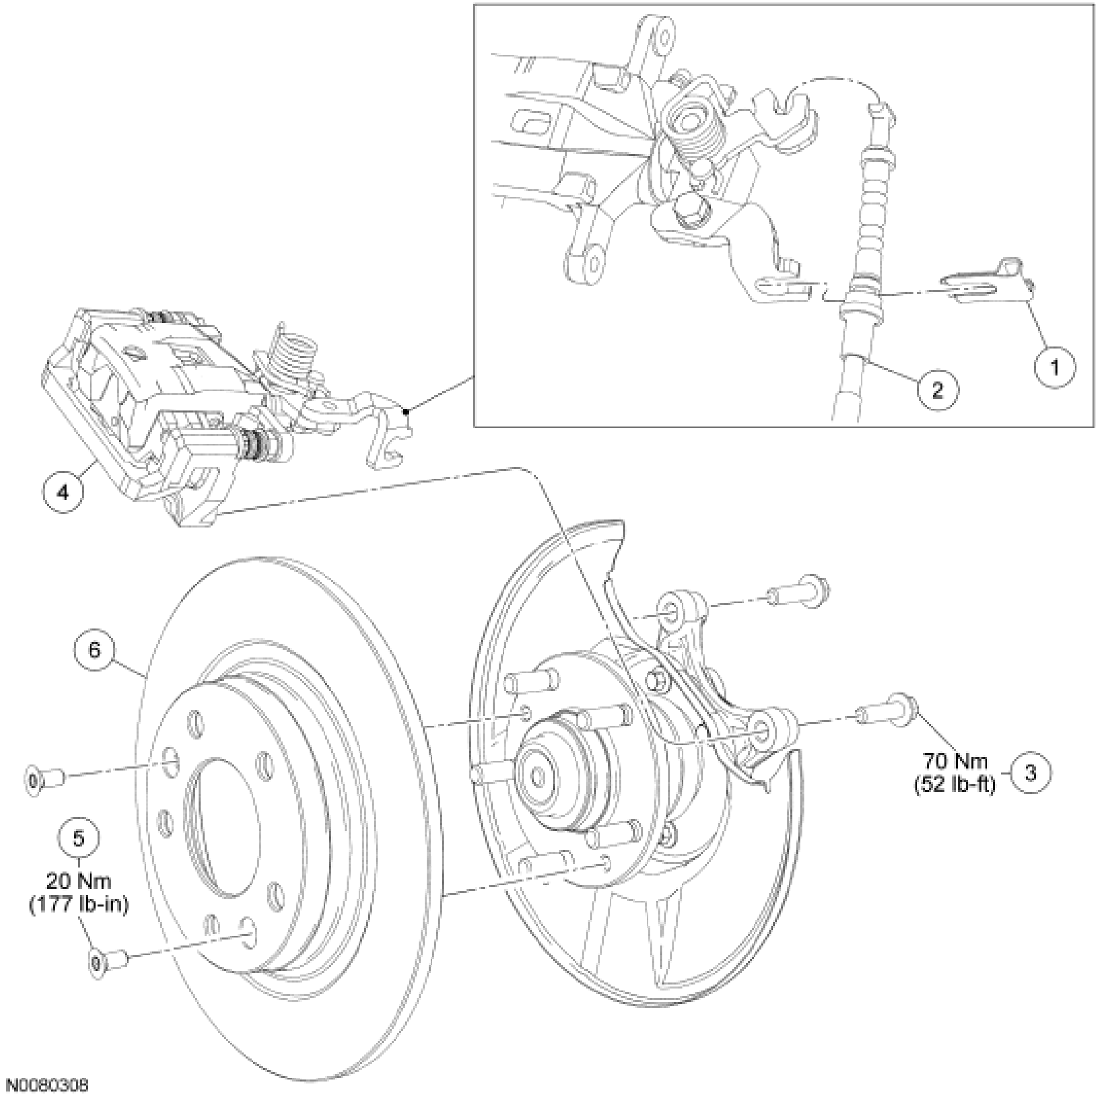

Fig. 7: Exploded View Of Brake Disc With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	2860	Parking brake cable conduit retaining clip
2	2A815	Parking brake cable
3	W711240	Brake caliper anchor plate bolt (2

		required)
4	-	Brake caliper, brake pads and brake caliper anchor plate assembly
5	W505741	Brake disc screw (2 required)
6	2C026	Brake disc

REMOVAL

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
2. Disconnect the parking brake cable from the brake caliper.
   - Pull back the parking brake lever.
   - Disconnect the cable from the parking brake lever.
   - Remove the cable conduit retaining clip.
   - Disconnect the cable from the brake caliper.

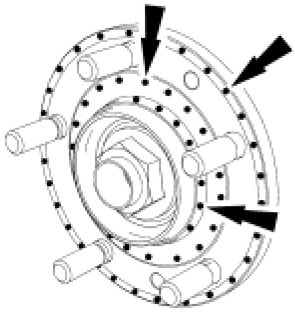
NOTE: Do not allow the brake caliper to hang from the brake hose or damage to the hose can occur.

3. Remove the 2 brake caliper anchor plate bolts and position the brake caliper, brake pads and brake caliper anchor plate aside as an assembly.
   - Support the brake caliper, brake pads and brake caliper anchor plate assembly using mechanic's wire.
4. Remove the 2 brake disc screws and the brake disc.

INSTALLATION

NOTE: Make sure the brake disc-to-hub mounting surface is free of rust and foreign material before applying anti-seize lubricant.

1. Install the brake disc and the 2 brake disc screws.
   - Using the specified brake cleaner, clean the mating surfaces.
   - Apply specified lubricant as shown.
   - Tighten the screws to 20 Nm (177 lb-in).



N0057940

Fig. 8: Locating Brake Disc Screws
Courtesy of FORD MOTOR CO.

NOTE: Make sure that the brake caliper hose is not twisted.

2. Position the brake caliper, brake pads and brake caliper anchor plate assembly and install the 2 brake caliper anchor plate bolts.
   - Tighten to 70 Nm (52 lb-ft).
3. Install the parking brake cable to the brake caliper.
   - Pull back the parking brake lever.
   - Connect the cable to the parking brake lever.
   - Install the cable conduit retaining clip.
4. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
5. Cycle the park brake several times to verify normal operation.
   - Apply brakes several times to verify correct brake operation.

BRAKE DISC SHIELD - FRONT WHEEL DRIVE (FWD)

Item	Part Number	Description
1	2K005 LH/ 2K004 RH	Brake disc shield
2	3K186 LH/ 3K185 RH	Wheel knuckle

REMOVAL

1. Remove the wheel bearing and wheel hub. For additional information, refer to **REAR SUSPENSION** article.
2. Index-mark the brake disc shield to the wheel knuckle.

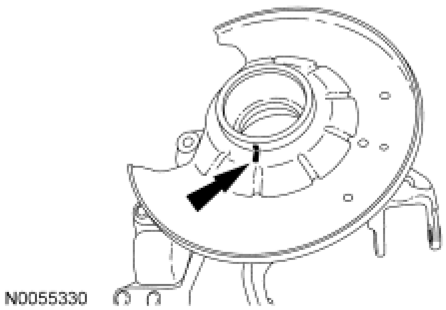

Fig. 11: Identifying Index-Mark On Brake Disc Shield To Wheel Knuckle
Courtesy of FORD MOTOR CO.

3. Cut the brake disc shield and remove it from the wheel knuckle.

INSTALLATION

1. Transfer the index mark from the removed brake disc shield to the new brake disc shield.
2. Position the brake disc shield onto the wheel knuckle.
3. Align the index marks and install the brake disc shield onto the wheel knuckle using the Front Subframe Bushing Remover/Installer.

Front insulator bracket-to-subframe bolts	90	66
Pinion nut	244	180
Rear driveshaft U-joint flange bolts	70	52
Side insulator bracket-to-rear axle differential bolts	90	66

DESCRIPTION AND OPERATION

REAR DRIVE AXLE AND DIFFERENTIAL

The rear drive axle consists of the following components:

- Dished circular flange
- Full-time fluid drive coupling
- Aluminum housing with steel housing cover
- Matched ring and pinion
- Conventional open differential
- Rubber bushing isolated mounting points

- Cover mounted axle vent
- The differential housing cover uses a silicone sealant rather than a gasket
- The active torque coupling is installed new as an assembly with the rear axle
- The pinion seal and the differential halfshaft seals are the only serviced components of the rear drive axle. If other components of the rear drive axle are worn or damaged, the assembly must be installed new.

The rear axle drive pinion receives power from the engine through the transaxle, power transfer unit (PTU), driveshaft and active torque coupling, and is engaged "ON DEMAND". The pinion gear rotates the differential ring gear, which is bolted to the differential case outer flange. Inside the differential case, 2 differential pinion gears are mounted on a differential pinion shaft, which is pinned to the case. These differential pinion gears are engaged with the splined differential side gears. The halfshafts are held in the differential side gears by a retainer circlip that is located on the inboard constant velocity (CV) joint stub shaft. When each halfshaft is installed, the retainer circlip engages a step in the differential side gear. There are no stub shaft bearings in the differential housing. As the differential case turns, it rotates the halfshafts and rear wheels. When it is necessary for one wheel and halfshaft to rotate faster than the other, the faster turning differential side gear causes the differential pinion gears to roll on the slower turning differential side gear. This allows differential action between the 2 halfshafts.

DIAGNOSTIC TESTS

REAR DRIVE AXLE AND DIFFERENTIAL

6. Using the special tools, remove and discard the drive pinion seal.

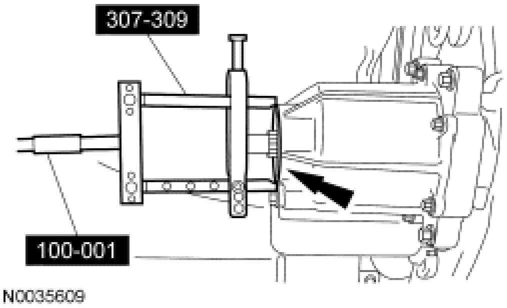

Fig. 9: Removing Drive Pinion Seal Using Special Tools (307-309, 100-001)
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: Make sure that the mating surface is clean before installing the new seal.

1. Using the special tool, install the drive pinion seal.

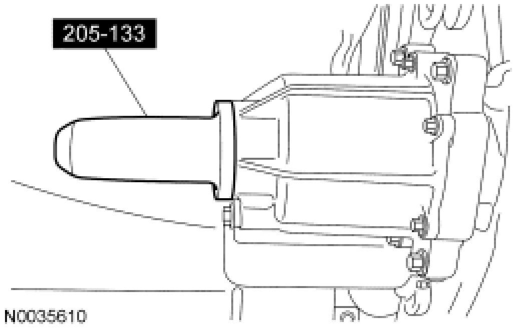

Fig. 10: Installing Drive Pinion Seal Using Special Tool (205-133)
Courtesy of FORD MOTOR CO.

NOTE: Lubricate the pinion flange splines with grease.

2. Line up the index marks and position the pinion flange.

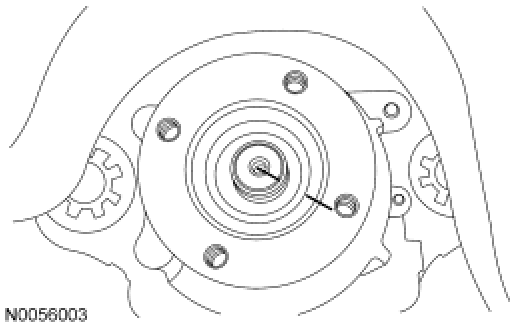

Fig. 11: Identifying Index-Mark On Pinion Of Yoke
Courtesy of FORD MOTOR CO.

3. Using the special tool, install the new pinion nut.
    - Tighten to 244 Nm (180 lb-ft).

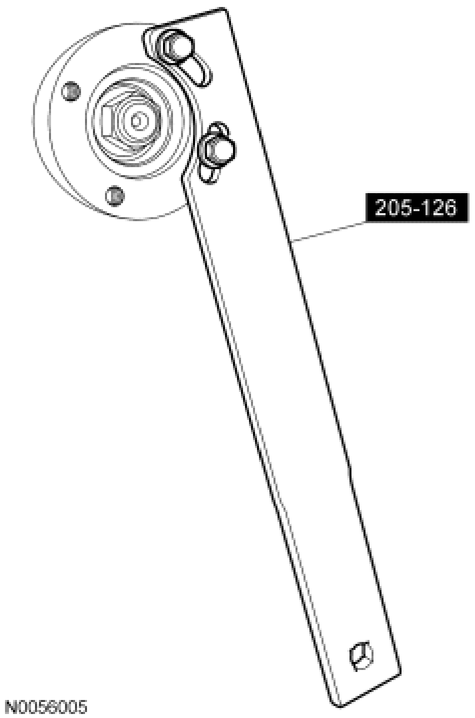

Fig. 12: Identifying Special Tool (205-126)
Courtesy of FORD MOTOR CO.

4. Line up the index marks and install the rear driveshaft U-joint flange with 4 new bolts.
   - Tighten to 70 Nm (52 lb-ft).

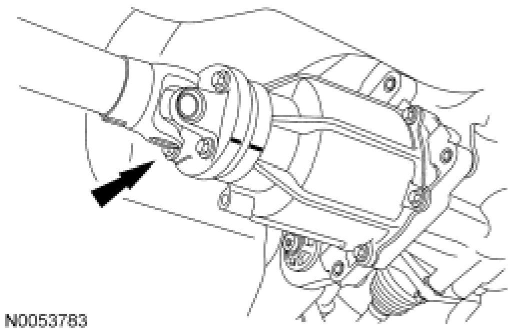

Fig. 13: Locating U-Joint Flange Bolts
Courtesy of FORD MOTOR CO.

DIFFERENTIAL HOUSING COVER

Material

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A
Motorcraft SAE 80W-90 Premium Rear Axle	

Lubricant XY-80W90-QL (US); CXY-80W90-1L (Canada)	WSP-M2C197-A

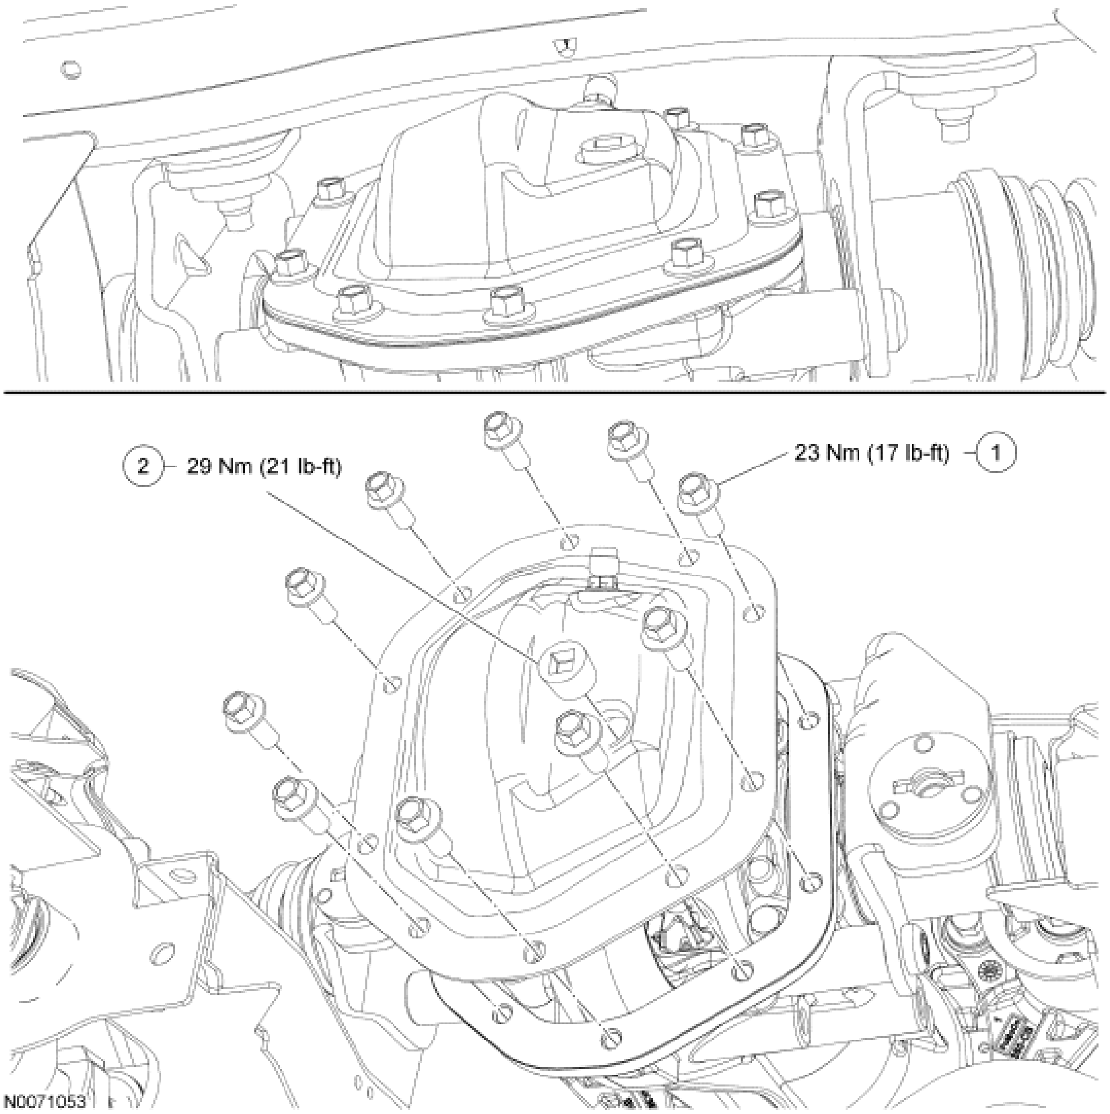

Fig. 14: Exploded View Of Differential Housing Cover Bolts With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W505262-S439	Differential cover bolt (10 required)
2	4N282	Differential fill plug

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the 10 bolts and the rear differential housing cover.

- Drain the differential fluid from the housing.

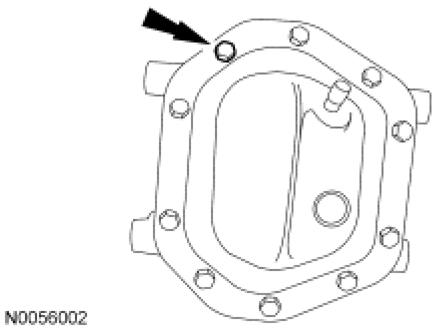

Fig. 15: Locating Rear Differential Housing Cover Bolts
Courtesy of FORD MOTOR CO.

INSTALLATION

CAUTION: Make sure the machined surfaces on the rear axle housing and the differential housing cover are clean and free of oil before installing the new silicone sealant. The inside of the rear axle must be covered when cleaning the machined surface to prevent damage to the component.

NOTE: Make sure the differential vent located on the rear cover is free of obstruction.

1. Clean the gasket mating surfaces of the differential housing and the differential housing cover.

NOTE: The differential housing cover must be installed within 15 minutes of application of the silicone, or new sealant must be applied. If possible, allow one hour before filling with lubricant to make sure the silicone sealant has correctly cured.

2. Apply a new continuous bead of clear silicone rubber as shown in the illustration.

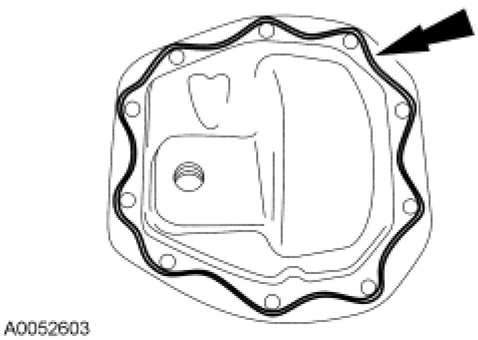

Fig. 16: Applying Sealant
Courtesy of FORD MOTOR CO.

3. Install the differential housing cover and the 10 bolts.
   - Tighten to 23 Nm (17 lb-ft).
4. Remove the filler plug, fill the rear axle with 1.15L (2.43 pt) of rear axle lubricant, 3-5 mm (0.118-0.196 in) below the bottom of the filler hole and install the filler plug.
   - Tighten to 29 Nm (21 lb-ft).

REMOVAL AND INSTALLATION

AXLE ASSEMBLY

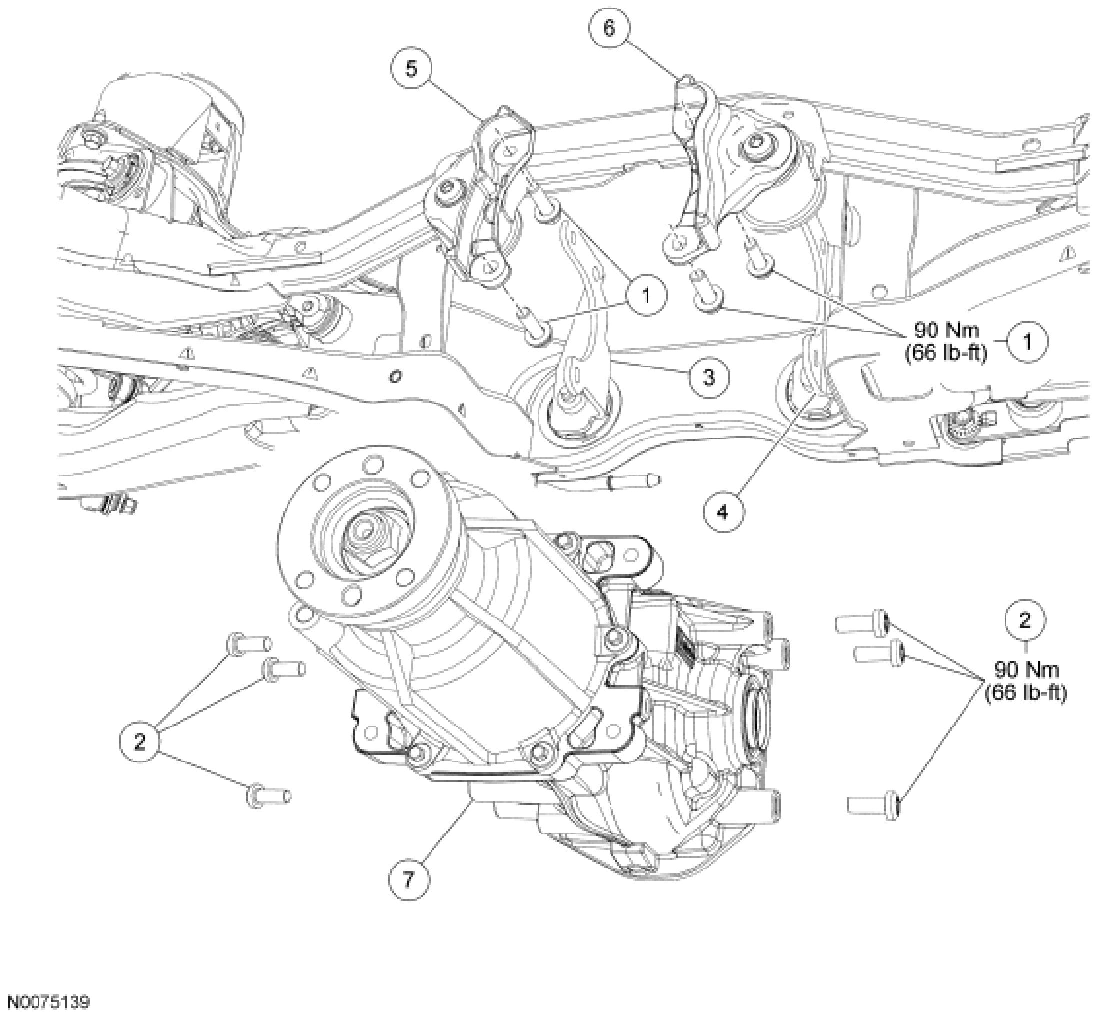

Fig. 17: Exploded View Of Axle Assembly With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description

1	W506540-S	Differential housing-to-front insulator bracket bolts (4 required)
2	W500043-S	Side insulator bracket-to-rear axle differential bolts (6 required)
3	4k630	Right rear insulator bracket
4	4K630	Left rear insulator bracket
5	4K360	Right front insulator bracket
6	4K630	Left rear insulator bracket
7	5L84	Rear axle assembly

REMOVAL AND INSTALLATION

1. Remove the driveshaft. For additional information, refer to **DRIVESHAFT** article.
2. Remove the rear halfshafts. For additional information, refer to **REAR DRIVE HALFSHAFTS** article.
3. Position a suitable transmission hydraulic jack to the axle housing. Securely strap the jack to the housing.

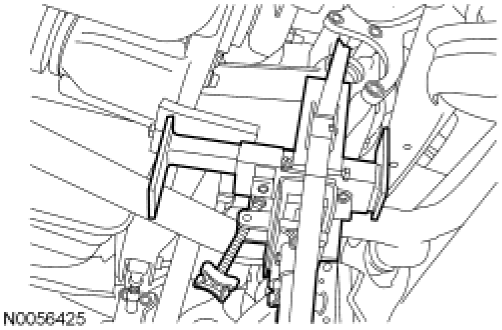

Fig. 18: Positioning Suitable Transmission Hydraulic Jack To Axle Housing
Courtesy of FORD MOTOR CO.

4. Disconnect the active torque coupling electrical connector.

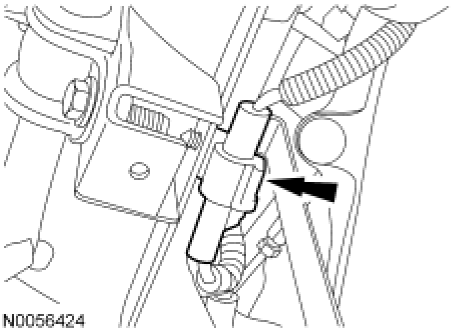

Fig. 19: Identifying Active Torque Coupling Electrical Connector
Courtesy of FORD MOTOR CO.

5. Remove the 4 differential housing-to-front insulator bracket bolts.
   - To install, tighten to 90 Nm (66 lb-ft).

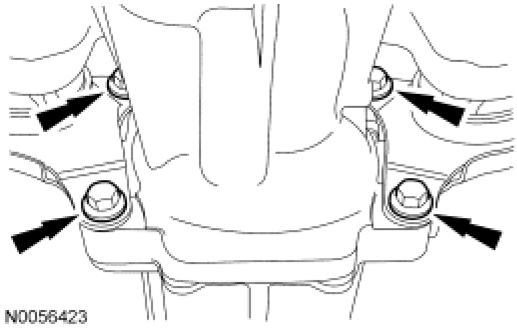

Fig. 20: Locating Differential Housing-To-Front Insulator Bracket Bolts
Courtesy of FORD MOTOR CO.

6. Loosen the LH front insulator bracket-to-subframe bolt, and rotate the bracket aside.
   - To install, tighten to 90 Nm (66 lb-ft).
7. Loosen the RH front insulator bracket-to-subframe bolt and the bracket, and rotate the bracket aside.
   - To install, tighten to 90 Nm (66 lb-ft).
8. Remove the 3 RH side insulator bracket-to-rear axle differential bolts.
   - To install, tighten to 90 Nm (66 lb-ft).

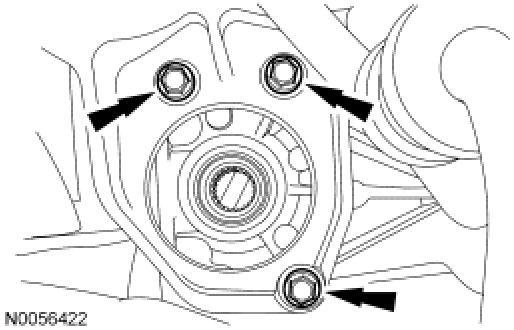

Fig. 21: Locating RH Side Insulator Bracket-To-Rear Axle Differential Bolts
Courtesy of FORD MOTOR CO.

9. Remove the 3 LH side insulator or bracket-to-rear axle differential bolts.
   - To install, tighten to 90 Nm (66 lb-ft).

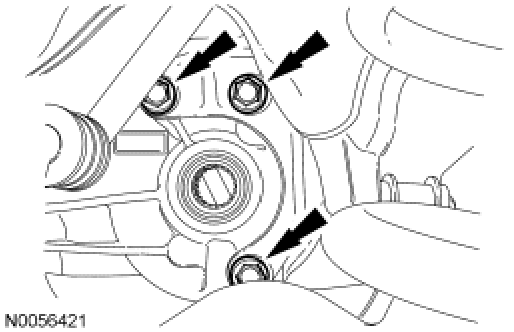

Fig. 22: Locating LH Side Insulator Or Bracket-To-Rear Axle Differential Bolts
Courtesy of FORD MOTOR CO.

10. Lower the rear axle assembly.
11. To install, reverse the removal procedure.

2008 TRANSMISSIONS

Rear Drive Halfshafts - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft
Axle shaft speed sensor bolt	23	17
Lower shock absorber bolt	115	85
Rear wheel hub nut	255	188
Toe link bracket nut	90	66
Upper arm bolt	110	81

DESCRIPTION AND OPERATION

REAR DRIVE HALFSHAFTS

The halfshafts consist of the following components:

- Inner constant velocity (CV) joints
- Outer CV joints
- Interconnecting shafts

The halfshafts are splined on the outboard stub shaft to drive the wheel hubs. They are retained in the wheel hubs by special wheel hub nuts which also control the wheel bearing preload. The halfshafts are splined on the inboard stub shaft and are retained by circlips. New circlips must be installed whenever the halfshafts are removed.

Halfshaft Joint

CV joints consist of the following components:

- CV joint boot clamps
- Convoluted CV joint boots
- Tripod joint housings
- Ball and cage housings
- Retainer circlips
- Special CV high temperature grease
- Never pick up or hold the halfshaft only by the inboard or outboard CV joint.
- Do not over angle the CV joints.

- Damage will occur to an assembled inboard CV joint if it is over plunged outward from the joint housing.
- Never use a hammer to remove or install the halfshafts from the rear hub.
- Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft.
- Do not allow the boots to contact sharp edges or hot exhaust components.
- Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the CV joints.
- Excessive pulling force on the interconnecting shaft between joints of the halfshaft will result in internal joint damage. Axial loads used in assisting removal must be applied through the inboard joint housing only.
- Do not drop assembled halfshafts. The impact will cut the boots from the inside without evidence of external damage.
- Do not remove the outer CV joint by pulling on the interconnecting shaft.
- Inspect all machined surfaces and splines for damage.

The CV joints mate the interconnecting shaft with the stub shaft. The joints allow for smooth rotation of the interconnecting shaft and the stub shafts. They also adjust for length variances and angle requirements as the vehicle goes through jounce and rebound.

The halfshaft joints are not repairable and are serviced as assemblies only.

DIAGNOSTIC TESTS

REAR DRIVE HALFSHAFTS

Refer to **DRIVELINE SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

HALFSHAFT

Special Tools

Illustration	Tool Name	Tool Number

Item	Part Number	Description
1	3N405	Rear wheel hub nut
2	W500547-S	Shaft speed sensor bolt
3	2C187	Shaft speed sensor
4	W500547-S	Upper arm bolt
5	W520515-S	Upper arm nut
6	W520515-S	Tie-rod bracket nuts (4 required)
7	W712880-S	Lower shock absorber bolt
8	W712848-S	Lower shock absorber nut
9	4B402	Rear halfshaft assembly

REMOVAL

1. Remove the tire and wheel. For additional information, refer to **WHEELS AND TIRES** article.
2. Remove and discard the rear wheel hub nut.
3. Remove the bolt and position aside the shaft speed sensor.

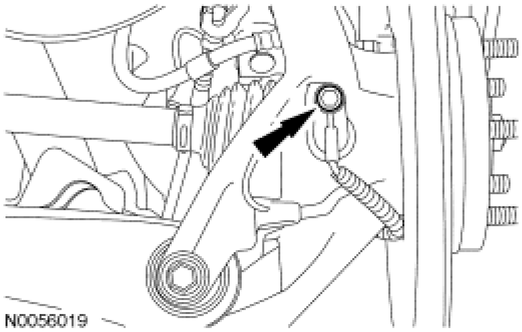

Fig. 2: Locating Shaft Speed Sensor Bolt
Courtesy of FORD MOTOR CO.

4. Remove the nut and lower shock absorber bolt.

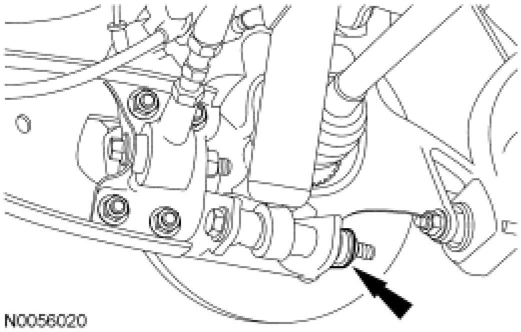

Fig. 3: Locating Lower Shock Absorber Bolt
Courtesy of FORD MOTOR CO.

5. Support the lower arm.

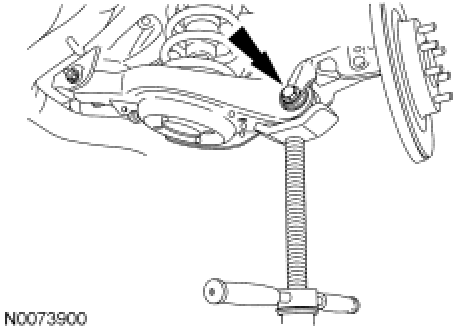

Fig. 4: Supporting Lower Arm

Courtesy of FORD MOTOR CO.

6. Remove the 4 toe link bracket nuts.

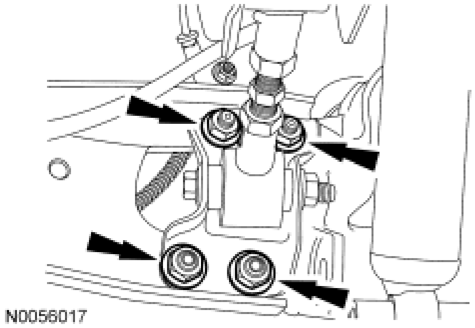

Fig. 5: Locating Link Bracket Nuts
Courtesy of FORD MOTOR CO.

7. Using the special tool, separate the halfshaft from the rear axle hub assembly.

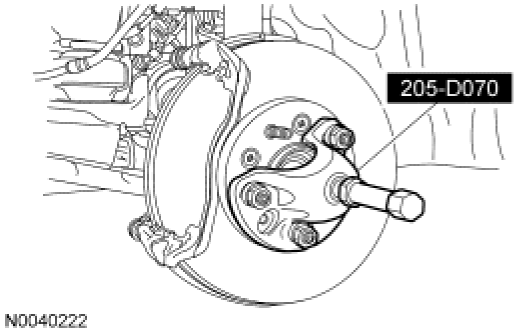

Fig. 6: Separating Halfshaft From Wheel Hub Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

CAUTION: Do not damage the oil seal protector when removing the axle halfshaft from the differential.

8. Using a suitable pry bar, remove the halfshaft.

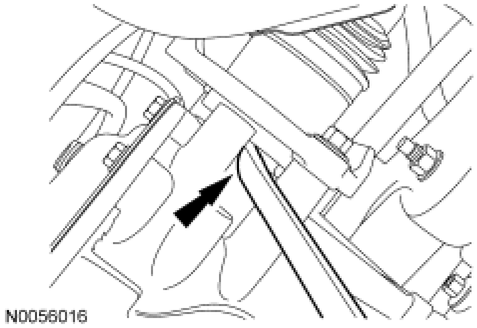

Fig. 7: Removing Halfshaft Using A Suitable Pry Bar
Courtesy of FORD MOTOR CO.

9. Remove and discard the circlip from the stub shaft.

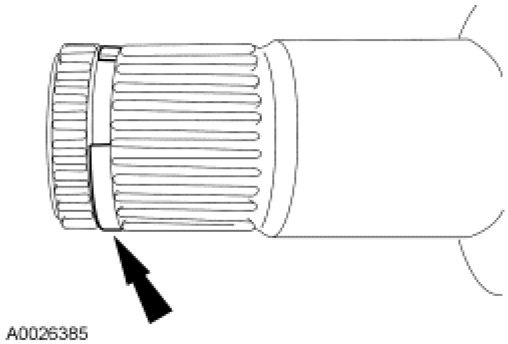

Fig. 8: Locating Halfshaft Circlip
Courtesy of FORD MOTOR CO.

INSTALLATION

CAUTION: Make sure to install the correct circlip for each application. Failure to use the correct diameter circlip may result in shaft removal concerns or shaft separation during vehicle operation.

1. Install a new circlip on the stub shaft.

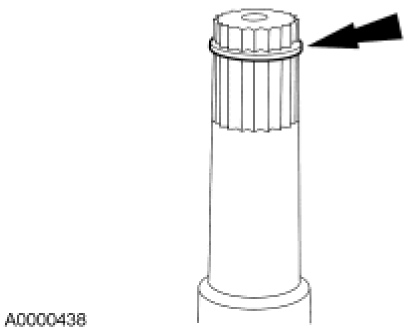

Fig. 9: Locating Intermediate Shaft Circlip
Courtesy of FORD MOTOR CO.

2. Install the stub shaft in the rear drive unit.
   - Make sure the circlip locks in the side gear.

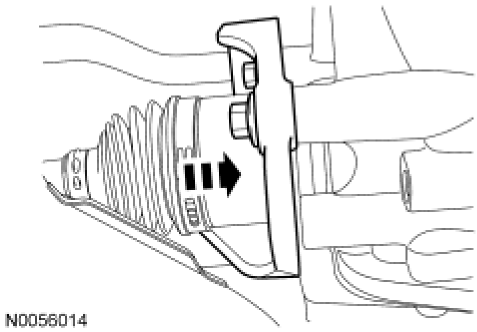

Fig. 10: Installing Stub Shaft In Rear Drive Unit
Courtesy of FORD MOTOR CO.

3. Using the special tool, install the outer halfshaft end into the hub assembly.

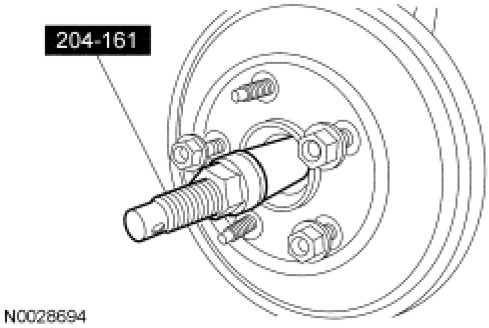

Fig. 11: Installing Outer Halfshaft End Into Hub Assembly
Courtesy of FORD MOTOR CO.

4. Position the lower arm.

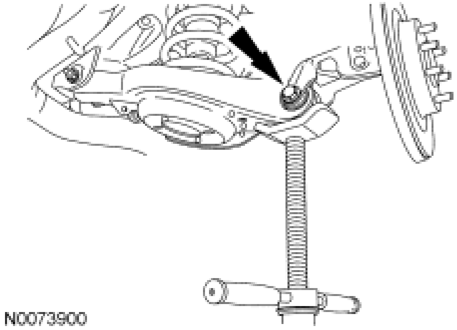

Fig. 12: Supporting Lower Arm
Courtesy of FORD MOTOR CO.

CAUTION: Do not tighten the rear wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered to the ground. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.

5. Install the new rear wheel hub nut.
    - To install, tighten to 255 Nm (188 lb-ft).
6. Stake the new nut in line with the keyway to a recommended minimum depth of 1 mm (0.039 in) below the keyway diameter to engage the locking feature.

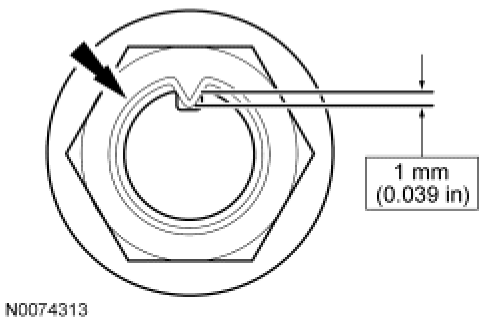

Fig. 13: Identifying Rear Wheel Hub Nut
Courtesy of FORD MOTOR CO.

7. Install the 4 rear toe link bracket nuts.
    - Tighten to 90 Nm (66 lb-ft).

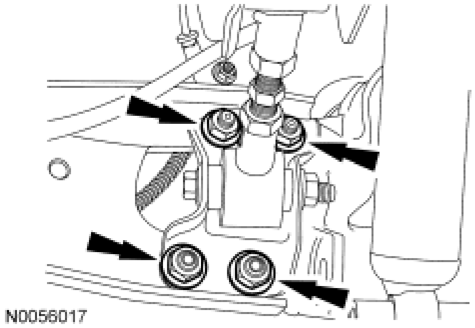

Fig. 14: Locating Link Bracket Nuts
Courtesy of FORD MOTOR CO.

8. Install the lower shock absorber bolt and nut.
    - Tighten to 115 Nm (85 lb-ft).

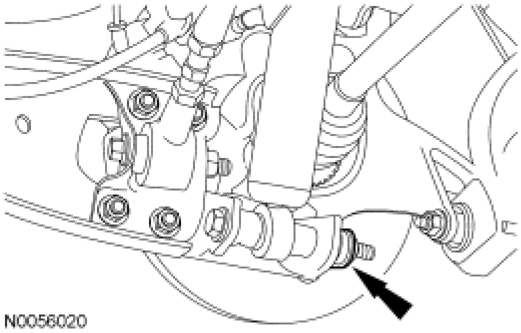

Fig. 15: Locating Lower Shock Absorber Bolt
Courtesy of FORD MOTOR CO.

9. Install the axle shaft speed sensor and bolt.
   - Tighten to 23 Nm (17 lb-ft).

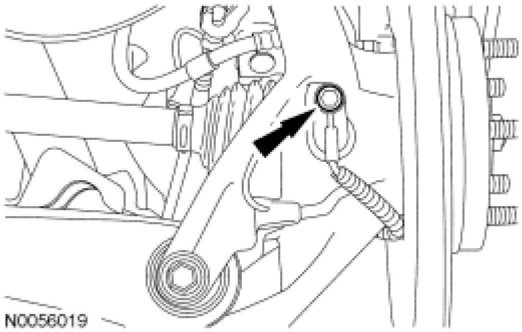

Fig. 16: Locating Shaft Speed Sensor Bolt
Courtesy of FORD MOTOR CO.

10. Fill the axle with the specified quantity of the specified lubricant.
11. Install the tire and wheel. For additional information, refer to **WHEELS AND TIRES** article.

DESCRIPTION AND OPERATION

REAR SUSPENSION

The rear suspension consists of the following components:

- Wheel bearing and wheel hub assemblies
- Wheel studs
- Upper arms
- Lower arms
- Toe links
- Stabilizer bar
- Stabilizer bar bushings
- Stabilizer bar links
- Trailing arms
- Wheel knuckles
- Wheel spindles
- Shock absorbers
- Coil springs

The rear suspension utilizes an independent short/long arm design. This suspension system incorporates a separate wheel knuckle for each wheel and allows the wheels to react to road imperfections independent of each other. This independent action offers improved isolation from the effects of jounce and rebound.

DIAGNOSTIC TESTS

REAR SUSPENSION

Refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

WHEEL BEARING AND WHEEL HUB

Special Tools

Illustration	Tool Name	Tool Number
	Remover, Drive Pinion Bearing Cone	205-D002 (D79L-4621-A) or equivalent
	Installer, Wheel Bearing Cup	205-147

 ST2446-A		
 ST2446-A	Remover/Installer, Wheel Bearing Cup	204-020
 ST2446-A	Step Plate	205-117

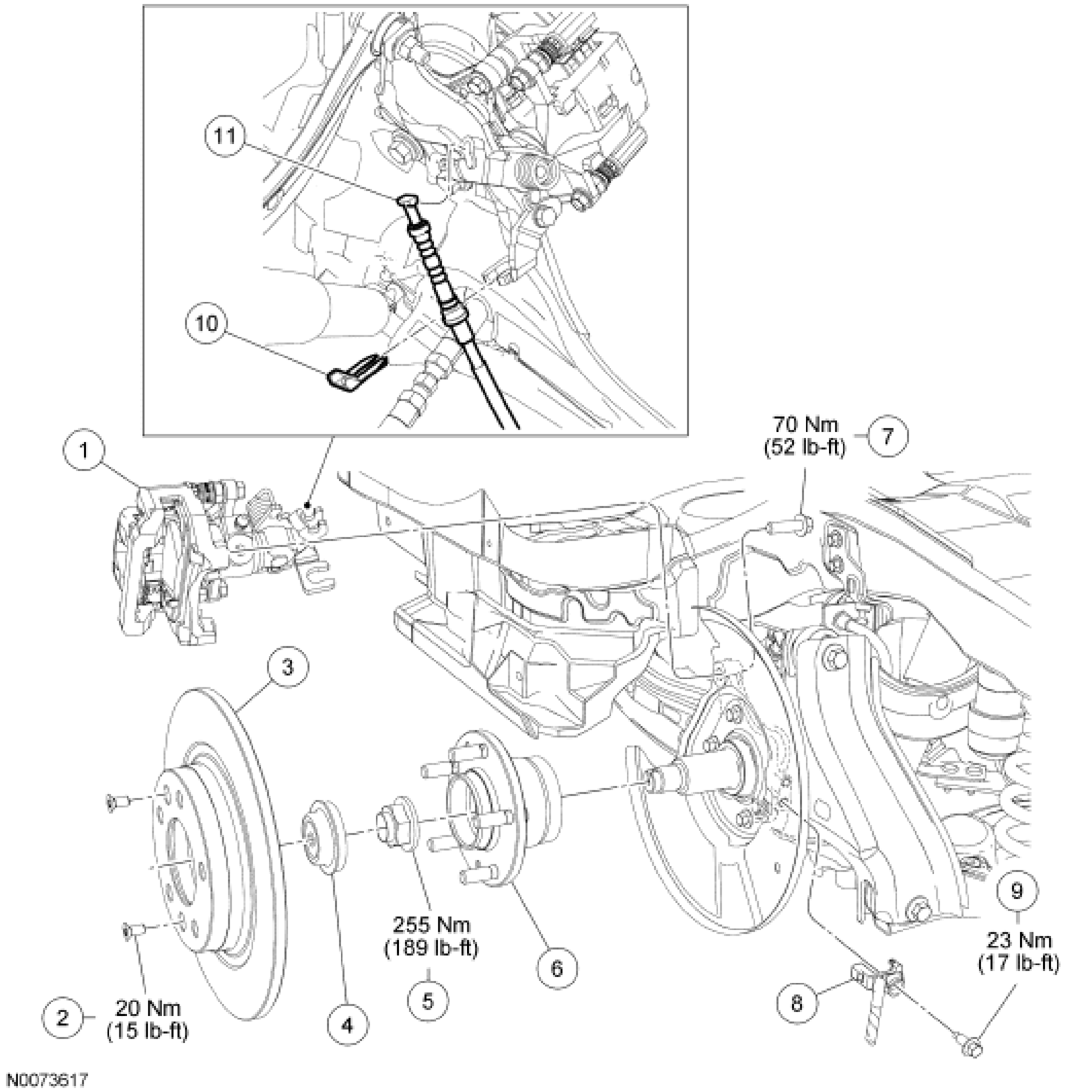

Fig. 1: Exploded View Of Wheel Bearing & Wheel Hub With Torque Specifications - Front Wheel Drive (FWD) Vehicles
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Brake caliper and anchor plate assembly
2	W505741	Brake disc bolt (2 required)
3	2C026	Brake disc
4	1N135	Grease cap
5	W712435	Wheel hub nut
6	1104	Wheel hub and bearing assembly
7	W711240	Brake caliper anchor plate bolt (2 required)
8	2C187	Wheel speed sensor

9	W500222	Wheel speed sensor bolt
10	2860	Parking brake cable clip
11	2A815	Rear parking brake cable assembly

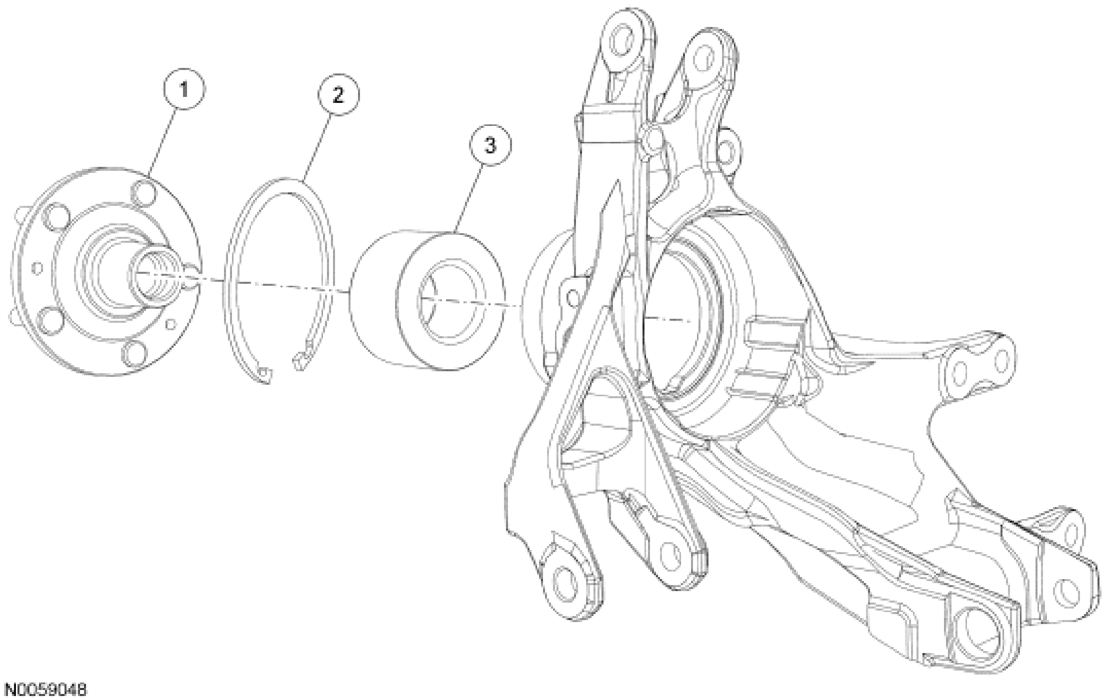

Fig. 2: Exploded View Of Wheel Bearing & Wheel Hub - All Wheel Drive (AWD) Vehicles
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	1104	Wheel hub
2	W303280	Snap ring
3	1215	Wheel bearing

REMOVAL

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

Front wheel drive (FWD) vehicles

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

2. If equipped, remove the wheel speed sensor bolt and position the sensor aside.
3. Disconnect the parking brake cable from the brake caliper in the following sequence.
    1. Remove the clip.
    2. Disconnect the parking brake cable from the brake caliper.

CAUTION: Do not allow the brake caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.

4. Remove the anchor plate bolts and position the brake caliper and anchor plate assembly aside.
    - Support the brake caliper and anchor plate assembly using mechanic's wire.
5. Remove the 2 brake disc bolts and the brake disc.
6. Remove and discard the grease cap.
7. Remove and discard the wheel hub nut and remove the wheel hub and bearing assembly.

All wheel drive (AWD) vehicles

8. Remove the wheel knuckle. For additional information, refer to **Wheel Knuckle**.
9. Using the special tool, press the wheel hub from the wheel bearing.

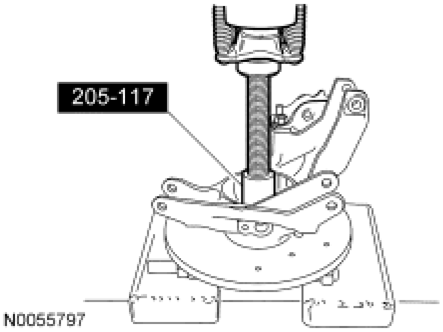

Fig. 3: Pressing Wheel Hub From Wheel Bearing Using Special Tool (205-117)
Courtesy of FORD MOTOR CO.

NOTE: This step may be necessary if the inner wheel bearing race remains in the wheel knuckle after removing the wheel hub.

10. Install the special tool, position in a suitable press and press the inner wheel bearing race from the wheel hub.

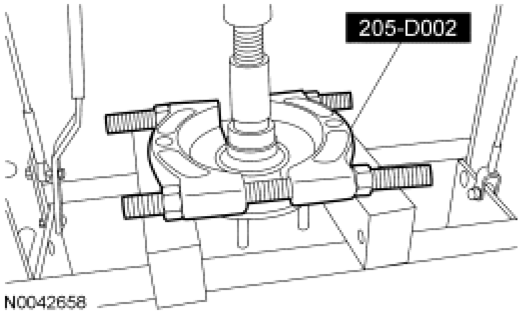

Fig. 4: Pressing Inner Wheel Bearing Race From Wheel Hub Using Special Tool (205-D002)
Courtesy of FORD MOTOR CO.

11. Remove the span ring.
12. Using the special tool, press the outer wheel bearing race from the wheel knuckle.

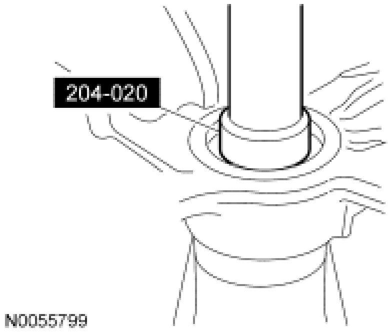

Fig. 5: Pressing Outer Wheel Bearing Race From Wheel Knuckle Using Special Tool (204-020)
Courtesy of FORD MOTOR CO.

INSTALLATION

AWD vehicles

1. Using the special tool, press the wheel bearing into the wheel knuckle.

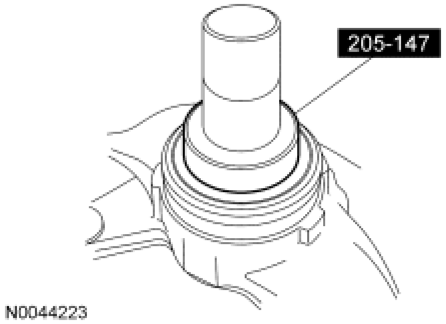

Fig. 6: Pressing Wheel Bearing Into Wheel Knuckle Using Special Tool (205-147)
Courtesy of FORD MOTOR CO.

2. Using the special tool, press the wheel hub into the wheel bearing.

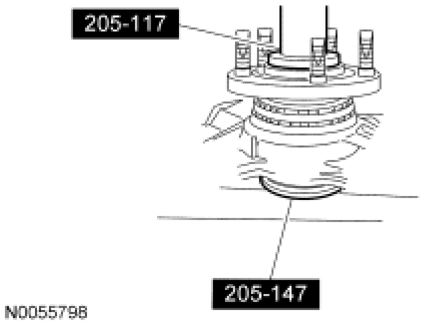

Fig. 7: Pressing Wheel Hub Into Wheel Bearing Using Special Tools (205-147, 205-117)
Courtesy of FORD MOTOR CO.

3. Install the wheel knuckle. For additional information, refer to **Wheel Knuckle**.

   FWD vehicles

4. If equipped, position the sensor and install the wheel speed sensor bolt.
   - Tighten to 23 Nm (17 lb-ft).
5. Connect the parking brake cable to the brake caliper in the following sequence.
   1. Install the clip.
   2. Connect the parking brake cable to the brake caliper.
6. Position the brake caliper and install the brake caliper anchor plate bolts.
   - Tighten to 70 Nm (52 lb-ft).
7. Install the brake disc and the 2 brake disc bolts.
   - Tighten to 20 Nm (15 lb-ft).
8. Install the grease cap.
9. Install the wheel hub and bearing assembly and the wheel hub nut.
   - Tighten to 255 Nm (189 lb-ft).
10. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

WHEEL STUDS

NOTE: **Front wheel drive (FWD) vehicle shown, all wheel drive vehicle (AWD) similar.**

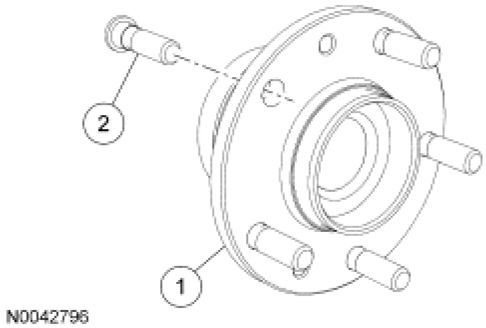

Fig. 8: Exploded View Of Wheel Studs
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	1104	Wheel bearing and wheel hub assembly
2	1107	Wheel stud

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the wheel bearing and wheel hub. For additional information, refer to **Wheel Bearing and Wheel Hub**.
3. Using a press, remove the wheel stud from the wheel hub.

INSTALLATION

1. Position the new wheel stud in the wheel hub, aligning the serrations in the wheel hub flange made by the original wheel stud.
2. Using a press, install the wheel stud.
3. Install the wheel bearing and wheel hub. For additional information, refer to **Wheel Bearing and Wheel Hub**.

WHEEL KNUCKLE

Special Tools

Illustration	Tool Name	Tool Number
	Remover, Front Wheel Hub	205-D070 (D93P-1175-B) or equivalent
	Installer, Halfshaft	204-161 (T97P-1175-4)

 ST2138-A		

NOTE: All wheel drive (AWD) MKZ vehicle shown, other vehicles similar.

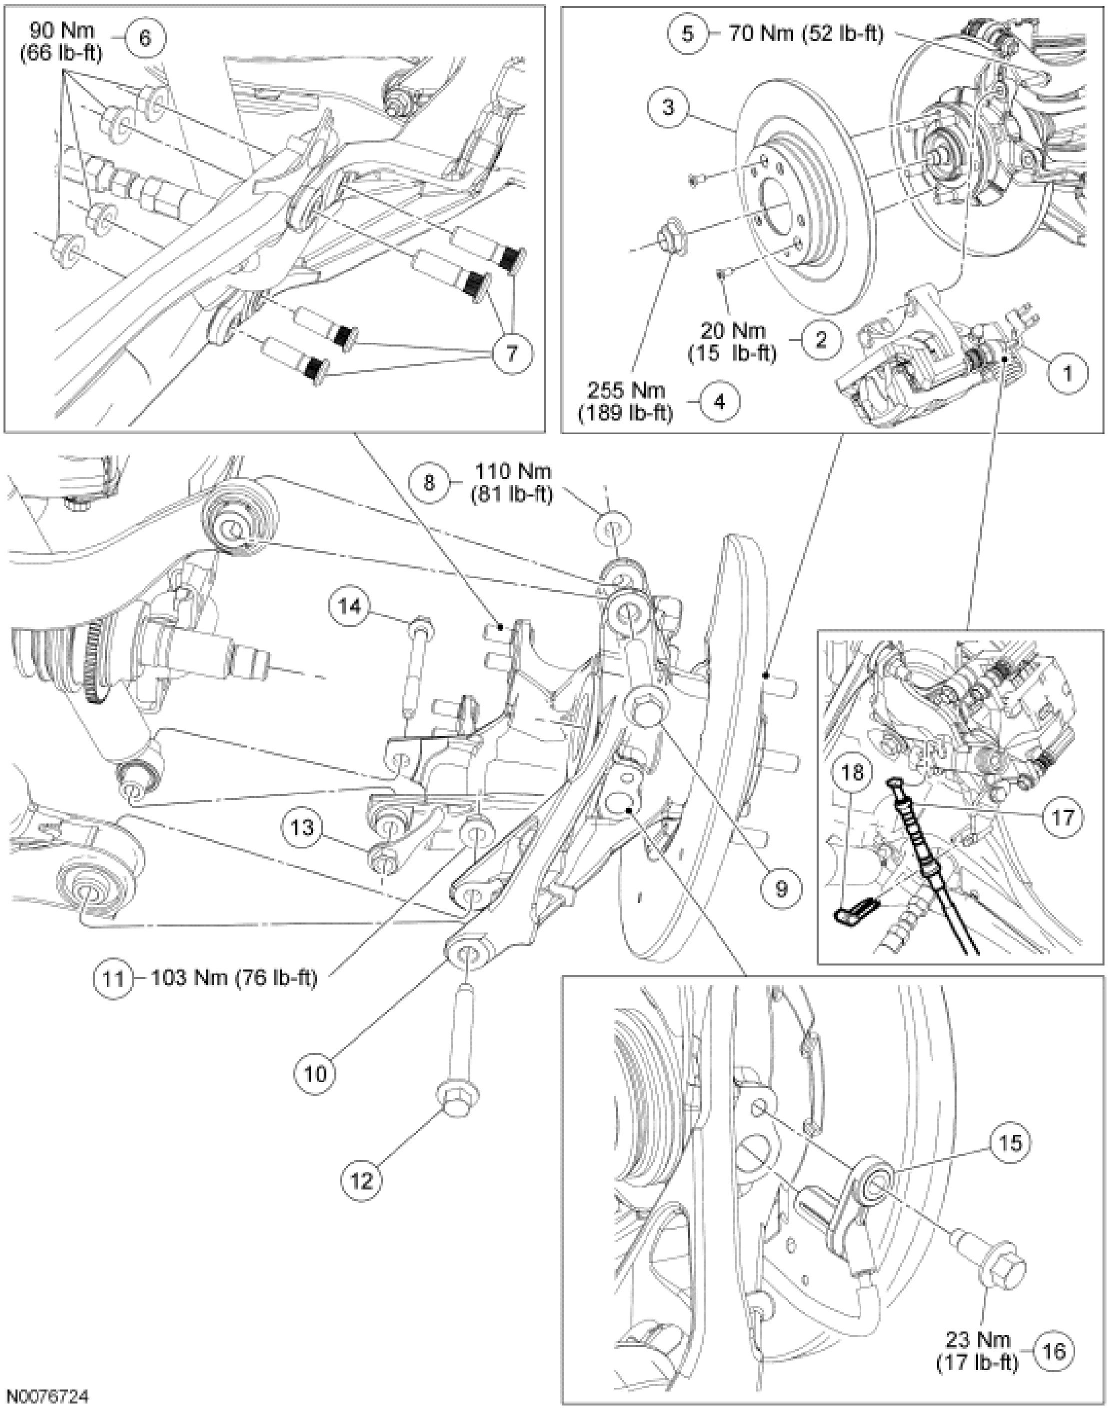

Fig. 9: Exploded View Of Wheel Knuckle With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Brake caliper and anchor plate assembly
2	W505741	Brake disc bolt (2 required)
3	2C026	Brake disc

4	W712435	Wheel hub nut
5	W711240	Brake caliper anchor plate bolt (2 required)
6	W520515	Trailing arm-to-wheel knuckle nut (4 required)
7	5B860	Trailing arm-to-wheel knuckle bolts (4 required)
8	W520515	Upper arm outboard nut
9	W500547	Upper arm outboard bolt
10	5A968	Wheel knuckle
11	W520215	Lower arm outboard nut
12	W513798	Lower arm outboard bolt
13	W302116	Shock absorber lower flag nut
14	W704586	Shock absorber lower bolt
15	2C187 LH/ 2C187 RH	Wheel speed sensor
16	W500222	Wheel speed sensor bolt
17	2860	Parking brake cable clip
18	2A815	Parking brake cable assembly

REMOVAL

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. If equipped, remove the wheel speed sensor bolt and position the sensor aside.
3. Disconnect the parking brake cable from the brake caliper in the following sequence.
    1. Remove the clip.
    2. Disconnect the parking brake cable from the brake caliper.

NOTE: Apply the brake to keep the halfshaft from rotating.

4. Remove and discard the wheel hub nut.

CAUTION: Do not allow the brake caliper and anchor plate assembly to hang from the brake hose or damage to the hose can occur.

5. Remove the anchor plate bolts and position the brake caliper and anchor plate assembly aside.
    - Support the brake caliper and anchor plate assembly using mechanic's wire.
6. Remove the 2 brake disc bolts and the brake disc.
7. Using the special tool, separate the halfshaft from the wheel hub.

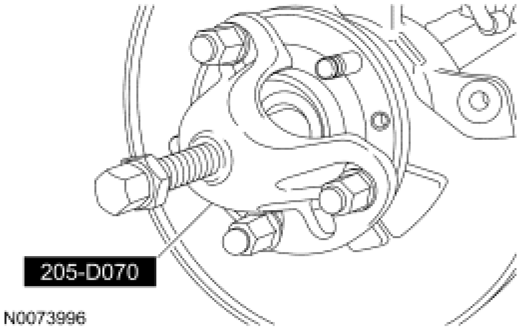

Fig. 10: Separating Halfshaft From Wheel Hub Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

8. Remove and discard the shock absorber lower bolt and flag nut.
    - If equipped, remove the shock absorber damper.
9. Using a suitable jack, raise the lower arm.

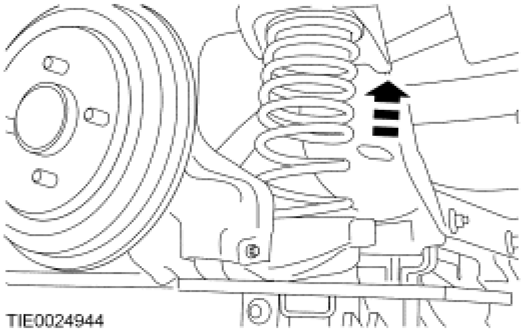

Fig. 11: Raising Rear Lower Arm
Courtesy of FORD MOTOR CO.

10. Remove and discard the upper arm outboard bolt.
11. Remove and discard the lower arm outboard bolt.
12. Remove the 4 trailing arm-to-knuckle nuts and the wheel knuckle.
    - Discard the nuts.

INSTALLATION

CAUTION: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip

of the fender is equal to 395 mm (15.55 in). This will prevent incorrect clamp load and bushing damage.

NOTE: Do not tighten the bolt at this time.

1. Position the wheel knuckle and install the 4 trailing arm-to-knuckle nuts.

NOTE: Do not tighten the bolt at this time.

2. Install the lower arm outboard bolt.

NOTE: Do not tighten the bolt at this time.

3. Install the upper arm outboard bolt.

NOTE: Do not tighten the bolt at this time.

4. Install the shock absorber lower bolt and flag nut.
5. Install the brake disc and the 2 brake disc bolts.
   - Tighten the bolts to 20 Nm (15 lb-ft).
6. Position the brake caliper and anchor plate assembly and install the 2 bolts.
   - Tighten the bolts to 70 Nm (52 lb-ft).
7. Using the special tool, install the halfshaft into the wheel hub.

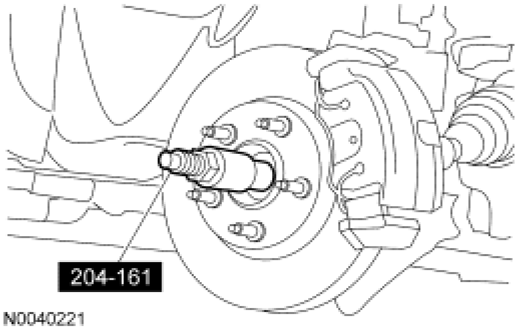

Fig. 12: Identifying Special Tool 204-161
Courtesy of FORD MOTOR CO.

CAUTION: Do not tighten the wheel hub nut with the vehicle on the ground. The nut must be tightened to specification before the vehicle is lowered onto the wheels. Wheel bearing damage will occur if the wheel bearing is loaded with the weight of the vehicle applied.

8. Install a new wheel hub nut.
   - While applying the brakes to prevent the wheel hub nut from turning, tighten the nut to 255 Nm

(189 lb-ft).

9. Connect the parking brake cable to the brake caliper in the following sequence.
    1. Install the clip.
    2. Connect the parking brake cable to the brake caliper.
10. If equipped, install the wheel speed sensor and the bolt.
    - Tighten to 23 Nm (17 lb-ft).

CAUTION: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in). This will prevent unequal clamp load and bushing damage.

11. Using the positioned suitable jack, raise the lower arm to bushing fastener tightening position.

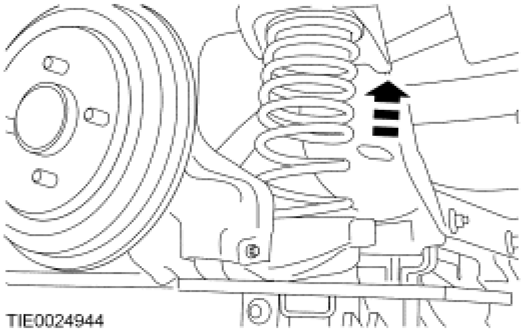

Fig. 13: Raising Rear Lower Arm
Courtesy of FORD MOTOR CO.

12. Tighten the 4 trailing arm-to-knuckle nuts to 90 Nm (66 lb-ft).
13. Tighten the lower arm outboard nut to 103 Nm (76 lb-ft).
14. Tighten the upper arm outboard bolt to 110 Nm (81 lb-ft).
15. Tighten the shock absorber lower bolt.
    - Tighten to 90 Nm (66 lb-ft), all wheel drive (AWD) vehicles.
    - Tighten to 115 Nm (85 lb-ft), front wheel drive (FWD) vehicles.
16. Lower and remove the jack.

WHEEL SPINDLE

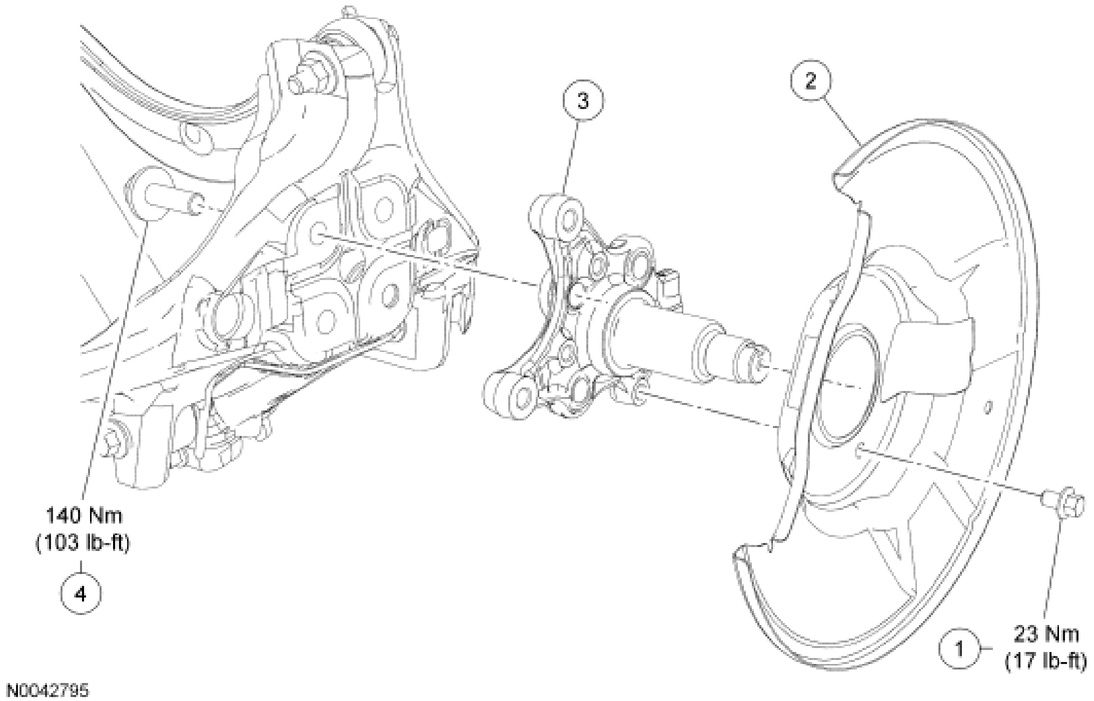

Fig. 14: Exploded View Of Wheel Spindle With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W500020	Brake disc shield bolt (3 required)
2	2K046 LH/ 2K045 RH	Brake disc shield
3	4A013	Wheel spindle
4	W500547	Wheel spindle bolt (4 required)

REMOVAL AND INSTALLATION

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the wheel bearing and wheel hub assembly. For additional information, refer to **Wheel Bearing and Wheel Hub**.
2. Remove the 3 brake disc shield bolts and remove the brake disc shield.
    - To install, tighten to 23 Nm (17 lb-ft).
3. Remove the 4 wheel spindle bolts and remove the wheel spindle.
    - To install, tighten to 140 Nm (103 lb-ft).

4. To install, reverse the removal procedure.

LOWER ARM

NOTE: Front wheel drive (FWD) shown, all wheel drive (AWD) similar.

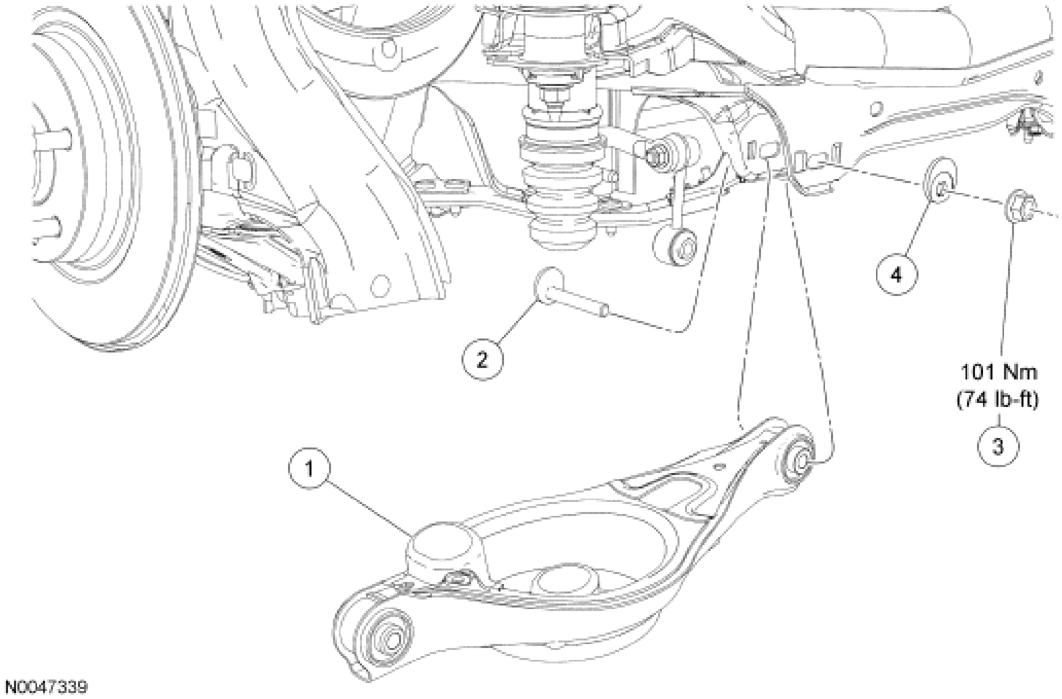

Fig. 15: Exploded View Of Lower Arm With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5A649	Lower arm
2	5K751	Cam bolt
3	W520515	Cam adjuster nut
4	6269	Cam adjuster

REMOVAL AND INSTALLATION

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the spring. For additional information, refer to **Spring**.
2. Remove the cam adjuster nut, cam adjuster, cam bolt and the lower arm.
   - Discard the nut.
   - To install, tighten to 101 Nm (74 lb-ft) with the suspension at the bushing fastener tightening position.

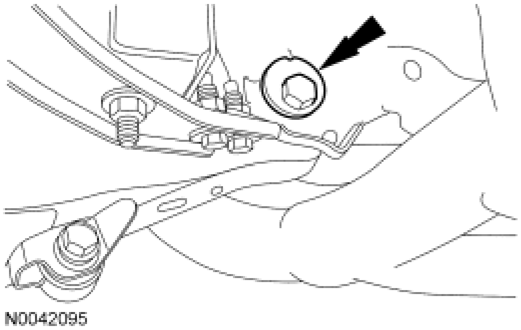

Fig. 16: Locating Cam Adjuster Nut
Courtesy of FORD MOTOR CO.

CAUTION: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in). This will prevent incorrect clamp load and bushing damage.

NOTE: Do not fully tighten the cam adjuster nut until the rear alignment has been checked and, if necessary, adjusted.

NOTE: Install the cam bolt and the cam adjuster with the cam facing upward.

3. To install, reverse the removal procedure.

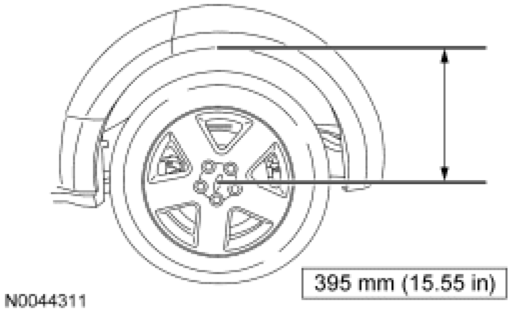

Fig. 17: Identifying Distance Between Center Of Hub And Lip Of Fender
Courtesy of FORD MOTOR CO.

UPPER ARM

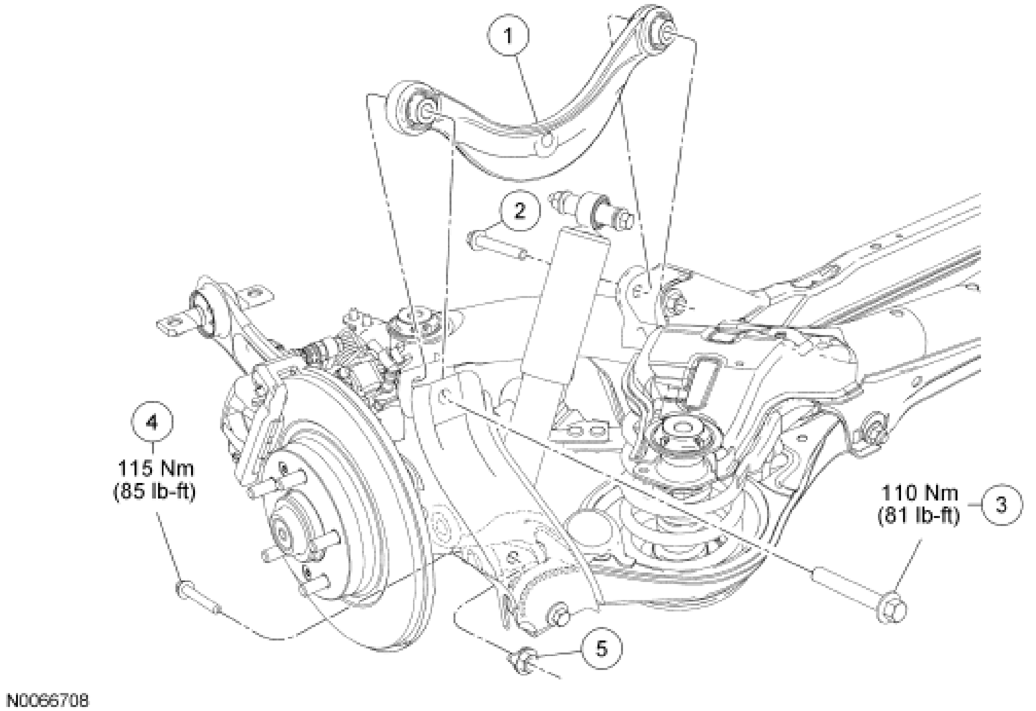

Fig. 18: Exploded View Of Upper Arm With Torque Specifications - Front Wheel Drive (FWD) Vehicles

6	W712880	Shock absorber lower bolt
7	18080	Shock absorber
8	-	Shock absorber lower mount bushing
9	W302116	Shock absorber lower flag nut

REMOVAL AND INSTALLATION

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

All vehicles

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
2. Using a suitable jack, support the trailing arm.

CAUTION: Do not fully tighten the shock absorber lower nut until the suspension is at the bushing fastener tightening position. This will prevent incorrect clamp load and bushing damage.

3. Remove and discard the shock absorber lower bolt and flag nut.
   - To install, tighten to 90 Nm (66 lb-ft), all wheel drive (AWD) vehicles.
   - To install, tighten to 115 Nm (85 lb-ft), front wheel drive (FWD) vehicles.

Front wheel drive (FWD) vehicles

4. Remove and discard the upper arm outboard bolt.
   - To install, tighten the bolt to 110 Nm (81 lb-ft) with the suspension at the bushing fastener tightening position.

All wheel drive (AWD) vehicles

5. Remove and discard the upper arm outboard bolt and nut.
   - To install, tighten the nut to 110 Nm (81 lb-ft) with the suspension at the bushing fastener tightening position.

All vehicles

6. Carefully lower the trailing arm and remove the jack.

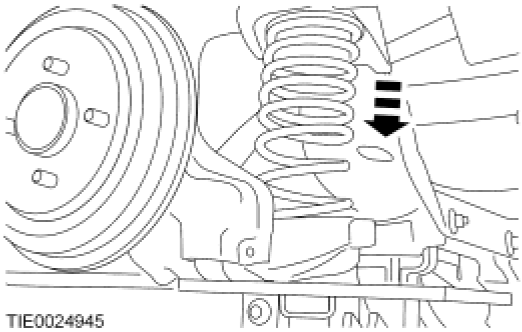

Fig. 20: Lowering Rear Lower Arm
Courtesy of FORD MOTOR CO.

NOTE: Position the shock absorber as necessary to remove the upper arm.

NOTE: When tightening the upper arm inboard bolt the suspension must be at the bushing fastener tightening position.

7. Remove and discard the upper arm inboard bolt and remove the upper arm.
   - To install, tighten the bolt to 100 Nm (74 lb-ft) and then rotate an additional 90 degrees.

CAUTION: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in). This will prevent incorrect clamp load and bushing damage.

8. To install, reverse the removal procedure.

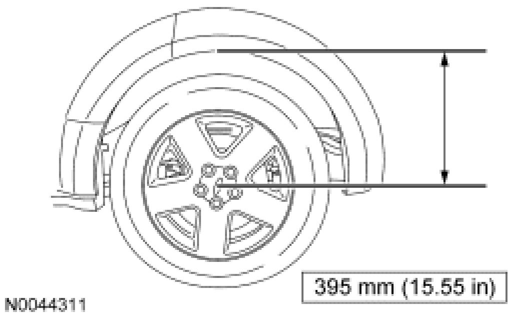

Fig. 21: Identifying Distance Between Center Of Hub And Lip Of Fender
Courtesy of FORD MOTOR CO.

9. Check and, if necessary, adjust the rear camber. For additional information, refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

TOE LINK

3	W500547	Toe link outboard bolt
4	W520515	Toe link outboard nut
5	5B674	Toe link

REMOVAL AND INSTALLATION

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

All vehicles

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

Front wheel drive (FWD) vehicles

2. Remove the toe link shield bolt.
    - To install, tighten to 8 Nm (71 lb-in).
3. Remove the push pin and the shield.

    All vehicles

4. Remove and discard the toe link inboard nut and bolt.
    - To install, tighten the nut to 110 Nm (81 lb-ft) with the suspension at the bushing fastener tightening position.
5. Remove and discard the toe link outboard bolt and remove the toe link.
    - To install, tighten to 110 Nm (81 lb-ft) with the suspension at the bushing fastener tightening position.

    CAUTION: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in). This will prevent incorrect clamp load and bushing damage.

6. To install, reverse the removal procedure.

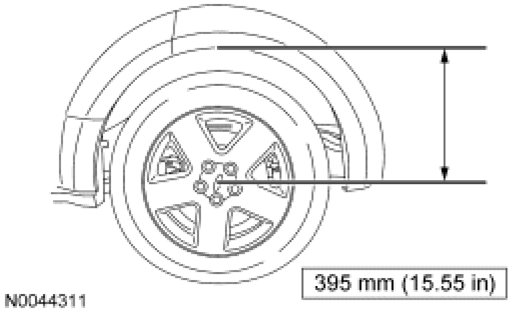

Fig. 24: Identifying Distance Between Center Of Hub And Lip Of Fender

Item	Part Number	Description
1	W711493	Trailing arm-to-frame bolts (2 required)
2	6C028	Cone washers (2 required)
3	5A995 LH/ 5A994 RH	Trailing arm
4	-	Wheel speed sensor bracket (part of 2C186 RH/2C187 LH)
5	W520102	Wheel speed sensor bracket nut
6	5A757	Trailing arm toe link bracket
7	5B860	Trailing arm-to-knuckle nut (4 required)

REMOVAL AND INSTALLATION

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

All wheel drive (AWD) vehicles

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

   All vehicles

2. Remove the parking brake cable bracket bolt and position the parking brake cable aside.
   - To install, tighten to 10 Nm (89 lb-in).

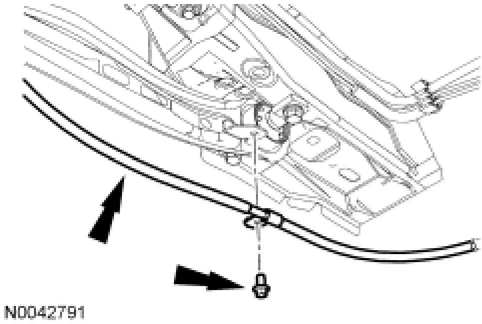

Fig. 27: Locating Parking Brake Cable Bracket Bolt
Courtesy of FORD MOTOR CO.

Front wheel drive (FWD) vehicles

3. Remove the wheel spindle. For additional information, refer to **Wheel Spindle**.
4. If equipped, detach the wheel speed sensor harness from the trailing arm.

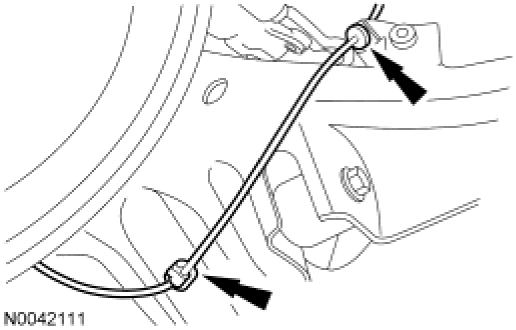

Fig. 28: Locating Wheel Speed Sensor Harness From Trailing Arm
Courtesy of FORD MOTOR CO.

5. Using a suitable jack, support the trailing arm.

> WARNING: **The coil spring is under extreme load. Care must be taken at all times when removing or installing a loaded spring. Failure to follow this instruction may result in serious personal injury.**

6. Remove and discard the lower arm outboard bolt.
   - To install, tighten to 103 Nm (76 lb-ft) with the suspension at the bushing fastener tightening

position.

7. Remove and discard the upper arm outboard bolt.
    - To install, tighten to 110 Nm (81 lb-ft) with the suspension at the bushing fastener tightening position.
8. Carefully lower the trailing arm and remove the jack.
9. Remove and discard the shock absorber lower bolt and flag nut.
    - To install, tighten to 115 Nm (85 lb-ft) with the suspension at the bushing fastener tightening position.
10. Remove and discard the toe link outboard bolt.
    - To install, tighten to 110 Nm (81 lb-ft) with the suspension at the bushing fastener tightening position.

AWD vehicles

11. Remove the wheel speed sensor harness bracket nut and position aside the bracket.
    - To install, tighten to 23 Nm (17 lb-ft).
12. Remove the toe link. For additional information, refer to **Toe Link**.
13. Remove the 4 trailing arm-to knuckle nuts and the trailing arm toe link bracket.
    - Discard the nuts.
    - To install, tighten to 90 Nm (66 lb-ft).

All vehicles

14. Remove the 2 trailing arm-to-frame bolts, cone washers and the trailing arm.
    - Discard the nuts.
    - To install, tighten the bolts to 125 Nm (92 lb-ft).

CAUTION: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in). This will prevent incorrect clamp load and bushing damage.

15. To install, reverse the removal procedure.

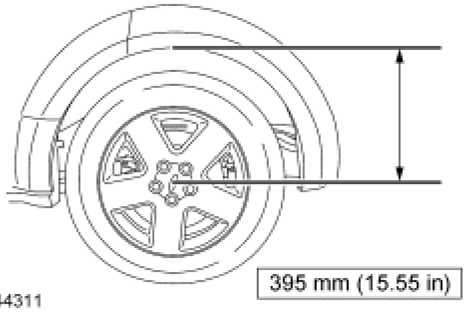

Fig. 29: Identifying Distance Between Center Of Hub And Lip Of Fender
Courtesy of FORD MOTOR CO.

16. Check and, if necessary, align the rear end. For additional information, refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

STABILIZER BAR AND LINK

NOTE: Front wheel drive (FWD) shown, all wheel drive (AWD) similar.

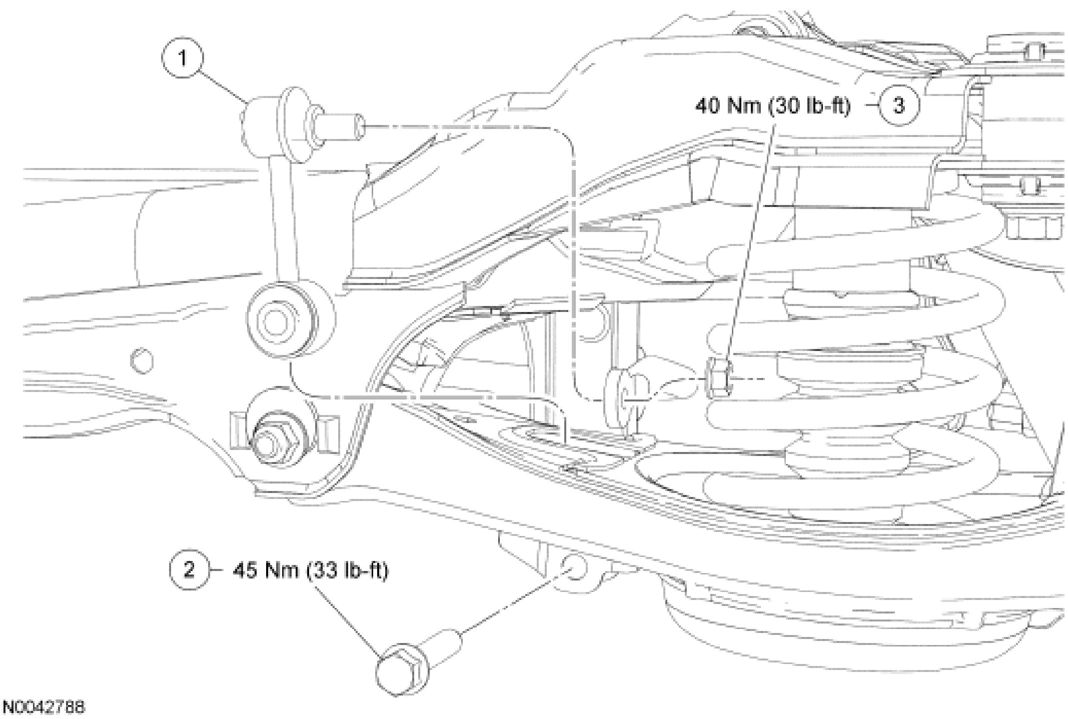

Fig. 30: Exploded View Of Stabilizer Bar & Link With Torque Specifications (1 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5A486	Stabilizer bar link
2	W302134	Stabilizer bar link lower bolt

3	W302118	Stabilizer bar link upper nut

NOTE: **FWD shown, AWD similar.**

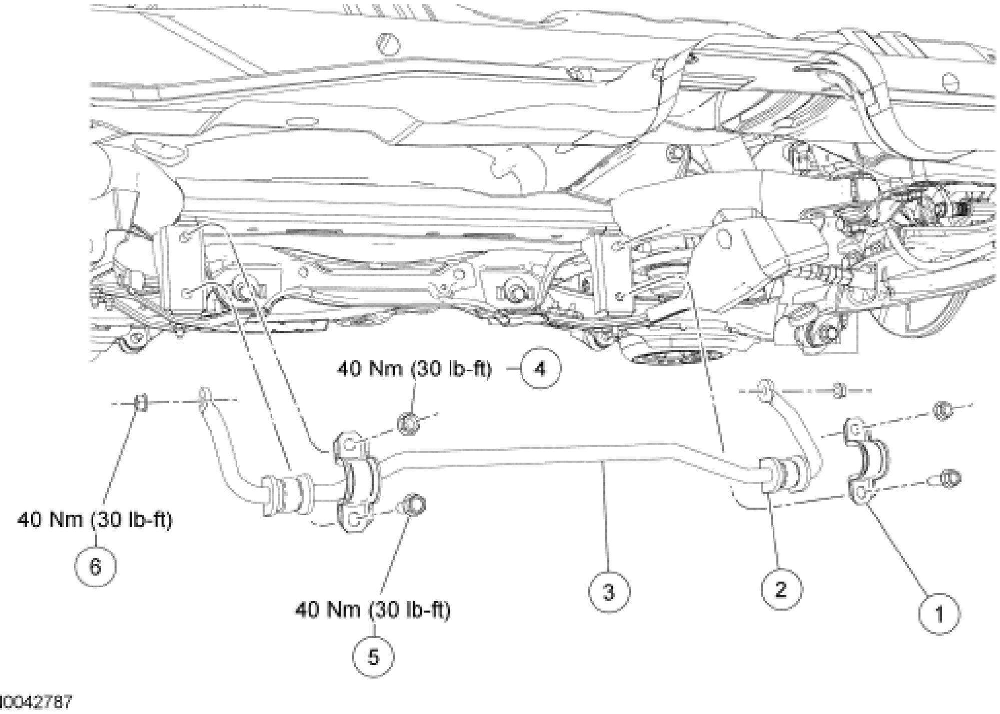

Fig. 31: Exploded View Of Stabilizer Bar & Link With Torque Specifications (2 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5B498	Stabilizer bar bracket (2 required)
2	5493	Stabilizer bar bushing (2 required)
3	5A772	Stabilizer bar
4	W302118	Stabilizer bar bracket nut (2 required)

6	W302118	Stabilizer bar link upper nut (2 required)

REMOVAL AND INSTALLATION

CAUTION: **Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.**

All wheel drive (AWD) vehicles

1. Remove the rear halfshafts. For additional information, refer to **REAR DRIVE HALFSHAFTS** article
2. Remove the RH side spring.

   Front wheel drive (FWD) vehicles

3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

   All vehicles

4. Remove the 2 stabilizer bar link upper nuts.
   - Discard the nuts.
   - To install, tighten to 40 Nm (30 lb-ft).
5. Remove the 2 stabilizer bar link lower bolts and the stabilizer bar links.
   - Discard the bolts.
   - To install, tighten to 45 Nm (33 lb-ft) with the suspension at the bushing fastener tightening position.
6. Remove the stabilizer bar bracket nuts.
   - Discard the nuts.
   - To install, tighten to 40 Nm (30 lb-ft) with the suspension at the bushing fastener tightening position.
7. Remove the stabilizer bar bracket bolts and the brackets.
   - Discard the bolts.
   - To install, tighten to 40 Nm (30 lb-ft) with the suspension at the bushing fastener tightening position.

   FWD vehicles

8. Remove the stabilizer bar.

   AWD vehicles

   CAUTION: Be careful not to contact the fuel lines or wiring harness when removing and installing the stabilizer bar or damage to the wiring harness or fuel lines may occur.

9. Remove the stabilizer bar from the RH side of the vehicle.

   All vehicles

10. Inspect the stabilizer bar bushings and install a new bushing(s) if necessary.

CAUTION: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. This will prevent incorrect clamp load and bushing damage.

11. To install, reverse the removal procedure.

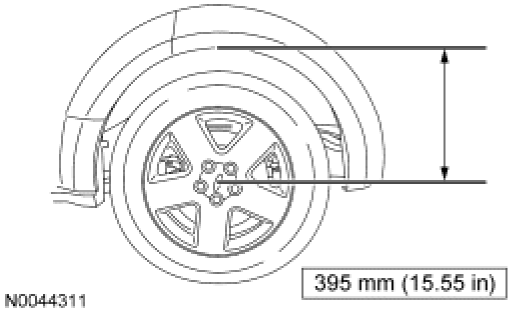

Fig. 32: Identifying Distance Between Center Of Hub And Lip Of Fender
Courtesy of FORD MOTOR CO.

SPRING

NOTE: Front wheel drive (FWD) shown, all wheel drive (AWD) similar.

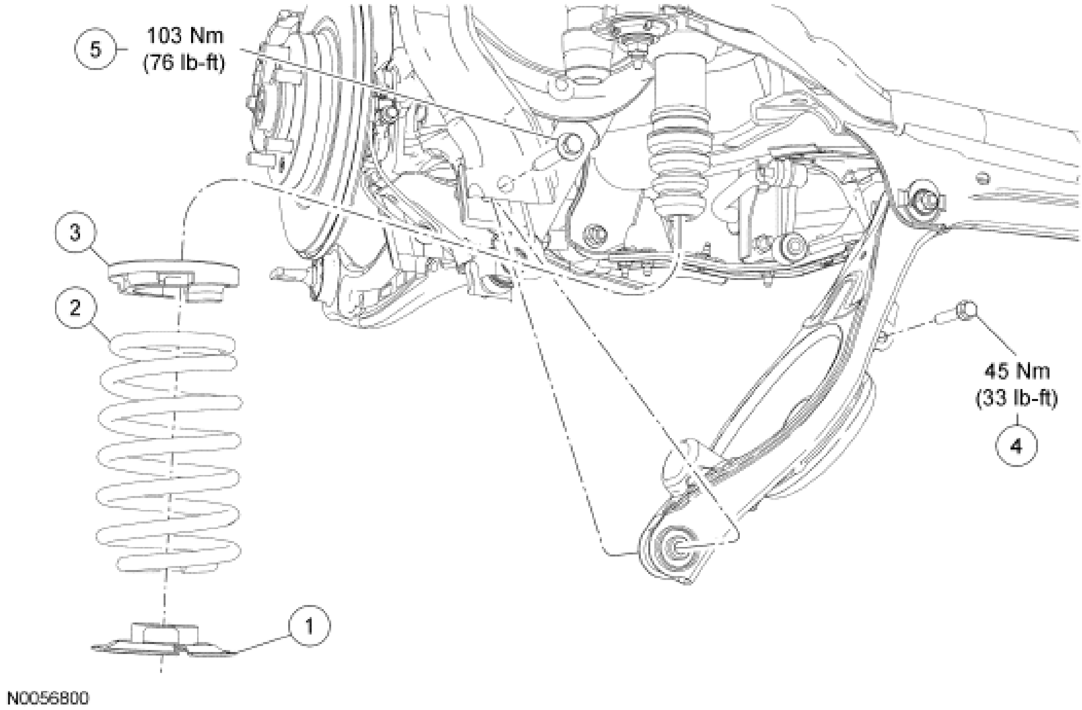

Fig. 33: Exploded View Of Spring With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5536A	Spring lower seat
2	5560	Spring
3	5536B	Spring upper seat
4	W302134	Stabilizer bar link lower bolt
5	W302125	Lower arm outboard bolt

REMOVAL

CAUTION: The coil spring is coated with long-term corrosion protective paint. Do not damage the paint during component servicing or spring damage may occur.

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

NOTE: Do not fully tighten the cam adjuster nut until the rear alignment has been checked and, if necessary, adjusted.

2. Index-mark the cam bolt and cam adjuster and then loosen the cam adjuster nut.

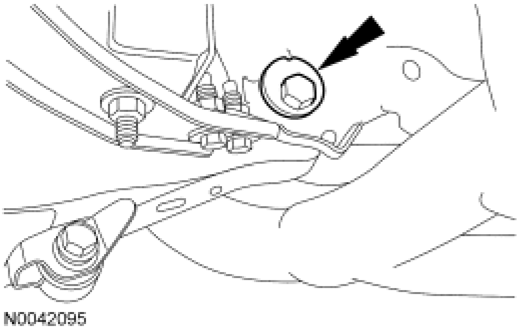

Fig. 34: Locating Cam Adjuster Nut
Courtesy of FORD MOTOR CO.

3. Remove the stabilizer bar link lower bolt.
4. Using a suitable jack, support the lower arm.

WARNING: The coil spring is under extreme load. Care must be taken at all

times when removing or installing a loaded spring. Failure to follow this instruction may result in serious personal injury.

5. Remove the lower arm outboard bolt.
6. Lower the lower arm and remove the spring.
   - Inspect the spring upper and lower seats, install new seats as necessary.

INSTALLATION

1. Position the spring upper seat onto the spring with the end of the spring 0-10 mm (0-0.39 in) from the step on the seat.

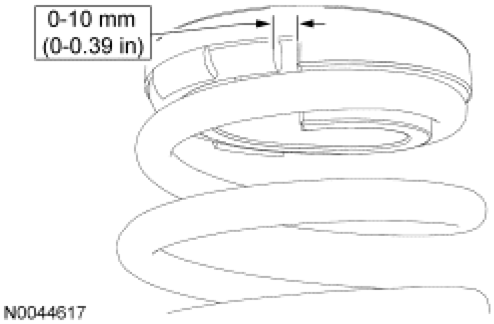

Fig. 35: Positioning Spring Upper Seat Onto Spring
Courtesy of FORD MOTOR CO.

2. If removed, position the spring lower seat into the lower arm aligning the recess in the seat with the projection on the lower arm.

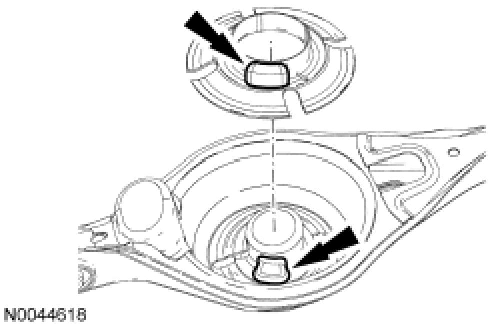

Fig. 36: Locating Spring Lower Seat Into Lower Arm
Courtesy of FORD MOTOR CO.

3. Position the spring onto the lower arm with the end of the spring 0-10 mm (0-0.39 in) from the step on the spring seat.

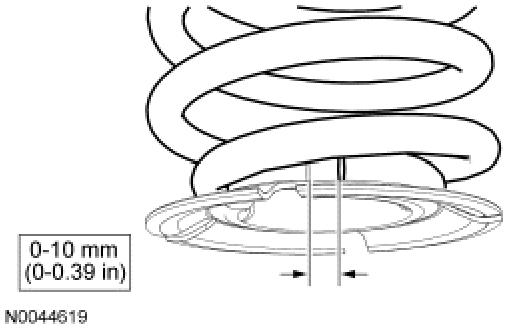

Fig. 37: Positioning Spring Onto Lower Arm With End Of Spring
Courtesy of FORD MOTOR CO.

NOTE: **Do not tighten the bolt at this time.**

4. Using the jack, raise the lower arm and install the lower arm outboard bolt.

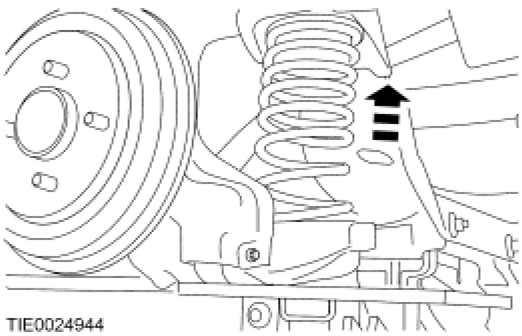

Fig. 38: Raising Rear Lower Arm
Courtesy of FORD MOTOR CO.

CAUTION: **Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. This will prevent incorrect clamp load and bushing damage.**

5. Using the jack, raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in).

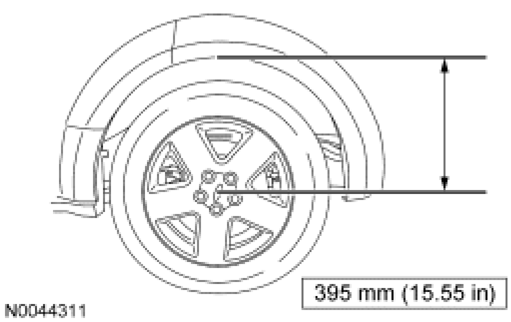

Fig. 39: Identifying Distance Between Center Of Hub And Lip Of Fender
Courtesy of FORD MOTOR CO.

6. Tighten the lower arm outboard bolt to 103 Nm (76 lb-ft).
7. Install the stabilizer bar link lower bolt.
    - Tighten to 45 Nm (33 lb-ft).
8. Align the index mark on the cam bolt and cam adjuster with the index mark on the lower arm and tighten the cam adjuster nut to 101 Nm (74 lb-ft).
9. Check and, if necessary, align the rear end. For additional information, refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

SHOCK ABSORBER

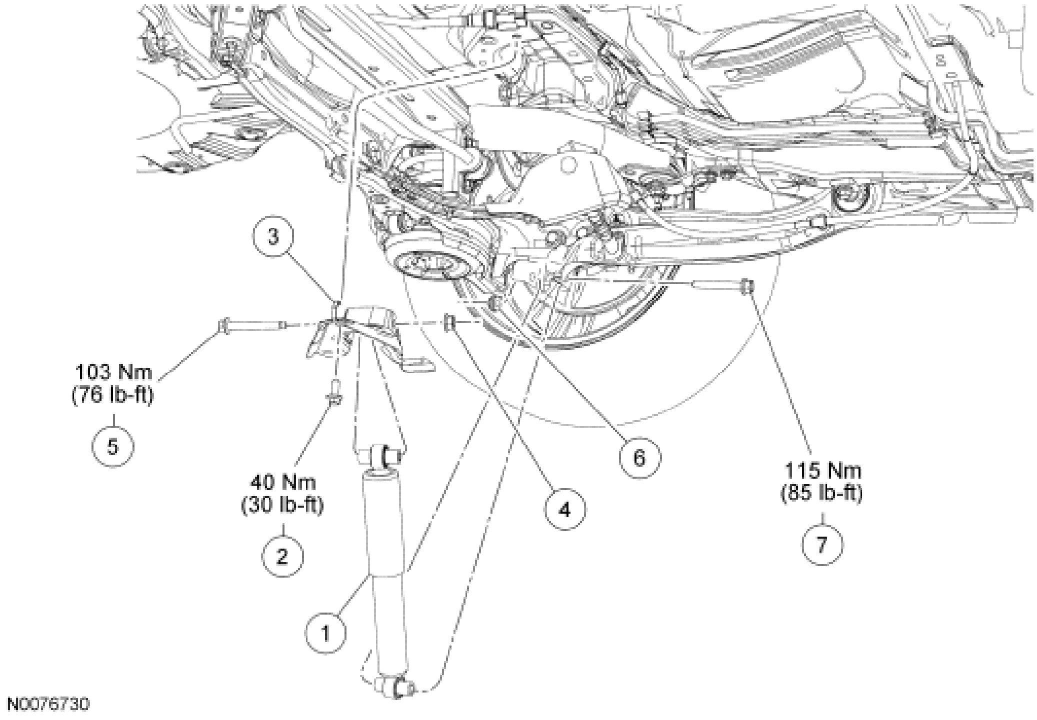

Fig. 40: Exploded View Of Shock Absorber With Torque Specifications - Front Wheel Drive (FWD) Vehicles
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	18125	Shock absorber
2	W302277	Bracket bolt (3 required)
3	18165 LH/ 18164 RH	Shock absorber bracket
4	W520515	Shock absorber upper nut
5	W500748	Shock absorber upper bolt
6	W302116	Shock absorber lower flag nut

7	W704586	Shock absorber lower bolt

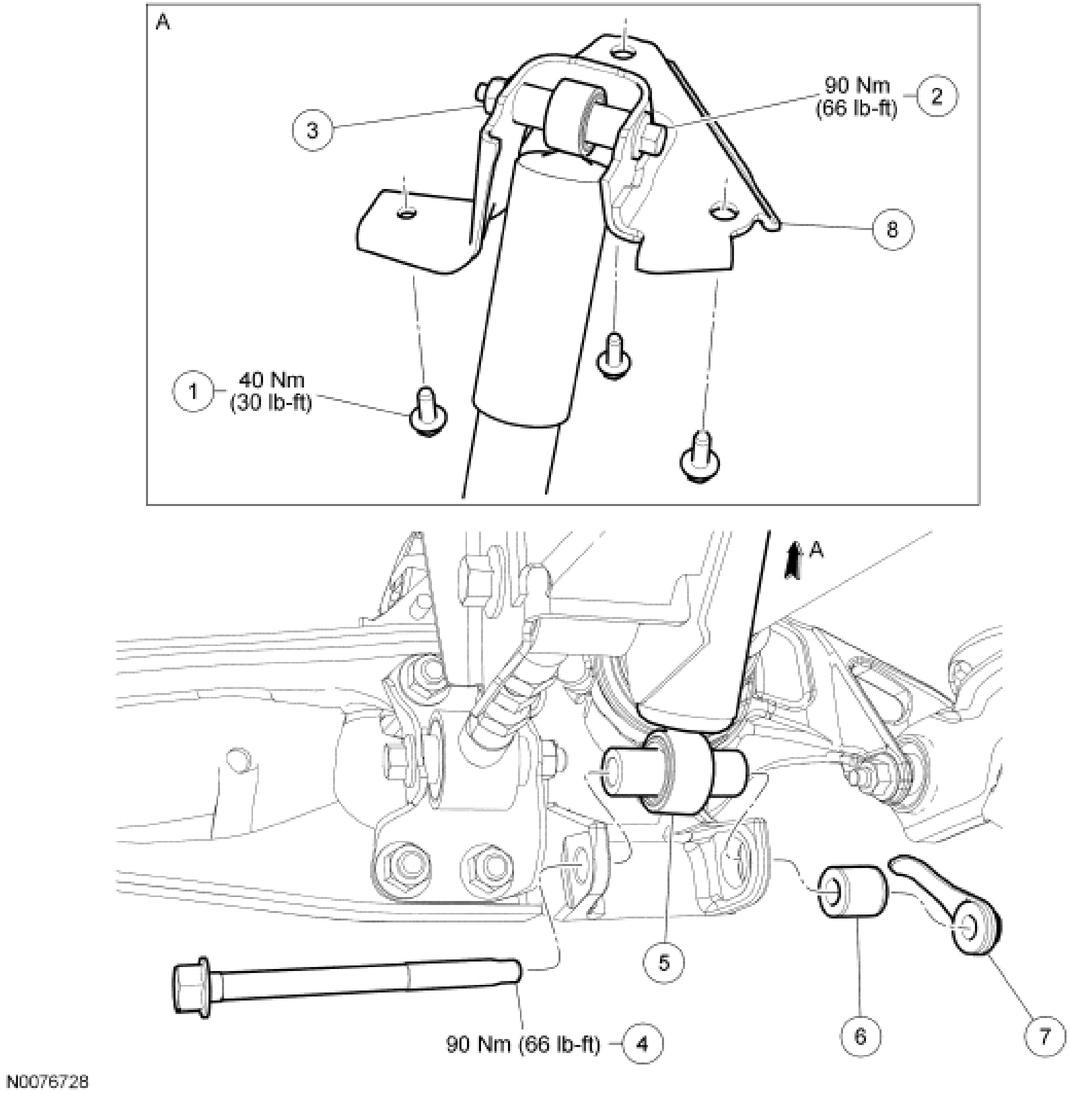

Fig. 41: Exploded View Of Shock Absorber With Torque Specifications - All Wheel Drive (AWD) MKZ Vehicles
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W302277	Bracket bolt (3 required)
2	W500748	Shock absorber upper bolt
3	W520515	Shock absorber upper nut
4	W704586	Shock absorber lower bolt
5	18125	Shock absorber
6	18199	Shock absorber lower mount bushing
7	W302117	Shock absorber lower flag nut

8	18165 LH/ 18164 RH	Shock absorber bracket

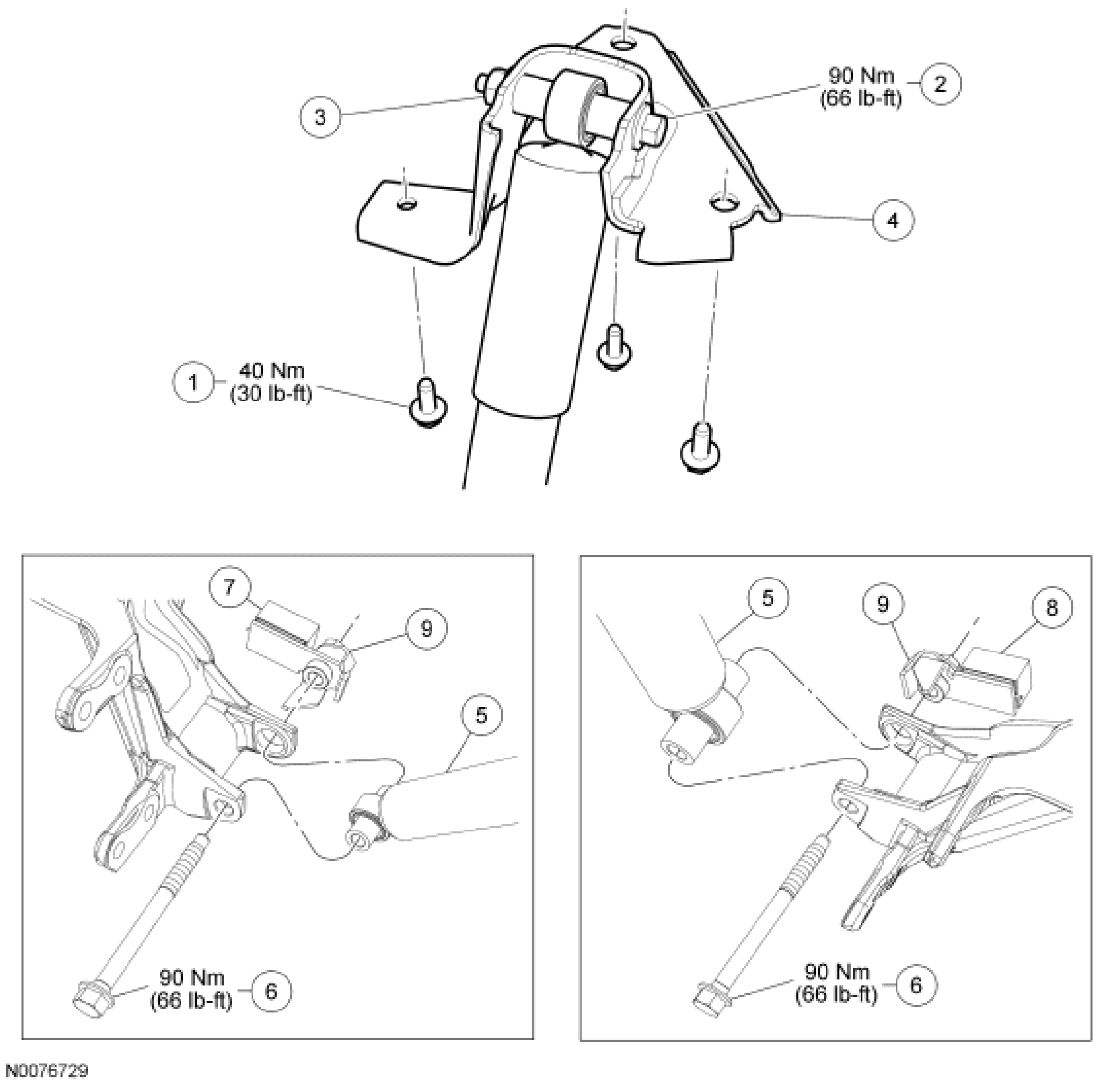

Fig. 42: Exploded View Of Shock Absorber With Torque Specifications - All Wheel Drive (AWD) Fusion/Milan Vehicles
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W302277	Bracket bolt (3 required)
2	W500748	Shock absorber upper bolt
3	W520515	Shock absorber upper nut
4	18165 LH/ 18164 RH	Shock absorber upper bracket
5	18125	Shock absorber
6	W712880	Shock absorber lower bolt
7	5B695	Shock absorber damper LH side

8	5B695	Shock absorber damper LH side
9	W712848	Shock absorber lower flag nut (with 17 in wheel)
9	W302117	Shock absorber lower flag nut (with 16 in wheel)

REMOVAL

CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure may result in major service expense. New parts must be installed with the same part numbers or equivalent part, if replacement is necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

NOTE: The new shock absorber is shipped with a strap securing it in the compressed position. Do not remove this strap until the shock absorber and bracket assembly are in position and the 3 bracket bolts have been installed.

1. Remove the upper arm. For additional information, refer to **Upper Arm**.
2. Compress the shock absorber and secure it in the compressed position using tie straps or a similar item.
3. Remove the 3 shock absorber bracket bolts and remove the shock absorber and upper bracket.
   - Discard the bolts.
4. Index-mark the shock absorber to the bracket.
5. Remove the shock absorber upper bolt, nut and the bracket.

INSTALLATION

1. Copy the index mark from the shock absorber that was removed to the shock absorber that is being installed.

   NOTE: Do not fully tighten the shock absorber upper bolt and nut at this time.

2. Position the shock absorber into the bracket and loosely install a new shock absorber upper bolt and nut.

   CAUTION: Do not allow the angle between the shock absorber and bracket to change while tightening the shock absorber upper nut or damage to the shock absorber may occur.

3. Align the index marks so the center line of the shock absorber is approximately 118 degrees from the alignment tab on the bracket and tighten the shock absorber upper nut.
   - Tighten to 90 Nm (66 lb-ft), all wheel drive (AWD) vehicles.
   - Tighten to 103 Nm (76 lb-ft), front wheel drive (FWD) vehicles.

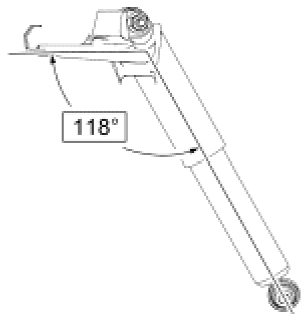

Fig. 43: Identifying Center Line Of Shock Absorber Angle
Courtesy of FORD MOTOR CO.

4. Position the shock absorber and bracket assembly and install the 3 bracket bolts.
   - Tighten to 40 Nm (30 lb-ft).
5. Install the upper arm. For additional information, refer to **Upper Arm**.

2008 ACCESSORIES & BODY, CAB

Rear View Mirrors - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-in
Exterior mirror mounting nuts	8	71

DESCRIPTION AND OPERATION

REAR VIEW MIRRORS

The main components of the rear view mirrors are:

- Exterior mirror control switch
- Exterior mirror cover
- Exterior mirror glass
- Exterior mirror glass adjustment motors
- Exterior mirror plastic housing
- Heated exterior mirror glass (optional)
- Interior auto-dimming rear view mirror
- LH exterior auto-dimming mirror glass (optional)
- Memory exterior mirrors (optional)
- Puddle lamps (optional)

For information on the puddles lamps, refer to **EXTERIOR LIGHTING** article.

Power Exterior Mirrors - Power mirrors allow the driver or passenger mirror glass to be positioned electronically. The position of the power mirror glass is controlled by the exterior rear view mirror control switch. Adjusting the exterior rear view mirror control switch to the LH or RH position determines which power mirror glass will be controlled.

Heated Exterior Mirrors - The power exterior rear view mirrors are available with a heated mirror glass feature, which heats the mirror glass to remove frost, snow, ice and condensation. The rear window defrost switch controls the operation of the heated exterior rear view mirrors. The heated exterior rear view mirrors only operate when the rear window defrost system is on.

Memory Exterior Mirrors - The memory mirror function recalls the preferred positioning of the LH and RH exterior mirror glass. The preferred positioning of the LH exterior mirror glass is retained in the driver door module (DDM) memory, while the preferred positioning of the RH exterior mirror glass is retained in the driver

seat module (DSM) memory. The memory mirror function is activated by the door mounted switches or the remote keyless entry (RKE) transmitter. When a memory position is recalled by the operator, the LH and RH exterior mirror glass will automatically adjust to the preferred position. The DDM and DSM are capable of setting a DTC for the memory mirror system when a system concern exists. For information on the DDM, refer to **MULTIFUNCTION ELECTRONIC MODULES** article. For information on the DSM and Memory Position Programming, refer to **SEATING** article.

Auto-Dimming Rear View Mirror(s) - The interior rear view and LH exterior mirror may be equipped with an auto-dimming feature. This feature automatically reduces the glare caused by headlamps reflecting in the mirror. The auto-dimming feature is activated when the ignition is in the RUN or ACC position. The interior rear view mirror adjusts the reflectance level of the interior rear view mirror and LH exterior mirror to eliminate unwanted glare. The reflectance level of the mirror glass is variable and depends on the amount of rear glare in relation to ambient light conditions in front of the interior rear view mirror. To provide increased visibility when backing up, the interior rear view mirror will automatically return to a high reflectance mode whenever the vehicle is in REVERSE.

DIAGNOSTIC TESTS

REAR VIEW MIRRORS

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

The LH and RH exterior mirror motors are controlled by the exterior rear view mirror control switch. Adjusting the exterior control switch to the LH or RH position determines which exterior mirror motor will be controlled. Power is supplied to the exterior mirror switch from the smart junction box (SJB). Only vehicles equipped with memory exterior rear view mirrors are capable of setting DTCs. The exterior mirrors use a jumper harness between the vehicle wire harness connector and the exterior mirror motor. The exterior mirror jumper harness is integral to the exterior mirror. If a concern with the exterior mirror jumper harness exists and cannot be repaired, a new exterior mirror must be installed.

Heated Exterior Mirror

The rear window defrost switch controls the operation of the heated exterior mirror glass. The heated exterior

mirror glass only operates when the rear window defrost system is ON. The heated exterior mirror glass power is supplied by the rear window defrost relay through SJB fuse 9 (10A), which isolates the heated exterior mirror system from the rear window defrost system in the event of a concern.

Memory Exterior Mirror

The memory mirror function recalls the preferred positioning of the exterior mirror motors when the transmission is in the PARK or NEUTRAL position and the door mounted switches or the remote keyless entry (RKE) transmitter are activated.

Each exterior mirror motor is equipped with a potentiometer, which the driver door module (DDM) and driver seat module (DSM) use to monitor the position of the mirrors. The DDM constantly tracks LH mirror motor position. The DSM constantly tracks RH mirror motor position. When a mirror motor position is stored in memory by the operator, the module will retain this position in memory for future recall. The position of the mirror motors are stored within the DDM and DSM memory as long as the modules retain power. When a memory position is recalled by the operator, the DDM and DSM will power the exterior mirror motors simultaneously and monitor the potentiometer circuits. When the stored memory position is reached, the DDM and DSM will remove power from the exterior mirror motors. If the exterior mirror control switch is operated during a memory recall, the DDM and DSM will stop the memory recall and respond to the exterior mirror control switch command.

For information on the DDM, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.

For information on the DSM and Memory Position Programming, refer to **SEATING** article.

Auto-Dimming Mirrors

The interior rear view and LH exterior mirror may be equipped with an auto-dimming feature. This feature automatically reduces the glare caused by headlamps reflecting in the mirror. The auto-dimming feature is disabled when the vehicle is in REVERSE. Power is supplied to the auto-dimming interior mirror when the ignition is in the RUN or ACC position.

The auto-dimming interior rear view mirror has 2 photoelectric sensors that detect forward and rearward light conditions, and based on those inputs, adjusts the reflectance level of the interior rear view mirror and LH exterior mirror to eliminate unwanted glare. The reflectance level of the mirror glass is variable and depends on the amount of rear glare in relation to ambient light conditions in front of the interior mirror.

When the forward sensor detects daytime conditions, the rearward sensor is inactive, and the mirror glass stays in a high reflectance mode. When the forward sensor detects nighttime conditions, the rearward sensor is active and detects glare from the headlights of vehicles approaching from the rear, or other glare producing light sources. To provide increased visibility when backing up, the interior rear view mirror glass and LH exterior mirror glass will automatically return to a high reflectance mode whenever the selector lever is placed in REVERSE.

If the forward or rearward sensors are blocked, the auto-dimming interior rear view mirror and LH exterior mirror might not work correctly.

Puddle Lamps

The exterior mirrors may be equipped with puddle lamps, which will illuminate when the interior lights are turned on by opening a door or by pressing the unlock button on the remote transmitter, if equipped. For information on the mirror-mounted puddle lamps, refer to **EXTERIOR LIGHTING** article.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Exterior mirror • Exterior mirror control switch • Exterior mirror cover • Exterior mirror glass • Interior rear view mirror	• Smart junction box (SJB) fuse(s): ○ 9 (10A) ○ 12 (7.5A) ○ 20 (7.5A) • Circuitry • Driver door module (DDM) • Driver seat module (DSM) • Exterior mirror control switch • Exterior mirror glass • Exterior mirror motor • Exterior mirror • Interior auto-dimming rear view mirror • Loose or corroded connections

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.

- check the scan tool connection to the VCM.
- refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.

6. If the scan tool does not communicate with the vehicle:
    - verify the ignition key is in the ON position.
    - verify the scan tool operation with a known good vehicle.
    - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the DSM.
7. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the DSM.
9. If the DTCs retrieved are related to the concern, go to Driver Door Module (DDM) DTC Chart or Driver Seat Module (DSM) DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart - Rear View Mirrors** or Go to **Symptom Chart - Noise, Vibration and Harshness (NVH)**.

DRIVER DOOR MODULE (DDM) DTC CHART

DTC	Description	Action
B1234	Mirror Switch Invalid Code	Go to **Pinpoint Test D**.
B1667	Mirror Driver Up/Down Motor Stalled	Go to **Pinpoint Test D**.
B1668	Mirror Driver Right/Left Motor Stalled	Go to **Pinpoint Test D**.
B2223	Driver Mirror Drive Circuit Failure	Go to **Pinpoint Test D**.
B2320	Driver Mirror Horizontal Feedback Potentiometer Circuit Failure	Go to **Pinpoint Test D**.
B2322	Driver Mirror Horizontal Feedback Potentiometer Circuit Short to Battery	Go to **Pinpoint Test D**.
B2324	Driver Mirror Vertical Feedback Potentiometer Circuit Failure	Go to **Pinpoint Test D**.
B2326	Driver Mirror Vertical Feedback Potentiometer Circuit Short to Battery	Go to **Pinpoint Test D**.
All other DTCs	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

DRIVER SEAT MODULE (DSM) DTC CHART

DTC	Description	Action
B1669	Mirror Passenger Up/Down Motor Stalled	Go to **Pinpoint Test D**.
B1670	Mirror Passenger Right/Left Motor Stalled	Go to **Pinpoint Test D**.
B2224	Passenger Mirror Drive Circuit Failure	Go to **Pinpoint Test D**.

B2312	Passenger Mirror Horizontal Feedback Potentiometer Circuit Failure	Go to **Pinpoint Test D**.
B2314	Passenger Mirror Horizontal Feedback Potentiometer Circuit Short to Battery	Go to **Pinpoint Test D**.
B2316	Passenger Mirror Vertical Feedback Potentiometer Circuit Failure	Go to **Pinpoint Test D**.
B2318	Passenger Mirror Vertical Feedback Potentiometer Circuit Short to Battery	Go to **Pinpoint Test D**.
All other DTCs	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart - Rear View Mirrors

Symptom Chart - Rear View Mirrors

Condition	Possible Sources	Action
• No communication with the driver door module (DDM)	• Circuitry • DDM communication network	• Go to **MODULE COMMUNICATIONS NETWORK** article.
• The mirrors are inoperative - non-memory mirrors	• Fuse • Circuitry • Exterior mirror control switch	• Go to **Pinpoint Test A**.
• A single mirror is inoperative - non-memory mirrors	• Circuitry • Exterior mirror control switch • Exterior mirror motor • Exterior mirror	• Go to **Pinpoint Test B**.
• A single mirror does not function with switch logic - non-memory mirrors	• Circuitry • Exterior mirror control switch • Exterior mirror motor • Exterior mirror	• Go to **Pinpoint Test C**.
• The memory mirror is inoperative	• Fuse • DDM • Driver seat module (DSM) • Circuitry • Exterior mirror motor • Exterior mirror	• Go to **Pinpoint Test D**.

	• Exterior mirror control switch	
• The heated exterior mirrors is inoperative	• Fuse • Circuitry • Exterior mirror glass • Exterior mirror	• Go to **Pinpoint Test E**.

• The auto-dimming mirror does not operate correctly	• Obstructed rearward-facing sensor:
	  • stickers, window decals, tags
	  • non-OEM window tinting
	• Obstructed forward-facing sensor:
	  • stickers, window decals, tags
	  • non-OEM window tinting
		• If possible, REMOVE the obstruction. If the obstruction cannot be removed, go to **Pinpoint Test F** to test the auto-dimming mirror for correct function.

	• Light source near or inside of vehicle	• None. Any light source the rearward-facing sensor is exposed to can be considered glare.
	• Vehicle inside garage or tunnel	• None. Ambient conditions are similar to nighttime conditions.
	• Fuse • Circuitry • Interior auto-dimming mirror • LH exterior mirror glass • LH exterior mirror	• Go to **Pinpoint Test F**.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: **Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.**

Symptom Chart - Noise, Vibration and Harshness (NVH)

Condition	Possible Sources	Action
• Mirror vibrates/loose	• Exterior mirror mounting nuts loose	• TIGHTEN nuts to 8 N.m (71 lb-in).
	NOTE: **Compare the LH and RH exterior mirror glass to verify that the exterior mirror glass is loose.** • Mirror glass loose	• PRESS the center of the exterior mirror glass up, down, left and right to make sure that the exterior mirror glass is seated correctly. If the exterior mirror glass is still loose, REMOVE the exterior mirror glass and INSPECT the exterior mirror backing plate for damage. If the exterior mirror backing plate is damaged, INSTALL a new exterior mirror glass. REFER to **Exterior Mirror Glass**.
	• Aftermarket air deflector/stone shields	• If possible, REMOVE aftermarket air deflector/stone shield, then ROAD TEST the vehicle. If concern is no longer present, ADVISE customer that aftermarket components were causing undesired vibration.
• Wind noise	• Foam gasket between the exterior mirror and door is missing or damaged	• VERIFY gasket is present and in good condition. REPOSITION gasket or INSTALL a new foam gasket between exterior mirror and door frame if necessary.
	• Exterior mirror is not correctly fitted to the door	• VERIFY that there are no gaps between the exterior mirror and the door. If necessary, LOOSEN the exterior mirror nuts and REPOSITION the exterior mirror.
	• Exterior mirror cover	• VERIFY that the exterior mirror cover is not loose or broken. If necessary, INSTALL a new exterior

		mirror cover. REFER to **Exterior Mirror Cover**.

Pinpoint Tests

Pinpoint Test A: The Mirrors are Inoperative - Non-Memory Mirrors

Refer to **SYSTEM WIRING DIAGRAMS** , Power Mirrors for schematic and connector information.

Normal Operation

Under normal operation, the exterior mirror control switch receives power through circuit SBP15 (WH/RD) and ground through circuit GD126 (BK/WH). The exterior mirror control switch uses circuit CPM23 (GY) as the common circuit for both exterior mirror up/down and right/left movement.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Exterior mirror control switch

PINPOINT TEST A: THE MIRRORS ARE INOPERATIVE - NON-MEMORY MIRRORS

A1 CHECK THE VOLTAGE TO THE EXTERIOR MIRROR CONTROL SWITCH - CIRCUIT SBP15 (WH/RD)

- Key in OFF position.
- Disconnect: Exterior Mirror Control Switch C527

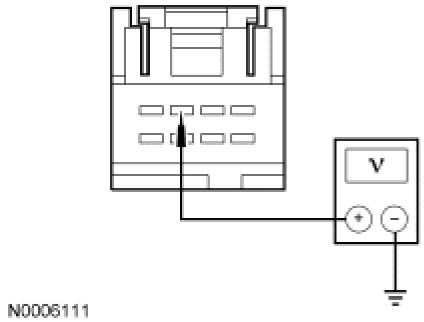

Fig. 1: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between exterior mirror control switch C527-3, circuit SBP15 (WH/RD) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A2.

  NO : VERIFY smart junction box (SJB) fuse 20 (7.5A) is OK. If OK, REPAIR the circuit. TEST

the system for normal operation.

A2 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

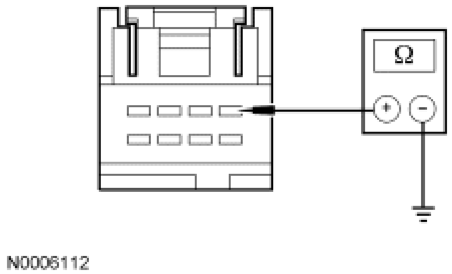

Fig. 2: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between exterior mirror control switch C527-1, circuit GD126 (BK/WH) harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to A3.

  NO : REPAIR the circuit. TEST the system for normal operation.

A3 CHECK CIRCUIT CPM23 (GY) FOR A SHORT TO VOLTAGE

- Key in ON position.

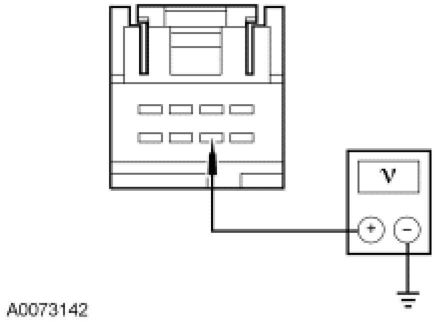

Fig. 3: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between exterior mirror control switch C527-6, circuit CPM23 (GY) harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to A4.

A4 CHECK CIRCUIT CPM23 (GY) FOR A SHORT TO GROUND

- Key in OFF position.

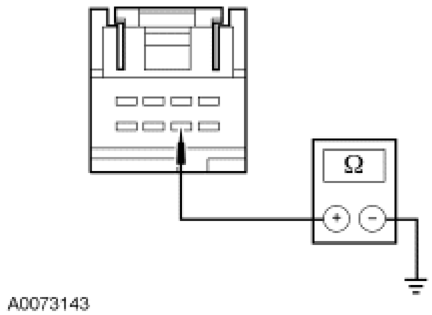

Fig. 4: Checking Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY) harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to A5.

  NO : REPAIR the circuit. TEST the system for normal operation.

A5 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN

- Disconnect: LH Exterior Mirror C516 (without heated mirrors) or C517 (with heated mirrors)

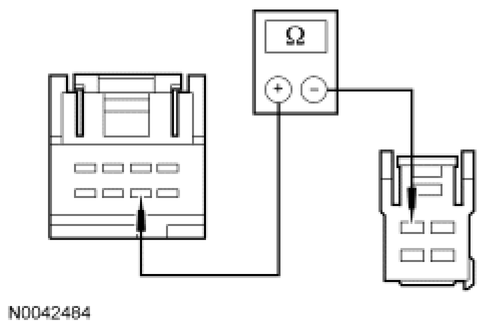

Fig. 5: Checking Circuit CPM23 (GY) For Open (Without Heated Mirror)
Courtesy of FORD MOTOR CO.

NOTE: Without heated mirrors.

- Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY) harness side and LH exterior mirror C516-2, circuit CPM23 (GY) harness side.

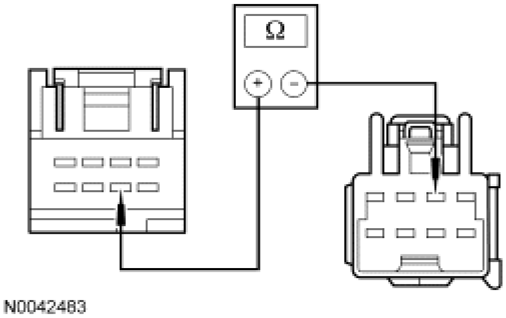

Fig. 6: Checking Circuit CPM23 (GY) For Open (With Heated Mirror)
Courtesy of FORD MOTOR CO.

NOTE: With heated mirrors.

- Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY) harness side and LH exterior mirror C517-2, circuit CPM23 (GY) harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST system for normal operation.

Pinpoint Test B: A Single Mirror is Inoperative - Non-Memory Mirrors

Refer to **SYSTEM WIRING DIAGRAMS** , Power Mirrors for schematic and connector information.

Normal Operation

Under normal operation, the exterior mirror control switch uses circuit CPM23 (GY) as the common circuit for both exterior mirror down/up and left/right movement.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Exterior mirror control switch
- Exterior mirror motor
- Exterior mirror

PINPOINT TEST B: A SINGLE MIRROR IS INOPERATIVE - NON-MEMORY MIRRORS

B1 CHECK THE LH MIRROR OPERATION

- Operate the LH exterior mirror using the exterior mirror control switch.
- **Does the LH exterior mirror operate?**

  YES : Go to B2.

  NO : Go to B4.

B2 CHECK THE EXTERIOR MIRROR CONTROL SWITCH

- Key in OFF position.
- Disconnect: Exterior Mirror Control Switch C527
- Carry out the Exterior Mirror Control Switch component test. Refer to COMPONENT TESTING.
- **Did the exterior mirror control switch pass the component test?**

  YES : Go to B3.

  NO : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

B3 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN

- Disconnect: RH Exterior Mirror C622 (without heated mirrors) or C625 (with heated mirrors)

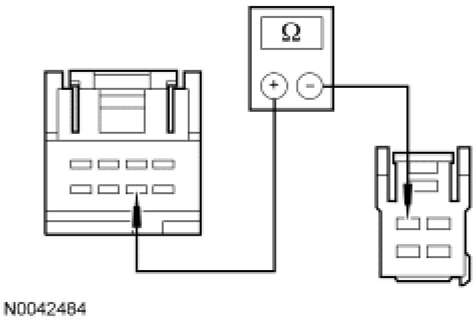

Fig. 7: Checking Circuit CPM23 (GY) For Open (Without Heated Mirror)
Courtesy of FORD MOTOR CO.

NOTE: **Without heated mirror.**

- Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY) harness side and RH exterior mirror C622-2, circuit CPM23 (GY) harness side.

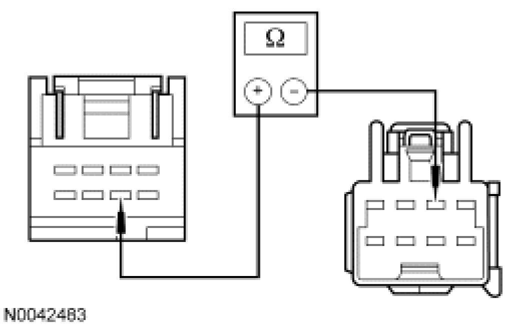

Fig. 8: Checking Circuit CPM23 (GY) For Open (With Heated Mirror)
Courtesy of FORD MOTOR CO.

NOTE: **With heated mirror.**

- Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY)

harness side and RH exterior mirror C625-2, circuit CPM23 (GY) harness side.

- **Is the resistance less than 5 ohms?**

  YES : CHECK the RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness can not be repaired, INSTALL a new RH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new exterior mirror motor. REFER to **Exterior Mirror Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

B4 CHECK THE EXTERIOR MIRROR CONTROL SWITCH

- Key in OFF position.
- Disconnect: Exterior Mirror Control Switch C527
- Carry out the Exterior Mirror Control Switch component test. Refer to COMPONENT TESTING.
- **Did the exterior mirror control switch pass the component test?**

  YES : Go to B5.

  NO : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

B5 CHECK CIRCUIT CPM23 (GY) FOR AN OPEN

- Disconnect: LH Exterior Mirror C516 (without heated mirrors) or C517 (with heated mirrors)

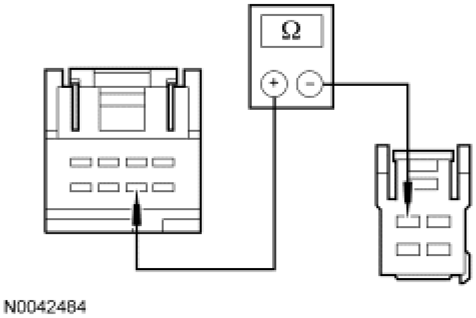

Fig. 9: Checking Circuit CPM23 (GY) For Open (Without Heated Mirror)
Courtesy of FORD MOTOR CO.

NOTE: Without heated mirror.

- Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY) harness side and LH exterior mirror C516-2, circuit CPM23 (GY) harness side.

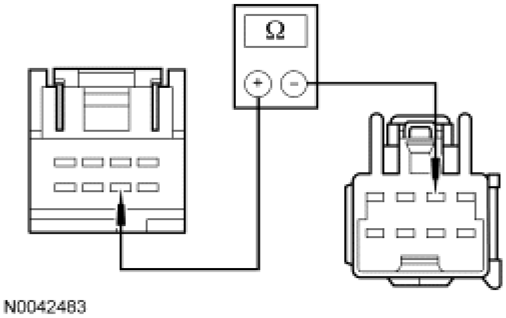

Fig. 10: Checking Circuit CPM23 (GY) For Open (With Heated Mirror)
Courtesy of FORD MOTOR CO.

NOTE: With heated mirror.

- Measure the resistance between exterior mirror control switch C527-6, circuit CPM23 (GY) harness side and LH exterior mirror C517-2, circuit CPM23 (GY) harness side.
- **Is the resistance less than 5 ohms?**

  YES : CHECK the LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness can not be repaired, INSTALL a new LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new exterior mirror motor. REFER to **Exterior Mirror Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test C: A Single Mirror Does Not Function With Switch Logic - Non-Memory Mirrors

Refer to **SYSTEM WIRING DIAGRAMS** , Power Mirrors for schematic and connector information.

Normal Operation

Under normal operation, the exterior mirror control switch uses circuits CPM16 (BN/BU), CPM17 (BU/GN), CPM20 (BN/WH), CPM21 (YE/VT) and CPM23 (GY) to control the exterior mirror motor movement. The exterior mirror switch controls the LH exterior mirror motor movement by switching voltage and ground to circuits CPM16 (BN/BU), CPM17 (BU/GN) and CPM23 (GY). The exterior mirror switch controls the RH exterior mirror motor movement by switching voltage and ground to circuits CPM20 (BN/WH), CPM21 (YE/VT) and CPM23 (GY).

Mirror Movement

- When the LH/RH exterior mirror motor receives ground through circuit CPM16 (BN/BU)/CPM20 (BN/WH) and power through circuit CPM23 (GY), the LH/RH exterior mirror motor will operate right.
- When the LH/RH exterior mirror motor receives power through circuit CPM16 (BN/BU)/CPM20 (BN/WH) and ground through circuit CPM23 (GY), the LH/RH exterior mirror motor will operate left.
- When the LH/RH exterior mirror motor receives ground through circuit CPM17 (BU/GN)/CPM21 (YE/VT) and power through circuit CPM23 (GY), the LH/RH exterior mirror motor will operate upward.

- When the LH/RH exterior mirror motor receives power through circuit CPM17 (BU/GN)/CPM21 (YE/VT) and ground through circuit CPM23 (GY), the LH/RH exterior mirror motor will operate downward.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Exterior mirror control switch
- Exterior mirror motor
- Exterior mirror

PINPOINT TEST C: A SINGLE MIRROR DOES NOT FUNCTION WITH SWITCH LOGIC - NON-MEMORY MIRRORS

C1 CHECK THE MIRROR MOVEMENT (RIGHT/LEFT)

- Operate the RH and LH exterior mirrors in the right and left direction using the exterior mirror control switch.
- **Do the exterior mirrors move left and right?**

  YES : Go to C2.

  NO : Go to C3.

C2 CHECK THE MIRROR MOVEMENT (DOWN/UP)

- Operate the RH and LH exterior mirrors in the down and up direction using the exterior mirror control switch.
- **Do the exterior mirrors move up and down?**

  YES : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

  NO : Go to C4.

C3 CHECK THE VOLTAGE TO THE INOPERATIVE MIRROR

- Key in OFF position.
- Disconnect: Inoperative LH Exterior Mirror C516 (without heated mirrors)/C517 (with heated mirrors) or RH Exterior Mirror C622 (without heated mirrors) or C625 (with heated mirrors)

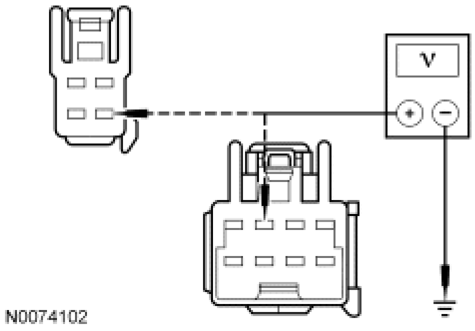

Fig. 11: Checking Voltage To Inoperative Mirror
Courtesy of FORD MOTOR CO.

NOTE: Position the exterior mirror control switch to the LH or RH position.

- While operating the exterior mirror control switch in the LEFT position, measure the voltage between ground and exterior mirror:

  NOTE: Without heated mirrors.

  - (LH) C516-3, circuit CPM16 (BN/BU) harness side.
  - (RH) C622-3, circuit CPM20 (BN/WH) harness side.

  NOTE: With heated mirrors.

  - (LH) C517-3, circuit CPM16 (BN/BU) harness side.
  - (RH) C625-3, circuit CPM20 (BN/WH) harness side.
- **Is the voltage greater than 10 volts?**

  YES : CHECK the RH or LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness can not be repaired, INSTALL a new RH or LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new RH or LH exterior mirror motor. REFER to **Exterior Mirror Motor**. TEST the system for normal operation.

  NO : Go to C5.

C4 CHECK THE VOLTAGE TO THE INOPERATIVE MIRROR

- Key in OFF position.
- Disconnect: LH Exterior Mirror C516 (without heated mirrors)/C517 (with heated mirrors) or RH Exterior Mirror C622 (without heated mirrors) or C625 (with heated mirrors)

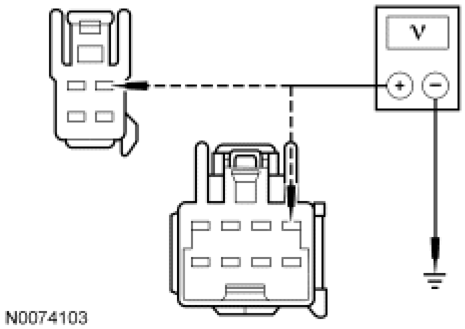

Fig. 12: Checking Voltage To Inoperative Mirror
Courtesy of FORD MOTOR CO.

NOTE: Position the exterior mirror control switch to the LH or RH position.

- While operating the exterior mirror control switch in the DOWN position, measure the voltage between ground and exterior mirror:

NOTE: Without heated mirrors.

- (LH) C516-1, circuit CPM17 (BU/GN) harness side.
- (RH) C622-1, circuit CPM21 (YE/VT) harness side.

NOTE: With heated mirrors.

- (LH) C517-1, circuit CPM17 (BU/GN) harness side.
- (RH) C625-1, circuit CPM21 (YE/VT) harness side.

- **Is the voltage greater than 10 volts?**

  YES : CHECK the RH or LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness can not be repaired, INSTALL a new RH or LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new RH or LH exterior mirror motor. REFER to **Exterior Mirror Motor**. TEST the system for normal operation.

  NO : Go to C6.

C5 CHECK CIRCUITS CPM16 (BN/BU) AND CPM20 (BN/WH) FOR AN OPEN

- Disconnect: Exterior Mirror Control Switch C527

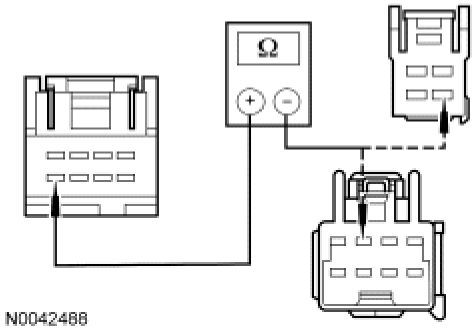

Fig. 13: Checking Circuit CPM16 (BN/BU) And Circuit CPM20 (BN/WH) For Open (Inoperative LH Mirror)
Courtesy of FORD MOTOR CO.

NOTE: Inoperative LH mirror.

- Measure the resistance between exterior mirror control switch C527-8, circuit CPM16 (BN/BU) harness side and LH exterior mirror:
  - (without heated mirror) C516-3, circuit CPM16 (BN/BU) harness side.
  - (with heated mirror) C517-3, circuit CPM16 (BN/BU) harness side.

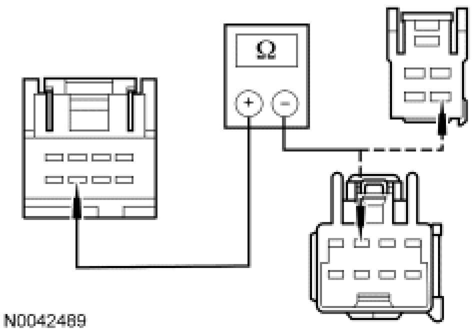

Fig. 14: Checking Circuit CPM16 (BN/BU) And Circuit CPM20 (BN/WH) For Open (Inoperative RH Mirror)
Courtesy of FORD MOTOR CO.

NOTE: Inoperative RH mirror.

- Measure the resistance between exterior mirror control switch C527-7, circuit CPM20 (BN/WH) harness side and RH exterior mirror:
  - (without heated mirror) C622-3, circuit CPM20 (BN/WH) harness side.
  - (with heated mirror) C625-3, circuit CPM20 (BN/WH) harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

C6 CHECK CIRCUITS CPM17 (BU/GN) AND CPM21 (YE/VT) FOR AN OPEN

- Disconnect: Exterior Mirror Control Switch C527

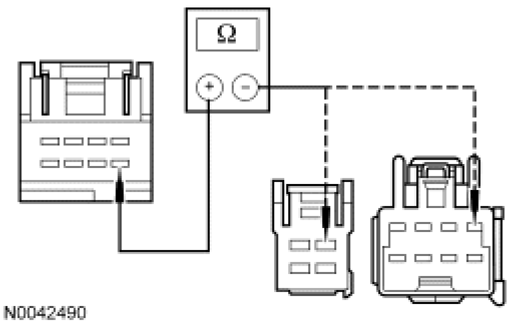

Fig. 15: Checking Circuit CPM17 (BU/GN) And CPM21 (YE/VT) For Open (Inoperative LH Mirror)
Courtesy of FORD MOTOR CO.

NOTE: Inoperative LH mirror.

- Measure the resistance between exterior mirror control switch C527-5, circuit CPM17 (BU/GN) harness side and LH exterior mirror:

- (without heated mirror) C516-1, circuit CPM17 (BU/GN) harness side.
- (with heated mirror) C517-1, circuit CPM17 (BU/GN) harness side.

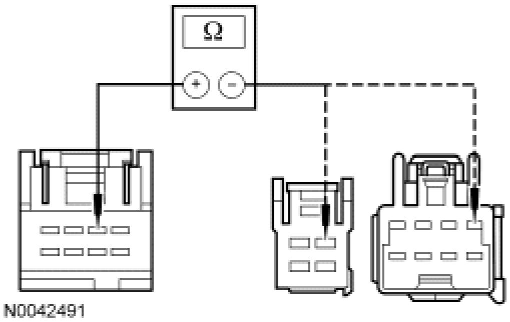

Fig. 16: Checking Circuit CPM17 (BU/GN) And CPM21 (YE/VT) For Open (Inoperative RH Mirror)
Courtesy of FORD MOTOR CO.

NOTE: Inoperative RH mirror.

- Measure the resistance between exterior mirror control switch C527-2, circuit CPM21 (YE/VT) harness side and RH exterior mirror:
  - (without heated mirror) C622-1, circuit CPM21 (YE/VT) harness side.
  - (with heated mirror) C625-1, circuit CPM21 (YE/VT) harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test D: The Memory Mirror is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** , Power Mirrors for schematic and connector information.

Normal Operation

Under normal operation, the exterior mirror control switch receives power from circuit SBP15 (WH/RD) and ground from circuit GD126 (BK/WH). The exterior mirror control switch uses circuits CPM16 (BN/BU), CPM17 (BU/GN), CPM20 (BN/WH), CPM21 (YE/VT) and CPM23 (GY) to send input signals to the driver door module (DDM). The DDM controls the LH exterior mirror motor movement by supplying the appropriate power and ground to circuits CPM26 (WH), CPM27 (GY/BU), CPM28 (BU/BN) and CPM29 (GN). The DDM communicates with the driver seat module (DSM) through the medium-speed controller area network (MS-CAN) whenever the DDM receives an input signal from the exterior mirror control switch for the RH mirror. The DSM controls the RH exterior mirror motor movement by supplying the appropriate power and ground to circuits CPM31 (YE/GY), CPM32 (WH/BU), CPM33 (WH/VT) and CPM34 (WH/BN).

The memory mirror system uses feedback potentiometers, located in the LH and RH exterior mirrors, in order to track the movement of the LH and RH exterior mirror motors. The DDM supplies the LH exterior mirror

feedback potentiometer reference voltage through circuit LPM30 (GY/VT) and ground through circuit RPM30 (YE). The DSM supplies the RH exterior mirror feedback potentiometer reference voltage through circuit LPM30 (GY/VT) and ground through circuit RPM30 (YE). The DDM receives feedback from the LH exterior mirror feedback potentiometer through left/right circuit VPM35 (YE/BU) and up/down circuit VPM36 (BN/YE). The DSM receives feedback from the RH exterior mirror feedback potentiometer through left/right circuit VPM37 (BU/OG) and up/down circuit VPM38 (BN/GN).

DTC Description	Fault Trigger Conditions
B1234 - Mirror Switch Invalid Code	Short to battery and the switch is activated or short to battery for greater than 2 minutes.
B1667 - Mirror Driver Up/Down Motor Stalled	Incorrect mirror motor position reported to the DDM during On-Demand Self Test.
B1668 - Mirror Driver Right/Left Motor Stalled	Incorrect mirror motor position reported to the DDM during On-Demand Self Test.
B1669 - Mirror Passenger Up/Down Motor Stalled	Incorrect mirror motor position reported to the DSM during On-Demand Self Test.
B1670 - Mirror Passenger Right/Left Motor Stalled	Incorrect mirror motor position reported to the DSM during On-Demand Self Test.
B2223 - Mirror Driver Drive Circuit Failure	Short to ground or battery.
B2224 - Mirror Passenger Drive Circuit Failure	Short to ground or battery.
B2312 - Mirror Passenger Horizontal Feedback Potentiometer Circuit Failure	Open or short to ground.
B2314 - Mirror Passenger Horizontal Feedback Potentiometer Circuit Short to Battery	Short to battery.
B2316 - Mirror Passenger Vertical Feedback Potentiometer Circuit Failure	Open or short to ground.
B2318 - Mirror Passenger Vertical Feedback Potentiometer Circuit Short to Battery	Short to battery.
B2320 - Mirror Driver Horizontal Feedback Potentiometer Circuit Failure	Open or short to ground.
B2322 - Mirror Driver Horizontal Feedback Potentiometer Circuit Short to Battery	Short to battery.
B2324 - Mirror Driver Vertical Feedback Potentiometer Circuit Failure	Open or short to ground.
B2326 - Mirror Driver Vertical Feedback Potentiometer Circuit Short to Battery	Short to battery.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- DDM
- DSM
- Exterior mirror motor

- Exterior mirror
- Exterior mirror control switch

PINPOINT TEST D: THE MEMORY MIRROR IS INOPERATIVE

D1 RETRIEVE THE DTCs FROM DSM AND DDM

- Use the recorded DSM and DDM DTCs from the continuous and on-demand self tests.
- **Are DTCs retrieved?**

  YES : If DTC B1234 - CARRY OUT the exterior mirror control switch component test. Refer to COMPONENT TESTING. If the switch tests OK, go to D11.

  If DTC B1667 or B1668 - If other DTCs are present, diagnose them first. If no other DTCs are present, INSPECT the LH exterior mirror motor for foreign material, damage or a binding condition. If no condition is found, Go to D12.

  If DTC B1669 or B1670 - If other DTCs are present, diagnose them first. If no other DTCs are present, INSPECT the RH exterior mirror motor for foreign material, damage or a binding condition. If no condition is found, Go to D14.

  If DTC B2223, go to D16.

  If DTC B2224, go to D19.

  If DTC B2312, B2316, B2320 or B2324, go to D22.

  If DTC B2314, B2318, B2322 or B2326, go to D26.

  NO : Go to D2.

D2 CHECK THE OPERATION OF THE EXTERIOR MIRRORS FROM THE EXTERIOR MIRROR CONTROL SWITCH

- Operate the mirrors using the exterior mirror control switch.
- **Do the mirrors operate from the exterior mirror control switch?**

  YES : Go to D8.

  NO : Go to D3.

D3 CHECK THE EXTERIOR MIRROR CONTROL SWITCH

- Key in OFF position.
- Disconnect: Exterior Mirror Control Switch C527
- Carry out the Exterior Mirror Control Switch component test. Refer to COMPONENT TESTING.
- **Did the exterior mirror control switch pass the component test?**

  YES : Go to D4.

  NO : INSTALL a new exterior mirror control switch. REFER to **Exterior Mirror Control Switch**. TEST the system for normal operation.

D4 CHECK CIRCUIT SBP15 (WH/RD) FOR VOLTAGE

- Key in ON position.

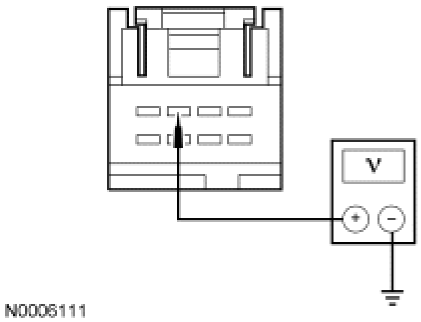

Fig. 17: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between exterior mirror control switch C527-3, circuit SBP15 (WH/RD) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to D5.

  NO : VERIFY smart junction box (SJB) fuse 20 (7.5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

D5 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

- Key in OFF position.

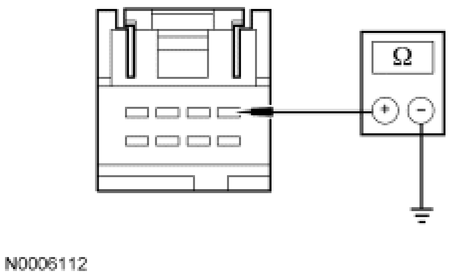

Fig. 18: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between exterior mirror control switch C527-1, circuit GD126 (BK/WH) harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to D6.

  NO : REPAIR the circuit. TEST the system for normal operation.

D6 CHECK CIRCUITS CPM16 (BN/BU), CPM17 (BU/GN), CPM20 (BN/WH), CPM21 (YE/VT) AND CPM23 (GY) FOR A SHORT TO GROUND

- Disconnect: DDM C568B

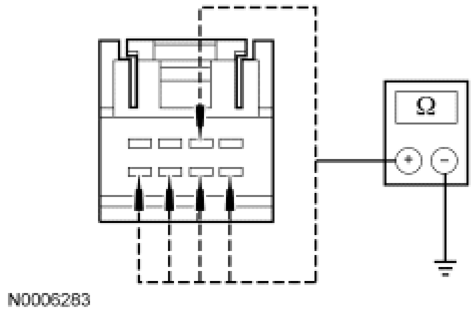

Fig. 19: Checking Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and exterior mirror control switch:
  - C527-2, circuit CPM21 (YE/VT) harness side.
  - C527-5, circuit CPM17 (BU/GN) harness side.
  - C527-6, circuit CPM23 (GY) harness side.
  - C527-7, circuit CPM20 (BN/WH) harness side.
  - C527-8, circuit CPM16 (BN/BU) harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to D7.

  NO : REPAIR the circuit(s). TEST the system for normal operation.

D7 CHECK CIRCUITS CPM16 (BN/BU), CPM17 (BU/GN), CPM20 (BN/WH), CPM21 (YE/VT) AND CPM23 (GY) FOR AN OPEN

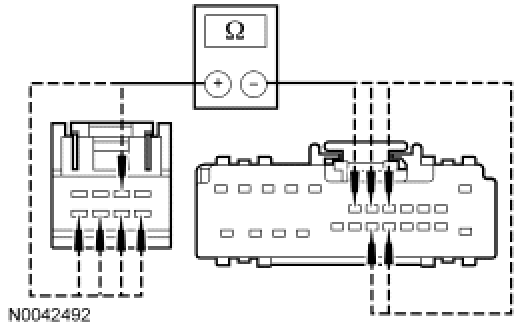

Fig. 20: Checking Circuits CPM21 (YE/VT), CPM17 (BU/GN), CPM20 (BN/WH), CPM16 (BN/BU) And CPM23 (GY) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between exterior mirror control switch:
  - C527-2, circuit CPM21 (YE/VT) harness side and DDM C568B-6, circuit CPM21 (YE/VT) harness side.
  - C527-5, circuit CPM17 (BU/GN) harness side and DDM C568B-17, circuit CPM17 (BU/GN) harness side.
  - C527-6, circuit CPM23 (GY) harness side and DDM C568B-18, circuit CPM23 (GY)

harness side.

- C527-7, circuit CPM20 (BN/WH) harness side and DDM C568B-5, circuit CPM20 (BN/WH) harness side.
- C527-8, circuit CPM16 (BN/BU) harness side and DDM C568B-7, circuit CPM16 (BN/BU) harness side.

- **Are the resistances less than 5 ohms?**

  YES : Go to D29.

  NO : REPAIR the circuit(s). TEST the system for normal operation.

D8 CHECK CIRCUIT RPM30 (YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DDM C568A

  NOTE: Inoperative LH mirror.

- Disconnect: DDM C568B

  NOTE: Inoperative LH mirror.

- Disconnect: DSM C3299C

  NOTE: Inoperative RH mirror.

- Disconnect: DSM C3299D

  NOTE: Inoperative RH mirror.

- Key in ON position.

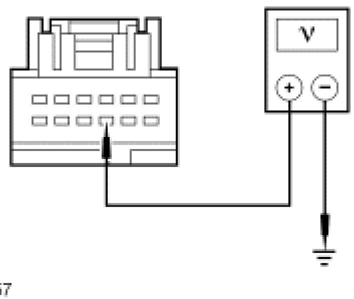

Fig. 21: Checking Circuit RPM30 (YE) For A Short To Voltage
Courtesy of FORD MOTOR CO.

NOTE: Inoperative LH mirror.

- Measure the voltage between DDM C568A-9, circuit RPM30 (YE) harness side and ground.

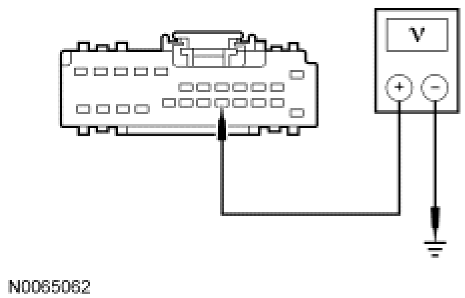

Fig. 22: Measuring Voltage Between DDM C568A-9, Circuit RPM30 (YE) Harness Side & Ground
Courtesy of FORD MOTOR CO.

NOTE: **Inoperative RH mirror.**

- Measure the voltage between DSM C3299C-17, circuit RPM30 (YE) harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to D9.

D9 CHECK CIRCUIT LPM30 (GY/VT) FOR SHORT TO GROUND

- Key in OFF position.
- Disconnect: Inoperative Exterior Mirror C522 (LH) and C626 (RH)

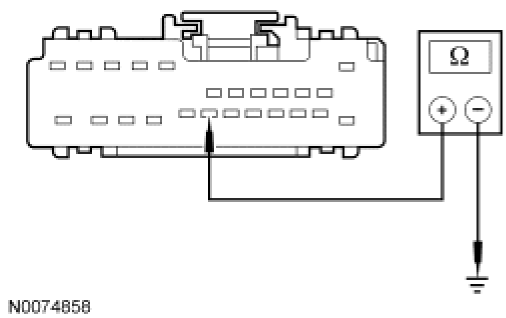

Fig. 23: Checking Circuit LPM30 (GY/VT) For Short To Ground
Courtesy of FORD MOTOR CO.

NOTE: **Inoperative LH mirror.**

- Measure the resistance between DDM C568B-19, circuit LPM30 (GY/VT) harness side and ground.

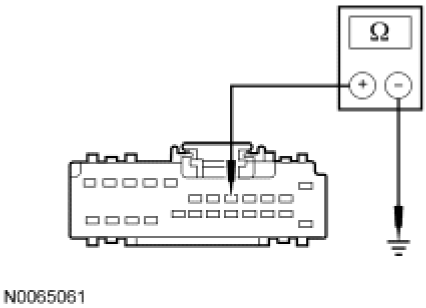

Fig. 24: Measuring Resistance Between DDM C568B-19, Circuit LPM30 (GY/VT) Harness Side & Ground
Courtesy of FORD MOTOR CO.

NOTE: Inoperative RH mirror.

- Measure the resistance between DSM C3299C-5, circuit LPM30 (GY/VT) harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to D10.

  NO : REPAIR the circuit. TEST the system for normal operation.

D10 CHECK CIRCUITS RPM30 (YE) AND LPM30 (GY/VT) FOR AN OPEN

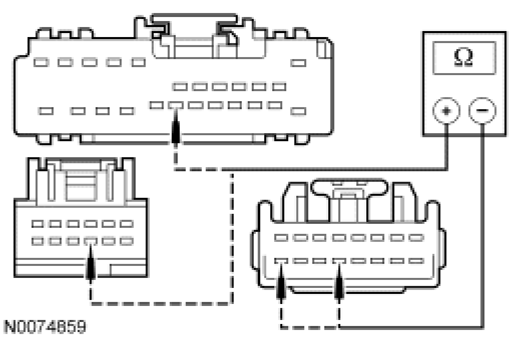

Fig. 25: Checking Circuits RPM30 (YE) & LPM30 (GY/VT) For An Open
Courtesy of FORD MOTOR CO.

NOTE: Inoperative LH mirror.

- Measure the resistance between LH exterior mirror:
  - C522-13, circuit LPM30 (GY/VT) harness side and DDM C568B-19, circuit LPM30 (GY/VT) harness side.
  - C522-16, circuit RPM30 (YE) harness side and DDM C568A-9, circuit RPM30 (YE) harness side.

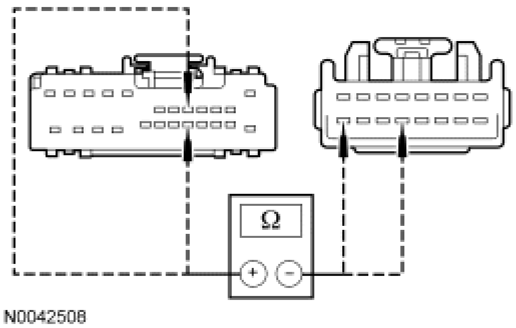

Fig. 26: Checking Feed And Return Circuit For Open (DTC B2312 And B2316)
Courtesy of FORD MOTOR CO.

NOTE: Inoperative RH mirror.

- Measure the resistance between RH exterior mirror:
  - C626-13, circuit LPM30 (GY/VT) harness side and DSM C3299C-5, circuit LPM30 (GY/VT) harness side.
  - C626-16, circuit RPM30 (YE) harness side and DSM C3299C-17, circuit RPM30 (YE) harness side.
- **Are the resistances less than 5 ohms?**

  YES : CHECK the LH or RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motors for open or shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH or RH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH or RH exterior mirror motor. REFER to **Exterior Mirror Motor**. TEST the system for normal operation.

  NO : REPAIR the circuit(s). TEST the system for normal operation.

D11 CHECK CIRCUITS CPM16 (BN/BU), CPM17 (BU/GN), CPM20 (BN/WH), CPM21 (YE/VT) AND CPM23 (GY) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Exterior Mirror Control Switch C527
- Disconnect: DDM C568B
- Key in ON position.

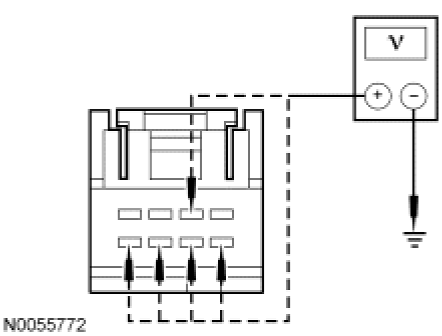

Fig. 27: Checking Circuits For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and exterior mirror control switch:
  - C527-2, circuit CPM21 (YE/VT) harness side.
  - C527-5, circuit CPM17 (BU/GN) harness side.
  - C527-6, circuit CPM23 (GY) harness side.
  - C527-7, circuit CPM20 (BN/WH) harness side.
  - C527-8, circuit CPM16 (BN/BU) harness side.
- **Is any voltage present?**

  YES : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

  NO : Go to D29.

D12 CHECK THE EXTERIOR MIRROR FOR VOLTAGE FROM THE DDM

- Key in OFF position.
- Disconnect: LH Exterior Mirror C522
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DDM DataLogger

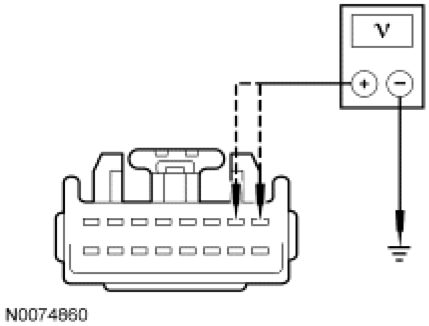

Fig. 28: Checking Exterior Mirror For Voltage From DDM (DTC B1667)
Courtesy of FORD MOTOR CO.

NOTE: DTC B1667.

- Measure the voltage between LH exterior mirror C522-1, circuit CPM29 (GN) harness side and ground while toggling the LH exterior mirror DDM PID DR_UP to On; and between LH exterior mirror C522-2, circuit CPM26 (WH) harness side and ground while toggling the LH exterior mirror DDM PID DR_DOWN to On.

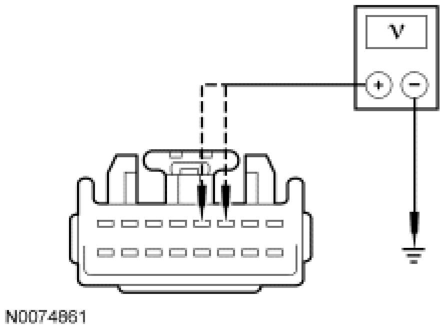

Fig. 29: Checking Exterior Mirror For Voltage From DDM (DTC B1668)
Courtesy of FORD MOTOR CO.

NOTE: DTC B1668.

- Measure the voltage between LH exterior mirror C522-3, circuit CPM27 (GY/BU) harness side and ground while toggling the LH exterior mirror DDM PID DR_LEFT to On; and between LH exterior mirror C522-4, circuit CPM28 (BU/BN) harness side and ground while toggling the LH exterior mirror DDM PID DR_RIGHT to On.
- **Do the voltages momentarily change from 0 volt to greater than 10 volts when the active command is toggled On?**

  YES : CHECK the LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted and open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

  NO : Go to D13.

D13 CHECK CIRCUITS CPM26 (WH), CPM27 (GY/BU), CPM28 (BU/BN) AND CPM29 (GN) FOR AN OPEN

- Key in OFF position.
- Disconnect: DDM C568A

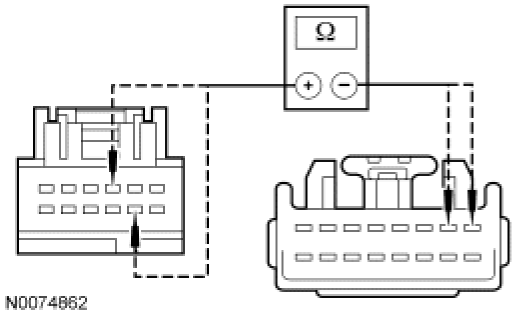

Fig. 30: Checking Circuits CPM26 (WH), CPM27 (GY/BU), CPM28 (BU/BN) & CPM29 (GN) For An Open
Courtesy of FORD MOTOR CO.

NOTE: DTC B1667.

- Measure the resistance between DDM:
  - C568A-8, circuit CPM26 (WH) harness side and LH exterior mirror C522-2, circuit CPM26 (WH) harness side.
  - C568A-3, circuit CPM29 (GN) harness side and LH exterior mirror C522-1, circuit CPM29 (GN) harness side.

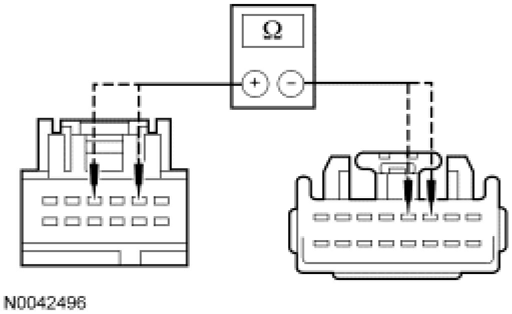

Fig. 31: Checking Circuits CPM26 (WH), CPM29 (GN), CPM28 (BU/BN) And CPM27 (GY/BU) For Open (DTC B1668)
Courtesy of FORD MOTOR CO.

NOTE: DTC B1668.

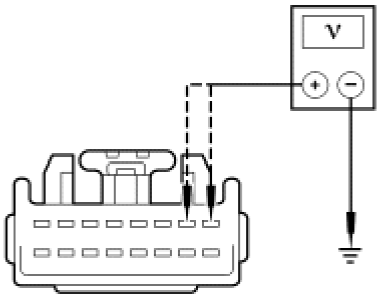
- Measure the resistance between DDM:
  - C568A-2, circuit CPM28 (BU/BN) harness side and LH exterior mirror C522-4, circuit CPM28 (BU/BN) harness side.
  - C568A-4, circuit CPM27 (GY/BU) harness side and LH exterior mirror C522-3, circuit CPM27 (GY/BU) harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to D29.

  NO : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

D14 CHECK THE EXTERIOR MIRROR FOR VOLTAGE FROM THE DSM

- Key in OFF position.
- Disconnect: RH Exterior Mirror C626
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DSM DataLogger

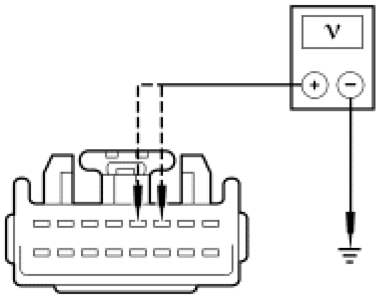


N0074863

Fig. 32: Checking Exterior Mirror For Voltage From DSM (DTC B1669)
Courtesy of FORD MOTOR CO.

NOTE: DTC B1669.

- Measure the voltage between RH exterior mirror C626-1, circuit CPM34 (WH/BU) harness side and ground while toggling the RH exterior mirror DSM PID PR_UP to On; and between RH exterior mirror C626-2, circuit CPM31 (YE/GY) harness side and ground while toggling the RH exterior mirror DSM PID PR_DOWN to On.



N0074864

Fig. 33: Checking Exterior Mirror For Voltage From DSM (DTC B1670)
Courtesy of FORD MOTOR CO.

NOTE: DTC B1670.

- Measure the voltage between RH exterior mirror C626-3, circuit CPM32 (WH/BU) harness side and ground while toggling the RH exterior mirror DSM PID PR_LEFT to On; and between RH exterior mirror C626-4, circuit CPM33 (WH/VT) harness side and ground while toggling the RH exterior mirror DSM PID PR_RIGHT to On.
- **Do the voltages momentarily change from 0 volt to greater than 10 volts when the active command is toggled On?**

  YES : CHECK the RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted and open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new RH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new RH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

NO : Go to D15.

D15 CHECK CIRCUITS CPM31 (YE/GY), CPM32 (WH/BU), CPM33 (WH/VT) AND CPM34 (WH/BN) FOR AN OPEN

- Key in OFF position.
- Disconnect: DSM C3299D

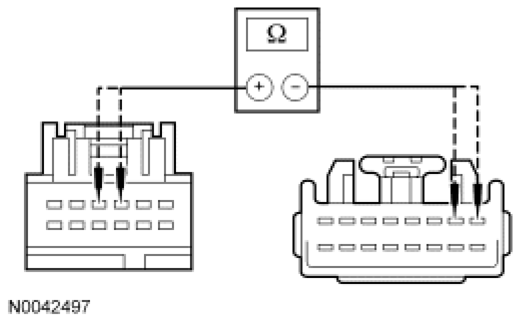


Fig. 34: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: DTC B1669.

- Measure the resistance between DSM:
  - C3299D-3, circuit CPM34 (WH/BN) harness side and RH exterior mirror C626-1, circuit CPM34 (WH/BN) harness side.
  - and RH exterior mirror C626-2, circuit CPM31 (YE/GY) harness side and DSM C3299D-4, circuit CPM31 (YE/GY) harness side.

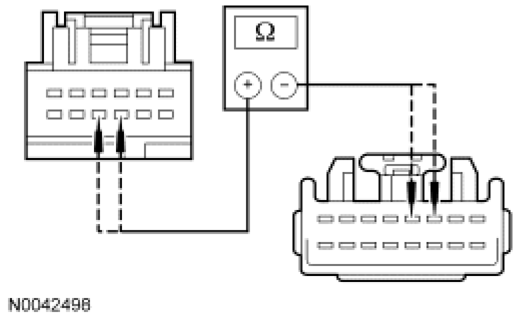

Fig. 35: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: DTC B1670.

- Measure the resistance between DSM:
  - C3299D-10, circuit CPM32 (WH/BU) harness side and RH exterior mirror C626-3, circuit CPM32 (WH/BU) harness side.

- C3299D-9, circuit CPM33 (WH/VT) harness side and RH exterior mirror C626-4, circuit CPM33 (WH/VT) harness side.

- **Are the resistances less than 5 ohms?**

  YES : Go to D28.

  NO : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

D16 CHECK CIRCUITS CPM26 (WH), CPM27 (GY/BU), CPM28 (BU/BN) AND CPM29 (GN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DDM C568A
- Key in ON position.

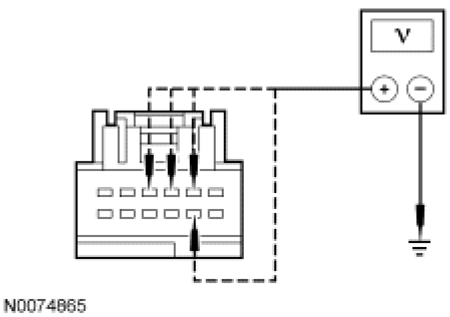

Fig. 36: Checking Circuits CPM26 (WH), CPM27 (GY/BU), CPM28 (BU/BN) & CPM29 (GN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and DDM:
  - C568A-2, circuit CPM28 (BU/BN) harness side.
  - C568A-3, circuit CPM29 (GN) harness side.
  - C568A-4, circuit CPM27 (GY/BU) harness side.
  - C568A-8, circuit CPM26 (WH) harness side.
- **Is any voltage present?**

  YES : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

  NO : Go to D17.

D17 CHECK CIRCUITS CPM26 (WH), CPM27 (GY/BU), CPM28 (BU/BN) AND CPM29 (GN) FOR A SHORT TO GROUND

- Key in OFF position.

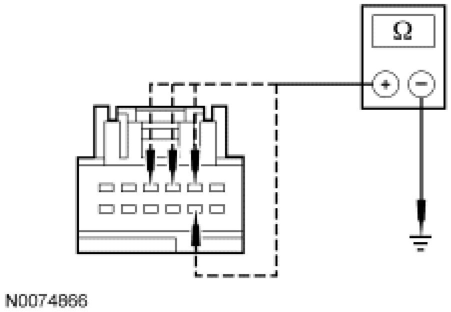

Fig. 37: Checking Circuits CPM26 (WH), CPM27 (GY/BU), CPM28 (BU/BN) & CPM29 (GN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and DDM:
  - C568A-2, circuit CPM28 (BU/BN) harness side.
  - C568A-3, circuit CPM29 (GN) harness side.
  - C568A-4, circuit CPM27 (GY/BU) harness side.
  - C568A-8, circuit CPM26 (WH) harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to D29.

  NO : Go to D18.

D18 CHECK THE LH EXTERIOR MIRROR FOR A SHORT TO GROUND

- Disconnect: LH Exterior Mirror C522

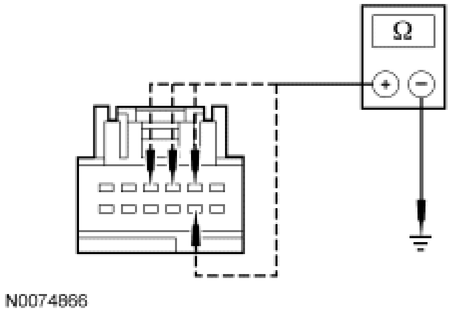

Fig. 38: Checking LH Exterior Mirror For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and DDM:
  - C568A-2, circuit CPM28 (BU/BN) harness side.
  - C568A-3, circuit CPM29 (GN) harness side.
  - C568A-4, circuit CPM27 (GY/BU) harness side.
  - C568A-8, circuit CPM26 (WH) harness side.
- **Are the resistances greater than 10,000 ohms?**

YES : CHECK the LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

NO : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

D19 CHECK CIRCUITS CPM31 (YE/GY), CPM32 (WH/BU), CPM33 (WH/VT) AND CPM34 (WH/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299D
- Key in ON position.

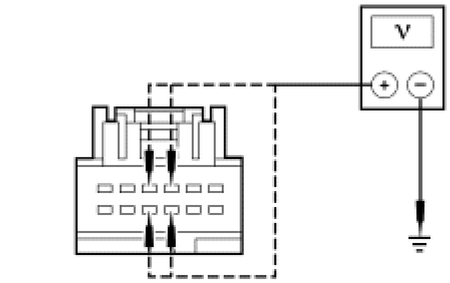

Fig. 39: Checking Circuits CPM31 (YE/GY), CPM32 (WH/BU), CPM33 (WH/VT) & CPM34 (WH/BN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and DSM:
  - C3299D-3, circuit CPM34 (WH/BN) harness side.
  - C3299D-4, circuit CPM31 (YE/GY) harness side.
  - C3299D-9, circuit CPM33 (WH/VT) harness side.
  - C3299D-10, circuit CPM32 (WH/BU) harness side.
- **Is any voltage present?**

  YES : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

  NO : Go to D20.

D20 CHECK CIRCUITS CPM31 (YE/GY), CPM32 (WH/BU), CPM33 (WH/VT) AND CPM34 (WH/BN) FOR A SHORT TO GROUND

- Key in OFF position.

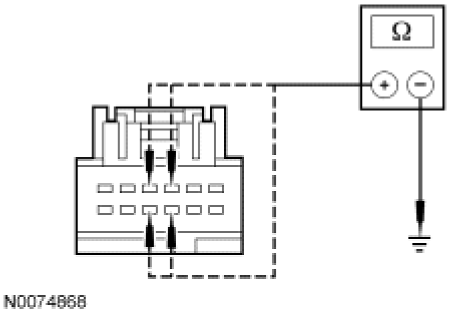

Fig. 40: Checking Circuits CPM31 (YE/GY), CPM32 (WH/BU), CPM33 (WH/VT) & CPM34 (WH/BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and DSM:
  - C3299D-3, circuit CPM34 (WH/BN) harness side.
  - C3299D-4, circuit CPM31 (YE/GY) harness side.
  - C3299D-9, circuit CPM33 (WH/VT) harness side.
  - C3299D-10, circuit CPM32 (WH/BU) harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to D28.

  NO : Go to D21.

D21 CHECK THE RH EXTERIOR MIRROR FOR A SHORT TO GROUND

- Disconnect: LH Exterior Mirror C626

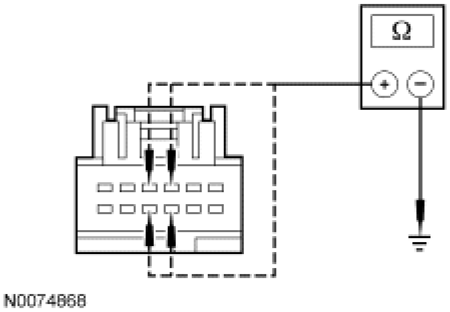

Fig. 41: Checking RH Exterior Mirror For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and DSM:
  - C3299D-3, circuit CPM34 (WH/BN) harness side.
  - C3299D-4, circuit CPM31 (YE/GY) harness side.
  - C3299D-9, circuit CPM33 (WH/VT) harness side.
  - C3299D-10, circuit CPM32 (WH/BU) harness side.
- **Are the resistances greater than 10,000 ohms?**

YES : CHECK the RH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new RH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new RH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

NO : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

D22 CHECK THE LH AND RH EXTERIOR MIRRORS

- Key in OFF position.
- Disconnect: DSM C3299D

NOTE: DTC B2312 or B2316.

- Disconnect: DDM C568A

NOTE: DTC B2320 or B2324.

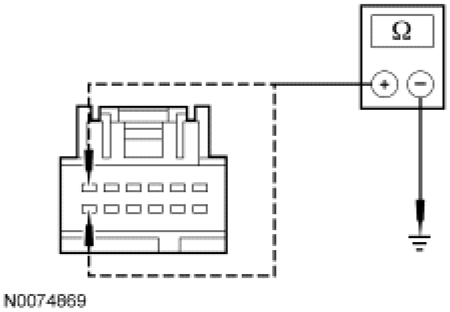

Fig. 42: Checking LH & RH Exterior Mirrors (DTC B2312 or B2316)
Courtesy of FORD MOTOR CO.

NOTE: DTC B2312 or B2316.

- Measure the resistance between ground and DSM:
  - (DTC B2312) C3299D-6, circuit VPM37 (BU/OG) harness side.
  - (DTC B2316)C3299D-12, circuit VPM38 (BN/GN) harness side.

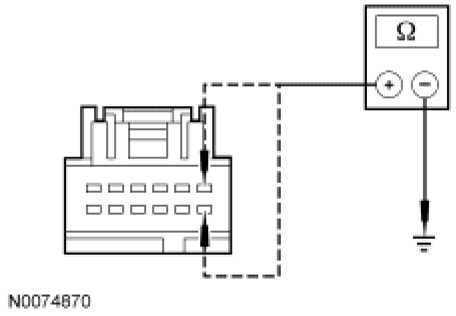

Fig. 43: Checking LH & RH Exterior Mirrors (DTC B2320 or B2324)
Courtesy of FORD MOTOR CO.

NOTE: DTC B2320 or B2324.

- Measure the resistance between ground and DDM:
  - (DTC B2320) C568A-7, circuit VPM35 (YE/BU) harness side.
  - (DTC B2324) C568A-1, circuit VPM36 (BN/YE) harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to D24.

  NO : Go to D23.

D23 CHECK CIRCUITS VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG) AND VPM38 (BN/GN) FOR A SHORT TO GROUND

- Disconnect: RH Exterior Mirror C625

NOTE: DTC B2312 or B2316.

- Disconnect: LH Exterior Mirror C522

NOTE: DTC B2320 or B2324.

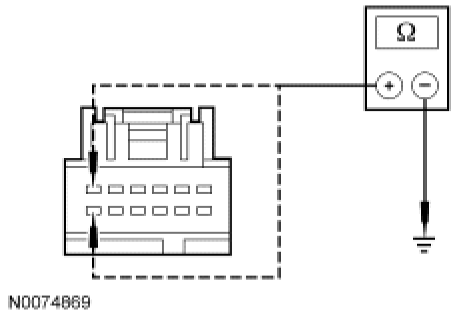

Fig. 44: Checking Circuits VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG) & VPM38 (BN/GN) For A Short To Ground (DTC B2312 or B2316)
Courtesy of FORD MOTOR CO.

NOTE: DTC B2312 or B2316.

- Measure the resistance between ground and DSM:
  - (DTC B2312) C3299D-6, circuit VPM37 (BU/OG) harness side.
  - (DTC B2316)C3299D-12, circuit VPM38 (BN/GN) harness side.

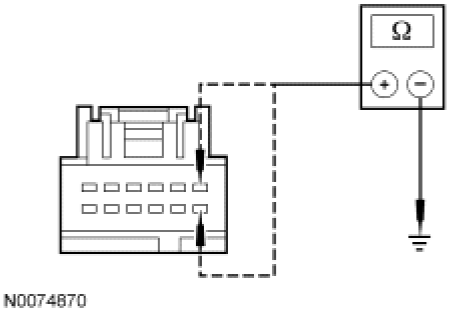

Fig. 45: Checking Circuits VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG) & VPM38 (BN/GN) For A Short To Ground (DTC B2320 or B2324)
Courtesy of FORD MOTOR CO.

NOTE: DTC B2320 or B2324.

- Measure the resistance between ground and DDM:
  - (DTC B2320) C568A-7, circuit VPM35 (YE/BU) harness side.
  - (DTC B2324) C568A-1, circuit VPM36 (BN/YE) harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : CHECK the RH or LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new RH or LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new RH or LH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

  NO : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

D24 CHECK THE RH AND LH EXTERIOR MIRRORS FOR AN INTERNAL OPEN

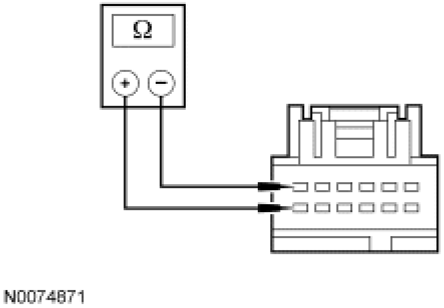

Fig. 46: Checking RH & LH Exterior Mirrors For An Internal Open (DTC B2312 or B2316)
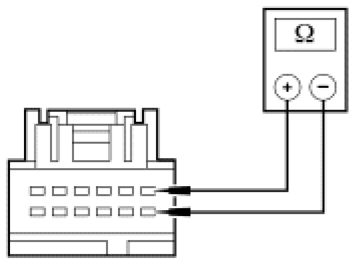
Courtesy of FORD MOTOR CO.

NOTE: **DTC B2312 or B2316.**

- Measure the resistance between DSM C3299D-6, circuit VPM37 (BU/OG) harness side and C3299D-12, circuit VPM38 (BN/GN) harness side.



N0074672

Fig. 47: Checking RH & LH Exterior Mirrors For An Internal Open (DTC B2320 or B2324)
Courtesy of FORD MOTOR CO.

NOTE: **DTC B2320 or B2324.**

- Measure the resistance between DDM C568A-7, circuit VPM35 (YE/BU) harness side and C568A-1, circuit VPM36 (BN/YE) harness side.
- **Is the resistance less than 5 ohms?**

  YES : For DTC B2312 or B2316, go to D28.

  For DTC B2320 or B2324, go to D29.

  NO : Go to D25.

D25 CHECK CIRCUITS VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG) AND VPM38 (BN/GN) FOR AN OPEN

- Disconnect: RH Exterior Mirror C626

NOTE: **DTC B2312 or B2316.**

- Disconnect: LH Exterior Mirror C522

NOTE: **DTC B2320 or B2324.**

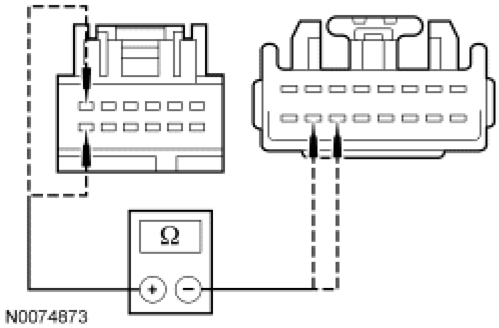


Fig. 48: Checking Circuits VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG) & VPM38 (BN/GN) For An Open (DTC B2312 or B2316)
Courtesy of FORD MOTOR CO.

NOTE: DTC B2312 or B2316.

- Measure the resistance between DSM:
  - (DTC B2312) C3299D-6, circuit VPM37 (BU/OG) harness side and C626-15, circuit VPM37 (BU/OG) harness side.
  - (DTC B2316) C3299D-12, circuit VPM38 (BN/GN) harness side and C626-14, circuit VPM38 (BN/GN) harness side.

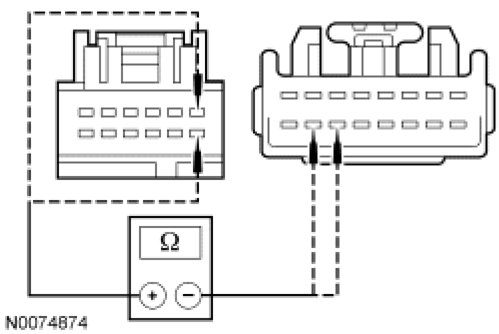

Fig. 49: Checking Circuits VPM35 (YE/BU), VPM36 (BN/YE), VPM37 (BU/OG) & VPM38 (BN/GN) For An Open (DTC B2320 or B2324)
Courtesy of FORD MOTOR CO.

NOTE: DTC B2320 or B2324.

- Measure the resistance between DDM:
  - (DTC B2320) C568A-7, circuit VPM35 (YE/BU) harness side and C522-15, circuit VPM35 (YE/BU) harness side.
  - (DTC B2324) C568A-1, circuit VPM36 (BN/YE) harness side and C522-14, circuit VPM36 (BN/YE) harness side.
- **Is the resistance less than 5 ohms?**

  YES : CHECK the RH or LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted circuits and damaged or pushed-out pins. If the jumper harness is

not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new RH or LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new RH or LH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

NO : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

D26 CHECK THE LH AND RH EXTERIOR MIRRORS

- Key in OFF position.
- Disconnect: DSM C3299D

NOTE: DTC B2314 or B2318.

- Disconnect: DDM C568A

NOTE: DTC B2322 or B2326.

- Key in ON position.

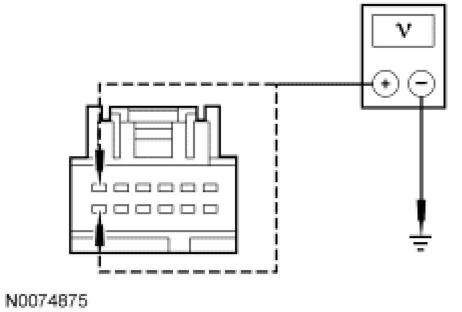

Fig. 50: Checking LH & RH Exterior Mirrors (DTC B2314 Or B2318)
Courtesy of FORD MOTOR CO.

NOTE: DTC B2314 or B2318.

- Measure the voltage between ground and DSM:
  - (DTC B2314) C3299D-6, circuit VPM37 (BU/OG) harness side.
  - (DTC B2318) C3299D-12, circuit VPM38 (BN/GN) harness side.

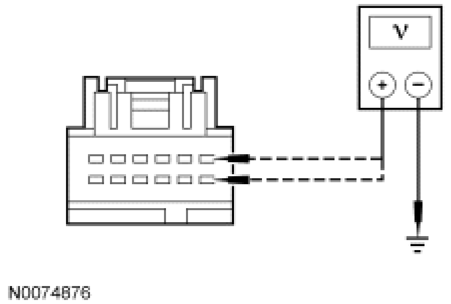

Fig. 51: Checking LH & RH Exterior Mirrors (DTC B2322 or B2326)
Courtesy of FORD MOTOR CO.

NOTE: DTC B2322 or B2326.

- Measure the voltage between ground and DDM:
  - (DTC B2322) C568A-7, circuit VPM35 (YE/BU) harness side.
  - (DTC B2326) C568A-1, circuit VPM36 (BN/YE) harness side.
- **Is any voltage present?**

  YES : Go to D27.

  NO : For DTC B2314 or B2318, go to D28.

  For DTC B2322 or B2326, go to D29.

D27 CHECK THE LH AND RH EXTERIOR MIRRORS

- Key in OFF position.
- Disconnect: RH Exterior Mirror C626

NOTE: DTC B2314 or B2318.

- Disconnect: LH Exterior Mirror C522

NOTE: DTC B2322 or B2326.

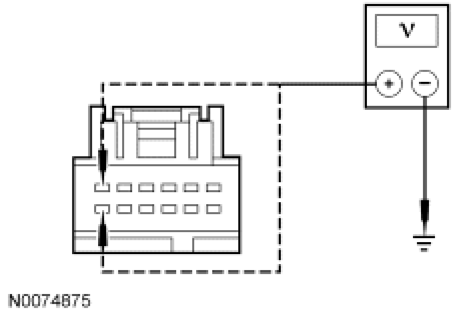

Fig. 52: Checking LH & RH Exterior Mirrors (DTC B2314 or B2318)
Courtesy of FORD MOTOR CO.

NOTE: DTC B2314 or B2318.

- Measure the voltage between ground and DSM:
  - (DTC B2314) C3299D-6, circuit VPM37 (BU/OG) harness side.
  - (DTC B2318) C3299D-12, circuit VPM38 (BN/GN) harness side.

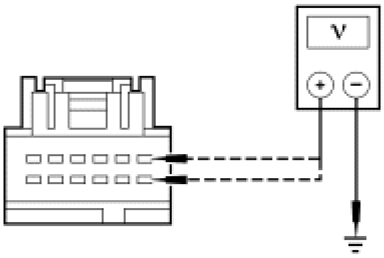

Fig. 53: Checking LH & RH Exterior Mirrors (DTC B2322 or B2326)
Courtesy of FORD MOTOR CO.

NOTE: DTC B2322 or B2326.

- Measure the voltage between ground and DDM:
  - (DTC B2322) C568A-7, circuit VPM35 (YE/BU) harness side.
  - (DTC B2326) C568A-1, circuit VPM36 (BN/YE) harness side.
- **Is any voltage present?**

  YES : REPAIR the circuit(s). CLEAR the DTCs. TEST the system for normal operation.

  NO : CHECK the RH or LH exterior mirror jumper harness between the vehicle harness and the exterior mirror motor for shorted circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new RH or LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new RH or LH exterior mirror motor. REFER to **Exterior Mirror Motor**. CLEAR the DTCs. TEST the system for normal operation.

D28 CHECK THE DSM FOR CORRECT OPERATION

- Disconnect all DSM connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all DSM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or

corroded connector. CLEAR the DTCs. REPEAT the self-test.

D29 CHECK THE DDM FOR CORRECT OPERATION

- Disconnect all DDM connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all DDM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DDM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: The Heated Exterior Mirror is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** , Heated Windows for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** , Power Mirrors for schematic and connector information.

Normal Operation

Under normal operation, the LH and RH exterior mirror glass receives power from SJB fuse 9 (10A) and through circuit CBP16 (BU/OG), when the rear window defrost system is on. Ground is supplied to the LH heated exterior mirror glass through circuit GD126 (BK/WH) and to the RH heated exterior mirror glass through circuit GD139 (BK/YE).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Exterior mirror glass
- Exterior mirror

PINPOINT TEST E: THE HEATED EXTERIOR MIRROR IS INOPERATIVE

E1 CHECK THE OPERATION OF THE REAR WINDOW DEFROST SYSTEM

- Key in ON position.
- Press the rear window defrost switch to the ON position.
- Place a hand on the rear window to verify that the rear window heats up.
- **Does the rear window defrost system operate?**

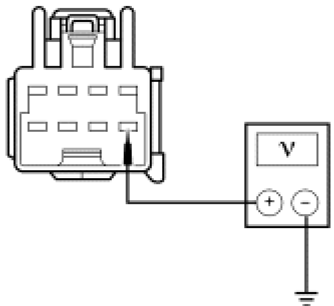
  YES : Go to E2.

  NO : REFER to **GLASS, FRAMES AND MECHANISMS** article to diagnose the rear window

defrost system.

E2 CHECK THE VOLTAGE TO THE EXTERIOR MIRRORS

- Key in OFF position.
- Disconnect: LH Exterior Mirror C517 (without memory mirrors)/C522 (with memory mirrors) or RH Exterior Mirror C625 (without memory mirrors)/C626 (with memory mirrors)
- Key in ON position.
- Press the rear window defrost switch to the ON position.

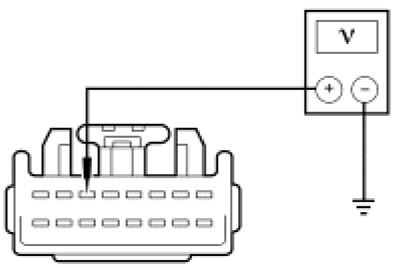


N0042519

Fig. 54: Checking Exterior Mirror For Power (Without Memory Mirrors)
Courtesy of FORD MOTOR CO.

NOTE: Without memory mirrors.

- Measure the voltage between ground and inoperative exterior mirror:
  - (LH) C517-5, circuit CBP16 (BU/OG) harness side.
  - (RH) C625-5, circuit CBP16 (BU/OG) harness side.



N0042518

Fig. 55: Checking Exterior Mirror For Power (With Memory Mirrors)
Courtesy of FORD MOTOR CO.

NOTE: With memory mirrors.

- Measure the voltage between ground and inoperative exterior mirror:
  - (LH) C522-6, circuit CBP16 (BU/OG) harness side.
  - (RH) C626-6, circuit CBP16 (BU/OG) harness side.

- **Is the voltage greater than 10 volts?**

  YES : Go to E3.

  NO : VERIFY the smart junction box (SJB) fuse 9 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

E3 CHECK THE EXTERIOR REAR VIEW MIRROR GROUND CIRCUIT FOR AN OPEN

- Key in OFF position.

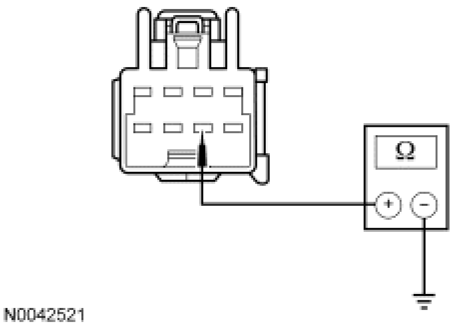


Fig. 56: Checking Exterior Rear View Mirror Ground Circuit For Open (Without Memory Mirrors)
Courtesy of FORD MOTOR CO.

NOTE: Without memory mirrors.

- Measure the resistance between ground and inoperative exterior mirror:
  - (LH) C517-6, circuit GD126 (BK/WH) harness side.
  - (RH) C625-6, circuit GD139 (BK/YE) harness side.

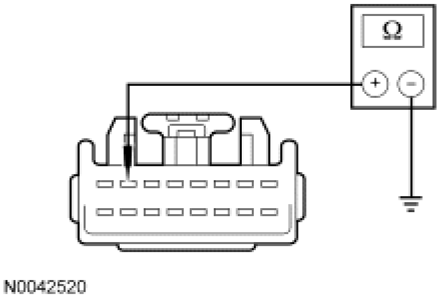

Fig. 57: Checking Exterior Rear View Mirror Ground Circuit For Open (With Memory Mirrors)
Courtesy of FORD MOTOR CO.

NOTE: With memory mirrors.

- Measure the resistance between ground and inoperative exterior mirror:
  - (LH) C522-7, circuit GD126 (BK/WH) harness side.

  - (RH) C626-7, circuit GD139 (BK/YE) harness side.
- **Is the resistance less than 5 ohms?**

  YES : CHECK the LH or RH exterior mirror jumper harness between the vehicle harness and the exterior mirror glass for open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH or RH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH or RH exterior mirror glass. REFER to **Exterior Mirror Glass**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test F: The Auto-Dimming Mirror Does Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** , Power Mirrors for schematic and connector information.

Normal Operation

The interior auto-dimming mirror receives power from circuit CBP02 (GN) and ground from circuit GD139 (BK/YE). If equipped with a LH exterior auto-dimming mirror, and the auto-dimming feature is activated, voltage is sent from the interior mirror to the LH exterior mirror though circuit LRD12 (BU/GY). Ground for the LH exterior mirror is provided by the interior mirror through circuit RRD12 (BN). When the vehicle is placed in REVERSE, voltage is sent to the interior mirror through circuit CBP12 (GN/WH) and the interior mirror will turn the dimming feature off. There are 2 photoelectric sensors: one in the front of the interior rear view mirror and one mounted on the glass side of the mirror. If the sensors are blocked, the interior auto-dimming mirror might not work correctly. Always verify both sensors are not physically blocked before attempting to diagnose auto-dimming mirror concerns.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Interior auto-dimming mirror
- LH exterior mirror glass
- LH exterior mirror

PINPOINT TEST F: THE AUTO-DIMMING MIRROR DOES NOT OPERATE CORRECTLY

NOTE:	**If the transmission range (TR) sensor is malfunctioning and the backup lamps are on all the time or do not turn on, the auto-dimming interior mirror will not darken or return to normal view.**

F1 CHECK THE OPERATION OF THE BACKUP LAMPS

- Key in ON position.
- Move the selector lever through the entire range.
- **Do the backup lamps illuminate only in REVERSE?**

  YES : Lincoln only: If the LH exterior mirror only is always dim, REPAIR circuit LRD12

(BU/GY) for a short to voltage. TEST the system for normal operation.

Lincoln only: If the LH exterior mirror only does not dim correctly, go to F10 .

Lincoln only: If the interior mirror only does not dim correctly and the LH exterior mirror does dim correctly, INSTALL a new interior mirror, REFER to **Auto-Dimming Interior Mirror**. TEST the system for normal operation.

Lincoln only: If the LH exterior mirror and interior mirror does not dim correctly, go to F2 .

Ford and Mercury only: If the interior mirror does not operate correctly, go to F2 .

NO : REFER to **EXTERIOR LIGHTING** article to diagnose the backup lamps.

F2 VERIFY THAT THE FORWARD AND REARWARD FACING SENSORS ARE NOT BLOCKED

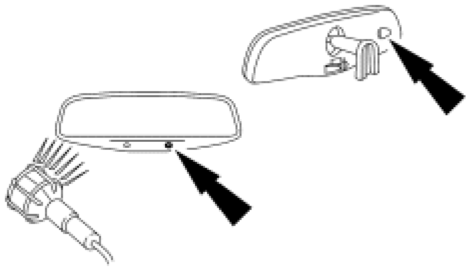
- Visually verify that the forward and rearward facing sensors are not blocked. Sources of blockage can include:
  - stickers, window decals or tags.
  - fold-down screens for TVs or DVD players.
  - non-OEM window tinting.
- **Were either of the sensors blocked?**

  YES : If possible, REMOVE the blockage. TEST the system for normal operation. If the blockage cannot be removed, REVIEW the operation of the interior auto-dimming mirror with the customer.

  NO : Go to F3.

F3 CHECK THE OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - DAYLIGHT CONDITIONS

- Key in ON position.



N0057545

Fig. 58: Checking Operation Of Interior Auto-Dimming Mirror - Daylight Conditions
Courtesy of FORD MOTOR CO.

- Use a bright lamp to simultaneously illuminate the forward-facing sensor and the rearward-facing sensor. The mirror should adjust to a high reflectance mode (mirror will be clear).
- **Does the mirror adjust to the high reflectance (clear) mode?**

  YES : Go to F4.

  NO : INSTALL a new interior mirror. REFER to **Auto-Dimming Interior Mirror**. TEST the system for normal operation.

F4 CHECK THE OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - NIGHT

TIME CONDITIONS WITH GLARE

- Key in ON position.

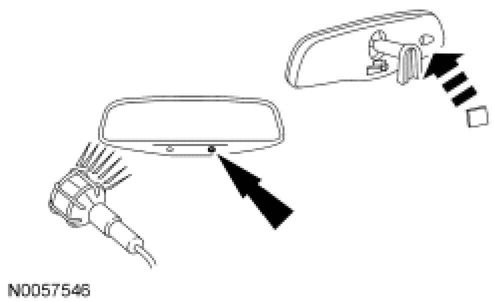


Fig. 59: Checking Operation Of Interior Auto-Dimming Mirror - Night Time Conditions With Glare
Courtesy of FORD MOTOR CO.

- Simulate night time conditions with glare:

  NOTE: Covering the sensor with a finger or hand is not adequate.

  - cover the forward-facing sensor with black electrical tape or other dark material.
  - illuminate the rearward-facing sensor. The mirror should darken to a lower reflectance mode.
- **Did the mirror darken to a lower reflectance (darker) mode?**

  YES : Go to F5.

  NO : Go to F7.

F5 CHECK THE OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - NIGHT TIME CONDITIONS WITHOUT GLARE

- Key in ON position.

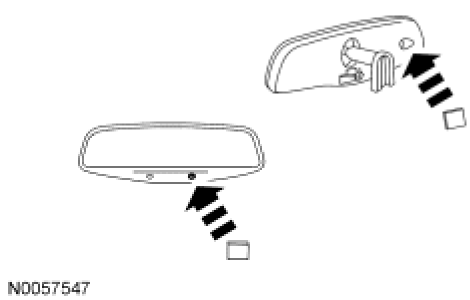

Fig. 60: Checking Operation Of Interior Auto-Dimming Mirror - Night Time Conditions Without Glare
Courtesy of FORD MOTOR CO.

- Simulate night time conditions without glare:

NOTE: Covering the sensor with a finger or hand is not adequate.

- cover the forward-facing sensor with black electrical tape or other dark material.
- cover the rearward-facing sensor. The mirror should adjust to the high reflectance mode.

- **Did the mirror adjust to the high reflectance (clear) mode?**

  YES : Go to F6.

  NO : Go to F7.

F6 CHECK THE OPERATION OF THE INTERIOR AUTO-DIMMING MIRROR - NIGHT TIME CONDITIONS WITH THE VEHICLE IN REVERSE

- Key in ON position.

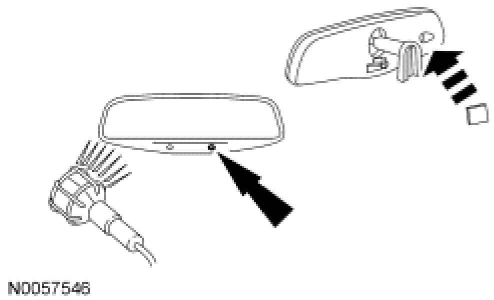

Fig. 61: Checking Operation Of Interior Auto-Dimming Mirror - Night Time Conditions With Glare
Courtesy of FORD MOTOR CO.

- Simulate night time conditions with glare:

NOTE: Covering the sensor with a finger or hand is not adequate.

- cover the forward-facing sensor with black electrical tape or other dark material.
- illuminate the rearward-facing sensor.

- Select REVERSE.
- **Did the mirror adjust to a high reflectance (clear) mode?**

  YES : The system is operating normally at this time. REVIEW operation of the interior auto-dimming mirror feature with the customer.

  NO : Go to F7.

F7 CHECK CIRCUIT CBP02 (GN) FOR VOLTAGE

- Key in OFF position.
- Disconnect: Interior Mirror C911 (without microphone) or C9030 (with microphone)
- Key in ON position.

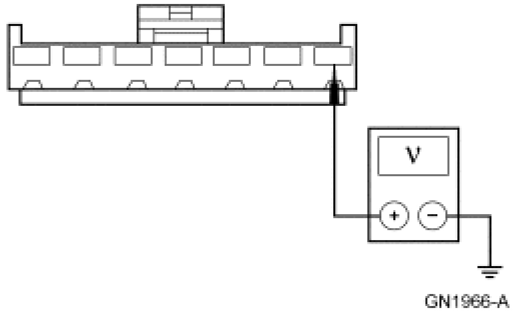

Fig. 62: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

NOTE: Without microphone.

- Measure the voltage between interior mirror C911-1, circuit CBP02 (GN) harness side and ground.

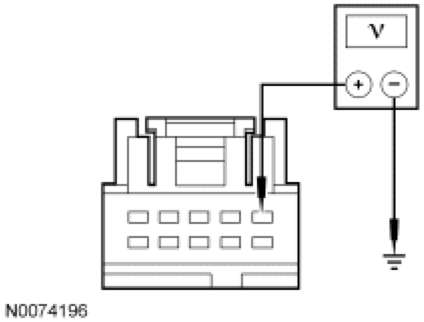

Fig. 63: Measuring Voltage Between Interior Mirror C911-1, Circuit CBP02 (GN) Harness Side & Ground
Courtesy of FORD MOTOR CO.

NOTE: With microphone.

- Measure the voltage between interior mirror C9030-1, circuit CBP02 (GN) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to F8.

  NO : VERIFY smart junction box (SJB) fuse 12 (7.5A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

F8 CHECK CIRCUIT GD139 (BK/YE) FOR AN OPEN

- Key in OFF position.

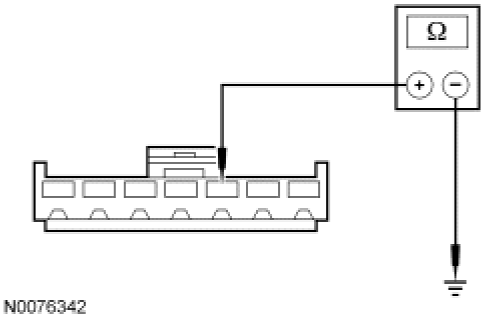

Fig. 64: Checking Circuit GD139 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

NOTE: Without microphone.

- Measure the resistance between interior mirror C911-3, circuit GD139 (BK/YE) harness side and ground.

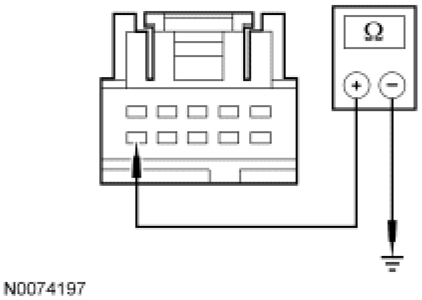

Fig. 65: Measuring Resistance Between Interior Mirror C911-3, Circuit GD139 (BK/YE) Harness Side & Ground
Courtesy of FORD MOTOR CO.

NOTE: With microphone.

- Measure the resistance between interior mirror C9030-10, circuit GD139 (BK/YE) harness side and ground.
- **Is the resistance less than 10 ohms?**

  YES : Go to F9.

  NO : REPAIR the circuit. TEST the system for normal operation.

F9 CHECK CIRCUIT CBP12 (GN/WH) FOR VOLTAGE

- Key in ON position.
- Select REVERSE.

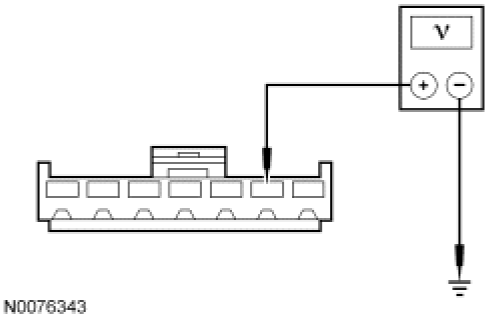

Fig. 66: Checking Circuit CBP12 (GN/WH) For Voltage
Courtesy of FORD MOTOR CO.

NOTE: Without microphone.

- Measure the voltage between interior mirror C911-2, circuit CBP12 (GN/WH) harness side and ground.

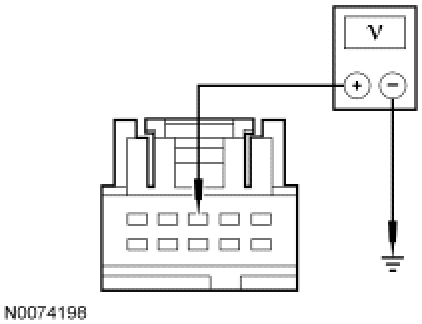

Fig. 67: Measuring Voltage Between Interior Mirror C911-2, Circuit CBP12 (GN/WH) Harness Side & Ground
Courtesy of FORD MOTOR CO.

NOTE: With microphone.

- Measure the voltage between interior mirror C9030-3, circuit CBP12 (GN/WH) harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new interior mirror. REFER to **Auto-Dimming Interior Mirror**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

F10 CHECK CIRCUIT LRD12 (BU/GY) FOR VOLTAGE

- Key in OFF position.
- Disconnect: LH Exterior Mirror C522
- Key in ON position.

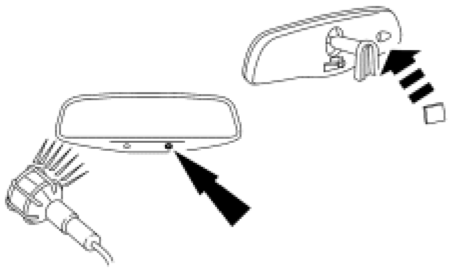

Fig. 68: Checking Operation Of Interior Auto-Dimming Mirror - Night Time Conditions With Glare
Courtesy of FORD MOTOR CO.

- Simulate night time conditions with glare:

NOTE: Covering the sensor with a finger or hand is not adequate.

  - cover the forward-facing sensor with black electrical tape or other dark material.
  - illuminate the rearward-facing sensor. The mirror should darken to a lower reflectance mode.

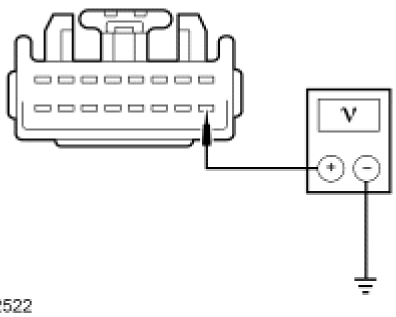

Fig. 69: Checking Circuit LRD12 (BU/GY) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between LH exterior mirror C522-9, circuit LRD12 (BU/GY) harness side and ground.
- **Is the voltage greater than 1 volt?**

  YES : Go to F11.

  NO : Go to F13.

F11 CHECK CIRCUIT RRD12 (BN) FOR GROUND

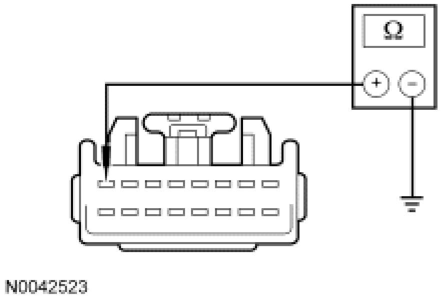

Fig. 70: Checking Circuit RRD12 (BN) For Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between LH exterior mirror C522-8, circuit RRD12 (BN) harness side and ground.
- **Is the resistance less than 15 ohms?**

  YES : CHECK the LH exterior mirror jumper harness between the vehicle harness and the exterior mirror glass for shorted or open circuits and damaged or pushed-out pins. If the jumper harness is not OK, REPAIR the jumper harness. If the jumper harness cannot be repaired, INSTALL a new LH exterior mirror. REFER to **Exterior Mirror**. If the jumper harness is OK, INSTALL a new LH exterior mirror glass. REFER to **Exterior Mirror Glass**. TEST the system for normal operation.

  NO : Go to F12.

F12 CHECK CIRCUIT RRD12 (BN) FOR AN OPEN

- Key in OFF position.
- Disconnect: Interior Mirror C911 (without microphone) or C9030 (with microphone)

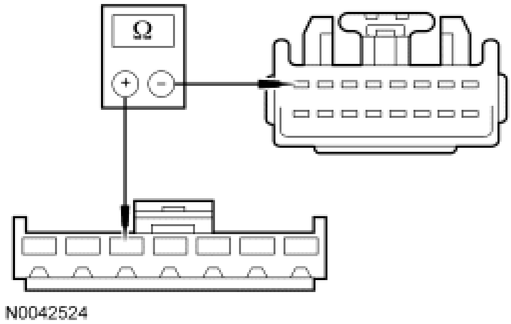

Fig. 71: Checking Circuit RRD12 (BN) For Open
Courtesy of FORD MOTOR CO.

NOTE: Without microphone.

- Measure the resistance between interior mirror C911-5, circuit RRD12 (BN) harness side and LH exterior mirror C522-8, circuit RRD12 (BN) harness side.

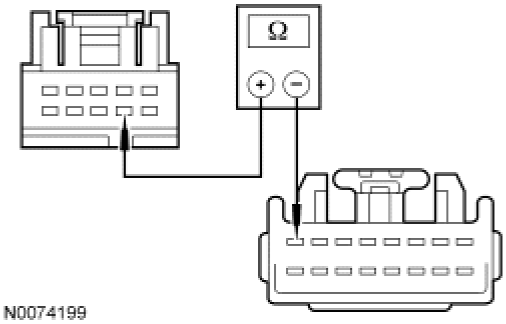

Fig. 72: Measuring Resistance Between Interior Mirror C911-5 & C522-8, Circuit RRD12 (BN) & RRD12 (BN) Harness Side
Courtesy of FORD MOTOR CO.

NOTE: **With microphone.**

- Measure the resistance between interior mirror C9030-7, circuit RRD12 (BN) harness side and LH exterior mirror C522-8, circuit RRD12 (BN) harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL new interior mirror. REFER to **Auto-Dimming Interior Mirror**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

F13 CHECK CIRCUIT LRD12 (BU/GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: Interior Mirror C911 (without microphone) or C9030 (with microphone)

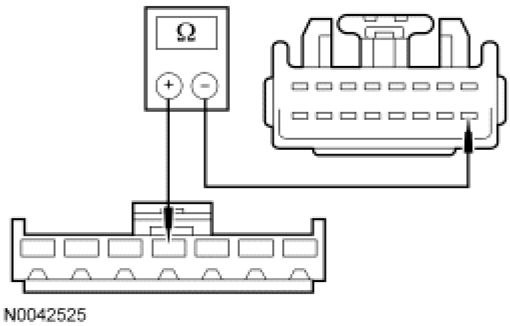

Fig. 73: Checking Circuit LRD12 (BU/GY) For Open
Courtesy of FORD MOTOR CO.

NOTE: **Without microphone.**

- Measure the resistance between LH exterior mirror C522-9, circuit LRD12 (BU/GY) harness side and interior mirror C911-4, circuit LRD12 (BU/GY) harness side.

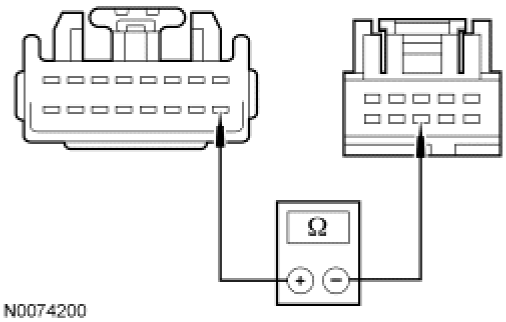

Fig. 74: Measuring Resistance Between LH Exterior Mirror C522-9 & C911-4, Circuit LRD12 (BU/GY) & LRD12 (BU/GY) Harness Side
Courtesy of FORD MOTOR CO.

NOTE: With microphone.

- Measure the resistance between LH exterior mirror C522-9, circuit LRD12 (BU/GY) harness side and interior mirror C9030-8, circuit LRD12 (BU/GY) harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to F14.

  NO : REPAIR the circuit. TEST the system for normal operation.

F14 CHECK CIRCUIT LRD12 (BU/GY) FOR A SHORT TO GROUND

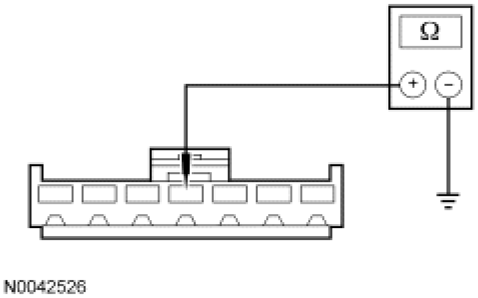

Fig. 75: Measuring Resistance
Courtesy of FORD MOTOR CO.

NOTE: Without microphone.

- Measure the resistance between interior mirror C911-4, circuit LRD12 (BU/GY) harness side and ground.

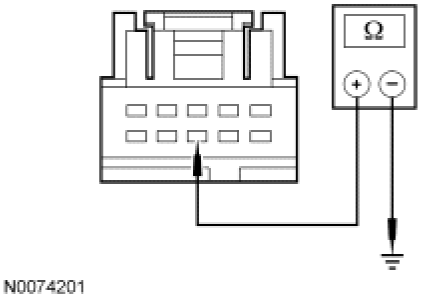

Fig. 76: Measuring Resistance Between Interior Mirror C911-4, Circuit LRD12 (BU/GY) Harness Side & Ground
Courtesy of FORD MOTOR CO.

NOTE: With microphone.

- Measure the resistance between interior mirror C9030-8, circuit LRD12 (BU/GY) harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL new interior mirror. REFER to **Auto-Dimming Interior Mirror**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

REMOVAL AND INSTALLATION

EXTERIOR MIRRORS - EXPLODED VIEW

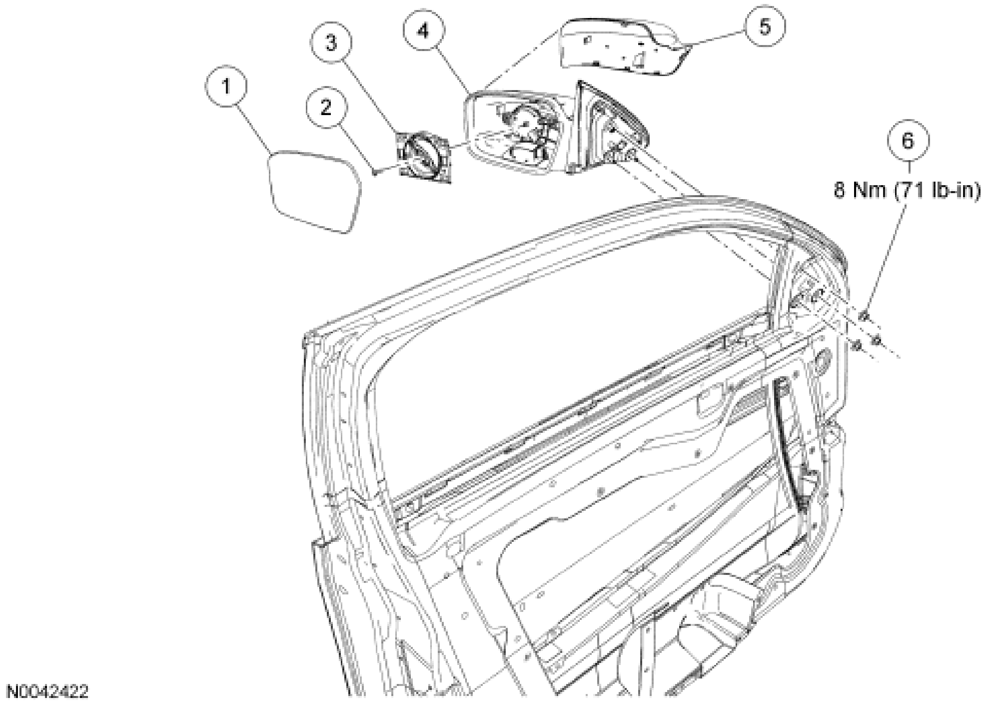

Fig. 77: Exploded View Of Exterior Mirrors With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	17K707	Exterior mirror glass
2	-	Exterior mirror motor screw
3	17D696	Exterior mirror motor
4	17682	Exterior mirror
5	17D742	Exterior mirror cover
6	N621906	Exterior mirror nut (3 required)

1. For additional information, refer to the procedures.

EXTERIOR MIRROR

REMOVAL AND INSTALLATION

1. Remove the front door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the front door sail panel.
   - If equipped, disconnect the speaker electrical connector.

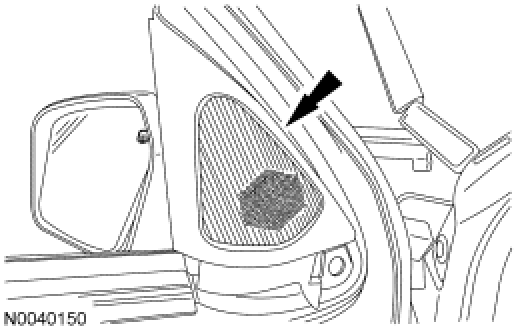

Fig. 78: Locating Front Door Sail Panel
Courtesy of FORD MOTOR CO.

3. Disconnect the exterior mirror electrical connector.

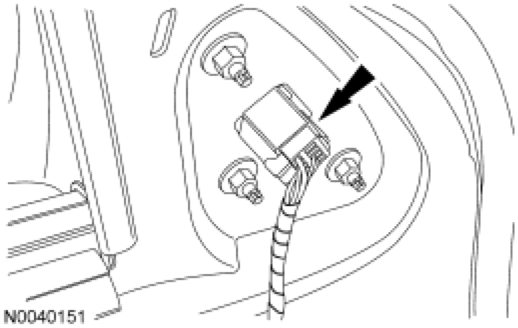

Fig. 79: Locating Exterior Mirror Electrical Connector
Courtesy of FORD MOTOR CO.

4. Remove the 3 exterior mirror nuts and the exterior mirror.
   - To install, tighten to 8 Nm (71 lb-in).

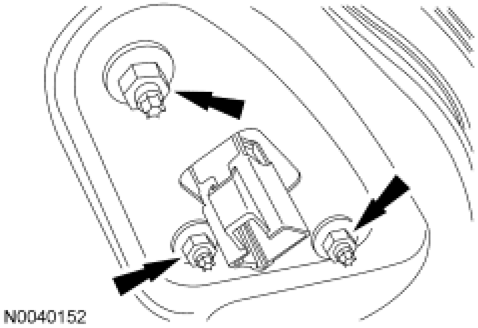

Fig. 80: Locating Exterior Mirror Bolts
Courtesy of FORD MOTOR CO.

5. To install, reverse the removal procedure.

EXTERIOR MIRROR GLASS

REMOVAL

1. Position the exterior mirror glass in the full down position.

WARNING: **Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.**

2. Pull the upper edge of the exterior mirror glass outward and then upward to release the locking tabs from the exterior mirror motor.

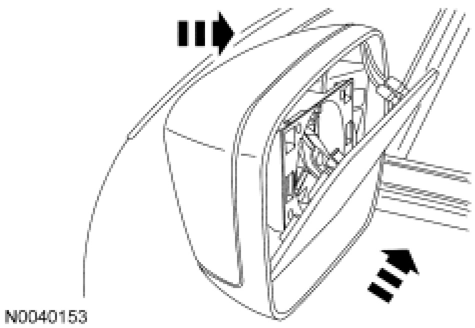

Fig. 81: Pulling Upper Edge Of Exterior Rear View Mirror Glass Outward And Upward
Courtesy of FORD MOTOR CO.

3. If equipped with heated mirrors, disconnect the electrical connectors from the exterior mirror glass.

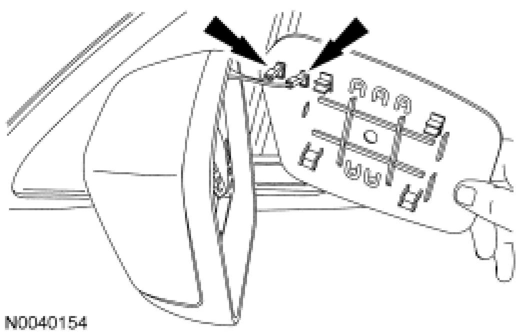

Fig. 82: Locating Electrical Connectors From Exterior Mirror Glass
Courtesy of FORD MOTOR CO.

INSTALLATION

1. If equipped with heated exterior mirrors, connect the electrical connectors to the exterior mirror glass.

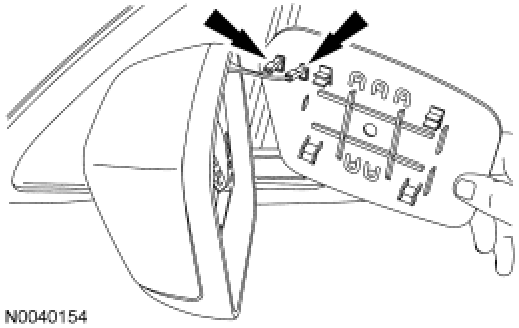

Fig. 83: Locating Electrical Connectors From Exterior Mirror Glass
Courtesy of FORD MOTOR CO.

2. Install the lower exterior mirror glass onto the exterior mirror motor.
3. Position the exterior glass upward.

WARNING: **Place a shop towel between the hands and the exterior mirror glass for protection in case of glass breakage during mirror service. Failure to follow this instruction may result in serious personal injury.**

NOTE: An audible click will be heard during installation.

4. Place a hand against the back of the exterior mirror and a hand flat against the upper exterior mirror glass and press the exterior mirror glass into the upper exterior mirror motor retainers.

EXTERIOR MIRROR MOTOR

1. Remove the exterior mirror glass. For additional information, refer to **Exterior Mirror Glass**.
2. Remove the exterior mirror motor screw.

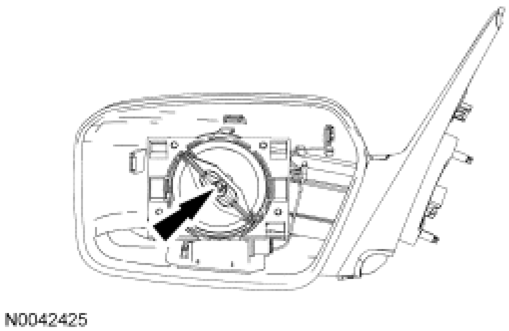

Fig. 84: Locating Screw From Center Of Exterior Rear View Mirror Motor
Courtesy of FORD MOTOR CO.

NOTE: Use a flat-blade screwdriver to remove the exterior mirror motor from the clips.

3. Remove the exterior mirror motor from the 3 mounting clips.
   - Disconnect the electrical connector.

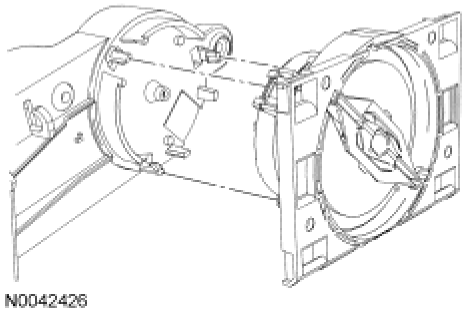

Fig. 85: Identifying Exterior Rear View Mirror Motor From Clips On Bracket
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.

EXTERIOR MIRROR COVER

1. Remove the exterior mirror glass. For additional information, refer to **Exterior Mirror Glass**.
2. Depress the 3 tabs and remove the exterior mirror cover.

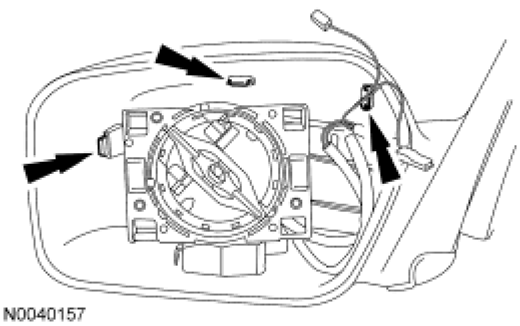

Fig. 86: Locating Exterior Mirror Cover Tabs
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.

EXTERIOR MIRROR CONTROL SWITCH

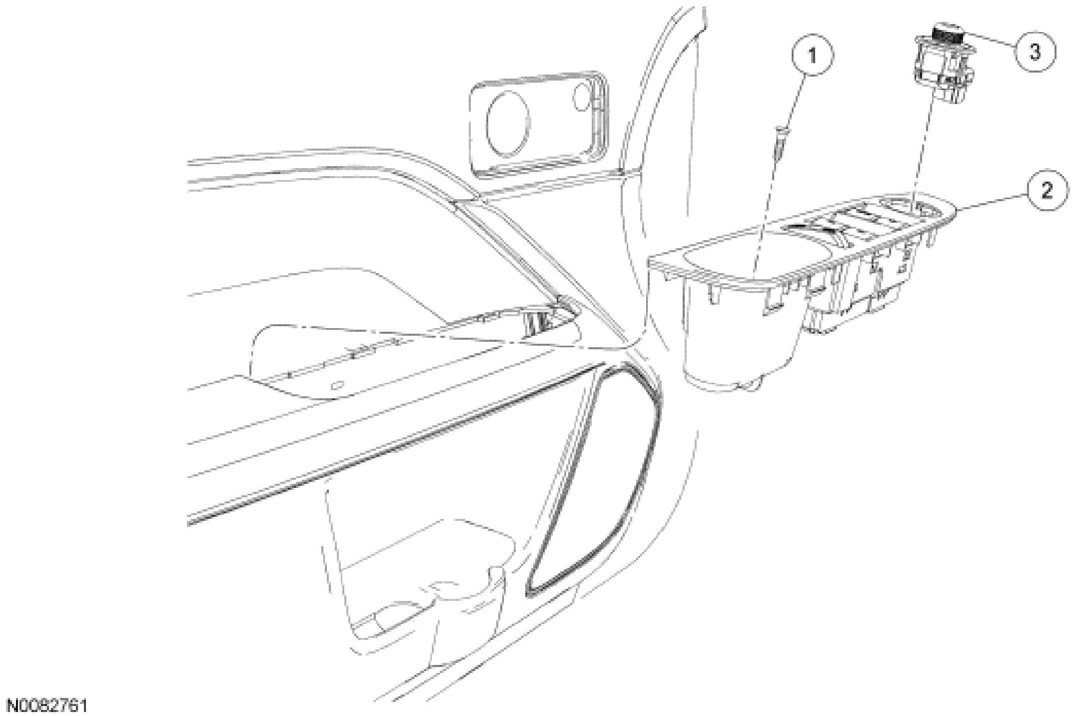

Fig. 87: Exploded View Of Exterior Mirror Control Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Window control switch screw
2	-	Window control switch bezel
3	17B676	Exterior mirror control switch

REMOVAL AND INSTALLATION

1. Remove the window control switch bezel in the following sequence.
    1. Remove the window control switch screw.
    2. Disconnect the electrical connectors.
2. Remove the exterior mirror control switch.
    - Depress the 2 locking tabs.

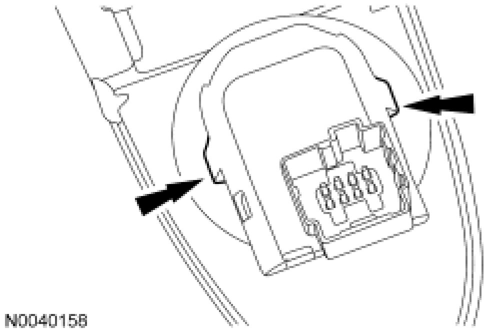

Fig. 88: Locating Exterior Mirror Control Switch Locking Tabs
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.

INTERIOR REAR VIEW MIRROR

Special Tools

Illustration	Tool Name	Tool Number
	Mirror Remover	501-D118
	Installer, Rear View Mirror	501-025 (T94P-17700-AH)

REMOVAL

NOTE: Twisting the interior rear view mirror base from right to left may cause a stress fracture to the windshield.

1. Remove the wire cover (if equipped).
2. Remove the compass by pulling down on the compass rearmost edge (if equipped).
3. Insert the special tool between the mirror mount and windshield bracket from the bottom.

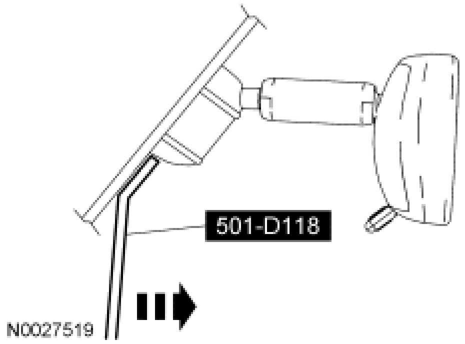

Fig. 89: Inserting Special Tool
Courtesy of FORD MOTOR CO.

4. Release the mirror mount from windshield bracket by pulling the tool away from the windshield.

INSTALLATION

1. Slide the mirror mount over the windshield bracket from the top and adjust the mirror to the upward position.

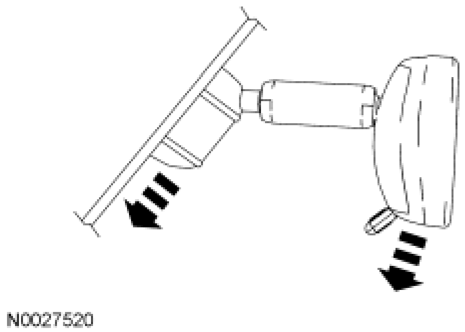

Fig. 90: Installing Mirror Mount Over The Windshield Bracket
Courtesy of FORD MOTOR CO.

2. Using the special tool, press the mirror assembly downward along the windshield until the mount is seated on the windshield bracket.

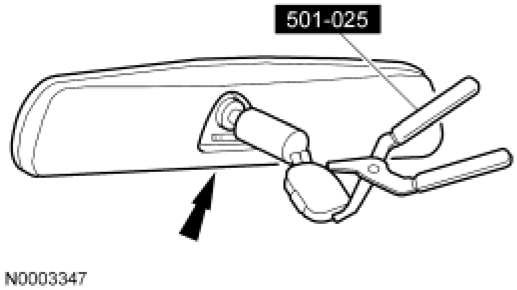

Fig. 91: Locating Mirror Assembly
Courtesy of FORD MOTOR CO.

3. Install compass and wire cover (if equipped).

AUTO-DIMMING INTERIOR MIRROR

Special Tools

Illustration	Tool Name	Tool Number
 ST2574-A	Mirror Remover	501-D118

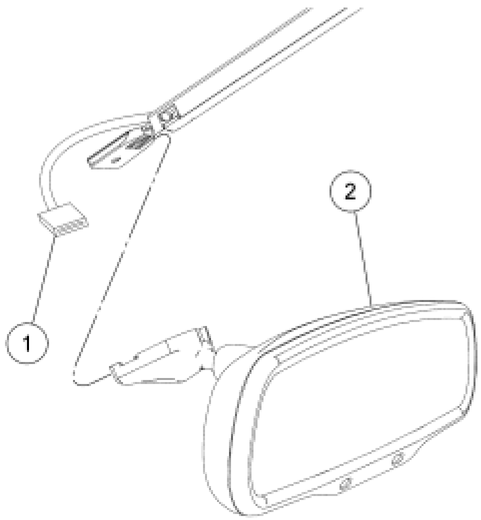

Fig. 92: Exploded View Of Auto-Dimming Interior Mirror
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Interior auto-dimming mirror electrical connector (part of 14A005)
2	17700	Interior auto-dimming mirror

REMOVAL

1. Remove the wire cover.
2. Disconnect the electrical connector.

3. Insert the special tool between the mirror mount and windshield bracket from the top.

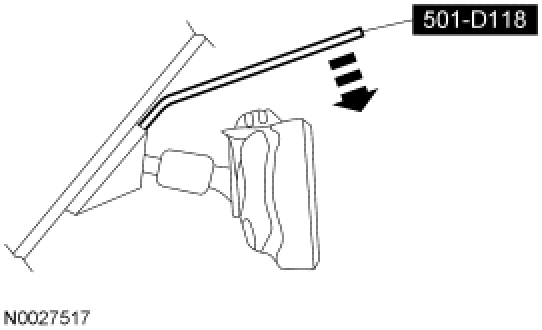

Fig. 93: Inserting Special Tool Between Mirror Mount & Windshield Bracket
Courtesy of FORD MOTOR CO.

NOTE: Twisting the interior rear view mirror base from right to left may cause a stress fracture to the windshield.

4. Release the mirror mount from the windshield bracket by pulling the tool and mirror down and away from the windshield.

INSTALLATION

1. Slide the mirror mount over the windshield bracket from the top and adjust the mirror to the upward position.

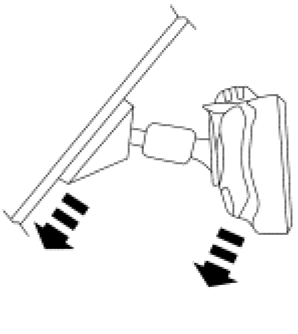

Fig. 94: Sliding Mirror Mount Over Windshield Bracket
Courtesy of FORD MOTOR CO.

2. Quickly press the mirror assembly downward along the windshield until a click is felt. The click indicates the base is engaged to the windshield bracket.
3. Connect the electrical connector and wire cover.
4. If equipped, check the compass zone and calibration. For additional information, refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

2008 ENGINE PERFORMANCE

Reference Values - Gasoline Engines

REFERENCE VALUE SYMPTOM CHART

The Reference Value Symptom Chart provides guidance in selecting the appropriate parameter identification (PID) or measured signal related to the fault area. Select a symptom from the symptom chart along with the category number and go to the PID/Measured Signal Chart. For multiple symptoms, select the symptom that is the most evident.

SYMPTOM CHART

Symptom Occurs During	Symptom	Category Number
Startup:	No start/Normal crank Hard start/Long crank Stall after start Diesels/Runs on	1 2 3 4
Idle:	MIL Stalls/Quits Slow Slow return Rolling Fast Rough Misses Backfires	5 6 7 8 9 10 11 12 13
Acceleration:	Stalls/Quits Misses Bucks/Jerks Backfires Hesitation Lack/Loss of power Surge Spark knock Cooling system temperature Poor fuel economy Emissions compliance	6 12 14 13 15 16 17 18 19 20 21
Cruise:	Stalls/Quits Misses Bucks/Jerks	6 12 14

	Backfires Lack/Loss of power Surge Spark knock Cooling system temperature Poor fuel economy Emissions compliance	13 16 17 18 19 20 21
Deceleration:	Stalls/Quits Backfires	6 13
Transmission Operation: (Automatic)	Shift/engagement concerns No overdrive	22 23

REFERENCE VALUE PARAMETER IDENTIFICATION (PID)/MEASURED SIGNAL CHART

The following listing reflects PIDS and/or measured values which may reveal a possible concern within each system shown. Match the category number with the related PID/measured signal and go to the Typical Diagnostic Reference Value Charts.

PID/MEASURED SIGNAL CHART

Category Number	Related PIDS/Measured Signals
5-9-10-17	WAC/ACCR

[a] Generic PID

Some signals can only be measured and require the use of a digital multimeter (DMM).

TYPICAL DIAGNOSTIC REFERENCE VALUES

NOTES:

Footnotes are referenced throughout the Typical Diagnostic Reference Value Charts. A letter in parentheses next to a value indicates supplemental information is applicable.

An attempt is made to provide as much information as possible; some vehicles may not display all input and output signals.

The Typical Diagnostic Reference Value Charts do not display fault parameter identifications (PIDs). These are PIDs which indicate a hard fault with the circuit. They display a value of YES or NO and are PIDs ending with the letter F.

Reference values may vary 20% depending on operating conditions, altitude, and other factors. RPM values are axle and tire dependent.

Values are taken at an altitude of approximately Meters 55.7 (600 ft) above sea level.

Refer to the Introduction part, Acronyms and Definitions for technical terms applicable to Ford Motor Company products.

Refer to**PARAMETER IDENTIFICATION (PID)** , for PID descriptions.

For detailed transmission diagnostics, refer to the Workshop article. Transmission signals may be referred to in either alpha or numeric form. For example, 1=A, 2=B, 3=C.

A. A/C on.
B. Cooling fan on (single, low or high speed).
C. Heated oxygen sensors (HO2S) should switch from rich to lean at least once every 3 seconds. HO2S voltage should toggle above and below 0.450 DCV and never be a negative value. Valid HO2S switching occurs only during closed loop fuel control operation.
D. Downstream HO2S(s) stay close to a constant voltage when the catalyst monitor is off (positive value only). When the catalyst monitor is on, the HO2S switches rich to lean above and below 0.450 DCV and never be a negative value. For downstream HO2S(s) (12, 13, 22) greater activity results when the catalyst monitor is active.
E. Brake pedal applied.
F. The electric vapor management valve (VMV) commanded current varies from 0 mA - 1000 mA depending on the PCM command to purge the EVAP system.
G. While pressing the transmission control switch (TCS) or switching to manual drive mode.
H. Value is dependent on fuel tank level. Typical operating range is 15% (empty) to 90% (full).
I. Steering wheel turned.
J. Clutch pedal applied.
K. Value is dependent upon ambient air temperature and may fall outside of range.
L. Value is not useful under this condition.
M. If equipped.

N. Transmission in selected range.
O. May change state under this condition.
P. While pressing switch.
Q. Value may cycle 5-6 times every 5 seconds.
R. Canister vent duty cycles to 100% (close) when EVAP monitor test is running.
S. Refer to Workshop article part 419-01.
T. EGR voltage and duty cycle will vary from 0-VBAT or 0-100% depending on EGR demand.
U. RPM dependent. If signal is 0 Hz at idle, check signal at 900 RPM.
V. Crank position.
W. Value may vary 20% depending on altitude, operating conditions, weather, and other factors.

Remote Convenience - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

UNIVERSAL TRANSMITTER

The universal transmitter is an integral part of the LH sun visor and provides a convenient way to substitute up to 3 hand-held transmitters with a single built-in device. The universal transmitter can learn the radio frequency codes of most current transmitters. The universal transmitter:

- operates garage doors, gates and home/office lighting and security systems.
- learns and transmits the radio frequency of up to 3 hand-held transmitters from any of the systems mentioned above.
- is powered by the vehicle battery and charging system.

DIAGNOSTIC TESTS

UNIVERSAL TRANSMITTER

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Universal transmitter • Receiver unit	• Smart junction box (SJB) fuse 3 (15A) • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom. Go to **Symptom Chart**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The universal transmitter is inoperative	• Fuse • Wiring, terminals or connectors • Universal transmitter • Receiver unit	• Go to **Pinpoint Test A**.

Pinpoint Tests

Pinpoint Test A: The Universal Transmitter is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Interior Lamps for schematic and connector information.

Normal Operation

The universal transmitter receives voltage on circuit CLN09 (YE/GN) and is grounded through circuit GD139 (BK/YE).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Receiver unit
- Universal transmitter

PINPOINT TEST A: THE UNIVERSAL TRANSMITTER IS INOPERATIVE

A1 CHECK THE UNIVERSAL TRANSMITTER

- Check the illumination of the universal transmitter by pressing one of the buttons.
- **Does the red indicator on the universal transmitter illuminate?**

  YES : Go to A2.

  NO : Go to A3.

A2 PROGRAM A HAND-HELD TRANSMITTER INTO A UNIVERSAL TRANSMITTER

- Program the universal transmitter. Refer to **Universal Transmitter Programming**.
- **Does the universal transmitter program successfully?**

  YES : The universal transmitter is OK. VERIFY the receiver operates correctly.

  NO : INSTALL a new LH sun visor assembly. TEST the system for normal operation.

A3 CHECK CIRCUIT CLN09 (YE/GN) FOR VOLTAGE

- Disconnect: LH Vanity Mirror Lamp C907

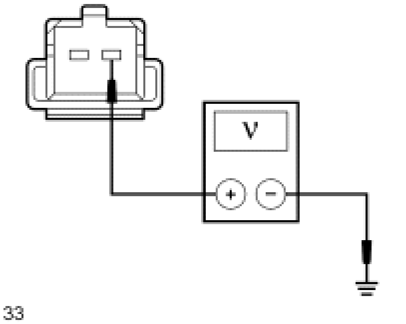

Fig. 1: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the LH vanity mirror lamp C907-1, circuit CLN09 (YE/GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A4.

  NO : VERIFY the smart junction box (SJB) fuse 3 (15A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

A4 CHECK CIRCUIT GD139 (BK/YE) FOR AN OPEN

- Key in OFF position.

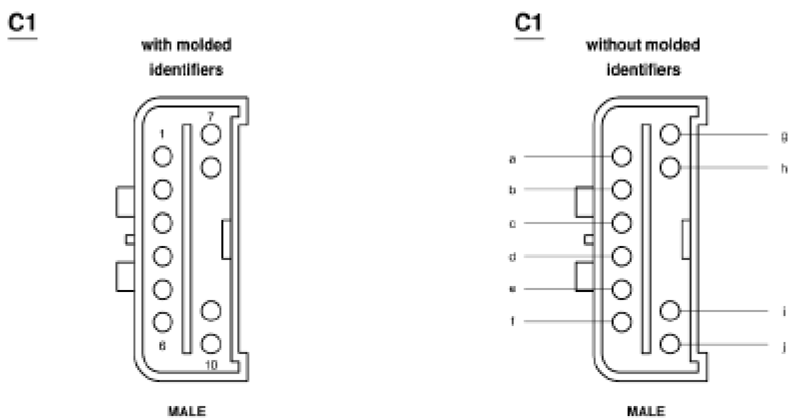

Fig. 2: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the LH vanity mirror lamp C907-2, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new LH sun visor assembly. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

GENERAL PROCEDURES

UNIVERSAL TRANSMITTER PROGRAMMING

NOTE: A new battery in the hand-held transmitter may allow quicker and easier training due to a more accurate transmission of the radio frequency signal.

1. Verify the hand-held transmitter is operative.
2. Turn the key to the ON position.
3. Prepare for programming the universal transmitter by erasing all 3 channels by holding down the 2 outside buttons until the red light begins to flash (20-30 seconds). Release both buttons.
4. Select 1 of the 3 universal transmitter buttons to be used for programming.
5. Hold the end of the hand-held transmitter 25-76 mm (1-3 in) away from the front surface of the universal transmitter so that the universal transmitter red light can still be seen.

   NOTE: During programming, the hand-held transmitter may automatically stop transmitting after 2 seconds, which may not be long enough to program the universal transmitter. If programming with this type of hand-held transmitter, continue to hold the button on the universal transmitter while pressing and releasing the hand-held transmitter button every 2 seconds.

6. At the same time, press the hand-held transmitter button and the desired button on the universal transmitter until the red light on the universal transmitter flashes first slowly, and then rapidly. Release both buttons when the rapid flashing begins.
7. Firmly press and hold for 5 seconds, then release the just-trained universal transmitter button up to 2 separate times to activate the door. If after 2 separate times, the door still does not activate, press and hold the just-trained universal transmitter button and observe the indicator light.
   - If the indicator light stays on constantly, programming is complete and the device should activate when the universal transmitter button is pressed and released.
   - If the indicator light blinks rapidly for 2 seconds and then turns to a constant light, follow the Training a Garage Door Opener Equipped With "Rolling Codes" procedure to complete the programming of a rolling code equipped device.

Training a Garage Door Opener Equipped With "Rolling Codes"

1. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
2. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.) There are 30 seconds to initiate step 3.
3. Return to the vehicle and firmly press, hold for 2 seconds and release the programmed universal transmitter button. Repeat the press/hold/release sequence a second time, and depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming process.

Roof opening panel air deflector screws	1	-	9
Roof opening panel frame bolts	12	9	-
Roof opening panel glass screws	6	-	53
Roof opening panel motor screws	4	-	35

DESCRIPTION AND OPERATION

ROOF OPENING PANEL

The roof opening panel consists of the following:

- Concertina blinds
- Air deflector
- Trough assembly
- Roof opening panel glass
- Roof opening panel motor
- Roof opening panel module
- Roof opening panel shield
- Roof opening panel switch
- Roof opening panel drain hoses

The roof opening panel is an electronically operated panel that can be opened or closed by pressing a switch located on the overhead console. It also has one-touch open, one-touch close, one-touch vent open and one-touch vent close features.

When the roof opening panel is in the fully CLOSED position, pressing the roof opening panel control switch rearward to the second detent and then releasing it will activate the one-touch open feature. Pressing the roof opening panel control switch in either direction with the roof opening panel moving will cancel the one-touch open operation.

With the roof opening panel glass in any OPEN position except VENT, rocking the roof opening panel control switch forward and then releasing it will activate the one-touch close feature. Pressing the roof opening panel control switch in either direction with the roof opening panel moving will cancel the one-touch close operation and the motion will immediately stop. Near the end of the forward travel, the rear portion of the roof opening panel glass moves upward on 2 lifter arms. This allows a weather-tight seal when the roof opening panel glass is closed.

If an obstacle contacts the leading edge of the roof opening panel glass during one-touch close operation, the roof opening panel glass will reverse direction and open to approximately the mid position and stop. The operator cannot stop this open motion once it has begun.

If an obstacle contacts the rear edge of the roof opening panel glass during one-touch vent close operation, the roof opening panel glass will reverse direction to the vent OPEN position.

When the roof opening panel glass is in the fully CLOSED position, pressing the roof opening panel control switch forward and then releasing it will activate the one-touch vent feature. Pressing the roof opening panel control switch in either direction with the roof opening panel moving will cancel the one-touch vent operation. There is a one-touch vent close feature.

Global Open - MKZ Only

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

The SJB sends a signal on the global open circuit, to both front door window motors and the roof opening panel motor, to open the windows based on a signal received from the remote keyless entry (RKE) transmitter. If the accessory delay relay is active, the global open feature will not operate.

DIAGNOSTIC TESTS

ROOF OPENING PANEL

Special Tools

Illustration	Tool Name	Tool Number
	73III Automotive Meter	105-R0057 or equivalent

Principles of Operation

Roof Opening Panel - The roof opening panel assembly uses an integrated motor and module to operate the roof opening panel. The roof opening panel motor and module are installed new as an assembly. The roof opening panel is an electronically operated glass panel that can be opened, closed or tilted by the roof opening panel switch. Actuating the switch in either a forward or rearward motion supplies a ground to the roof opening panel motor/module. The roof opening panel has one-touch open and one-touch close features that are activated when the switch is momentarily pressed to the double detent OPEN or CLOSE position. These functions are controlled by the roof opening panel motor/module.

The roof opening panel motor must be initialized whenever the roof opening panel motor has been removed from the roof opening panel system, the roof opening panel assembly has been removed from the vehicle, a new roof opening panel motor has been installed or a new roof opening panel assembly has been installed.

Global Open - MKZ only

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

When the unlock button of the remote keyless entry (RKE) transmitter is held for 2 seconds the global open activates. The SJB sends a signal to activate the one-touch open operation of the roof opening panel. The global open feature does not operate if the delay accessory is active.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Roof opening panel • Roof opening panel frame • Roof opening panel drain hoses • Roof opening panel lifter assemblies • Roof opening panel trough • Roof opening panel air deflector assembly • Roof opening panel seal • Roof opening panel shield	• Battery junction box (BJB) fuse 33 (20A) • Smart junction box (SJB) fuse 12 (7.5A) • Circuitry • Accessory delay relay • Roof opening panel motor and module assembly • Roof opening panel switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern is not visually evident, determine the symptom. Go to **Symptom Chart - Roof Opening Panel** or Go to **Symptom Chart - Noise, Vibration and Harshness (NVH)**.

Symptom Chart - Roof Opening Panel

Symptom Chart - Roof Opening Panel

Condition	Possible Sources	Action
• The roof opening panel leaks	• Roof opening panel adjustment • Front rail seal • Drain tube attachment points • Roof opening panel water trough and seal • Roof opening panel drain hose • Roof opening panel weatherstrip/seals • Mechanism mistimed	• Go to **Pinpoint Test B**.
• The roof opening panel does not open or close	• Roof opening panel adjustment • Fuse(s) • Circuitry • Roof opening panel switch • Roof opening panel motor/module assembly • Roof opening panel lifter assemblies • Roof opening panel motor not initialized	• Go to **Pinpoint Test E**.
• The one-touch open feature is inoperative	• Roof opening panel motor not initialized • Roof opening panel motor/module • Roof opening panel control switch • Circuitry	• INITIALIZE the roof opening panel motor/module. REFER to **Roof Opening Panel Motor Initialization**. If concern is still present after initialization, INSTALL a new roof opening panel motor/module. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Motor**. TEST the system for normal operation. Go to

		Pinpoint Test E.
• The global open function is inoperative/does not operate correctly	• Circuitry • Roof opening panel motor • Smart junction box (SJB) • Remote keyless entry (RKE) transmitters • Roof opening panel not initialized	• Go to **Pinpoint Test F**.
• The roof opening panel does not seat in flush position from any position	• Incorrect roof opening panel adjustment • Mechanism mistimed	• REFER to **Roof Opening Panel Alignment**.
• Roof opening panel reverses during operation	• Mechanism mistimed	• REFER to **Timing Adjustment**.
	• Roof opening panel not initialized	• REFER to **Roof Opening Panel Motor Initialization**.
	• Roof opening panel adjustment • Concertina blind broken or loose • Foreign material in guide	• REFER to **Roof Opening Panel Alignment**.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: **Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.**

Symptom Chart - Noise, Vibration and Harshness (NVH)

Condition	Possible Sources	Action
• The roof opening panel has excessive wind noise	• Incorrect adjustment • Roof opening panel weatherstrip/seals • Mechanism mistimed	• Go to **Pinpoint Test A**.

	assembly	
• The roof opening panel rattles	• Roof opening panel trough • Roof opening panel lifter assemblies • Roof opening panel water trough guide • Headliner • Motor pad • Rear side brackets	• Go to **Pinpoint Test C**.
• The roof opening panel is noisy during operation	• Roof opening panel • Roof opening panel tracks • Roof opening panel lifter assemblies • Roof opening panel adjustment • Roof opening panel motor/module assembly	• Go to **Pinpoint Test D**.

Pinpoint Tests

Pinpoint Test A: The Roof Opening Panel Has Excessive Wind Noise

Normal Operation

When the roof opening panel glass is completely closed, it is flush with the roof panel.

This pinpoint test is intended to diagnose the following:

- Incorrect roof opening panel alignment
- Poorly fitting roof opening panel seal/weatherstrip
- Incorrect installation of the roof opening panel and motor/module
- Incorrect curvature of the air deflector

PINPOINT TEST A: THE ROOF OPENING PANEL HAS EXCESSIVE WIND NOISE

A1 VERIFY ROOF OPENING PANEL NOISE

- Road test the vehicle with the roof opening panel in the CLOSED and OPEN positions.
- **Is the wind noise present only in the OPEN position?**

  YES : Go to A4.

  NO : Go to A2.

A2 CHECK THE ROOF OPENING PANEL WEATHERSTRIP

NOTE:	**Make sure the weatherstrip is secured to the glass, not cut, cracked, pinched, loose or obstructed in CLOSED, VENT and OPEN positions.**

- Check the roof opening panel weatherstrip.

- **Is the roof opening panel weatherstrip OK?**

  YES : Go to A3.

  NO : INSTALL a new roof opening panel weatherstrip. REFER to **Roof Opening Panel - Exploded View**. TEST the system for normal operation.

A3 CHECK ROOF OPENING PANEL ALIGNMENT

- Check the roof opening panel alignment.
- **Is the alignment OK?**

  YES : CHECK for correct installation of the roof opening panel and motor/module. REFER to **Roof Opening Panel - Exploded View**,**Roof Opening Panel Frame** and **Roof Opening Panel Motor**. TEST the system for normal operation.

  NO : ALIGN the roof opening panel. REFER to **Roof Opening Panel Alignment**. TEST the system for normal operation.

A4 CHECK THE AIR DEFLECTOR

- Make sure the air deflector is securely attached.
- **Is the air deflector OK?**

  YES : PARTIALLY close the roof opening panel until the noise is eliminated. If the noise is eliminated, INFORM the customer that changing glass location will eliminate the wind noise. If the wind noise is not eliminated, INSTALL a new air deflector. TEST the system for normal operation.

  NO : INSTALL new air deflector assembly. REFER to **Roof Opening Panel - Exploded View** and **Air Deflector**. TEST the system for normal operation.

Pinpoint Test B: The Roof Opening Panel Leaks

Normal Operation

When the roof opening panel glass is completely closed, it is flush with the roof panel.

This pinpoint test is intended to diagnose the following:

- Incorrect roof opening panel adjustments
- Damaged roof opening panel drain hoses
- Damaged roof opening panel seal/weatherstrip
- Damaged roof opening panel frame
- Incorrect position of the roof opening panel glass

PINPOINT TEST B: THE ROOF OPENING PANEL LEAKS

B1 CHECK THE ALIGNMENT OF THE ROOF OPENING PANEL

NOTE:	**Make sure the roof opening panel weatherstrip is not cracked or loose.**

- Check the roof opening panel weatherstrip.

- **Does the roof opening panel seal correctly?**

  YES : Go to B2.

  NO : ALIGN the roof opening panel. REFER to **Roof Opening Panel Alignment**. TEST the system for normal operation.

B2 CHECK THE ROOF OPENING PANEL DRAIN HOSES

> **NOTE: Make sure the roof opening panel drain hoses are not cracked, slit, pinched or obstructed.**

- Check the 4 roof opening panel drain hoses for correct operation.
- **Are the roof opening panel drain hoses OK?**

  YES : Go to B3.

  NO : REPAIR or INSTALL a new roof opening panel drain hose(s). TEST the system for normal operation.

B3 CHECK THE ROOF OPENING PANEL DRAIN HOSE ATTACHMENT POINTS

> **NOTE: Make sure the roof opening panel drain hose attachment points are not damaged or obstructed.**

- Check the roof opening panel drain hose attachment points for correct attachment.
- **Are the roof opening panel drain hose attachment points OK?**

  YES : Go to B4.

  NO : REPAIR or INSTALL a new roof opening panel frame. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**. TEST the system for normal operation.

B4 CHECK THE ROOF OPENING PANEL REAR TROUGH CONDITION

- Check the roof opening panel rear trough for damage.
- **Is the roof opening panel trough OK?**

  YES : Go to B5.

  NO : REPAIR or INSTALL a new roof opening rear trough. REFER to **Roof Opening Panel - Exploded View**, **Roof Opening Panel Frame** and **Trough Assembly**. TEST the system for normal operation.

B5 CHECK THE CONDITION OF THE ROOF OPENING GLASS PANEL

- Check the roof opening panel frame for damage that may cause the roof opening panel glass seal to seat incorrectly.
- **Is the roof opening panel frame OK?**

  YES : INSTALL a new roof opening panel glass. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Glass**. TEST the system for normal operation.

  NO : REPAIR or INSTALL a new roof opening panel frame. REFER to **Roof Opening Panel - Exploded View** **Roof Opening Panel Frame**. TEST the system for normal operation.

Pinpoint Test C: The Roof Opening Panel Rattles

Normal Operation

When the roof opening panel glass is completely closed, it is flush with the roof panel. All components should be secured correctly.

This pinpoint test is intended to diagnose the following:

- Roof opening panel
- Roof opening panel air deflector assembly
- Roof opening panel trough
- Roof opening panel lifter assemblies
- Headliner
- Roof opening panel motor/module pad
- Roof opening panel frame

PINPOINT TEST C: THE ROOF OPENING PANEL RATTLES

C1 CHECK THE ROOF OPENING PANEL WEATHERSTRIP

NOTE:	**Make sure the weatherstrip is secured to the glass, not cut, cracked, pinched, loose or obstructed in CLOSED, VENT and OPEN positions.**

- Check the roof opening panel weatherstrip.
- **Is the roof opening panel weatherstrip OK?**

YES : Go to C2.

NO : INSTALL a new roof opening panel weatherstrip. REFER to **Roof Opening Panel - Exploded View**. TEST the system for normal operation.

C2 CHECK THE ROOF OPENING PANEL TIGHTNESS

- Manually push up and fore/aft.
- **Is the roof opening panel loose?**

YES : ALIGN the roof opening panel. REFER to **Roof Opening Panel Alignment**. TEST the system for normal operation.

NO : Go to C3.

C3 CHECK THE ROOF OPENING PANEL TRACKS

- Open the roof opening panel.
- Check the roof opening panel tracks for obstructions and damage.
- **Are the roof opening panel tracks OK?**

YES : Go to C4.

NO : REMOVE all the roof opening panel track obstructions and REPAIR the roof opening panel tracks. If the roof opening panel tracks cannot be repaired, INSTALL a new roof opening panel frame. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**. TEST the system for normal operation.

C4 CHECK THE ROOF OPENING PANEL TROUGH AND TROUGH GUIDES

- Check the water roof opening panel trough and trough guides for any loose obstructions.
- **Are the roof opening panel trough and trough guides installed securely and free from obstructions?**

  YES : Go to C5.

  NO : REMOVE all obstructions from the roof opening panel trough guides and install securely. INSTALL a new roof opening panel frame if the trough guides are damaged. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**. TEST the system for normal operation.

C5 CHECK THE ROOF OPENING PANEL SHIELD (SUNSHADE)

- Check the roof opening panel shield for correct installation.
- **Is the roof opening panel shield installed correctly?**

  YES : Go to C6.

  NO : INSTALL the roof opening panel shield correctly. REFER to **Roof Opening Panel Shield**. TEST the system for normal operation.

C6 CHECK THE ROOF OPENING PANEL AIR DEFLECTOR ASSEMBLY

- Check the roof opening panel air deflector assembly for obstructions and damage.
- **Is the roof opening panel air deflector assembly OK?**

  YES : Go to C7.

  NO : REMOVE all obstructions and REPAIR or INSTALL a new roof opening panel air deflector assembly. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**. TEST the system for normal operation.

C7 CHECK THE ROOF OPENING PANEL GLASS

- Verify the roof opening panel glass is free from obstructions and damage, and is securely fastened.
- **Is the roof opening panel glass OK?**

  YES : Go to C8.

  NO : REPAIR or INSTALL a new roof opening panel glass. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Glass**. TEST the system for normal operation.

C8 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES

- Verify the roof opening panel lifter assemblies are free from obstructions and damage.
- **Are the roof opening panel lifter assemblies OK?**

  YES : Go to C9.

  NO : REMOVE all obstructions from the roof opening panel lifter assemblies and REPAIR any damage. If the roof opening panel lifter assemblies cannot be repaired, INSTALL a new roof opening panel frame. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**. TEST the system for normal operation.

C9 CHECK ROOF OPENING PANEL FRAME INSTALLATION

- Check all roof opening fasteners for correct torque and verify correct installation of the roof opening panel frame. Refer to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**.

- **Is the roof opening panel correctly installed and tightened to specification?**

  YES : Go to C10.

  NO : TIGHTEN the loose fasteners or REINSTALL the roof opening panel frame. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame** in this section. TEST the system for normal operation.

C10 CHECK THE ROOF OPENING PANEL FRAME FOR RATTLES

- Check the roof opening panel frame assembly for any loose parts or for any condition that will cause rattles.
- **Is there a condition that will cause rattles?**

  YES : INSTALL a suitable sound damper material to correct the condition. If the rattle still persists, INSTALL a new roof opening panel frame. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**. TEST the system for normal operation.

  NO : INSTALL a new roof opening panel frame. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**. TEST the system for normal operation.

Pinpoint Test D: The Roof Opening Panel is Noisy During Operation

Normal Operation

The roof opening panel operates smoothly while opening and closing.

This pinpoint test is intended to diagnose the following:

- Obstructed or damaged roof opening panel
- Obstructed or damaged roof opening panel lifter assemblies
- Incorrect roof opening panel adjustment
- Noisy roof opening panel motor/module assembly

PINPOINT TEST D: THE ROOF OPENING PANEL IS NOISY DURING OPERATION

D1 CHECK THE ROOF OPENING PANEL FOR OBSTRUCTIONS OR DAMAGE

- Check the roof opening panel for any obstructions and damage.
- **Are there any obstructions and/or damage?**

  YES : REMOVE all obstructions. REPAIR any damage. If the damage cannot be repaired, INSTALL a new roof opening panel frame. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**. TEST the system for normal operation.

  NO : Go to D2.

D2 CHECK THE ROOF OPENING PANEL OPERATION

- Check the roof opening panel during operation.
- **Is the roof opening panel loose or incorrectly aligned?**

  YES : ALIGN the roof opening panel. REFER to **Roof Opening Panel Alignment**. TEST the system for normal operation.

  NO : Go to D3.

D3 CHECK THE ROOF OPENING PANEL TRACKS

- Open the roof.
- Check the roof opening panel tracks for obstructions and damage.
- **Are the roof opening panel tracks OK?**

  YES : Go to D4.

  NO : REMOVE all obstructions and REPAIR any damage. If the roof opening panel tracks cannot be repaired, INSTALL a new roof opening panel frame. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**. TEST the system for normal operation.

D4 CHECK THE ROOF OPENING PANEL SHIELD

- Check the roof opening panel shield for correct movement.
- **Is the roof opening panel shield moving correctly?**

  YES : Go to D5.

  NO : REMOVE and REINSTALL the roof opening panel shield. REFER to **Roof Opening Panel Shield**. TEST the system for normal operation.

D5 CHECK THE ROOF OPENING PANEL LIFTER ASSEMBLIES

- Check the roof opening panel lifter assemblies for obstructions and damage.
- **Are the roof opening panel lifter assemblies OK?**

  YES : Go to D6.

  NO : REMOVE all obstructions and REPAIR any damage. If the roof opening panel lifter assemblies cannot be repaired, INSTALL a new roof opening panel frame. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**. TEST the system for normal operation.

D6 CHECK THE ROOF OPENING PANEL MOTOR/MODULE

- Remove the roof opening panel motor/module and leave the electrical connector connected.
- Operate the roof opening panel to the full OPEN and CLOSED position.
- **Does the motor/module make excessive noise?**

  YES : INSTALL a new roof opening panel motor/module. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Motor**. TEST the system for normal operation.

  NO : REINSTALL the roof opening panel motor/module. TEST the system for normal operation. If the roof opening panel is still noisy, INSTALL a new roof opening panel frame. REFER to **Roof Opening Panel - Exploded View** and **Roof Opening Panel Frame**. If the roof opening panel is no longer noisy, the system is operating correctly. The concern may have been caused by an incorrectly installed roof opening panel motor.

Pinpoint Test E: The Roof Opening Panel Does Not Open or Close

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Roof Opening Panel for schematic and connector information.

The roof opening panel motor must be initialized whenever the roof opening panel motor has been removed from the roof opening panel system, the roof opening panel assembly has been removed from the vehicle, a new

roof opening panel motor has been installed or a new roof opening panel assembly has been installed. Refer to **Roof Opening Panel Motor Initialization**.

Normal Operation

The roof opening panel uses an integrated motor and module to operate the roof opening panel. A new roof opening panel motor/module is installed as an assembly.

The roof opening panel motor/module receives voltage from the accessory delay relay through circuit CBP02 (GN) when the key is in the ACC or RUN position and voltage at all times through circuit SBB33 (RD). Ground is supplied to the motor/module through circuit GD139 (BK/YE). The roof opening panel motor/module provides ground to the roof opening panel switch through circuit CPR39 (VT/WH). When the roof opening panel switch is pressed to the CLOSED position, a ground signal is sent to the roof opening panel motor/module through circuit CPR40 (YE/OG), which causes the roof opening panel to close. When the roof opening panel switch is pressed to the OPEN position, a ground signal is sent to the roof opening panel motor/module through circuit CPR31 (VT/BN), which causes the roof opening panel to open.

One-touch open and one-touch close features are enabled when the motor/module receives a ground input from the roof opening panel switch through circuit CPR38 (WH/BU).

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Inoperative roof opening panel switch
- Inoperative roof opening panel motor/module assembly
- Inoperative accessory delay relay
- Roof opening panel motor not initialized

PINPOINT TEST E: THE ROOF OPENING PANEL DOES NOT OPEN OR CLOSE

E1 CHECK THE ROOF OPENING PANEL OPERATION

- Key in ON position.
- Attempt to operate the roof opening panel to the vent position.
- **Does the roof opening panel operate to the vent position?**

  YES : Go to E2.

  NO : Go to E3.

E2 CHECK THE MOTOR/MODULE FOR INITIALIZATION

- Carry out the roof opening panel motor initialization procedure. Refer to **Roof Opening Panel Motor Initialization**.
- **Is the concern still present?**

  YES : Go to E3.

  NO : The system is operating normally at this time. The roof opening panel motor was not initialized.

E3 CHECK THE POWER WINDOWS

- Key in ON position.
- Verify the power windows operate.
- **Do the power windows operate?**

  YES : Go to E4.

  NO : REFER to **GLASS, FRAMES AND MECHANISMS** article to diagnose the accessory delay relay circuit.

E4 CHECK THE ROOF OPENING PANEL SWITCH

- Key in OFF position.
- Disconnect: Roof Opening Panel Switch C912
- Carry out the roof opening panel switch component test. Refer to COMPONENT TESTING.
- **Is the roof opening panel switch OK?**

  YES : Go to E5.

  NO : INSTALL a new roof opening panel switch. REFER to **Roof Opening Panel Control Switch**. TEST the system for normal operation.

E5 CHECK VOLTAGE TO THE ROOF OPENING PANEL MOTOR/MODULE - CIRCUITS CBP02 (GN) AND SBB33 (RD)

- Key in OFF position.
- Disconnect: Roof Opening Panel Motor/Module C921
- Key in ON position.

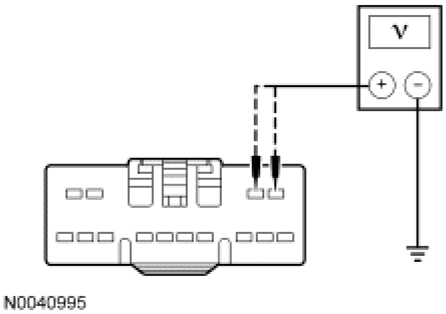

Fig. 1: Checking Voltage To Roof Opening Panel Motor/Module - Circuit CBP02 (GN) And SBB33 (RD)
Courtesy of FORD MOTOR CO.

- Measure the voltage between roof opening panel motor/module C921-2, circuit CBP02 (GN) and C921-1, circuit SBB33 (RD), harness side and ground.
- **Are the voltages greater than 10 volts, but less than 16 volts?**

  YES : Go to E6.

  NO : VERIFY smart junction box (SJB) fuse 12 (7.5A) and battery junction box (BJB) fuse 33 (20A) are OK. If OK, REPAIR the circuit. TEST the system for normal operation.

E6 CHECK THE ROOF OPENING PANEL GROUND - CIRCUIT GD139 (BK/YE)

- Key in OFF position.

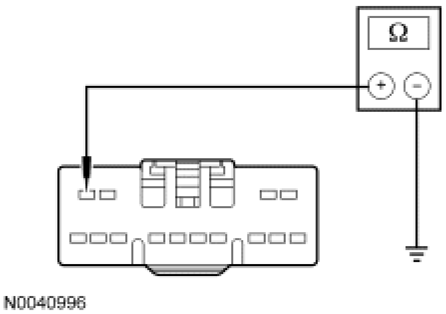

Fig. 2: Checking Roof Opening Panel Ground - Circuit GD139 (BK/YE)
Courtesy of FORD MOTOR CO.

- Measure the resistance between roof opening panel motor/module C921-4, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E7.

  NO : REPAIR the circuit. TEST the system for normal operation.

E7 CHECK CIRCUIT CPR39 (VT/WH) FOR AN OPEN

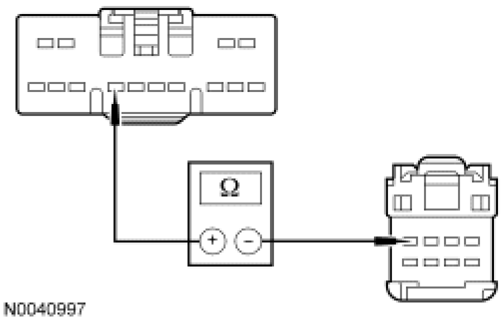

Fig. 3: Checking Circuit CPR39 (VT/WH) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between overhead console C912-4, circuit CPR39 (VT/WH), and roof opening panel motor/module C921-11, circuit CPR39 (VT/WH) harness side.
- **Is the resistance less than 5 ohms?**

  YES : CHECK the overhead console jumper harness for loose pins, an open or a short in circuit CPR39 (VT/WH) between the roof opening panel switch socket and overhead console C912-4. If the overhead console jumper harness is not OK, INSTALL a new overhead console jumper harness and TEST the system for normal operation. If the overhead console jumper harness is OK, go to E8.

  NO : REPAIR the circuit. TEST the system for normal operation.

E8 CHECK CIRCUIT CPR40 (YE/OG) FOR AN OPEN

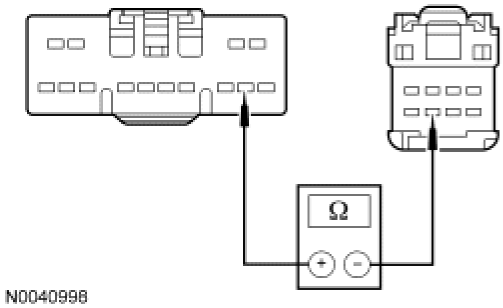

Fig. 4: Checking Circuit CPR40 (YE/OG) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between overhead console C912-7, circuit CPR40 (YE/OG), and roof opening panel motor/module C921-6, circuit CPR40 (YE/OG) harness side.
- **Is the resistance less than 5 ohms?**

  YES : CHECK the overhead console jumper harness for loose pins, an open or a short in circuit CPR40 (YE/OG) between the roof opening panel switch socket and overhead console C912-7. If the overhead console jumper harness is not OK, INSTALL a new overhead console jumper harness and TEST the system for normal operation. If the overhead console jumper harness is OK, go to E9.

  NO : REPAIR the circuit. TEST the system for normal operation.

E9 CHECK CIRCUIT CPR31 (VT/BN) FOR AN OPEN

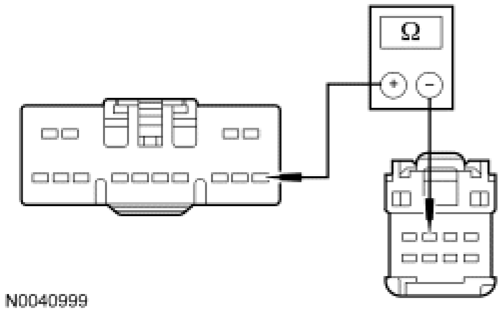

Fig. 5: Checking Circuit CPR31 (VT/BN) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between overhead console C912-3, circuit CPR31 (VT/BN), and roof opening panel motor/module C921-5, circuit CPR31 (VT/BN) harness side.
- **Is the resistance less than 5 ohms?**

  YES : CHECK the overhead console jumper harness for loose pins, an open or a short in circuit CPR31 (VT/BN) between the roof opening panel switch socket and overhead console C912-3. If the overhead console jumper harness is not OK, INSTALL a new overhead console jumper harness, and TEST the system for normal operation. If the overhead console jumper harness is OK, go to E10.

  NO : REPAIR the circuit. TEST the system for normal operation.

E10 CHECK CIRCUIT CPR38 (WH/BU) FOR AN OPEN

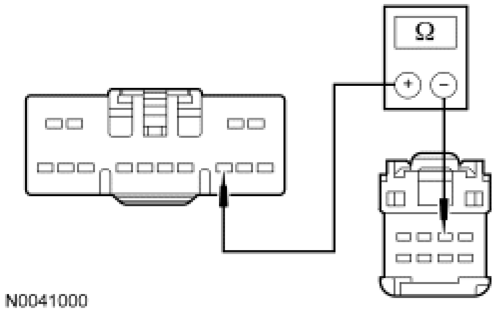

Fig. 6: Checking Circuit CPR38 (BU/BK) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between overhead console C912-2, circuit CPR38 (WH/BU), and roof opening panel motor/module C921-7, circuit CPR38 (WH/BU) harness side.
- **Is the resistance less than 5 ohms?**

  YES : CHECK the overhead console jumper harness for loose pins, an open or a short in circuit CPR38 (WH/BU) between the roof opening panel switch socket and overhead console C912-2. If the overhead console jumper harness is not OK, INSTALL a new overhead console jumper harness and TEST the system for normal operation. If the overhead console jumper harness is OK, go to E11.

  NO : REPAIR the circuit. TEST the system for normal operation.

E11 CHECK THE ROOF OPENING PANEL MOTOR/MODULE FOR CORRECT OPERATION

- Disconnect all roof opening panel motor/module connectors.
- Check for:
  - corrosion.
  - bent or pushed-out pins.
- Connect all roof opening panel motor/module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new roof opening panel motor/module. REFER to **Roof Opening Panel Motor**. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test F: The Global Open Function is Inoperative/Does Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Roof Opening Panel for schematic and connector information.

Normal Operation

When the global open feature is activated the smart junction box (SJB) sends a signal through circuit CPW01 (BN/BU) to the roof opening panel motor. The global open feature does not function when the delayed accessory is active.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Roof opening panel motor
- SJB
- Remote keyless entry (RKE) transmitters
- Roof opening panel not initialized

PINPOINT TEST F: THE GLOBAL OPEN FUNCTION IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

NOTE: **One-touch open must be operational for the global open function to operate correctly. Make sure the one-touch open is operational before proceeding with this diagnostic.**

F1 VERIFY THE POWER WINDOWS ARE OPERATIONAL

- Operate the power windows using the global open procedure.
- **Do the power windows operate correctly?**

  YES : Go to F2.

  NO : REFER to **GLASS, FRAMES AND MECHANISMS** article to diagnose the inoperative windows.

F2 CHECK CIRCUIT CPW01 (BN/BU) FOR AN OPEN

- Disconnect: Roof Opening Panel Motor C921
- Disconnect: SJB C2280c

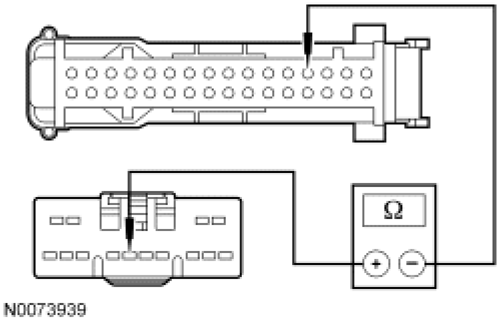

Fig. 7: Checking Circuit CPW01 (BN/BU) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between roof opening panel motor C921-10, circuit CPW01 (BN/BU), harness side and the C2280c-29, circuit CPW01 (BN/BU) harness side.
- **Is the resistance less than 5 ohms?**

YES : INSTALL a new roof opening panel motor. REFER to **Roof Opening Panel Motor**. INITIALIZE the roof opening panel motor. REFER to **Roof Opening Panel Motor Initialization** TEST the system for normal operation.

NO : REPAIR the circuit. INITIALIZE the roof opening panel motor. REFER to **Roof Opening Panel Motor Initialization**. TEST the system for normal operation.

GENERAL PROCEDURES

ROOF OPENING PANEL ALIGNMENT

1. Open the roof opening panel to the VENT position.
2. Loosen the 4 roof opening panel glass screws.
    - To access the glass screws, unclip the top portion of the concertina blind and position aside as shown.

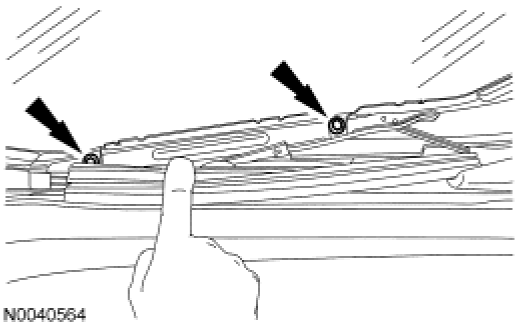

Fig. 8: Locating Roof Opening Panel Glass Screws
Courtesy of FORD MOTOR CO.

3. Close the roof opening panel glass.

NOTE: **The correct position of the roof opening panel glass to the roof panel should be -1.50 mm to 0 mm (-0.059 to 0 in) at the front edge and 0 mm to 1.5 mm (0 to 0.059 in) at the rear edge of the roof panel.**

Make sure the roof opening panel is centered in the roof opening.

4. Adjust the roof opening panel glass.

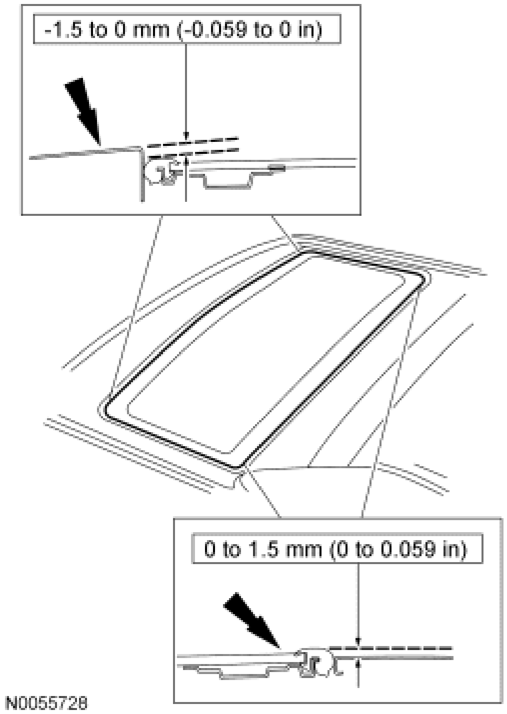

Fig. 9: Identifying Roof Opening Panel Glass Gap
Courtesy of FORD MOTOR CO.

5. Tighten the 4 roof opening panel glass screws to 6 N.m (53 lb-in).

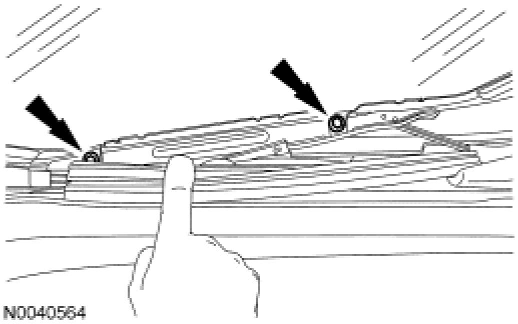

Fig. 10: Locating Roof Opening Panel Glass Screws
Courtesy of FORD MOTOR CO.

6. Open the roof opening panel to the VENT position.
7. Reattach the concertina blind making sure that it is fully seated on the 3 clips in roof panel glass.

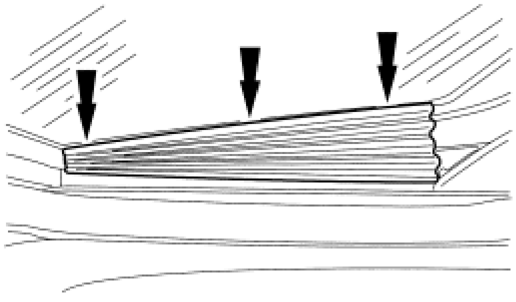

Fig. 11: Locating Roof Panel Glass Clips
Courtesy of FORD MOTOR CO.

ROOF OPENING PANEL MOTOR INITIALIZATION

WARNING: **Keep objects and body parts clear of the glass panel when carrying out the initialization procedure. During the initialization procedure, the glass panel closes with high force and cannot detect objects in its path. Failure to follow this instruction may result in serious personal injury.**

NOTE: A new roof opening panel motor must be initialized after installation. It will only move toward the VENT position until initialized.

NOTE: The roof opening panel motor initialization procedure must be done when repairs are carried out on any part of the roof opening panel system, including: any time the roof opening panel motor has been removed from the roof opening panel assembly, a new roof opening panel motor has been installed or when a new roof opening panel assembly has been installed.

1. Turn the ignition to the RUN position.
2. For a new roof opening panel motor, press and hold the roof opening panel control switch forward until the roof opening panel glass moves to the full VENT position.

   NOTE: Make sure the front door is open during this step.

3. Cycle the ignition from ON to OFF and then back to ON.
4. Within 5 seconds:
   - press and release the roof opening panel control switch forward.
   - press and hold the roof opening panel control switch forward.
5. Continue holding roof opening panel control switch forward for 5 seconds after the roof opening panel motor stops moving to confirm this position to the roof opening panel motor.

   NOTE: Only complete open and close motions count towards the cycle count. If the roof opening panel reverses during closing operations, perform the cycles with the roof opening panel control switch continuously held

during the closing motions.

6. Release the roof opening panel switch and test the system for normal operation by checking the one-touch open, one-touch close, one-touch vent and close operations. Five complete cycles must be carried out for the roof opening panel motor to be correctly initialized.
    - If roof opening panel does not operate correctly, repeat Steps 2 through 6.

TIMING ADJUSTMENT

NOTE: **Anytime a roof opening panel motor is removed, the cables/mechanisms can experience free-play movement. It is important that the cables do not move. They are timed to be parallel with each other. If one or both are moved in either direction, they must be re-timed.**

1. Remove the roof opening panel glass. For additional information, refer to **Roof Opening Panel Glass**.
2. Remove the roof opening panel motor. For additional information, refer to **Roof Opening Panel Motor**.
3. Using a flat-blade screwdriver, push on the back of the drive slide until it contacts the timing screw. Repeat on other side.

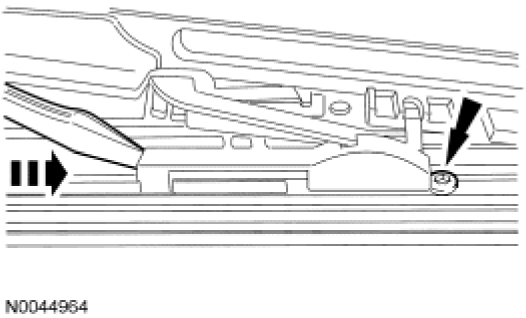

Fig. 12: Pushing On Back Of Drive Slide Until It Contacts Timing Screw Using A Flat-Blade Screwdriver
Courtesy of FORD MOTOR CO.

4. Reinstall the roof opening panel motor but do not carry out the roof opening panel motor initialization. For additional information, refer to **Roof Opening Panel Motor**.
5. Reinstall the roof opening panel glass. For additional information, refer to **Roof Opening Panel Glass**.
6. Operate the roof opening panel to the full VENT position and hold for 6 seconds.
7. Initialize the roof opening panel motor. For additional information, refer to **Roof Opening Panel Motor Initialization**.

REMOVAL AND INSTALLATION

ROOF OPENING PANEL - EXPLODED VIEW

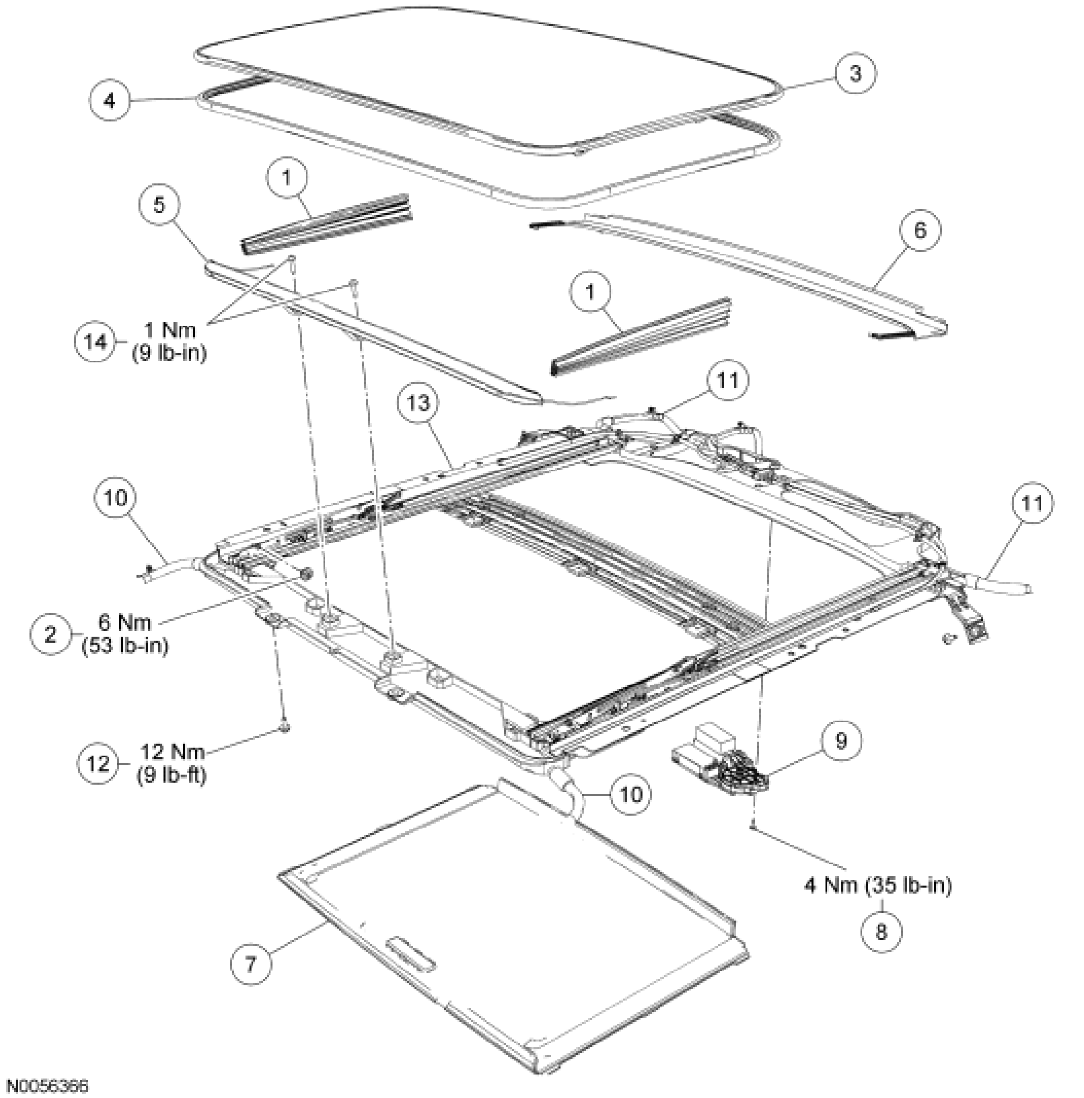

Fig. 13: Exploded View Of Roof Opening Panel With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	500A66	Concertina blinds (2 required)
2	-	Roof opening panel glass screw (4 required)
3	54500A18	Roof opening panel glass
4	5451884	Roof opening panel glass seal
5	54500A26	Roof opening panel air deflector
6	7854022	Roof opening panel trough
7	54519A02	Roof opening panel shield
8	-	Roof opening panel motor screw (3 required)

9	15B689	Roof opening panel motor
10	502C52A	Front drain hoses
11	502C52B	Rear drain hoses
12	-	Roof opening panel frame bolt (8 required)
13	54502C22	Roof opening panel frame
14	-	Air deflector screws

1. For additional information, refer to the individual procedures.

ROOF OPENING PANEL GLASS

1. Open the roof opening panel to the VENT position.
2. Remove the 4 roof opening panel glass screws.
   - To access the glass screws, unclip the top portion of the concertina blind and position aside as shown.
   - To install, tighten to 6 N.m (53 lb-in).

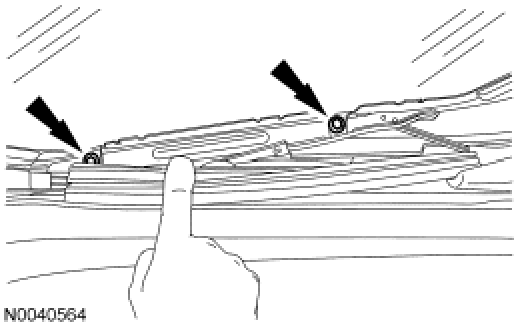

Fig. 14: Locating Roof Opening Panel Glass Screws
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.
   - Verify that the roof opening panel is centered and aligned before tightening the screws. For additional information, refer to **Roof Opening Panel Alignment**.
   - Initialize the roof opening panel motor. For additional information, refer to **Roof Opening Panel Motor Initialization**.

ROOF OPENING PANEL SHIELD

REMOVAL AND INSTALLATION

1. Remove the roof opening panel glass. For additional information, refer to **Roof Opening Panel Glass**.
2. Remove the trough assembly. For additional information, refer to **Trough Assembly**.
3. Slide the roof opening panel shield forward halfway.

4. Disengage the roof opening panel shield guide feet.
    - Lift the front portion of the roof opening panel shield upward at center until able to disengage one of the front guide feet.

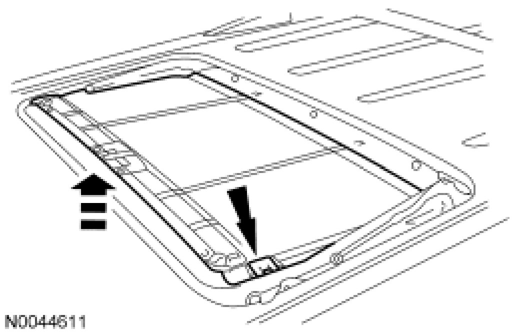

Fig. 15: Disengaging Roof Opening Panel Shield Guide Feet
Courtesy of FORD MOTOR CO.

5. With one of the guide feet released, carefully rotate the roof opening panel in a clockwise manner to disengage the remaining guide feet.

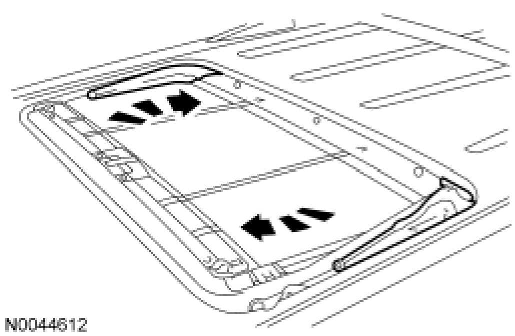

Fig. 16: Rotating Roof Opening Panel In Clockwise
Courtesy of FORD MOTOR CO.

6. To install, reverse the removal procedure.
    - Initialize the roof opening panel motor. For additional information, refer to **Roof Opening Panel Motor Initialization**.

ROOF OPENING PANEL MOTOR

REMOVAL AND INSTALLATION

NOTE: Anytime a roof opening panel motor is removed, the cables/mechanisms can experience free-play movement. It is important that the cables do not move. They are timed to be parallel with each other. If one or both are moved in either direction, they must be retimed.

1. Close the roof opening panel glass.

2. Open the 4 passenger assist handle covers.
    - Remove the bolts and remove the handles.
        - To install, tighten to 5 Nm (44 lb-in).
3. Remove the A-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
4. Remove the B-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
5. Remove the C-pillar trim panels. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
6. Remove the overhead console.
    - Disconnect the electrical connector.
7. If equipped, disconnect the automatic-dimming rear view mirror electrical connector.
8. Remove the sun visors and the sun visor clips.
    - If equipped, disconnect the electrical connectors.
9. Remove the 2 headliner pushpins at the rear.
10. Remove the interior lamp.
    - Disconnect the electrical connector.
11. Position the headliner forward to gain access to the roof opening panel motor.
12. Remove the 3 roof opening panel motor screws and the roof opening panel motor.
    - Disconnect the electrical connector.
    - To install, tighten to 4 N.m (35 lb-in).

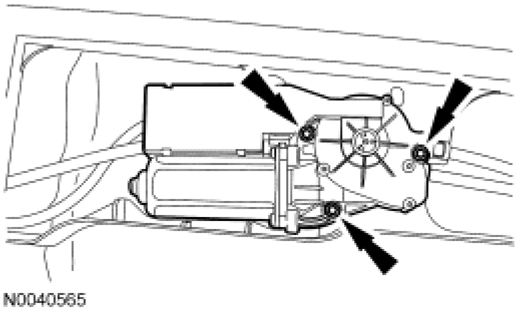

Fig. 17: Removing Roof Opening Panel Motor Screws
Courtesy of FORD MOTOR CO.

13. To install, reverse the removal procedure.
    - Initialize the roof opening panel motor. For additional information, refer to **Roof Opening Panel Motor Initialization**.

AIR DEFLECTOR

REMOVAL AND INSTALLATION

1. Position the roof opening panel glass to the full OPEN position.
2. Disengage the front portion of the roof opening panel air deflector. Remove the 2 screws.
    - To install, tighten to 1 Nm (9 lb-in).

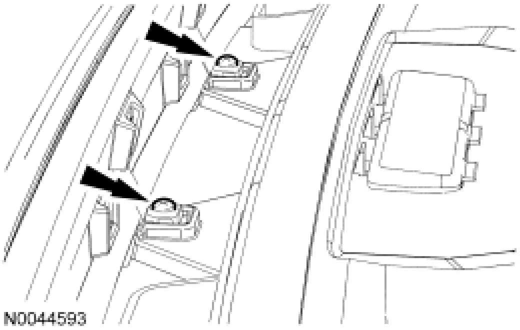

Fig. 18: Locating Roof Opening Panel Air Deflector Screws
Courtesy of FORD MOTOR CO.

3. Lift upward and pull to unlock the spring on each side to remove the air deflector assembly.
4. To install, reverse the removal procedure.
    - Initialize the roof opening panel motor. For additional information, refer to **Roof Opening Panel Motor Initialization**.

ROOF OPENING PANEL FRAME

REMOVAL AND INSTALLATION

1. Remove the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Disconnect the 4 roof opening panel drain hoses.
3. Disconnect the electrical connector.
4. Remove the 8 roof opening panel frame bolts and remove the roof opening panel frame.
    - To install tighten to 12 N.m (9 lb-ft).
5. To install, reverse the removal procedure.
    - Initialize the roof opening panel motor. For additional information, refer to **Roof Opening Panel Motor Initialization**.

TROUGH ASSEMBLY

REMOVAL AND INSTALLATION

1. Remove the roof opening panel glass. For additional information, refer to **Roof Opening Panel Glass**.
2. Remove the trough assembly.
    - Pull the trough assembly arms outward to release the trough assembly guide arm pins from the roof opening panel frame to remove.

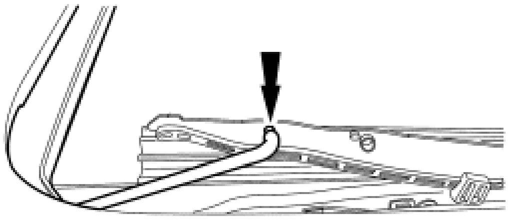

Fig. 19: Locating Trough Assembly Arm Pins
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.
   - Initialize the roof opening panel motor. For additional information, refer to **Roof Opening Panel Motor Initialization**.

ROOF OPENING PANEL CONTROL SWITCH

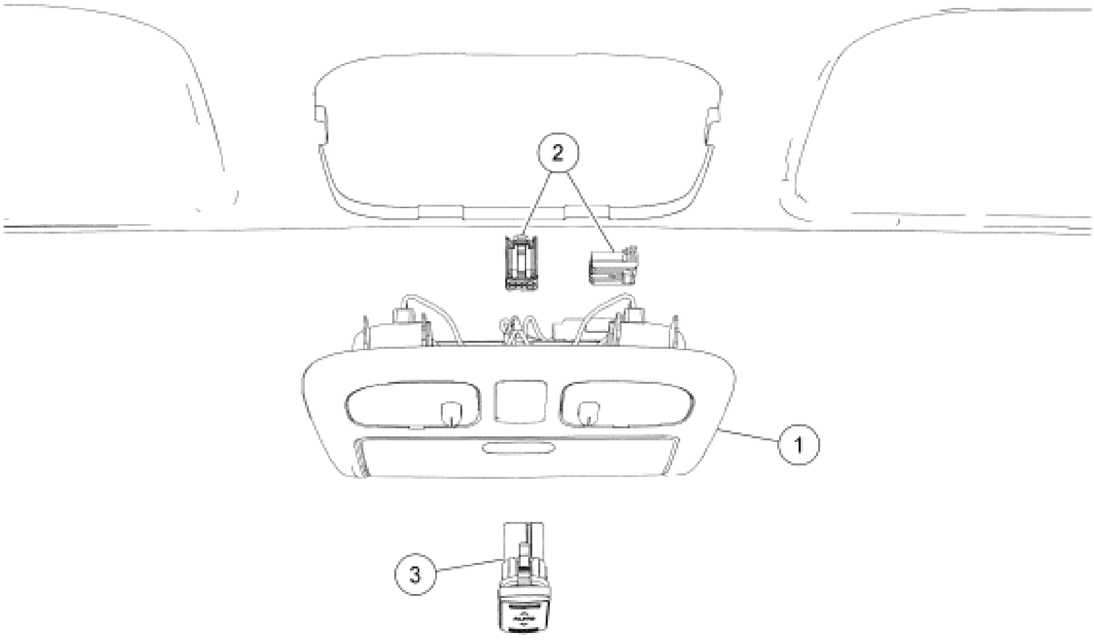

Fig. 20: Exploded View Of Roof Opening Panel Control Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	54519A70	Overhead console
2	-	Overhead console electrical connectors
3	15B69	Roof opening panel control switch

REMOVAL AND INSTALLATION

1. Open the storage compartment cover and remove the 2 screws.

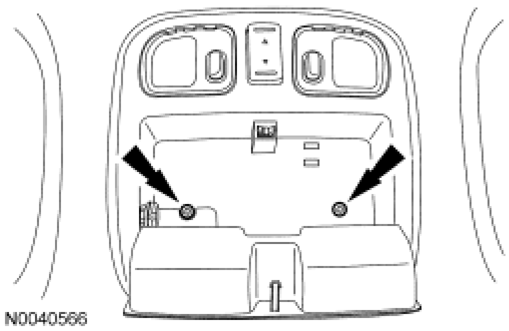

Fig. 21: Locating Storage Compartment Cover Screws
Courtesy of FORD MOTOR CO.

2. Disconnect the overhead console electrical connectors.
3. Disengage the clips and remove the switch from the overhead console.

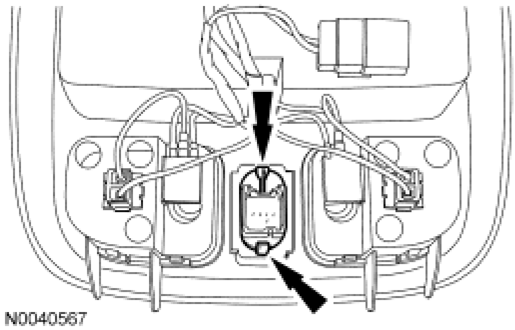

Fig. 22: Locating Overhead Console Electrical Connectors Pin And Switch
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

SAFETY BELT SYSTEM

WARNING: **After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- **Retractors**
- **Buckles**
- **Belt tension sensor (BTS) (if equipped)**
- **Front safety belt buckle support assemblies (slide bar) (if equipped)**

- **Safety belt shoulder belt height adjusters (if equipped)**
- **Child safety seat tether bracket assemblies**
- **Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)**

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

When installing any new active occupant restraint components, use only the replacement parts specified in the Ford Customer Service Division Master Parts Catalog.

The active restraint system consists of the following:

- Front safety belt shoulder height adjusters
- Front row safety belt buckles attached to the inboard side of the seats
- Front row safety belt retractors and pretensioners located behind the lower B-pillar trim panels
- Rear center safety belt retractor, attached to the parcel shelf sheet metal and safety belt buckle assembly, attached to the floor pan under the rear seat cushion
- Rear dual safety belt buckle assembly, attached to the floor pan under the seat cushion
- LATCH at rear outboard seating positions, attached below the rear seat cushion
- Child safety seat tether anchors are attached to the parcel shelf sheet metal for all 3 rear seating positions

Safety Belt, Lap/Shoulder

While the vehicle is in motion, the combination lap and shoulder belt adjusts to the occupant's movement. However, if the vehicle brakes hard, corners hard or if the vehicle receives an impact of 8 km/h (5 mph) or more, the lap and shoulder belt locks and helps reduce the occupant's forward movement.

Safety Belt Retractor and Pretensioner

The safety belt retractor and pretensioner is a pyrotechnic device that removes excess webbing from the safety belt when deployed. The pretensioner works in conjunction with the front air bag system. When the front air bags deploy, the pretensioners deploy, causing the retractor to move downward, removing excess webbing from

the lap and shoulder safety belts.

If the vehicle is involved in a collision that results in deployment of the front air bags and safety belt pretensioners, a new driver and passenger seat belt system (including safety belt buckle and pretensioners, safety belt retractors and height adjusters) must be installed.

For safety belt retractor pretensioner diagnostic information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

For safety belt retractor pretensioner disposal information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Dual Locking Mode Retractors

NOTE: When installing a dual locking mode retractor, the retractor should be checked to make sure it is not in the automatic locking retractor (ALR) mode after installation in the stowed position.

All continuous-loop, 3-point retractor systems, except the driver position, are equipped with the dual locking mode system.

The emergency locking retractor (ELR) mode will allow the occupant freedom of movement, locking tight only on hard braking, hard cornering or an impact of approximately 8 km/h (5 mph). The ELR mode helps to reduce the forward movement of the driver and passengers. The ELR mode is continuously in operation at all seating positions.

The ALR portion of this system does not allow the occupant freedom of movement. The ALR mode is used when locking a child seat in an outboard seating position or when a tight belt fit is desired. The ALR mode is automatically engaged when the webbing is fully extracted from the retractor and then allowed to retract. As the webbing is retracted back onto the spool, an audible clicking sound is made indicating the retractor is in ALR mode and the webbing will not pull back out of the retractor. To disengage the ALR mode, let the webbing retract back onto the spool. The ALR mode is disengaged when the webbing is free to move out and back into the retractor.

The automatic locking mode must be used when installing a child safety seat in the front or rear passenger seating positions where dual locking mode retractors are provided.

Energy Management Retractor

This vehicle has a safety belt system with an energy management feature at the front seating positions to help further reduce the risk of injury in the event of a head-on collision.

The energy management retractor feature is designed to pay out webbing in a controlled manner. This feature is designed to help reduce the belt force acting on an occupant's chest.

Safety Belt Extension

In certain cases, the safety belt may be too short even when it is fully extended. Additional length can be added

to the belt length by using a safety belt extension. Safety belt extensions are available through the dealership parts department at no cost. Safety belt extensions are only available with black webbing. Two extension assemblies are available for the front and rear seating positions.

Use only extensions manufactured by the same supplier as the safety belt. Manufacturer identification is located at the end of the webbing on the label. Also, use the safety belt extension only if the safety belt is too short for you when fully extended. Do not use the extension to change the fit of the shoulder belt across the torso.

Child Safety Seat Tether Anchors

The child safety seat tether anchors are attached to the parcel shelf sheet metal.

Lower Anchors and Tethers for Children (LATCH)

The LATCH system is a standardized and uniform attachment system for installing child safety seats in passenger vehicles. LATCH-equipped child safety seats have lower attachments that connect to the vehicle portion of the LATCH system.

The vehicle portion of the system consists of attachment points (6-mm wires) at outboard second row seating positions. The attachment points protrude from the bite line between the seat cushion and seat backrest.

If a child safety seat was in use during a collision, inspect the vehicle portion of the system for damage. If any of the attachment points (6-mm wires) are damaged, a new one must be installed.

The child safety seat tether anchors and LATCH system is a structural member of the seat frame and floor pan beneath the rear seat cushion.

Safety Belt Warning System

The safety belt warning indicator illuminates and a chime sounds to remind the occupants to fasten their safety belts.

The conditions of operation for the safety belt warning indicator and chime are as follows:

- If the driver safety belt is not buckled before the ignition switch is turned to the ON position, the safety belt warning indicator illuminates for 1-2 minutes and the warning chime sounds for 4-8 seconds.
- If the driver safety belt is buckled while the warning indicator is illuminated and the reminder chime is sounding, the safety belt warning indicator and warning chime will turn off.
- If the driver safety belt is buckled before the ignition switch is turned to ON, the safety belt warning indicator and reminder chime will remain off.

Belt-Minder®

The Belt-Minder® feature is a supplemental warning to the safety belt warning function. This feature provides additional reminders by intermittently sounding a chime and illuminating the safety belt warning indicator, in the instrument cluster (IC), when the driver and front passenger safety belt is unbuckled.

The Belt-Minder® feature uses information from the front passenger sensing system to determine if a front seat passenger is present and therefore potentially in need of a warning. To avoid activating the Belt-Minder® feature for objects placed in the front passenger seat, warnings will only be given to front seat occupants over a certain weight, as determined by the front passenger sensing system.

Both the driver and passenger safety belt usages are monitored and either may activate the Belt-Minder® feature. The warnings are the same for the driver and the front passenger. If the Belt-Minder® warnings have expired (warnings for approximately 5 minutes) for one occupant (driver or front passenger), the other occupant can still activate the Belt-Minder® feature.

When the Belt-Minder® feature is activated, the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.

The Belt-Minder® feature uses 2 different warning chimes. During the first minute of activation, the warning chime will sound once every second. The remaining warning chimes will sound twice every second while the system is activated.

To activate or deactivate the Belt-Minder® feature, refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article or the Owner's Literature.

If...	Then...
The driver or front passenger safety belt is not buckled before the vehicle has reached at least 5 km/h (3 mph) and 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt-Minder® feature is activated - the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until safety belts are buckled.
The driver or front passenger safety belt becomes unbuckled for approximately one minute while the vehicle is traveling at least 5 km (3 mph) and more than 1-2 minutes have elapsed since the ignition switch has been turned to ON.	The Belt-Minder® feature is activated-the safety belt warning indicator illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belts are buckled.
The driver and front passenger safety belts are buckled before the ignition switch is turned to the ON position or less than 1-2 minutes have elapsed since the ignition switch has been turned ON.	The Belt-Minder® feature will not activate.

DIAGNOSTIC TESTS

SAFETY BELT SYSTEM

Inspection and Verification

1. Verify the customer's concern by operating the active restraint system to duplicate the condition.
2. Inspect to determine if any of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Safety belt webbing integrity • Safety belt buckle and tongue assembly • Safety belt retractor	• Wiring, terminal or connector • Safety belt warning indicator lamp burned out • High-speed controller area network (HS-CAN) network concern

3. If the inspection reveals an obvious concern(s) that can be readily identified, service as required. With the exception of removing a twist from the safety belt webbing, do not attempt to repair a component of the safety belt system; new components must be installed.
4. If the concern remains after the inspection, determine the symptom. Go to **Symptom Chart**.
5. To check the active restraint system for correct operation, carry out the appropriate Functional Test(s).

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The safety belt warning indicator lamp does not operate	• Burned-out lamp/LED • Circuitry • Instrument cluster (IC) • Restraints control module (RCM)	• If the air bag warning indicator is illuminated, REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. If the air bag warning indicator is not illuminated, REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
• The safety belt warning chime does not operate	• Safety belt switch • IC module • RCM • Circuitry	• If the air bag warning indicator is illuminated, REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. If the air bag warning indicator is not illuminated, REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
• Excessive pressure on the occupant during normal wear, the webbing cannot be extracted, excessive slack in webbing does	• Front safety belt retractor and tongue • Rear safety belt retractor and tongue	• CARRY OUT the component **Functional Test - Buckle and Tongue**. INSTALL a new retractor if necessary.

not retract		
• The Belt-Minder® feature is inoperative	• Belt-Minder® feature is deactivated • Circuitry	• REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article or the Seating and Safety Restraints section of the Owner's Literature to activate the Belt-Minder® feature. If the Belt-Minder® is activated, REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnose.

Component Test

Carry out the appropriate Functional Test(s) as determined in Inspection and Verification.

Functional Test - Buckle and Tongue

The safety belt buckle and tongue assembly must operate freely during the latching and unlatching function. Fasten the safety belt by inserting the tongue (male portion) into the buckle (female portion).

1. Verify the following during the latching sequence:
   - Tongue insertion is not hindered by excessive effort.
   - A "click" is heard when the buckle latches the tongue.
2. Verify the system integrity by forcefully pulling on the belt webbing.
3. Unlatch the belt by fully depressing the buckle release button and allow the belt to release and retract.
4. Verify the following during the unlatching process:
   - Push-button depression does not require excessive effort.
   - Tongue can be removed easily from the buckle.
   - Repeat the above steps 3 times.
5. If the inspection reveals an obvious concern(s) that can be readily identified, service as required. Do not attempt to carry out any repair on the buckle and tongue assembly. If a concern exists with either component, a new safety belt buckle and safety belt retractor assembly must be installed.

Functional Test - Retractor

The safety belt retractor assembly must be freely operational for extraction and retraction of the safety belt webbing between full extension and in-vehicle stowed positions.

1. Extract and retract the safety belt between the full extension and stowed positions.
2. Verify the retractor operates without excessive effort or binding.
3. Install a new safety belt retractor and buckle if no obvious concerns are noticed and the complaint has

been verified.

Functional Test - System Road Test Inspection

NOTE: If the RH or second and third rear safety belts are to be tested, the assistance of a passenger is required.

1. Fasten the safety belts and proceed to a safe area.
2. Attain a speed of 8 km/h (5 mph).

WARNING: The driver and passenger must be prepared to brace themselves in the event the safety belt retractor does not lock. Failure to follow this instruction may result in serious personal injury.

3. Test the safety belts.
   1. Grasp the shoulder harness and prepare to lean forward.

      WARNING: Apply maximum brake force only on dry concrete or equivalent hard surface, NEVER on wet pavement or gravel. Failure to follow this instruction may result in serious personal injury.

      WARNING: The driver and passenger must be prepared to brace themselves in the event the safety belt retractor does not lock. Failure to follow this instruction may result in serious personal injury.

      NOTE: Do not jerk on the safety belt webbing when carrying out this test. Lean forward slightly when the brake application is made.

   2. Make a maximum brake application without a skid.
4. The safety belts should lock up with minimum webbing extension.
5. If there is a lockup of both shoulder straps, the safety belt assemblies are functioning correctly. Should either or both retractors fail to lock up at the 8 km/h (5 mph) speed, repeat the test at a constant 24 km/h (15 mph) speed. (This test must be carried out with a RH front or rear passenger if the RH front or rear safety belts are to be tested.)

NOTE: Before installing a new safety belt assembly, inspect the mounting area for damage and distortion. If the retractor of a new safety belt assembly has been bolted into a damaged or distorted mounting area, the retractor may be warped and may not function. If this is the case, remove the retractor, return the vehicle structure to its original production configuration and install a new safety belt assembly.

6. If any retractors do not lock up at the 24 km/h (15 mph) test, return the vehicle for service of malfunctioning safety belts.

Functional Test - Automatic Locking Retractor (ALR)

WARNING: **After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- **Retractors**
- **Buckles**
- **Belt tension sensor (BTS) (if equipped)**
- **Front safety belt buckle support assemblies (slide bar) (if equipped)**
- **Safety belt shoulder belt height adjusters (if equipped)**
- **Child safety seat tether bracket assemblies**
- **Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)**

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Position the seat back into the full up position.
2. Position the height adjuster (if equipped) in the full down or up position.
3. Latch the seat belt buckle and tongue assembly.
4. Pull the shoulder belt out until the automatic locking retractor (ALR) feature is activated.
5. Release the shoulder belt and allow it to retract until it stops.
6. Pull on the shoulder belt to check that the belt has remained in the ALR mode. If the belt is not locked, install a new safety belt assembly.
7. Unlatch the safety belt tongue from the buckle and allow the safety belt to retract to its stowed position.
8. Pull the shoulder belt to verify the retractor assembly has converted automatically out of the ALR mode. If the shoulder belt remains locked in the stowed position, install a new safety belt retractor assembly.

GENERAL PROCEDURES

SAFETY BELT CLEANING

Material

Item	Specification
Motorcraft Professional Strength Carpet and Upholstery Cleaner ZC-54	-

WARNING: **Do not bleach or re-dye the safety belt webbing, as the webbing may weaken. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.**

1. Clean the safety belt webbing only with the recommended carpet and upholstery cleaner. Follow the instructions provided with the cleaning solution.

SAFETY BELT MAINTENANCE

WARNING: **After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- **Retractors**
- **Buckles**
- **Belt tension sensor (BTS) (if equipped)**
- **Front safety belt buckle support assemblies (slide bar) (if equipped)**
- **Safety belt shoulder belt height adjusters (if equipped)**
- **Child safety seat tether bracket assemblies**
- **Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)**

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

NOTE: **The safety belt assemblies should be periodically inspected to make sure that**

they have not become damaged and that they remain in correct operating condition, particularly if they have been subjected to severe stress.

NOTE: **Before installing a new safety belt assembly, the safety belt attaching areas must be inspected for damage and distortion. If the attaching points are damaged and distorted, the sheet metal must be worked back to its original shape and structural integrity.**

1. Carry out all applicable Functional Tests for the component(s). For additional information, refer to the appropriate Functional Test procedure in **Safety Belt System**. Install the new safety belt(s) as directed.

SAFETY BELT PROCEDURE AFTER A COLLISION

WARNING: **After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- **Retractors**
- **Buckles**
- **Belt tension sensor (BTS) (if equipped)**
- **Front safety belt buckle support assemblies (slide bar) (if equipped)**
- **Safety belt shoulder belt height adjusters (if equipped)**
- **Child safety seat tether bracket assemblies**
- **Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)**

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Before installing a new safety belt assembly, the safety belt attaching areas must be inspected for damage and distortion. If the attaching points are damaged and distorted, the sheet metal must be worked back to its original shape and structural integrity.
2. Install the new safety belt(s). For additional information, refer to the appropriate procedure. Carry out all

applicable Functional Tests for the component(s). For additional information, refer to the appropriate Functional Test procedure in **Safety Belt System**.

SAFETY BELT SHOULDER HEIGHT ADJUSTER WITH STRIPPED WELD NUTS

1. Remove the B-pillar trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Use the half-inch drill with integral stop to drill out the damaged threads in the upper pillar structure.

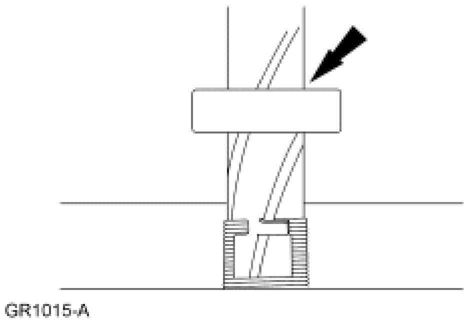

Fig. 1: Drilling Out Damaged Threads
Courtesy of FORD MOTOR CO.

NOTE: After each rotation, back off tap slightly to remove new cuttings and be sure to blow out any chips before proceeding.

3. Apply a suitable lubricant to the M14 x 1.5 tap with integral stop and tap new threads.

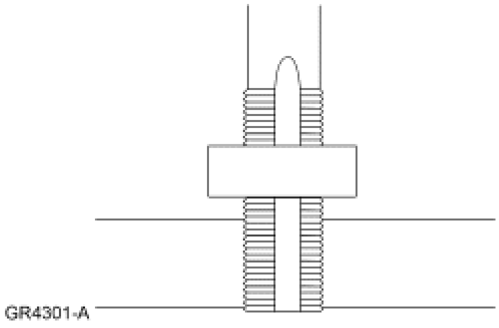

Fig. 2: Tapping New Threads
Courtesy of FORD MOTOR CO.

4. Use a threaded insert and screw it into the retapped hole until it is slightly below the surface.

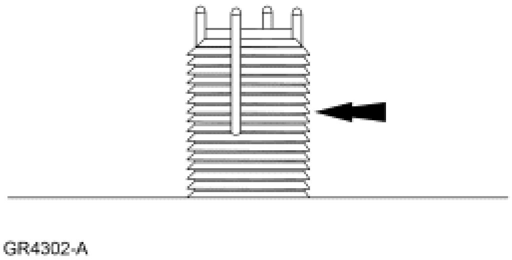

Fig. 3: Threaded Insert
Courtesy of FORD MOTOR CO.

5. Use a hammer to lightly tap the installation tool several times to seat the insert keys.

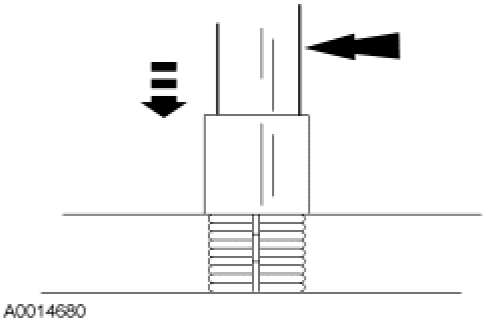

Fig. 4: Tapping Installation Tool To Seat Insert Keys
Courtesy of FORD MOTOR CO.

6. If the bolt(s) on the height adjuster is not stripped, reinstall the original safety belt shoulder height adjuster. If the bolt(s) is stripped, install a new safety belt shoulder height adjuster. For additional information, refer to the appropriate height adjuster procedure.

SAFETY BELT TONGUE ROTATED ON BELT

1. Fold the safety belt as indicated.

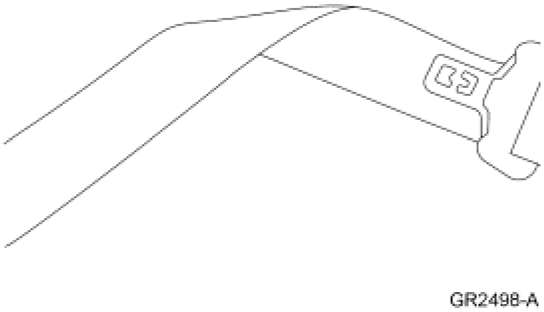

Fig. 5: Folding Safety Belt
Courtesy of FORD MOTOR CO.

2. Pull the safety belt tongue over the fold in the safety belt.

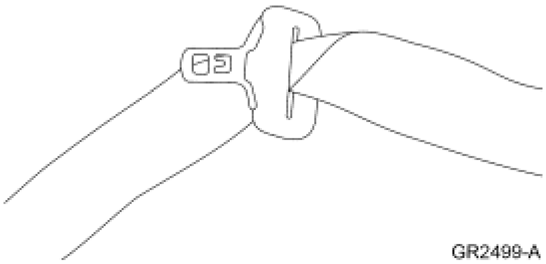

Fig. 6: Pulling Safety Belt Tongue Over Fold In Safety Belt
Courtesy of FORD MOTOR CO.

REMOVAL AND INSTALLATION

SAFETY BELT RETRACTOR AND PRETENSIONER

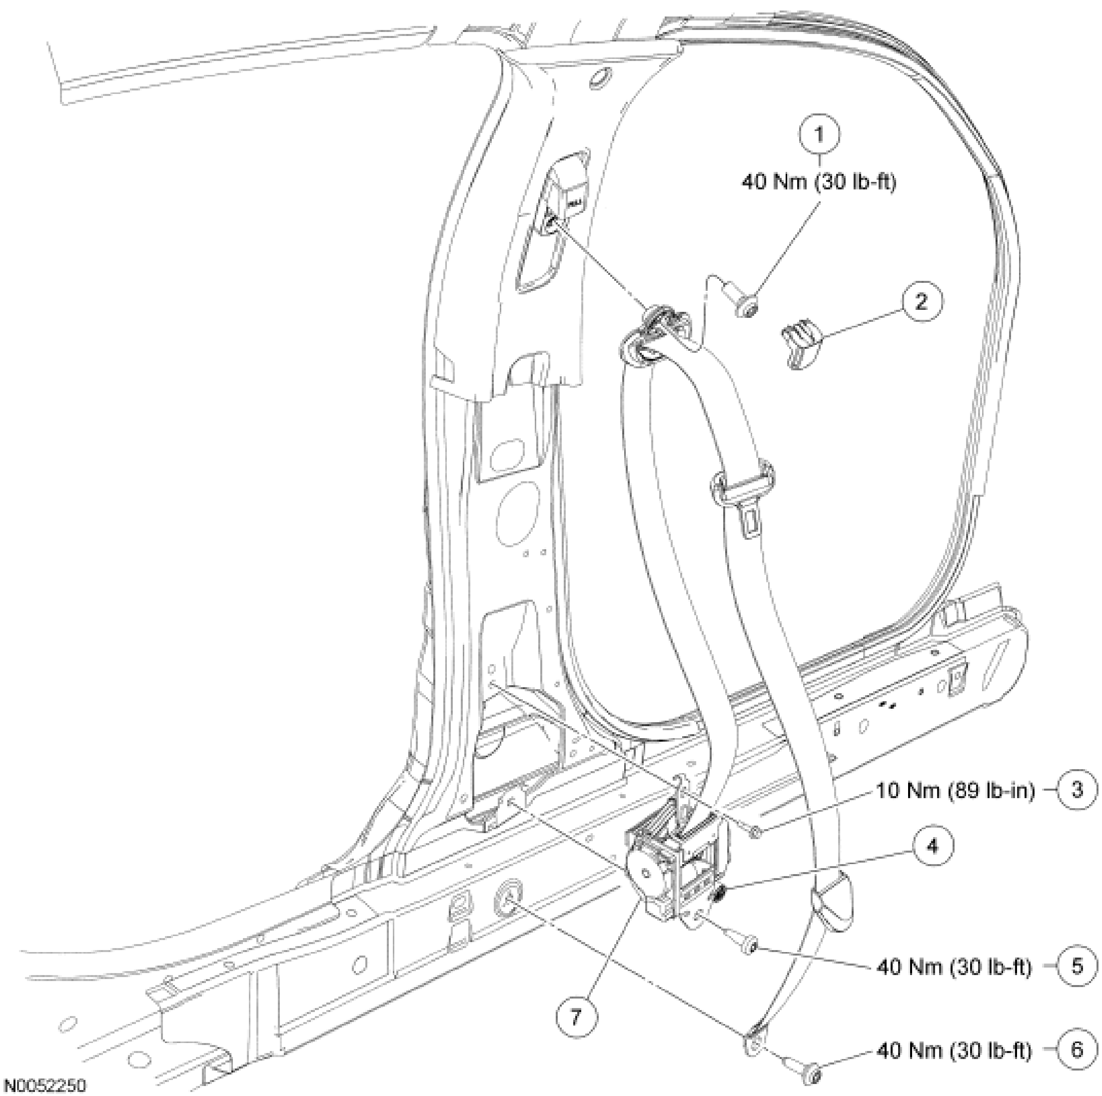

Fig. 7: Exploded View Of Safety Belt Retractor & Pretensioner With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Bolt, D-ring (part of 611B09 LH/ 611B08 RH)
2	60262	Cover, D-ring
3	W505253	Bolt, safety belt retractor (upper)
4	-	Electrical connector
5	W700883	Bolt, safety belt retractor and pretensioner (lower)
6	-	Bolt, safety belt retractor anchor (part of 611B08 RH/ 611B09 LH)
7	611B08 RH/ 611B09 LH	Safety belt retractor and pretensioner

REMOVAL AND INSTALLATION

WARNING: **After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- **Retractors**
- **Buckles**
- **Belt tension sensor (BTS) (if equipped)**
- **Front safety belt buckle support assemblies (slide bar) (if equipped)**
- **Safety belt shoulder belt height adjusters (if equipped)**
- **Child safety seat tether bracket assemblies**
- **Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)**

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: LH shown, RH similar.

All front retractors

NOTE: If equipped with power seats, position the passenger seat track downward to access the safety belt retractor anchor bolt.

1. Position the seat to the most forward position.
2. Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NOTE: Inspect the D-ring cover for damage. If the cover is damaged or does not remain attached, install a new D-ring cover.

3. Remove the D-ring cover.
4. Remove the bolt and D-ring.
   - To install, tighten to 40 Nm (30 lb-ft).
5. Remove the lower B-pillar trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

   RH front retractor

6. Remove the safety belt retractor anchor cover from the side of the seat.

   All front retractors

7. Remove the bolt and safety belt retractor anchor.
   - To install, tighten to 40 Nm (30 lb-ft).
8. Disconnect the electrical connector.
9. Remove the upper bolt.
   - To install, tighten to 10 Nm (89 lb-in).
10. Remove the lower bolt and safety belt retractor and pretensioner.
    - To install, tighten to 40 Nm (30 lb-ft).

NOTE: Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.

NOTE: When installing a dual locking mode retractor, the retractor should be checked to make sure it is not in the automatic locking retractor (ALR) mode after installation in the stowed position.

11. To install, reverse the removal procedure.
12. Repower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

13. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in **Safety Belt System**.

SAFETY BELT RETRACTOR - REAR, CENTER

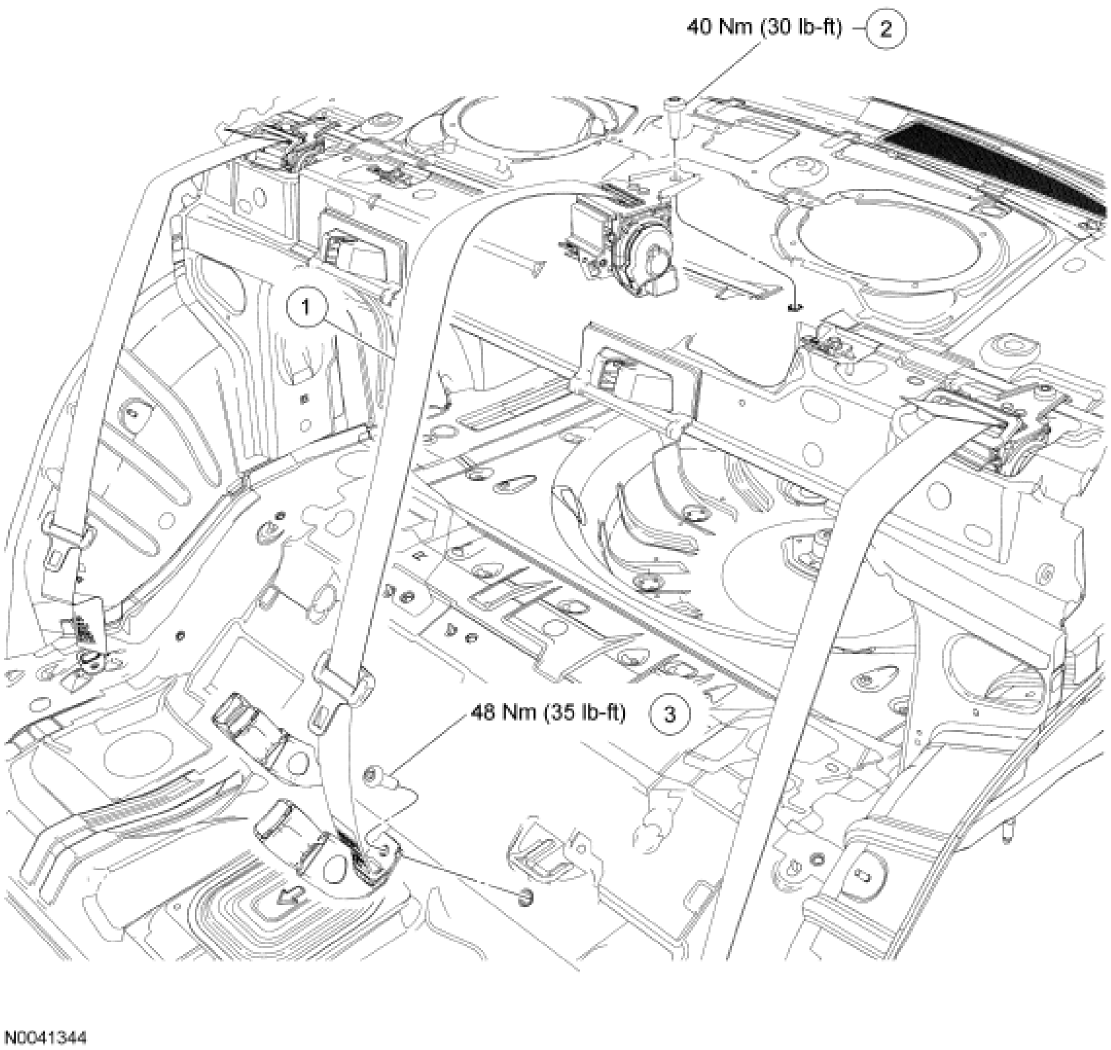

Fig. 8: Exploded View Of Rear Center Safety Belt Retractor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	611B66	Rear center safety belt retractor
2	W700883	Bolt, safety belt retractor
3	-	Bolt (part of 611B66)

REMOVAL AND INSTALLATION

WARNING: **After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- **Retractors**
- **Buckles**
- **Belt tension sensor (BTS) (if equipped)**
- **Front safety belt buckle support assemblies (slide bar) (if equipped)**
- **Safety belt shoulder belt height adjusters (if equipped)**
- **Child safety seat tether bracket assemblies**
- **Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)**

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Remove the rear seat cushion. For additional information, refer to **SEATING** article.
2. Remove the bolt and safety belt retractor anchor.
   - To install, tighten to 48 Nm (35 lb-ft).
3. Remove the parcel shelf. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
4. Remove the bolt and center safety belt retractor.
   - To install, tighten to 40 Nm (30 lb-ft).

NOTE: **Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.**

NOTE: **When installing a dual locking mode retractor, the retractor should be checked to make sure it is not in the automatic locking retractor (ALR) mode after installation in the stowed position.**

5. To install, reverse the removal procedure.

6. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in **Safety Belt System**.

SAFETY BELT RETRACTOR - REAR, OUTBOARD

NOTE: **LH shown, RH similar.**

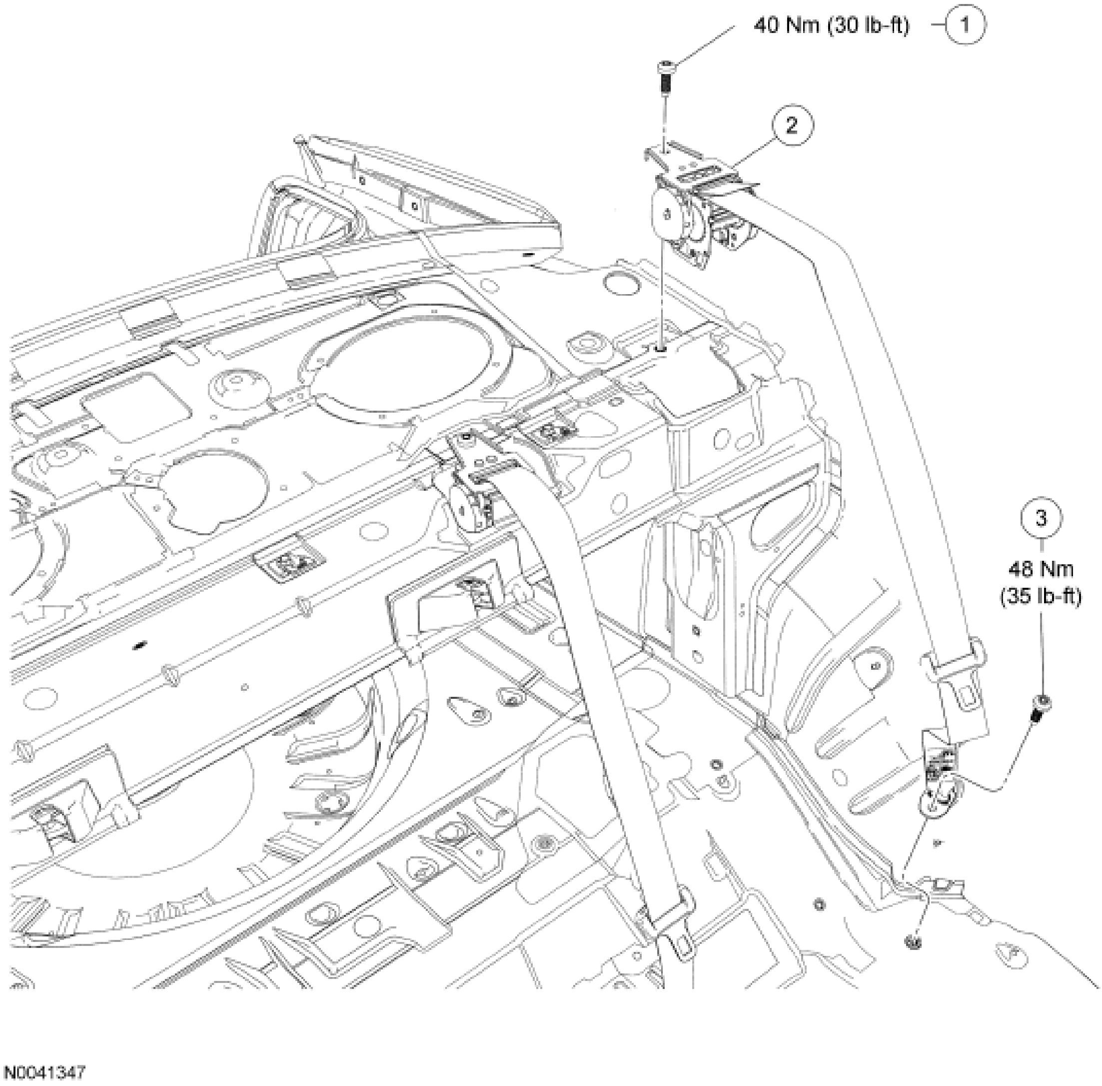

Fig. 9: Exploded View Of Rear Outboard Safety Belt Retractor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Bolt (part of 611B68)
2	611B68	Safety belt retractor assembly
3	-	Bolt (part of 611B68)

REMOVAL AND INSTALLATION

WARNING: **After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- **Retractors**
- **Buckles**
- **Belt tension sensor (BTS) (if equipped)**
- **Front safety belt buckle support assemblies (slide bar) (if equipped)**
- **Safety belt shoulder belt height adjusters (if equipped)**
- **Child safety seat tether bracket assemblies**
- **Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)**

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Remove the rear seat cushion. For additional information, refer to **SEATING** article.
2. Remove the rear seat bolster. For additional information, refer to **SEATING** article.
3. Remove the parcel shelf. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
4. Remove the bolt and safety belt retractor anchor.
   - To install, tighten to 48 Nm (35 lb-ft).
5. Remove the bolt and safety belt retractor.
   - To install, tighten to 40 Nm (30 lb-ft).

NOTE: **Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.**

NOTE: **When installing a dual locking mode retractor, the retractor should be**

checked to make sure it is not in the automatic locking retractor (ALR) mode after installation in the stowed position.

NOTE: **During installation, the web loop position of the safety belt anchor must face outboard of the vehicle.**

6. To install, reverse the removal procedure.
7. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in **Safety Belt System**.

SAFETY BELT SHOULDER HEIGHT ADJUSTER

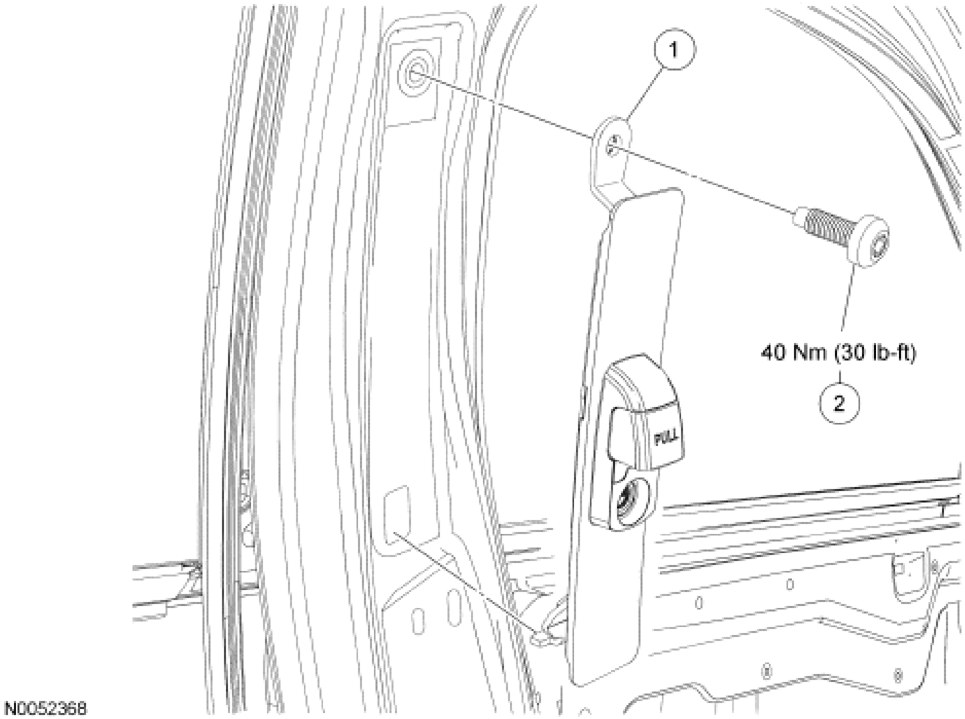

Fig. 10: Exploded View Of Safety Belt Shoulder Height Adjuster With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	602B82	Safety belt shoulder height adjuster
2	-	Bolt (part of 602B82)

REMOVAL AND INSTALLATION

WARNING: **After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- **Retractors**
- **Buckles**
- **Belt tension sensor (BTS) (if equipped)**
- **Front safety belt buckle support assemblies (slide bar) (if equipped)**
- **Safety belt shoulder belt height adjusters (if equipped)**
- **Child safety seat tether bracket assemblies**
- **Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)**

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Remove the upper B-pillar trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Position the safety belt shoulder height adjuster down and remove the bolt.
   - To install, tighten to 40 Nm (30 lb-ft).

NOTE: **When installing the safety belt shoulder height adjuster, the lower T-tab must be engaged into the body prior to installing the bolt.**

3. Remove the safety belt shoulder height adjuster.
   1. Rotate the safety belt shoulder height adjuster downward to release the lower tab.
   2. Remove the safety belt shoulder height adjuster.

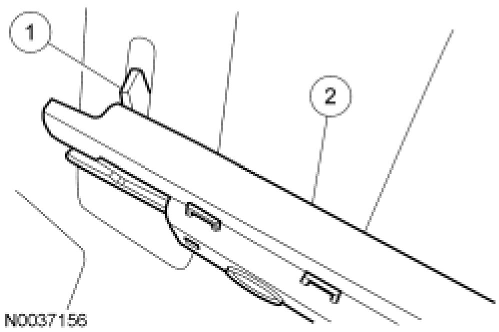

Fig. 11: Safety Belt Shoulder Height Adjuster & Tab
Courtesy of FORD MOTOR CO.

NOTE:	**Make sure the safety belt webbing is not twisted and the safety belts and buckles are accessible to the occupants.**

4. To install, reverse the removal procedure.
5. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in **Safety Belt System**.

SAFETY BELT BUCKLE - FRONT

NOTE:	**LH shown, RH similar.**

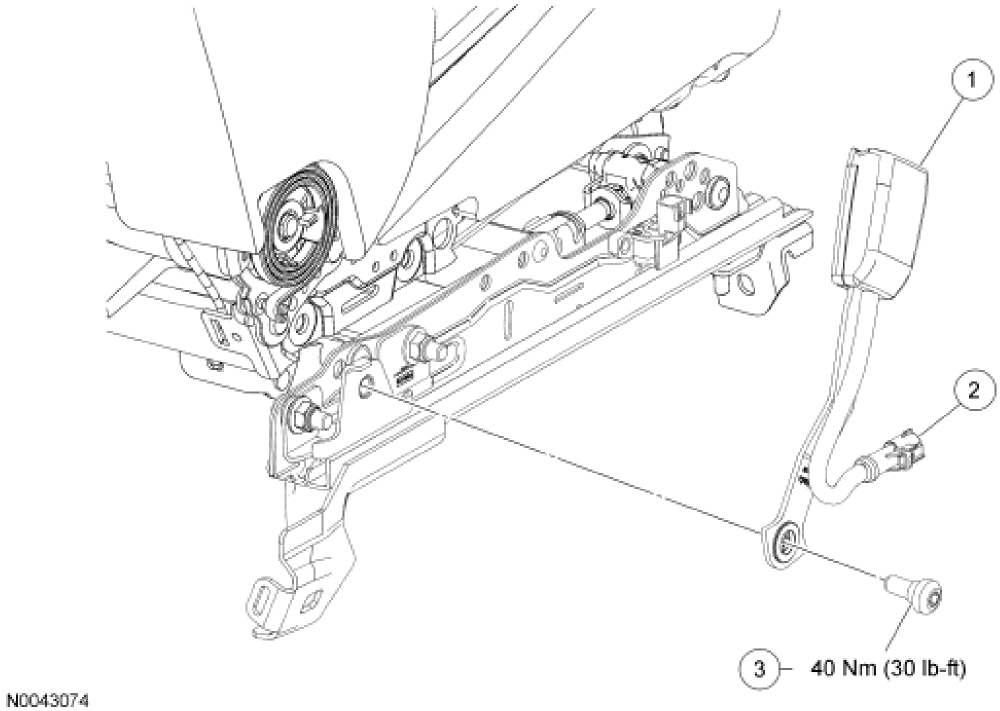

Fig. 12: Exploded View Of Front Safety Belt Buckle With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	61203 LH/ 61202 RH	Safety belt buckle
2	-	Electrical connector
3	-	Bolt (part of 61203 LH/ 61202 RH)

REMOVAL AND INSTALLATION

WARNING: **After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- **Retractors**
- **Buckles**
- **Belt tension sensor (BTS) (if equipped)**
- **Front safety belt buckle support assemblies (slide bar) (if equipped)**
- **Safety belt shoulder belt height adjusters (if equipped)**
- **Child safety seat tether bracket assemblies**
- **Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)**

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the seat. For additional information, refer to **SEATING** article.

2. Disconnect the electrical connector.
    - Release the retainer on the side of the seat cushion cover to remove the wire for the safety belt buckle switch.
3. Remove the bolt.
    - To install, tighten to 40 Nm (30 lb-ft).
4. Remove the safety belt buckle through the opening in the seat cushion cover.
5. To install, reverse the removal procedure.
    - Make sure that the safety belt buckle is routed through the seat cushion cover.
6. Install the seat. **If the passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **SEATING** article.

    Passenger seat

7. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test and prove out the SRS. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

    All seats

8. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in **Safety Belt System**.

SAFETY BELT BUCKLE - REAR

2	60044	RH and center safety belt buckle assembly

REMOVAL AND INSTALLATION

WARNING: **After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- **Retractors**
- **Buckles**
- **Belt tension sensor (BTS) (if equipped)**
- **Front safety belt buckle support assemblies (slide bar) (if equipped)**
- **Safety belt shoulder belt height adjusters (if equipped)**
- **Child safety seat tether bracket assemblies**
- **Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)**

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

NOTE: **The LH safety belt buckle is a part of the center safety belt retractor assembly and is not serviced separately. To remove the LH safety belt buckle, refer to Safety Belt Retractor - Rear, Center.**

1. Remove the rear seat cushion. For additional information, refer to **SEATING** article.
2. Remove the bolt and dual safety belt buckle assembly.
   - To install, tighten to 48 Nm (35 lb-ft).

NOTE: **Make sure the safety belt webbing is not twisted and the safety belts and**

buckles are accessible to the occupants.

NOTE: **The anti-rotation tab of the safety belt anchor buckle assembly must be correctly aligned before tightening fastener for correct installation.**

3. To install, reverse the removal procedure.
4. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in **Safety Belt System**.

CHILD SAFETY SEAT TETHER ANCHOR

Item	Part Number	Description
1	-	Bolts (part of 613D26)
2	613D26	Safety seat tether anchors

REMOVAL AND INSTALLATION

WARNING: **After any crash, all of the following safety belt assemblies and attaching hardware must be inspected by an authorized dealer to verify correct function:**

- **Retractors**

- **Buckles**
- **Belt tension sensor (BTS) (if equipped)**
- **Front safety belt buckle support assemblies (slide bar) (if equipped)**
- **Safety belt shoulder belt height adjusters (if equipped)**
- **Child safety seat tether bracket assemblies**
- **Automatic locking retractor (ALR) feature for child safety seats (passenger seating positions only)**

If any safety belt assembly is damaged, does not operate correctly or does not pass all of the Functional Tests in the Diagnosis and Testing portion of this section, a new safety belt assembly must be installed. If any safety belt assembly attaching areas are damaged or distorted, the sheet metal must be restored to its original structural integrity and new safety belt assembly and attaching hardware must be installed. Failure to install new safety belt assemblies and attaching hardware may increase the risk of serious personal injury or death in a crash.

After any crash that results in deployment of the driver and/or front outboard passenger safety belt pretensioners, new driver and/or front outboard passenger safety belt systems (including retractors, buckles and height adjusters) must be installed. Failure to install new safety belt systems increases the risk of serious personal injury or death in a crash.

1. Open the cover and remove the bolt and child safety seat tether anchor.
   - To install, tighten to 28 Nm (21 lb-ft).

   WARNING: **Always tighten the child safety seat tether anchor/bolt to specification. Failure to follow this instruction may result in the child's safety seat being incorrectly secured, which increases the risk of serious personal injury or death to the child in a sudden stop or crash.**

2. To install, reverse the removal procedure.
3. Check the active restraint system for correct operation. For additional information, refer to the appropriate Functional Test procedure in **Safety Belt System**.

DESCRIPTION AND OPERATION

SEATS

Front Seats

The front seats can be equipped with the following systems:

- Two-way manual seat track
- Four-way manual seat track
- Six-way power seat track
- Manual recline
- Power recline
- Backrest, without fold-flat
- Backrest with fold-flat (optional, passenger only)
- Heated seats
- Heated/cooled climate controlled seats (MKZ only)
- Memory driver seat (MKZ only)
- Manual lumbar
- Power lumbar
- Adjustable head restraints
- Seat side air bags
- Occupant classification sensor (OCS) system on passenger seat

Driver Seat Module (DSM) - Memory Seat

The power driver seat, exterior mirrors and adjustable pedal positions are controlled by the driver seat module (DSM) only when the vehicle is equipped with the programmable/recall memory option. The DSM is located on the driver seat track.

This system allows automatic positioning of the driver power bucket seat, exterior power mirrors and adjustable pedals to 2 programmable positions. Memory positions can be stored at any time. A memory recall can be initiated only if the vehicle is in PARK or NEUTRAL and the ignition switch is not in START. A memory recall in progress will not be affected by moving the ignition switch to START or by moving the selector lever out of PARK or NEUTRAL. For information on programming memory positions or recalling stored memory position, refer to **Memory Position Programming**.

Easy Entry/Easy Exit

The memory driver seat easy entry/exit feature moves the seat slightly rearward for easier exit from the vehicle and returns the seat forward after entry. The easy entry/easy exit feature can be enabled/disabled using selections on the message center. Refer to Driver Controls in the Owner's Literature for additional instructions for using the message center.

Heated Seats

This system allows independent seat electrical heating of each front seat on demand.

The serviceable components of the system are:

- the seat heater mats located in the seat cushion and backrest.
- the dual heated seat module located on the passenger seat track.
- the heated seat switches, located on the HVAC module.

Climate Controlled Seats

The climate control seat system is able to heat and cool the front seats. Each climate controlled seat is operated by push-buttons on the HVAC module located on the instrument panel. Each front seat temperature is then monitored and controlled by the dual climate controlled seat module (DCSM) located on the passenger front seat track.

The climate controlled seat system contains the following serviceable components:

- HVAC module
- DCSM
- Thermo-electric device (TED) and blower assembly within each front seat cushion and backrest
- Air filter (attached to each TED and blower assembly)
- Cushion and backrest manifolds
- Cushion and backrest foam pads
- Cushion and backrest trim covers

Manual Lumbar

The manual front seat backrest lumbar is adjusted by a knob mounted on the side of the seat cushion side shield.

Power Lumbar

The driver seat has an electro-mechanical backrest pad adjuster. The lumbar switch adjustment is on the side of the seat cushion side shield and is part of the seat control switch.

Manual Recline

The manual recline can be adjusted by a handle mounted on the outboard side of the cushion side shield.

Front Seats Without Backrest Fold-Flat

Manual recliners on seats that do not fold-flat are only serviceable by installing a new backrest frame assembly.

Passenger Seats With Backrest Fold-Flat

Front passenger seats can come with a backrest that folds flat, when option with manual recline. The recliners on this backrest will recline the backrest back or fold the backrest forward. Pull up on the recliner handle allowing the backrest to recline forward. When the backrest reclines fully forward, if the recliner handle is held up, the backrest will continue to fold forward until it reaches the fold-flat position. Manual recliners on seats

that fold-flat are serviced separately from the backrest frame assembly.

Power Recline

The driver seat has an electro-mechanical backrest adjuster. The backrest adjustment switch is located on the side of the seat cushion side shield and is part of the seat control switch.

Power recliners are only serviceable by installing a new backrest frame assembly. However, the recliner motor can be serviced separately.

Seat Side Air Bags

The driver and passenger seat side air bags are attached to the seat backrest frame. If a seat side air bag deployment has occurred or for more information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Occupant Classification Sensor (OCS) System

The occupant classification sensor (OCS) system is standard equipment on all front passenger seats. For diagnosing or servicing the OCS system, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Rear Seats

These seats are a 60/40 split folding backrest. The 60 percent has a fold down armrest and may be equipped with cup holders. Each backrest is held in place at the top with its own latch attached to the package tray sheet metal and a striker attached to each backrest frame. The rear seat backrest latch release handles are located in the luggage compartment.

The cushion foam pad for an all wheel drive (AWD) vehicle is different than that for a front wheel drive (FWD) vehicle. The center tunnel is higher on an AWD vehicle, creating the need for a shorter cushion foam pad. Make sure when installing a new cushion foam pad, the correct part is being installed.

DIAGNOSTIC TESTS

SEATS

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	Fluke 73III Automotive Meter	105-R0057 or equivalent
	Vehicle Communication Module (VCM) and Integrated Diagnostic	software with appropriate hardware, or equivalent scan tool

 ST2834-A	System (IDS)	
 ST2574-A	Flex Probe Kit	105-R025C or equivalent

Medium-Speed Controller Area Network (MS-CAN)

This vehicle utilizes a communication system called a medium-speed controller area network (MS-CAN). When diagnosing the memory seat or climate controlled seat, use a Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool with the latest software update with the capability of communicating over the MS-CAN bus.

Principles of Operation

Driver and Passenger Power Seats Without Memory

The 10-way power seat control feature moves the seat in 10 possible directions: the seat can be moved forward or backward and the front and back of the cushion can be moved up and down independently. The backrest of the seat can be moved forward and backward, and the lumbar can be moved IN and OUT. All 10 positions are controlled by one switch. The power seat feature operates independent of the ignition switch position.

The 8-way power seat control feature moves the seat in 8 possible directions. It is like the 10-way power seat, less power lumbar.

The 6-way power seat control feature moves the seat in 6 possible directions. It is like the 10-way power seat, less power lumbar and recline.

The power seat motors are hardwired to the seat control switch. The circuits are normally at ground through the seat control switch. An individual circuit is switched to voltage when a specific adjustment position is selected.

Power Driver Seat With Memory

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

NOTE: A memory recall in progress does not prohibit the initiation of another memory recall; the most recently requested memory recall will be executed.

The driver power memory seat is controlled by the driver seat module (DSM). The memory seat feature allows

the driver to program a personalized seat position that can be recalled using the memory switch or a remote keyless entry (RKE) transmitter. There are 2 memory settings possible. The exterior mirror positions are also stored and recalled with the driver memory seat positions.

The driver seat control switch provides voltage to the DSM when activated. The NEUTRAL position of the driver seat control switch position is a ground state through the seat control switch contacts. A voltage input causes the DSM to power the appropriate motor until the input is removed. Ground is the normal state of the motor circuits through the DSM and is not switched to control the motors. The DSM internally switches the appropriate circuit from ground to voltage for operating the motors.

As the seat is adjusted, the DSM constantly monitors the motor position sensors to record the current seat position. The DSM will remove voltage from the motor upon termination of the seat control switch input or if the DSM does not see movement from the motor by monitoring the position sensor.

The DSM communicates DTCs and other information using the MS-CAN communication bus. It should be noted for diagnostics that because CAN bus communication is more robust and reliable than other methods, it may be possible to have limited module communication with one of the CAN bus circuits disconnected or shorted to ground. Refer to **MODULE COMMUNICATIONS NETWORK** article for information concerning MS-CAN bus communication.

For information on programming memory positions or recalling a stored memory position, refer to **Memory Position Programming**. For information on remote keyless entry transmitter programming, refer to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.

The DSM is located under the driver seat. To install a new DSM, refer to **MULTIFUNCTION ELECTRONIC MODULES** article. Programmable module installation (PMI) must be carried out when installing a new DSM. Refer to **MODULE CONFIGURATION** article.

This part only diagnoses concerns specific to the memory seat. To diagnose a memory exterior mirror concern, refer to **REAR VIEW MIRRORS** article.

Easy Exit/Easy Entry

The easy entry/exit feature is a function of the driver seat module (DSM) that moves the driver seat backwards about 2 in (50.8 mm) when the ignition key is removed from the ignition switch. The DSM receives a key out command over the MS-CAN communication network and powers the driver seat rearward. This function will not operate if the seat is less than the 51 mm (2 in) travel distance to the end of the track or the function has been disabled. The DSM will also cancel this operation if a valid input command is received from the driver seat control switch, memory SET switch or exterior mirror control switch.

The DSM will record the current seat position before powering the seat for an easy exit function. This recorded position will be used to return the seat to this position on the easy entry operation. During easy entry operation, the seat is returned to the position previous to the easy exit operation. Easy entry operation will be cancelled if a valid input command from the seat control switch, memory SET switch or exterior mirror control switch is received by the DSM.

The easy entry/exit feature can be enabled/disabled using a scan tool. When enabled, the feature becomes a user accessible item on the message center allowing the user to turn the feature on and off. Refer to the Owner's

Literature or **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article for information on the message center.

Heated Seats

Vehicles equipped with front heated seats are equipped with a single-heated seat module to control both front heated seats. The heated seat module is located on the passenger seat track. The HVAC module includes both driver and passenger heated seat control buttons and indicators. The heated seat system will function independently of the vehicle's climate control system. A momentary ground signal is transmitted to the heated seat module when a heated seat switch button on the HVAC module is depressed and ignition switched voltage is supplied. Upon receiving each control signal to an input circuit, the heated seat module will decrease one setting (the sequence is HI, LOW, OFF, HI, etc.). When a heated seat is set to HI, both LED indicators above that heated seat's control button will illuminate. When a heated seat is set to LOW, only one LED indicator above that switch will illuminate. When activated, the heated seat module supplies voltage to the selected seat's heater circuit. Each seat's cushion heater mat and backrest heater mat is connector in a series circuit to the heated seat module and powered by the output circuit for that seat and ground. The heated seat module monitors inputs from a temperature sensor, located in each seat's cushion heater mat and maintains seat temperature by regulating current flow to the heater circuits. The heated seat module will remain ON until the heated seat switch button is depressed to cycle the heated seat module OFF. If ignition voltage is switched OFF, the heated seat module will enter an OFF state.

Climate Controlled Seat System

NOTE: **Avoid applying voltage directly to a thermo-electric device (TED) for testing its operation. Doing so may cause damage to the TED.**

NOTE: **When installing a new dual climate controlled seat module (DCSM), it is necessary to carry out programmable module installation (PMI). Refer to MODULE CONFIGURATION article.**

Both the driver and front passenger climate controlled seats are independently controlled electronically by the DCSM mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E.

If one of the BJB fuses open, both seats will remain operational because the voltage supply circuits are internally connected in the DCSM.

Both climate controlled seats operate independently. If a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module. If the system shuts down due to a DTC fault, cycling the ignition OFF and then ON again will reset the DCSM to function until the DTC resets.

The 4 switches (identified with seat icons) on the HVAC module activate each seat system setting and illuminate LEDs above each switch to indicate the operating mode, 3 LEDs for HIGH, 2 LEDs for MED or 1

LED for LOW. The push-buttons with the blue seat icon operate the seat cooling mode and the push-buttons with the red seat icon operate the seat heating mode. The climate controlled seat system is not equipped with auto-mode.

Each driver and front passenger seat cushion and backrest is equipped with a thermo-electric device (TED) and blower motor assembly. Applying voltage polarity to the TED in one direction, causes it to heat. Applying voltage polarity in the opposite direction causes the TED to cool. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the incoming air depending on the control switch settings. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once activated, the DCSM maintains the heating/cooling modes until deactivated.

The temperature differences between the individual heated and cooled settings is minimal. For example, it is difficult to distinguish between LOW COOL and MEDIUM COOL settings. Measuring seat temperature at different settings is possible by monitoring the DCSM PIDs using the scan tool.

The HVAC module communicates climate controlled seat commands to the DCSM using the medium-speed controller area network (MS-CAN) communication bus. The MS-CAN bus is connected to the data link connector (DLC) for diagnostic use. No direct connection exists between the DCSM and HVAC module for the climate controlled seat switches. The climate controlled seats can be commanded using the diagnostic tool to verify both module communication on the MS-CAN bus and operation of the DCSM. This method may be useful for isolating a control switch concern. It should also be noted that because CAN bus communication is more robust and reliable than other methods, it may be possible to have limited module communication with one of the CAN bus circuits disconnected or shorted to ground. Refer to **MODULE COMMUNICATIONS NETWORK** article for additional information concerning CAN bus communication.

Heating Characteristics

NOTE: The presence of overtemperature faults (DTCs B2729, B2730, B272A and B272B) can be induced by incorrect operation of the climate controlled seat system after an initial HEAT setting has been attained. If a HEAT setting is repeatedly turned OFF and ON in an attempt to increase the seat temperature, an overtemperature condition can result and the DTCs will be set.

- In HEAT mode, the TED circuits of a given seat are wired in parallel internally in the DCSM.
- The climate controlled seat system draws approximately 24 amperes, with both seats heating, until reaching the set point and then the system operates at a reduced amperage to maintain the climate setting.
- In HEAT mode, the TED can add up to 40°C-60°C (72°F-108°F) to the ambient air temperature entering the system.
- There are 3 manual settings based on the LEDs above each seat heat switch button on the HVAC module. The first setting is HIGH (3 LEDs), the second setting is MED (2 LEDs), the third is LOW (1 LED) then OFF (no LEDs).
- In the LOW setting, the DCSM is set to maintain TED temperature at approximately 46°C (115°F).
- In the HIGH setting, the DCSM is set to maintain TED temperature at 65°C (149°F).
- When heating, the DCSM will vary the speed of the fans and the TED duty cycle in order to reach and maintain the temperature determined by the switch setting.

- Seat heating has a maximum operating duration of 15 minutes.

Climate Controlled Seat Heat State	Initial Temperature	Final Temperature
HIGH	90°C (194°F)	65°C (149°F)
MED	80°C (176°F)	60°C (140°F)
LOW	75°C (167°F)	46°C (115°F)

Cooling Characteristics

- In cool mode, the TED circuits of a given seat are wired in series internally in the DCSM.
- The climate controlled seat system draws approximately 7 amps when in cool mode on high setting.
- In cool mode, the TED can remove up to 8°C (14°F) from the ambient air temperature entering the system.
- There are 3 manual settings based on the LEDs above each seat cool switch button on the HVAC module. The first setting is HIGH (3 LEDs), the second setting is MED (2 LEDs) and the third is LOW (1 LED) then OFF (no LEDs).
- When cooling, the DCSM maintains constant speed of the fans and constant TED supply voltage (duty cycle) in open loop cool mode.
- Seat cooling has a maximum operating duration of 30 minutes.

Climate Controlled Seat Cool State	TED Voltage	TED Supply Duty Cycle
HIGH	Vbat	100%
MED	Vbat	75%
LOW	Vbat	50%

The climate controlled seat system is deactivated by one of the following actions:

- Selecting the HVAC module setting to manual OFF.
- Turning the vehicle OFF.

If the temperature at one of the TEDs falls below 5°C (41°F), the DCSM will shut down the TEDs and initiate system recovery mode. If the temperature continues to drop below 2°C (36°F), the DCSM will shut down the fans in the affected seat.

Climate Controlled Seat System Recovery Mode

NOTE: The presence of overtemperature faults (DTCs B2729, B2730, B272A and B272B) can be induced by incorrect operation of the climate controlled seat system after an initial heat setting has been attained. If a heat setting is repeatedly turned OFF and ON in an attempt to increase the seat temperature or repeatedly toggled between heat and cool modes, an overtemperature condition can result and the DTCs will be set.

If the temperature at one of the TEDs rises above 110°C (230°F) in the heat mode or 65°C (149°F) in the cool mode for more than 4 seconds, the DCSM will record an overtemperature DTC, remove voltage from the TEDs and go into recovery mode (blower only) for 30 seconds to cool down the TEDs. The same will occur if a temperature difference of 60°C (108°F) or greater is seen between the backrest and cushion TEDs on either front seat. The DCSM will continue to monitor the TEDs while in recovery mode. If the temperature of the TEDs does not drop to 105°C (221°F) in the heat mode or 60°C (140°F) in the cool mode after 30 seconds, the system will continue to cool the TEDs in recovery mode for up to 5 minutes. If the TEDs cool down at anytime after 30 seconds, but before 5 minutes (checked at 4-second intervals), the system will operate as normal. An overtemperature DTC will still be recorded even if the system recovers and is operating normally. Recovery mode is more likely to occur during extreme cabin temperatures with significant seat back sunload. If the system does not recover within 30 seconds in heat mode or within 5 minutes in cool mode, the DCSM will disable that seat (fault mode) and remain off until the ignition is cycled. Also, if the DCSM detects temperature differential fault twice during the same ignition cycle, it will shutdown. When a fault causes a shutdown, the climate controlled seat indicators will turn off for the affected seat and that seat will not be operational until the next key cycle.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical and electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Switch(es)
• Seat tracks obstructed or damaged
• Lumbar assembly
	• Battery junction box (BJB) fuse(s):
	  ○ 11 (20A Fusion and Milan) (30A MKZ) (heated seats or passenger climate controlled seat)
	  ○ 12 (30A) (driver climate controlled seat)
	  ○ 15 (10A) (driver memory seat)
	  ○ 31 (30A) (passenger power seat)
	  ○ 32 (30A) (driver power seat or driver memory seat)
	• Smart junction box (SJB) fuse 28 (10A)

damaged • Recliner assembly damaged (backrest frame) • Thermo-electric device (TED) assembly filter dirty (cushion or backrest)	(heated seats) • Wiring harness • Loose or corroded connections • Seat control switch(es) • Power seat motor (seat track) • Memory seat position switch • Seat cushion heater • Seat backrest heater • Heated seat module • Lumbar control switch • Power lumbar motor • TED assembly (cushion or backrest) • Power recliner motor • Driver seat module (DSM) • Driver door module (DDM) • HVAC module • Dual climate controlled seat module (DCSM)

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern is with the power seat (non-memory seat) or heated seat and the cause is not visually evident, verify the symptom and Go to **Symptom Chart**.

NOTE: Make sure to use the latest scan tool software release.

5. If the concern is with the memory seat or climate controlled seat and the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

6. If the scan tool does not communicate with the VCM:

- check the VCM connection to the vehicle.
- check the scan tool connection to the VCM.
- refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.

7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
9. Clear the continuous DTCs and carry out the self-test diagnostics for the DSM, DDM, DCSM.
10. If the DTCs retrieved are related to the concern, go to Driver Seat Module (DSM) DTC Chart, Dual Climate Controlled Seat Module (DCSM) DTC Chart or Driver Door Module (DDM) DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
11. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

Driver Seat Module (DSM) DTC Chart

DRIVER SEAT MODULE (DSM) DTC CHART

DTC	Description	Retrieved	Action
B1342	ECU Is Faulted	On-Demand and Continuous	INSTALL a new driver seat module (DSM) and carry out PMI. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

• The heated seat is inoperative - driver	• Fuse • Circuitry • Heated seat switch • Seat cushion heater mat • Seat backrest heater mat • Heated seat module	• Go to **Pinpoint Test O**.
• The heated seat is inoperative - passenger	• Fuse • Circuitry • Heated seat switch • Seat cushion heater	• Go to **Pinpoint Test P**.

	mat • Seat backrest heater mat • Heated seat module	
• The heated seat is inoperative - driver seat does heat but the heated seat indicator does not illuminate when pressed	• Wiring, terminals or connectors • HVAC module • Heated seat module	• Go to **Pinpoint Test Q**.
• The heated seat is inoperative - passenger seat does heat but the heated seat indicator does not illuminate when pressed	• Wiring, terminals or connectors • HVAC module • Heated seat module	• Go to **Pinpoint Test R**.
• All climate controlled seats are inoperative	• Fuse • Circuitry • MS-CAN communication fault • DCSM • HVAC module	• VERIFY battery junction box (BJB) fuse 11 (30A) and 12 (30A) are OK. If OK, CARRY OUT the Data Links Diagnostics test using a scan tool and verify network communication of the HVAC and DCSM. REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose a module communication or network concern. If OK, CARRY OUT the DCSM self-test and retrieve any DTCs. If any DTC is present, REFER to the Dual Climate Controlled Seat Module (DCSM) DTC Chart. CHECK the climate control system for correct operation. REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article for diagnosis of the HVAC or climate control system. If OK, INSTALL a new dual climate controlled seat module (DCSM) and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**.
• A single climate controlled seat is inoperative - switch indicators may or may not illuminate	• Circuitry • HVAC module • DCSM	**NOTE:** **If a fault occurs setting a DTC specific to only one climate controlled seat, the DCSM will disable only the affected seat**

		outputs and allow the other seat to remain operational. CHECK for DTCs specific to the affected climate controlled seat and, if a DTC is present, REFER to the Dual Climate Controlled Seat Module (DCSM) DTC Chart. **NOTE:** **The DCSM receives battery voltage to C3305a pins E and F. Pin F is used by the module for driver seat system operation and pin E is used for the passenger seat system operation. It may be possible for voltage to be missing from one pin location and cause only one climate controlled seat to become inoperative.** • Go to **Pinpoint Test AG**.

Pinpoint Tests

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when taking measurements. Failure to use the correct probe adapter(s) may damage the connector.

Refer to Inspection and Verification, Driver Seat Module (DSM) DTC Chart, Driver Door Module (DDM) DTC Chart, Dual Climate Controlled Seat Module (DCSM) DTC Chart and the Symptom Chart for direction to the appropriate pinpoint test.

Pinpoint Test A: The Power Seat is Inoperative - Driver, With Power Recliner

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB32 (VT/RD) and is supplied ground on circuit GD126 (BK/WH). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor or power recline motor to move the seat or backrest. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor or power recline motor, which moves the seat or backrest in the opposite direction. There are 3 power seat track motors that combine to move

the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the power recline mechanism to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire power seat track. The power recline motor is serviced separately.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Seat control switch

PINPOINT TEST A: THE POWER SEAT IS INOPERATIVE - DRIVER, WITH POWER RECLINER

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

A1 CHECK CIRCUIT SBB32 (VT/GN) FOR VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Driver Seat Control Switch C360

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Measure the voltage between driver seat control switch C360-5, circuit SBB32 (VT/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A2.

  NO : VERIFY battery junction box (BJB) fuse 32 (30A) is OK. If BJB fuse 32 (30A) is OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

A2 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

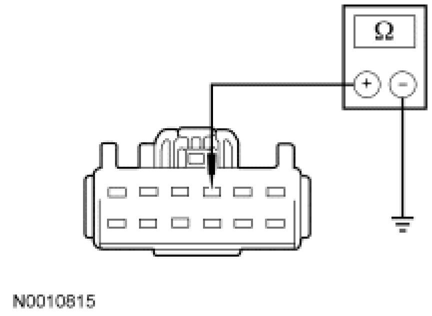

Fig. 1: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C360-3, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new driver seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test B: The Power Seat is Inoperative - Driver, Without Power Recliner

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB32 (VT/RD) and is supplied ground on circuit GD126 (BK/WH). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an entire power seat track.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors

- Seat control switch

PINPOINT TEST B: THE POWER SEAT IS INOPERATIVE - DRIVER, WITHOUT POWER RECLINER

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

B1 CHECK CIRCUIT SBB32 (VT/RD) FOR VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Driver Seat Control Switch C369

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

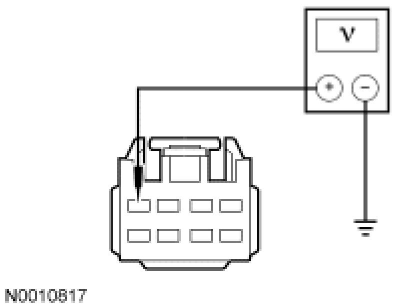

Fig. 2: Checking Circuit SBB32 (VT/RD) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat control switch C369-4, circuit SBB32 (VT/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to B2.

  NO : VERIFY battery junction box (BJB) fuse 32 (30A) is OK. If BJB fuse 32 (30A) is OK, REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

B2 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

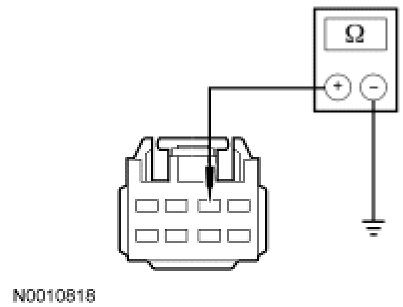

Fig. 3: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C369-2, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new driver seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test C: The Power Seat is Inoperative - Passenger

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Seats for schematic and connector information.

Normal Operation

The passenger seat control switch is powered by battery voltage on circuit SBB31 (WH/RD) and is supplied ground on circuit GD139 (BK/YE). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new seat track motor needs to be installed, it is necessary to install an entire power seat track.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Seat control switch

PINPOINT TEST C: THE POWER SEAT IS INOPERATIVE - PASSENGER

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

C1 CHECK CIRCUIT SBB31 (WH/RD) FOR VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: Passenger Seat Control Switch C3190

WARNING:	**Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

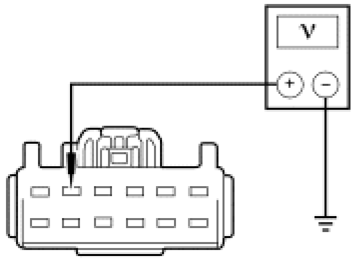

Fig. 4: Checking Circuit SBB31 (WH/RD) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat control switch C3190-5, circuit SBB31 (WH/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to C2.

NO : VERIFY battery junction box (BJB) fuse 31 (30A) is OK. If BJB fuse 31 (30A) is OK, REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

C2 CHECK CIRCUIT GD139 (BK/YE) FOR AN OPEN

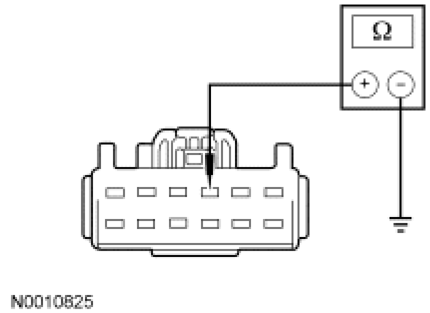

Fig. 5: Checking Circuit GD139 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3190-3, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new passenger seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test D: The Power Seat Moves But is Loose

Normal Operation

The power seat movement should be smooth and the seat cushion should not rock during or after operation.

This pinpoint test is intended to diagnose the following:

- Loose fastening hardware
- Seat track

PINPOINT TEST D: THE POWER SEAT MOVES BUT IS LOOSE

D1 CHECK THE FASTENING HARDWARE

- Inspect for loose fastening hardware on the affected seat.
- **Is the fastening hardware loose?**

  YES : TIGHTEN all fastening hardware to specification. TEST the system for normal operation.

  NO : IDENTIFY the cause and REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test E: The Power Seat Moves But is Noisy

Normal Operation

The power seat should move quietly during operation. Some noise is acceptable.

This pinpoint test is intended to diagnose the following:

- Seat track
- Seat track component
- Object obstructing seat movement

PINPOINT TEST E: THE POWER SEAT MOVES BUT IS NOISY

E1 CHECK THE TRACK ALIGNMENT

- Check the alignment of the track to the floor and the track to the seat.
- **Is the track out of alignment?**

  YES : ALIGN the track to the seat and the floor. TEST the system for normal operation.

  NO : IDENTIFY the cause and REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test F: The Power Seat Does Not Make Full Travel

Normal Operation

The power seat should travel fully horizontal (forward/rearward) and vertical (front up/down and rear up/down).

This pinpoint test is intended to diagnose the following:

- Obstruction
- Seat track

PINPOINT TEST F: THE POWER SEAT DOES NOT MAKE FULL TRAVEL

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of**

faults before releasing the vehicle to the customer.

F1 CHECK FOR AN OBSTRUCTION IN THE SEAT TRACK

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Remove the affected seat. Refer to **Seat - Front**.
- **Are there any obstructions in the track?**

  YES : REMOVE the obstruction(s).

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

  NO : IDENTIFY the cause and REPAIR as necessary.

  REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

Pinpoint Test G: The Power Seat Does Not Move Horizontally/Vertically/Recline - Driver

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB32 (VT/RD) and is supplied ground on circuit GD126 (BK/WH). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor or power recline motor to move the seat or backrest. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor or power recline motor, which moves the seat or backrest in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the power recline mechanism to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire power seat track. The power recline motor is serviced separately.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Seat control switch
- Seat track
- Seat recliner motor

PINPOINT TEST G: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY/RECLINE - DRIVER

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

G1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION

- Operate the driver power seat forward and rearward.
- **Will the seat move horizontally?**

  YES : Go to G2.

  NO : Go to G3.

G2 CHECK THE RECLINER MOTOR FOR CORRECT OPERATION

- Recline the driver backrest forward and rearward.
- **Will the seat backrest recline forward and rearward?**

  YES : Go to G6.

  NO : Go to G13.

G3 CHECK VOLTAGE TO THE DRIVER SEAT HORIZONTAL MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Driver Seat Motor C357

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

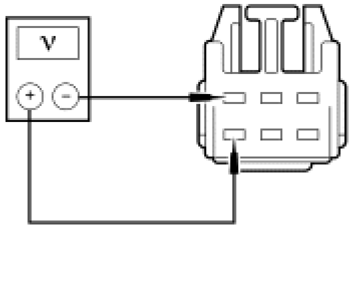

Fig. 6: Checking Voltage To Driver Seat Horizontal Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat motor C357-6, circuit CPS28 (GN), harness side and C357-3, circuit CPS23 (GN/VT), harness side, while operating the seat control switch horizontal adjust forward and rearward.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to G4.

G4 CHECK CIRCUIT CPS28 (GN) FOR AN OPEN AND SHORT TO GROUND

- Disconnect: Driver Seat Control Switch C360

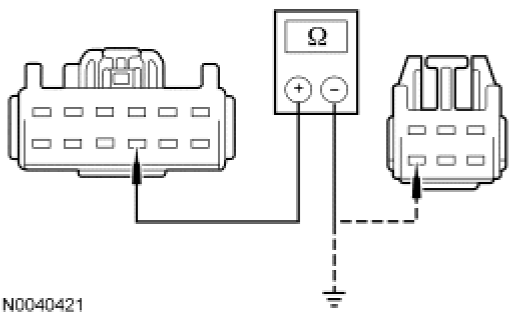

Fig. 7: Checking Circuit CPS28 (GN) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C360-9, circuit CPS28 (GN), harness side and driver seat motor C357-6, circuit CPS28 (GN), harness side; and between driver seat control switch C360-9, circuit CPS28 (GN), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

  YES : Go to G5.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G5 CHECK CIRCUIT CPS23 (GN/VT) FOR AN OPEN AND SHORT TO GROUND

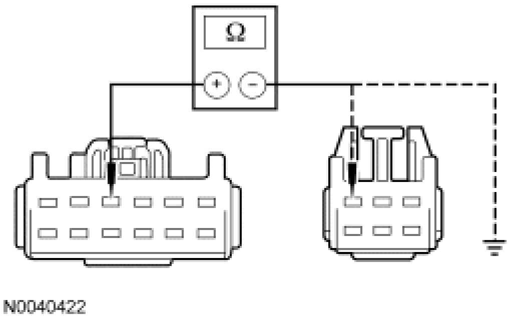

Fig. 8: Checking Circuit CPS23 (GN/VT) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C360-4, circuit CPS23 (GN/VT), harness side and driver seat motor C357-3, circuit CPS23 (GN/VT), harness side; and between driver seat control switch C360-4, circuit CPS23 (GN/VT), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

  YES : INSTALL a new driver seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G6 DETERMINE THE SEAT HEIGHT ADJUST FAILURE

- Operate the front and rear seat height adjustments.
- **Does the seat front and rear height adjust up and down?**

  YES : If only front height adjust operates, go to G7.

  If only rear height adjust operates, go to G10.

  NO : INSTALL a new driver seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G7 CHECK THE VOLTAGE TO THE DRIVER SEAT REAR HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

- Disconnect the driver seat side air bag C327.
- Disconnect: Driver Seat Motor C357

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

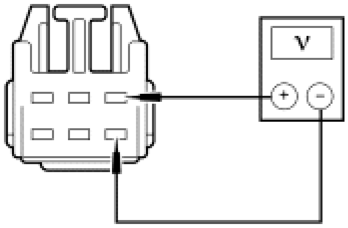

Fig. 9: Checking Voltage To Driver Seat Rear Height Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat motor C357-1, circuit CPS27 (BU/BN), harness side and C357-4, circuit CPS26 (YE/BU), harness side, while operating the seat control switch rear height adjust up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to G8.

G8 CHECK CIRCUIT CPS27 (BU/BN) FOR AN OPEN AND SHORT TO GROUND

- Disconnect: Driver Seat Control Switch C360

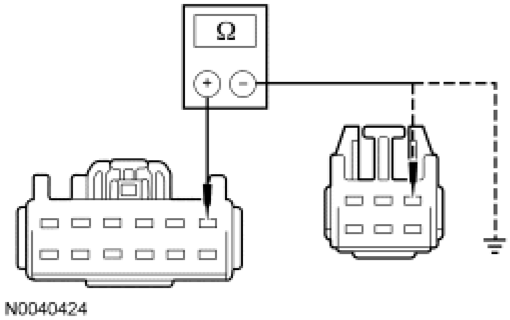

Fig. 10: Checking Circuit CPS27 (BU/BN) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C360-1, circuit CPS27 (BU/BN), harness side and driver seat motor C357-1, circuit CPS27 (BU/BN), harness side; and between driver seat control switch C360-1, circuit CPS27 (BU/BN), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

  YES : Go to G9.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G9 CHECK CIRCUIT CPS26 (YE/BU) FOR AN OPEN AND SHORT TO GROUND

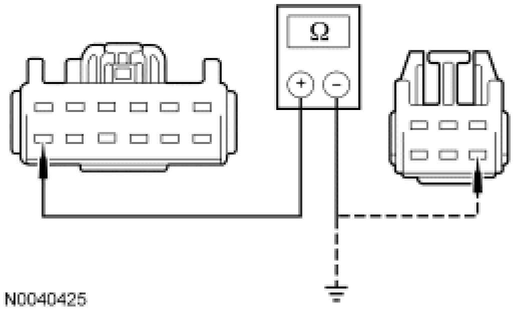

Fig. 11: Checking Circuit CPS26 (YE/BU) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C360-12, circuit CPS26 (YE/BU), harness side and driver seat motor C357-4, circuit CPS26 (YE/BU), harness side; and between driver seat control switch C360-12, circuit CPS26 (YE/BU), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

  YES : INSTALL a new driver seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G10 CHECK VOLTAGE TO THE DRIVER SEAT FRONT HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Driver Seat Motor C357

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

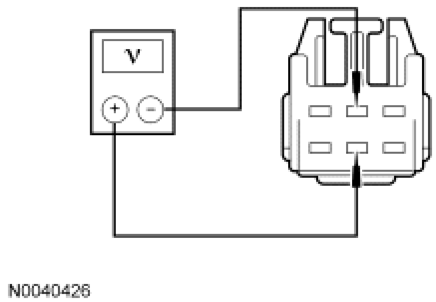

Fig. 12: Checking Voltage To Driver Seat Front Height Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat motor C357-2, circuit CPS25 (WH/VT), harness side and C357-5, circuit CPS24 (GY), harness side, while operating the seat control switch front height adjust up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to G11.

G11 CHECK CIRCUIT CPS25 (WH/VT) FOR AN OPEN AND SHORT TO GROUND

- Disconnect: Driver Seat Control Switch C360

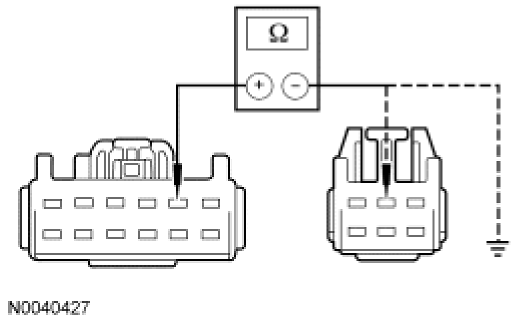

Fig. 13: Checking Circuit CPS25 (WH/VT) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C360-2, circuit CPS25 (WH/VT), harness side and driver seat motor C357-2, circuit CPS25 (WH/VT), harness side; and between driver seat control switch C360-2, circuit CPS25 (WH/VT), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

YES : Go to G12.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G12 CHECK CIRCUIT CPS24 (GY) FOR AN OPEN AND A SHORT TO GROUND

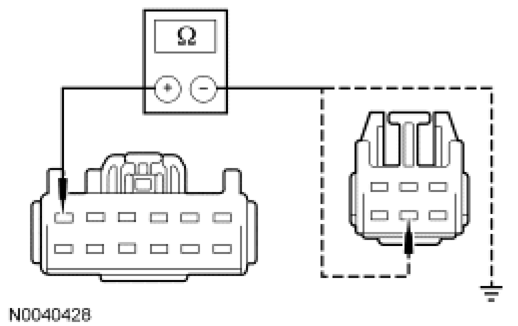

Fig. 14: Checking Circuit CPS24 (GY) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C360-6, circuit CPS24 (GY) harness side, and driver seat motor C357-5, circuit CPS24 (GY), harness side; and between driver seat control switch C360-6, circuit CPS24 (GY), harness side and ground.

- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

  YES : INSTALL a new driver seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G13 CHECK VOLTAGE TO THE DRIVER SEAT RECLINER MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Driver Seat Recliner Motor C3187

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

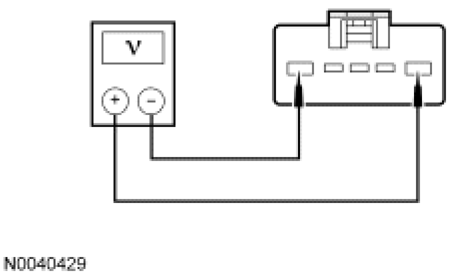

Fig. 15: Checking Voltage To Driver Seat Recliner Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat recliner motor C3187-1, circuit CPS29 (WH/BN), harness side and C3187-5, circuit CPS30 (VT/BN), harness side, while operating the seat control switch recline adjust forward and rearward.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions**

and 0 volts in the rest position?

YES : INSTALL a new driver seat recliner motor. REFER to **Seat Recliner Motor**. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to G14.

G14 CHECK CIRCUIT CPS29 (WH/BN) FOR AN OPEN AND SHORT TO GROUND

- Disconnect: Driver Seat Control Switch C360

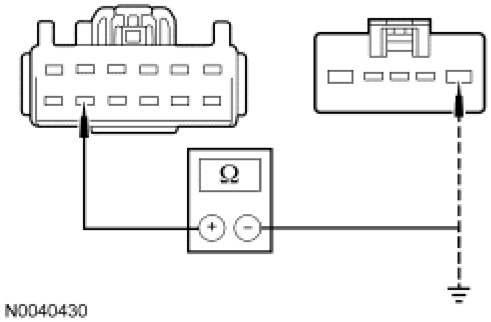

Fig. 16: Checking Circuit CPS29 (WH/BN) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C360-11, circuit CPS29 (WH/BN), harness side and driver seat recliner motor C3187-1, circuit CPS29 (WH/BN), harness side; and between driver seat control switch C360-11, circuit CPS29 (WH/BN), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat recliner motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

YES : Go to G15.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

G15 CHECK CIRCUIT CPS30 (VT/BN) FOR AN OPEN AND SHORT TO GROUND

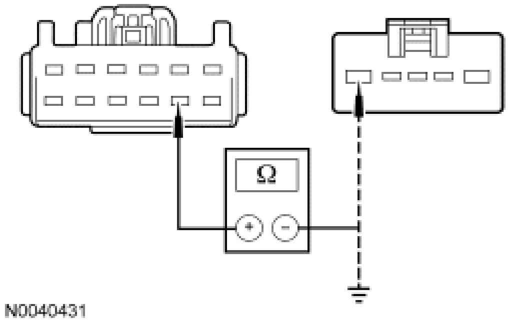

Fig. 17: Checking Circuit CPS30 (VT/BN) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C360-8, circuit CPS30 (VT/BN) harness side, and driver seat recliner motor C3187-5, circuit CPS30 (VT/BN), harness side; and between driver seat control switch C360-8, circuit CPS30 (VT/BN), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat recliner motor and the driver seat control switch; and greater than 10,000 ohms between the seat control switch and ground?**

  YES : INSTALL a new driver seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test H: The Power Seat Does Not Move Horizontally/Vertically - Driver

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB32 (VT/RD) and is supplied ground on circuit GD126 (BK/WH). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor to move the seat. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor, which moves the seat in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). If a new motor needs to be installed, it is necessary to install an entire power seat track.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Seat control switch
- Seat track

PINPOINT TEST H: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY - DRIVER

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

H1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION

- Operate the driver power seat forward and rearward.
- **Will the seat move horizontally?**

  YES : Go to H5.

  NO : Go to H2.

H2 CHECK VOLTAGE TO THE DRIVER SEAT HORIZONTAL MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Driver Seat Motor C357

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

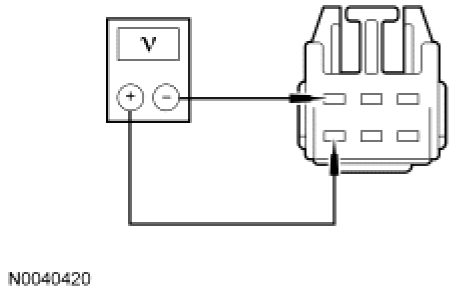

Fig. 18: Checking Voltage To Driver Seat Horizontal Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat motor C357-6, circuit CPS23 (GN/VT), harness side and C357-3, circuit CPS22 (BN), harness side, while operating the seat control switch horizontal adjust forward and rearward.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to H3.

H3 CHECK CIRCUIT CPS22 (BN) FOR AN OPEN AND SHORT TO GROUND

- Disconnect: Driver Seat Control Switch C369

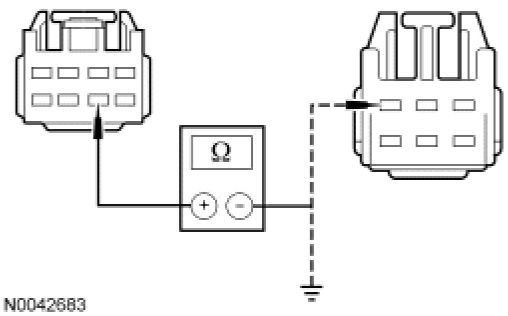

Fig. 19: Checking Circuit CPS22 (BN) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C369-6, circuit CPS22 (BN), harness side and driver seat motor C357-3, circuit CPS22 (BN), harness side; and between driver seat control switch C369-6, circuit CPS22 (BN), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

  YES : Go to H4.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H4 CHECK CIRCUIT CPS23 (GN/VT) FOR AN OPEN AND SHORT TO GROUND

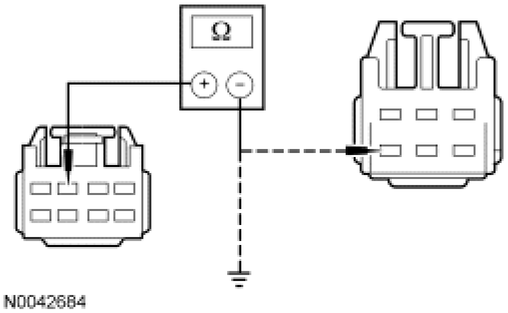

Fig. 20: Checking Circuit CPS23 (GN/VT) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C369-3, circuit CPS23 (GN/VT), harness side and driver seat motor C357-6, circuit CPS23 (GN/VT), harness side; and between driver seat control switch C369-3, circuit CPS23 (GN/VT), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

  YES : INSTALL a new driver seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H5 DETERMINE THE SEAT HEIGHT ADJUST FAILURE

- Operate the front and rear seat height adjustments.
- **Does the seat front and rear height adjust up and down?**

  YES : If only front height adjust operates, go to H6.

  If only rear height adjust operates, go to H9.

  NO : INSTALL a new driver seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H6 CHECK VOLTAGE TO THE DRIVER SEAT REAR HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

- Disconnect the driver seat side air bag C327.
- Disconnect: Driver Seat Motor C357

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

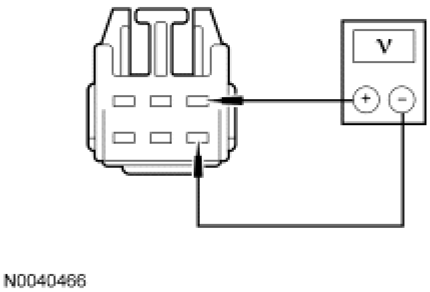

Fig. 21: Checking Voltage To Driver Seat Rear Height Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat motor C357-1, circuit CPS27 (BU/BN), harness side and C357-4, circuit CPS26 (YE/BU), harness side, while operating the seat control switch rear height adjust up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to H7.

H7 CHECK CIRCUIT CPS27 (BU/BN) FOR AN OPEN AND SHORT TO GROUND

- Disconnect: Driver Seat Control Switch C369

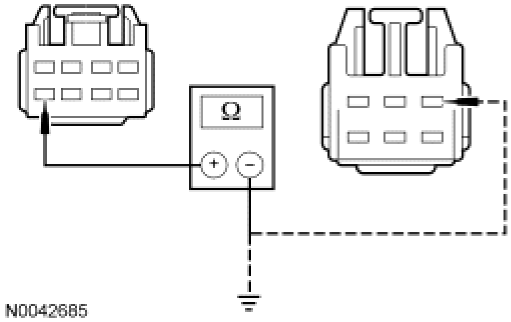

Fig. 22: Checking Circuit CPS27 (BU/BN) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C369-8, circuit CPS27 (BU/BN), harness side and driver seat motor C357-1, circuit CPS27 (BU/BN), harness side; and between driver seat control switch C369-8, circuit CPS27 (BU/BN), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

  YES : Go to H8.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H8 CHECK CIRCUIT CPS26 (YE/BU) FOR AN OPEN AND SHORT TO GROUND

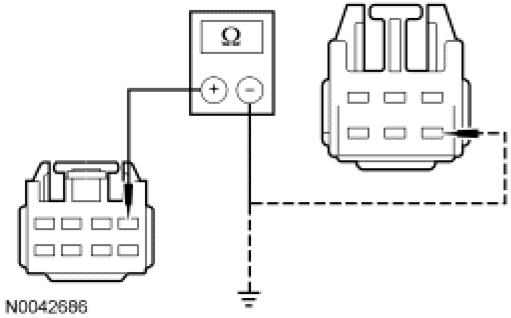

Fig. 23: Checking Circuit CPS26 (YE/BU) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C369-1, circuit CPS26 (YE/BU), harness side and driver seat motor C357-4, circuit CPS26 (YE/BU), harness side; and between driver seat control switch C369-1, circuit CPS26 (YE/BU), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

  YES : INSTALL a new driver seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H9 CHECK VOLTAGE TO THE DRIVER SEAT FRONT HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Driver Seat Motor C357

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

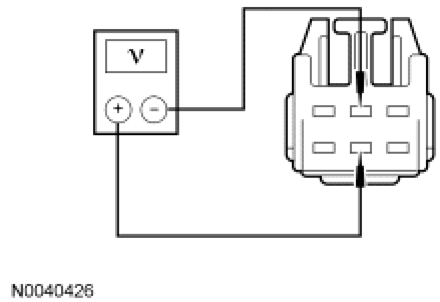

Fig. 24: Checking Voltage To Driver Seat Front Height Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat motor C357-2, circuit CPS25 (WH/VT), harness side and C357-5, circuit CPS24 (GY), harness side, while operating the seat control switch front height adjust up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to H10.

H10 CHECK CIRCUIT CPS25 (WH/VT) FOR AN OPEN AND SHORT TO GROUND

- Disconnect: Driver Seat Control Switch C369

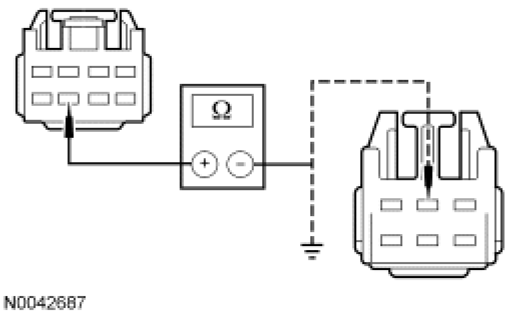

Fig. 25: Checking Circuit CPS25 (WH/VT) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C369-7, circuit CPS25 (WH/VT), harness side and driver seat motor C357-2, circuit CPS25 (WH/VT), harness side; and between driver seat control switch C369-7, circuit CPS25 (WH/VT), harness side and ground.
- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

  YES : Go to H11.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

H11 CHECK CIRCUIT CPS24 (GY) FOR AN OPEN

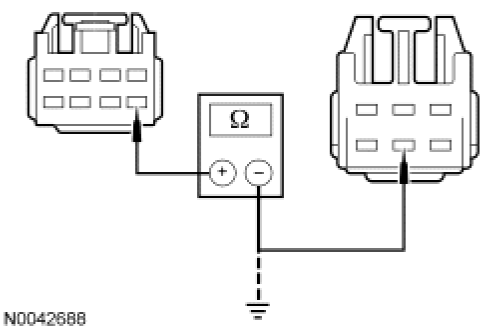

Fig. 26: Checking Circuit CPS24 (GY) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat control switch C369-5, circuit CPS24 (GY) harness side, and driver seat motor C357-5, circuit CPS24 (GY), harness side; and between driver seat control switch C3069-5, circuit CPS24 (GY), harness side and ground.

- **Is the resistance less than 5 ohms between the driver seat motor and the driver seat control switch; and greater than 10,000 ohms between the driver seat control switch and ground?**

  YES : INSTALL a new driver seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test I: The Power Seat Does Not Move Horizontally/Vertically/Recline - Passenger

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Seats for schematic and connector information.

Normal Operation

The passenger seat control switch is powered by battery voltage on circuit SBB31 (WH/RD) and is supplied ground on circuit GD139 (BK/YE). When pressed, the seat control switch supplies that voltage and ground to a power seat track motor or power recline motor to move the seat or backrest. When pressed in the opposite direction, the seat control switch reverses the polarity to that same power seat track motor or power recline motor, which moves the seat or backrest in the opposite direction. There are 3 power seat track motors that combine to move the seat cushion horizontally (forward/rearward) and vertically (front up/down and rear up/down). There is an additional motor in the power recline mechanism to move the seat backrest forward and rearward. If a new seat track motor needs to be installed, it is necessary to install an entire power seat track. The power recline motor is serviced separately.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Seat control switch
- Seat track
- Seat recliner motor

PINPOINT TEST I: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY/RECLINE - PASSENGER

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

I1 CHECK THE HORIZONTAL MOTOR FOR CORRECT OPERATION

- Operate the passenger power seat forward and rearward.
- **Will the seat move horizontally?**

  YES : Go to I2.

  NO : Go to I3.

I2 CHECK THE RECLINER MOTOR FOR CORRECT OPERATION

- Recline the passenger backrest forward and rearward.
- **Will the seat backrest recline forward and rearward?**

  YES : Go to I6.

  NO : Go to I13.

I3 CHECK VOLTAGE TO THE PASSENGER SEAT HORIZONTAL MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: Passenger Seat Motor C3015

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

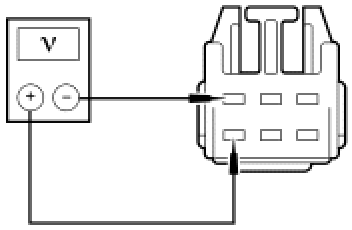

Fig. 27: Checking Voltage To Driver Seat Horizontal Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat motor C3015-6, circuit CPS38 (GN/BU), harness side and C3015-3, circuit CPS33 (WH), harness side, while operating the seat control switch horizontal adjust forward and rearward.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

YES : INSTALL a new passenger seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to I4.

I4 CHECK CIRCUIT CPS38 (GN/BU) FOR AN OPEN AND SHORT TO GROUND

- Disconnect: Passenger Seat Control Switch C3190

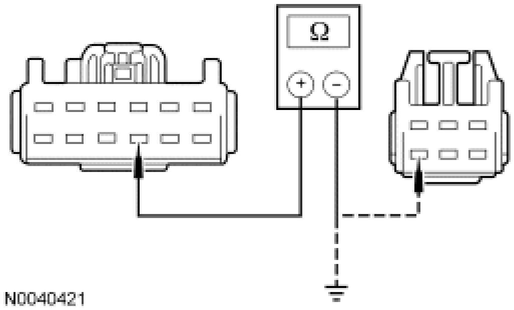

Fig. 28: Checking Circuit CPS28 (GN) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3190-9, circuit CPS38 (GN/BU), harness side and passenger seat motor C3015-6, circuit CPS38 (GN/BU), harness side; and between passenger seat control switch C3190-9, circuit CPS38 (GN/BU), harness side and ground.
- **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**

YES : Go to I5.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I5 CHECK CIRCUIT CPS33 (WH) FOR AN OPEN AND SHORT TO GROUND

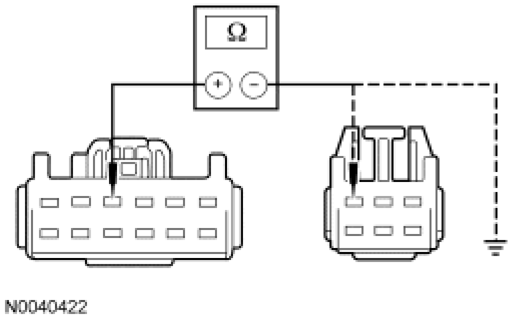

Fig. 29: Checking Circuit CPS23 (GN/VT) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3190-4, circuit CPS33 (WH), harness side and passenger seat motor C3015-3, circuit CPS33 (WH), harness side; and between passenger seat control switch C3190-4, circuit CPS33 (WH), harness side and ground.
- **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**

  YES : INSTALL a new passenger seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I6 DETERMINE THE SEAT HEIGHT ADJUST FAILURE

- Operate the front and rear seat height adjustments.
- **Does the seat front and rear height adjust up and down?**

  YES : If only front height adjust operates, go to I7.

  If only rear height adjust operates, go to I10.

  NO : INSTALL a new passenger seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I7 CHECK VOLTAGE TO THE PASSENGER SEAT REAR HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in

the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

- Disconnect the passenger seat side air bag C313.
- Disconnect: Passenger Seat Motor C3015

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

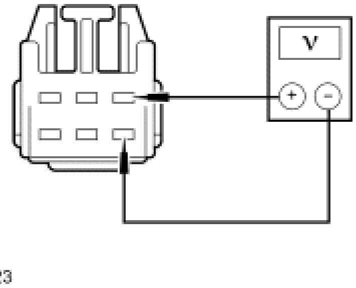

Fig. 30: Checking Voltage To Driver Seat Rear Height Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat motor C3015-1, circuit CPS37 (WH/BU), harness side and C3015-4, circuit CPS36 (YE/GY), harness side, while operating the seat control switch rear height adjust up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new passenger seat track assembly. REFER to **Seat Track**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to I8.

I8 CHECK CIRCUIT CPS37 (WH/BU) FOR AN OPEN AND SHORT TO GROUND

- Disconnect: Passenger Seat Control Switch C3190

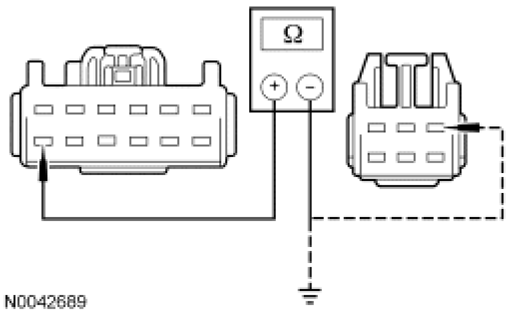

Fig. 31: Checking Circuit CPS37 (WH/BU) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3190-12, circuit CPS37 (WH/BU), harness side and passenger seat motor C3015-1, circuit CPS37 (WH/BU), harness side; and between passenger seat control switch C3190-12, circuit CPS37 (WH/BU), harness side and ground.
- **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**

  YES : Go to I9.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I9 CHECK CIRCUIT CPS36 (YE/GY) FOR AN OPEN AND SHORT TO GROUND

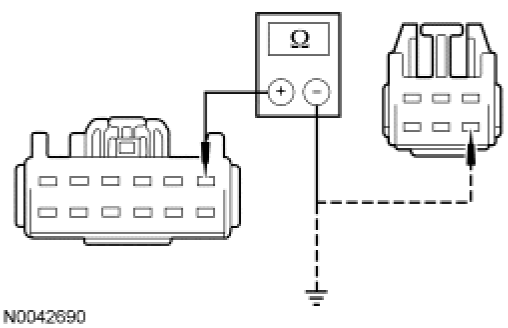

Fig. 32: Checking Circuit CPS36 (YE/GY) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3190-1, circuit CPS36 (YE/GY), harness side and passenger seat motor C3015-4, circuit CPS36 (YE/GY), harness side; and between passenger seat control switch C3190-4, circuit CPS36 (YE/GY), harness side and ground.
- **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**

YES : INSTALL a new passenger seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I10 CHECK VOLTAGE TO THE PASSENGER SEAT FRONT HEIGHT MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: Passenger Seat Motor C3015

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

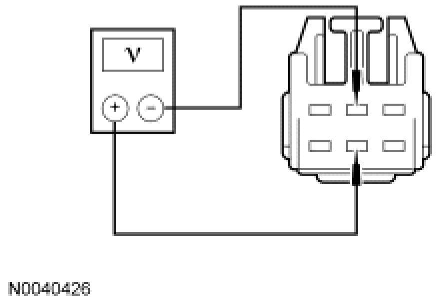

Fig. 33: Checking Voltage To Driver Seat Front Height Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat motor C3015-2, circuit CPS35 (VT/GN), harness side and C3015-5, circuit CPS34 (GY/BU), while operating the seat control switch front height adjust up and down.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new passenger seat track assembly. REFER to **Seat Track**. TEST the system

for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to I11.

I11 CHECK CIRCUIT CPS35 (VT/GN) FOR AN OPEN AND SHORT TO GROUND

- Disconnect: Passenger Seat Control Switch C3190

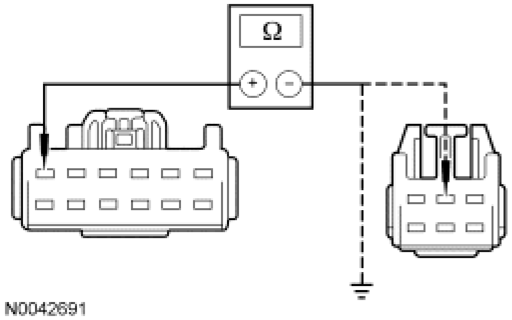

Fig. 34: Checking Circuit CPS35 (VT/GN) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3190-6, circuit CPS35 (VT/GN), harness side and passenger seat motor C3015-2, circuit CPS35 (VT/GN), harness side; and between passenger seat control switch C3190-6, circuit CPS35 (VT/GN), harness side and ground.
- **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**

YES : Go to I12.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I12 CHECK CIRCUIT CPS34 (GY/BU) FOR AN OPEN

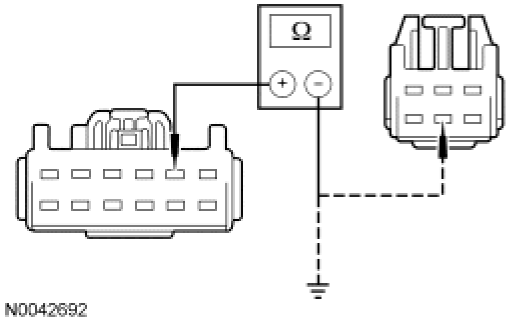

Fig. 35: Checking Circuit CPS34 (GY/BU) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3190-2, circuit CPS34 (GY/BU) harness side, and passenger seat motor C3015-5, circuit CPS34 (GY/BU), harness side; and between passenger seat control switch C3190-2, circuit CPS34 (GY/BU), harness side and ground.
- **Is the resistance less than 5 ohms between the passenger seat motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**

  YES : INSTALL a new passenger seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I13 CHECK VOLTAGE TO THE PASSENGER SEAT RECLINER MOTOR

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: Passenger Seat Recliner Motor C3189

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

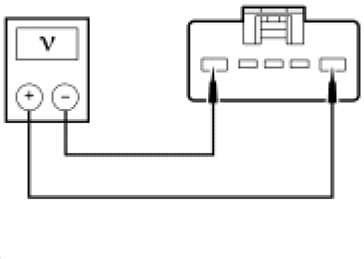

Fig. 36: Checking Voltage To Driver Seat Recliner Motor

Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger seat recliner motor C3189-1, circuit CPS39 (GY/YE), harness side and C3189-5, circuit CPS40 (VT/GY), harness side, while operating the seat control switch recline adjust forward and rearward.
- **Is the voltage greater than 10 volts when the seat control switch is operated in both directions and 0 volts in the rest position?**

  YES : INSTALL a new passenger seat recliner motor. REFER to **Seat Recliner Motor**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to I14.

I14 CHECK CIRCUIT CPS39 (GY/YE) FOR AN OPEN AND SHORT TO GROUND

- Disconnect: Passenger Seat Control Switch C3190

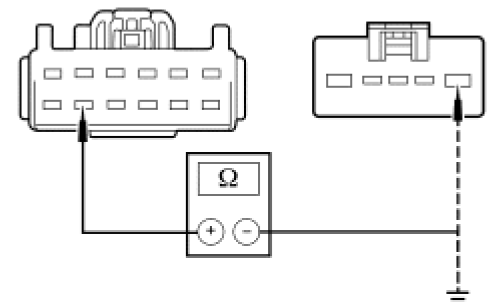

Fig. 37: Checking Circuit CPS29 (WH/BN) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

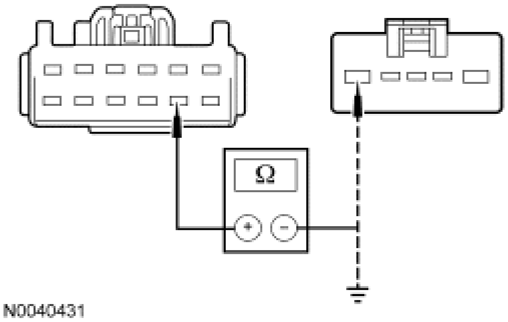
- Measure the resistance between passenger seat control switch C3190-11, circuit CPS39 (GY/YE), harness side and passenger seat recliner motor C3189-1, circuit CPS39 (GY/YE), harness side; and between passenger seat control switch C3190-11, circuit CPS39 (GY/YE), harness side and ground.
- **Is the resistance less than 5 ohms between the passenger seat recliner motor and the passenger seat control switch; and greater than 10,000 ohms between the passenger seat control switch and ground?**

  YES : Go to I15.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

I15 CHECK CIRCUIT CPS40 (VT/GY) FOR AN OPEN AND SHORT TO GROUND



N0040431

Fig. 38: Checking Circuit CPS30 (VT/BN) For Open And Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat control switch C3190-8, circuit CPS40 (VT/GY) harness side, and passenger seat recliner motor C3189-5, circuit CPS40 (VT/GY), harness side; and between passenger seat control switch C3190-8, circuit CPS40 (VT/GY), harness side and ground.
- **Is the resistance less than 5 ohms between the passenger seat recliner motor and the passenger seat control switch; and greater than 10,000 ohms between the seat control switch and ground?**

  YES : INSTALL a new passenger seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test J: The Memory Seat is Inoperative/Does Not Operate Correctly - Does Not Operate Horizontally/Vertically/Recline

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Memory Seats for schematic and connector information.

Refer to COMPONENT TESTING.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB15 (WH/RD) and is supplied ground on circuit GD126 (BK/WH). When pressed, the seat control switch supplies the voltage and ground to the applicable driver seat module (DSM) inputs. The DSM then supplies voltage and ground to the appropriate power seat track motor or power recline motor based on the inputs received from the seat control switch. When pressed in the opposite direction, the seat control switch reverses the polarity to the DSM inputs, and the DSM likewise reverses polarity of the appropriate power seat track motor or power recliner motor circuits causing the seat or backrest to move in the opposite direction. There are 3 power seat track motors that combine to move the seat horizontally (forward/rearward) and vertically (front up/down and rear up/down). The seat backrest power

recliner mechanism uses a single motor to move the seat backrest forward and rearward.

Battery voltage is also supplied to DSM on circuits SBB15 (WH/RD) and SBB32 (VT/RD). Ground is supplied to the DSM on circuit GD126 (BK/WH).

Each motor, in the memory power seat track and power recliner mechanism contains a Hall-effect position sensor. The DSM supplies a signal feed circuit to each position sensor and a shared reference signal return circuit. Each position sensor sends a signal voltage back to the DSM used to monitor the position of the power seat and seat backrest. The DSM uses this information to return the seat to a stored pre-programmed position when pressing the memory seat position switch or a remote entry transmitter. The memory seat position switch is hard-wired to the driver door module (DDM) and communicates memory SET commands to the DSM via medium-speed controller area network (MS-CAN). For information on programming memory positions or recalling a stored memory position, refer to **Memory Position Programming**.

The following pinpoint test diagnoses a memory seat that does not operate in one or more directions when using the seat control switch. If the memory seat moves in all directions using the seat control switch, go to **Pinpoint Test K**.

DTC Description	Fault Trigger Conditions
• B1342 - ECU is Faulted	If a programming error is detected, the DTC is set.
• B1663 - Seat Driver Front Up/Down Motor Stalled • B1664 - Seat Driver Rear Up/Down Motor Stalled • B1665 - Seat Driver Forward/Backward Motor Stalled	During self-test, the driver seat module (DSM) attempts to operate the appropriate seat track motor and uses the motor's position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no movement continues to be monitored after 250 milliseconds, the DSM disables the output.
• B1666 - Seat Driver Recline Motor Stalled	During self-test, the DSM attempts to operate the recliner motor and uses the recliner motor position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no motor movement is still monitored after 250 milliseconds, the DSM disables the output.
• B1703 - Seat Driver Recline Forward Switch Circuit Short to	If voltage is sensed on the switch input circuit during the DSM Self-

Battery • B1707 - Seat Driver Recline Rearward Switch Circuit Short to Battery	Test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1711 - Seat Driver Front Up Switch Circuit Short to Battery • B1715 - Seat Driver Front Down Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM Self-Test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1719 - Seat Driver Forward Switch Circuit Short to Battery • B1723 - Seat Driver Rearward Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM Self-Test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
• B1727 - Seat Driver Rear Up Switch Circuit Short to Battery • B1731 - Seat Driver Rear Down Switch Circuit Short to Battery	If voltage is sensed on the switch input circuit during the DSM Self-Test, the DTC is set. If voltage is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Seat control switch
- Seat track
- Seat recliner motor
- DSM

PINPOINT TEST J: THE MEMORY SEAT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - DOES NOT OPERATE HORIZONTALLY/VERTICALLY/RECLINE

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

J1 CHECK DSM GEAR SELECTED (TRANS GEAR) PID

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM

  NOTE: D6_PRK applies to both park and overdrive.

- Operate the transmission gear selector in all positions while monitoring the following DSM PID TRANS GEAR states:
  - D6_PRK
  - REV
  - NTRL
  - D6_PRK
  - DRIVE1
- **Do the PID states agree with the selected positions?**

  YES : Go to J2.

  NO : To diagnose a transmission gear selector (PRNDL) status concern, REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article.

J2 CHECK DSM IGNITION SWITCH STATUS (IGN_SW) PID

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM
- Cycle the ignition switch in all positions while monitoring the following DSM IGN_SW PID states:
  - Off
  - Accessory
  - Run
  - Start
- **Do the PID states agree with the selected positions?**

  YES : Go to J3.

  NO : To diagnose an ignition switch status concern, REFER to **STEERING COLUMN SWITCHES** article.

J3 RETRIEVE THE DTCs

- Operate the memory seat and memory exterior mirrors in all directions through the full range of travel.

- Place the memory seat and memory exterior mirrors in central travel positions.
- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DSM/Retrieve DTCs
- **Are any DTCs retrieved?**

  YES : If DTCs B1663, B1664, B1665 and B1666 are all retrieved, go to J12.

  If DTC B1663, go to J22.

  If DTC B1664, go to J25.

  If DTC B1665, go to J28.

  If DTC B1666, go to J31.

  If DTC B1703, go to J5.

  If DTC B1707, go to J5.

  If DTC B1711, go to J5.

  If DTC B1715, go to J5.

  If DTC B1719, go to J5.

  If DTC B1723, go to J5.

  If DTC B1727, go to J5.

  If DTC B1731, go to J5.

  If DTC B1342, INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT programmable module installation (PMI). REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to J4.

J4 CHECK DSM SEAT CONTROL SWITCH PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM
- Monitor the following DSM seat control switch PIDs while activating the seat control switch in all positions:
  - Driver Power Seat Front Up/Down Switch (SFNT_SW)
  - Driver Power Seat Forward/Backward Switch (SFWD_SW)
  - Driver Power Seat Rear Up/Down Switch (SREARSW)
  - Driver Power Seat Recline Switch Status (SRCL_SW)
- **Do the PID states agree with the switch positions?**

  YES : Go to J11.

NO : VERIFY battery junction box (BJB) fuse 15 (10A) is OK.

If BJB fuse 15 (10A) fails while operating the seat control switch, DISCONNECT the seat control switch C3297 and Go to J9.

If BJB fuse 15 (10A) is OK, go to J5.

J5 CHECK THE SEAT CONTROL SWITCH

- Key in OFF position.
- Remove the seat control switch. Refer to **Seat Control Switch**.
- Check the seat control switch. Refer to COMPONENT TESTING.
- **Is the seat control switch OK?**

  YES : Go to J6.

  NO : INSTALL a new seat control switch. REFER to **Seat Control Switch**. REPEAT the self-test. CLEAR the DTCs.

J6 CHECK CIRCUIT SBB15 (WH/RD) FOR VOLTAGE TO THE SEAT CONTROL SWITCH

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

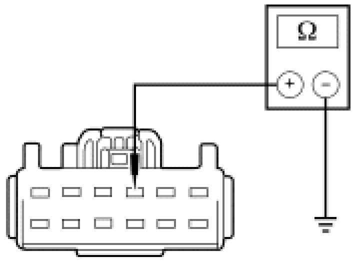
- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Measure the voltage between seat control switch C3297-5, circuit SBB15 (WH/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to J7.

  NO : VERIFY BJB fuse 15 (10A) is OK. If BJB fuse 15 (10A) is OK, REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J7 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN



N0010815

Fig. 39: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3297-3, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

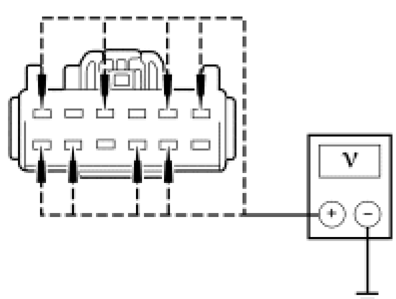
  YES : Go to J8.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J8 CHECK THE SEAT CONTROL SWITCH TO DRIVER SEAT MODULE CIRCUITS FOR A SHORT TO VOLTAGE

- Disconnect: DSM C3299b
- Key in ON position.



N0013557

Fig. 40: Checking Seat Control Switch To Driver Seat Module Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the following seat control switch pins, harness side and ground.

Connector-Pin	Circuit
	CPS06

C3297-9	(GN/WH)
C3297-4	CPS01 (GN/BU)
C3297-2	CPS03 (VT/GY)
C3297-6	CPS02 (GY/YE)
C3297-11	CPS07 (GY/BN)
C3297-8	CPS08 (VT/OG)
C3297-12	CPS04 (YE/OG)
C3297-1	CPS05 (BU/WH)

- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to J9.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J9 CHECK THE SEAT CONTROL SWITCH TO DRIVER SEAT MODULE CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Seat Control Switch C3297

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

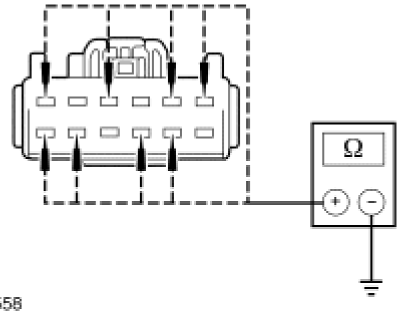


Fig. 41: Checking Seat Control Switch To Driver Seat Module Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following seat control switch pins, harness side and ground.

Connector-Pin	Circuit
C3297-9	CPS06 (GN/WH)
C3297-4	CPS01 (GN/BU)
C3297-2	CPS03 (VT/GY)
C3297-6	CPS02 (GY/YE)
C3297-11	CPS07 (GY/BN)
C3297-8	CPS08 (VT/OG)
C3297-12	CPS04 (YE/OG)
C3297-1	CPS05 (BU/WH)

- **Are the resistances greater than 10,000 ohms?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J10.

J10 CHECK THE SEAT CONTROL SWITCH TO DSM CIRCUITS FOR AN OPEN

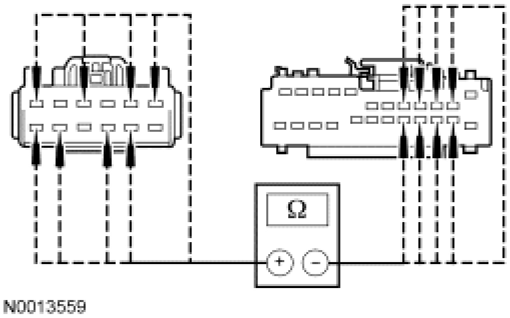

Fig. 42: Checking Seat Control Switch To DSM Circuits For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following seat control switch pins, harness side and DSM pins, harness side.

Seat Control Switch Connector-Pin	Circuit	DSM Connector-Pin
C3297-9	CPS06 (GN/WH)	C3299b-15
C3297-4	CPS01 (GN/BU)	C3299b-3
C3297-2	CPS03 (VT/GY)	C3299b-14
C3297-6	CPS02 (GY/YE)	C3299b-2
C3297-11	CPS07 (GY/BN)	C3299b-17
C3297-8	CPS08 (VT/OG)	C3299b-5
C3297-12	CPS04 (YE/OG)	C3299b-4
C3297-1	CPS05 (BU/WH)	C3299b-16

- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT PMI. REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J11 CHECK THE POWER SEAT TRACK OPERATION USING DSM SEAT TRACK MOTOR PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM
- Toggle the following DSM active commands ON and OFF while monitoring the seat movement:
    - Front Motor Up (FRONT_UP)
    - Front Motor Down (FRONT_DWN)
    - Rear Motor Up (REAR_UP)
    - Rear Motor Down (REAR_DWN)
    - Horizontal Motor Forward (HORZ_FWD)
    - Horizontal Motor Backward (HORZ_BWD)
    - Recline Motor Backward (RECL_BWD)
    - Recline Motor Forward (RECL_FWD)
- **Does the driver seat operate correctly?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT PMI. REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If no seat movement, go to J12.

  If no front vertical seat movement, go to J22.

  If no rear vertical seat movement, go to J25.

  If no horizontal seat movement, go to J28.

  If no recline seat movement, go to J31.

J12 CHECK DSM CIRCUIT SBB32 (VT/RD) FOR VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: DSM C3299a

WARNING: **Make sure no one is in the vehicle and there is nothing**

blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

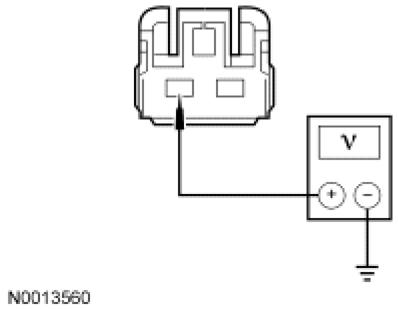

Fig. 43: Checking DSM Circuit SBB32 (VT/RD) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299a-2, circuit SBB32 (VT/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to J13.

  NO : VERIFY BJB fuse 32 (30A) is OK. If OK, REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J13 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

- Disconnect: DSM C3299c

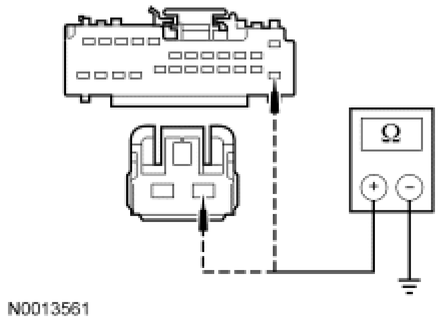

Fig. 44: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299a-1, circuit GD126 (BK/WH), harness side and

ground; and between DSM C3299c-13, circuit GD126 (BK/WH), harness side and ground.

- **Is the resistance less than 5 ohms?**

  YES : Go to J14.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J14 CHECK CIRCUITS CPS24 (GY) AND CPS25 (WH/VT) FOR A SHORT TO GROUND

- Disconnect: DSM C3299b

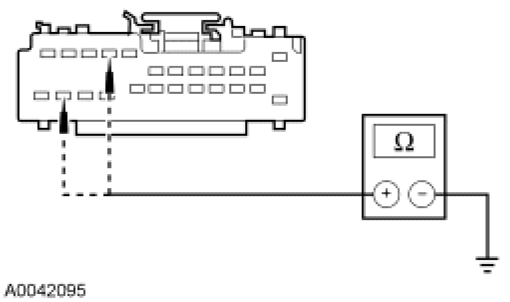

Fig. 45: Checking Circuits CPS24 (GY) & CPS25 (WH/VT) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-9, circuit CPS25 (WH/VT), harness side and ground; and between DSM C3299b-23, circuit CPS24 (GY), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to J16.

  NO : Go to J15.

J15 CHECK THE FRONT HEIGHT POWER SEAT MOTOR CIRCUITS CPS25 (WH/VT) AND CPS24 (GY) FOR A SHORT TO GROUND

- Disconnect: Power Seat Motor C357

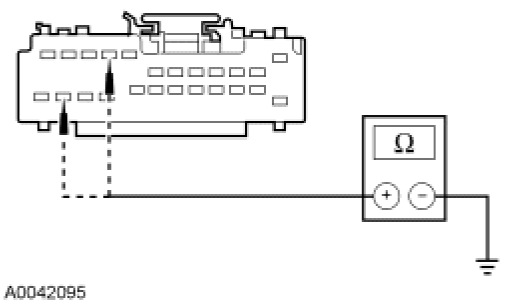

Fig. 46: Checking Front Height Power Seat Motor Circuits CPS25 (WH/VT) & CPS24 (GY) For A Short To Ground

Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-9, circuit CPS25 (WH/VT), harness side and ground; and between DSM C3299b-23, circuit CPS24 (GY), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J16 CHECK CIRCUITS CPS27 (BU/BN) AND CPS26 (YE/BU) FOR A SHORT TO GROUND

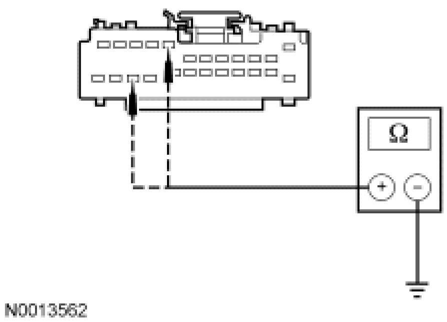

Fig. 47: Checking Circuits CPS27 (BU/BN) & CPS26 (YE/BU) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-8, circuit CPS27 (BU/BN), harness side and ground; and between DSM C3299b-22, circuit CPS26 (YE/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to J18.

  NO : Go to J17.

J17 CHECK THE REAR HEIGHT POWER SEAT MOTOR CIRCUITS CPS27 (BU/BN) AND CPS26 (YE/BU) FOR A SHORT TO GROUND

- Disconnect: Power Seat Motor C357

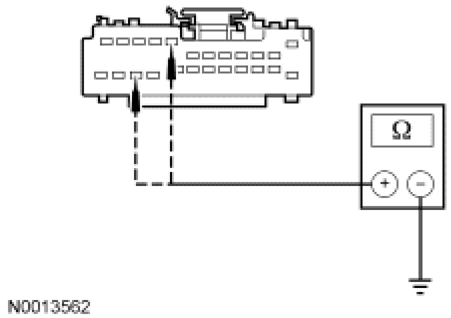

Fig. 48: Checking Rear Height Power Seat Motor Circuits CPS27 (BU/BN) & CPS26 (YE/BU) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-8, circuit CPS27 (BU/BN), harness side and ground; and between DSM C3299b-22, circuit CPS26 (YE/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J18 CHECK CIRCUITS CPS23 (GN/VT) AND CPS22 (BN) FOR A SHORT TO GROUND

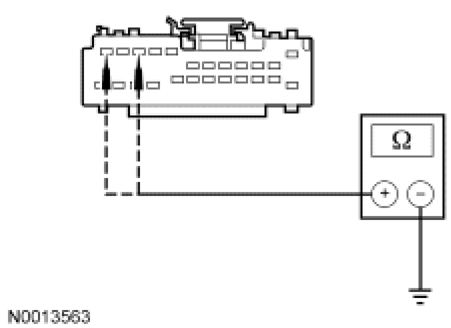

Fig. 49: Checking Circuits CPS23 (GN/VT) & CPS22 (BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-10, circuit CPS23 (GN/VT), harness side and ground; and between DSM C3299b-12, circuit CPS22 (BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to J20.

NO : Go to J19.

J19 CHECK THE HORIZONTAL POWER SEAT MOTOR CIRCUITS CPS23 (GN/VT) AND CPS22 (BN) FOR A SHORT TO GROUND

- Disconnect: Power Seat Motor C357

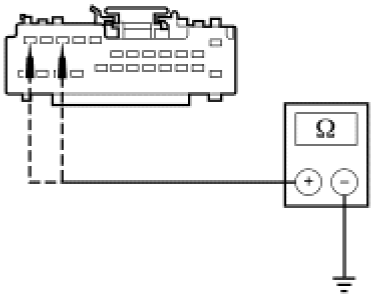

Fig. 50: Checking Horizontal Power Seat Motor Circuits CPS23 (GN/VT) & CPS22 (BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-10, circuit CPS23 (GN/VT), harness side and ground; and between DSM C3299b-12, circuit CPS22 (BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J20 CHECK CIRCUITS CPS29 (WH/BN) AND CPS30 (VT/BN) FOR A SHORT TO GROUND

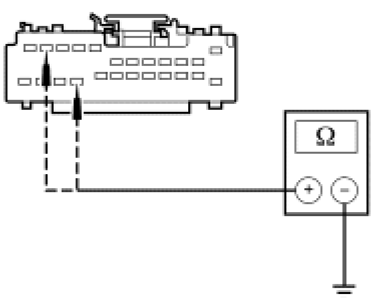

Fig. 51: Checking Circuits CPS29 (WH/BN) & CPS30 (VT/BN) For A Short To Ground

Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-11, circuit CPS29 (WH/BN), harness side and ground; and between DSM C3299b-21, circuit CPS30 (VT/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT PMI. REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J21.

J21 CHECK THE DRIVER POWER SEAT RECLINER MOTOR CIRCUITS CPS29 (WH/BN) AND CPS30 (VT/BN) FOR A SHORT TO GROUND

- Disconnect: Driver Power Seat Recliner Motor C3187

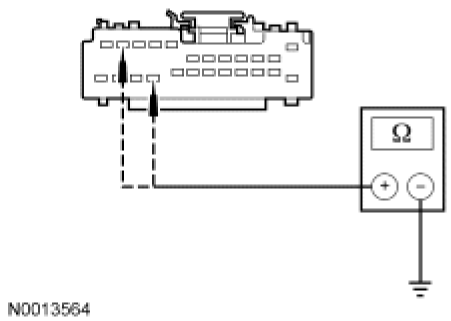

Fig. 52: Checking Driver Power Seat Recliner Motor Circuits CPS29 (WH/BN) & CPS30 (VT/BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-11, circuit CPS29 (WH/BN), harness side and ground; and between DSM C3299b-21, circuit CPS30 (VT/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new driver seat recliner motor. REFER to **Seat Recliner Motor**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J22 CHECK FOR VOLTAGE AT THE FRONT HEIGHT MOTOR USING DSM SEAT TRACK

MOTOR PIDs

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Power Seat Motor C357

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM
  - Front Motor Up (FRONT_UP)
  - Front Motor Down (FRONT_DWN)

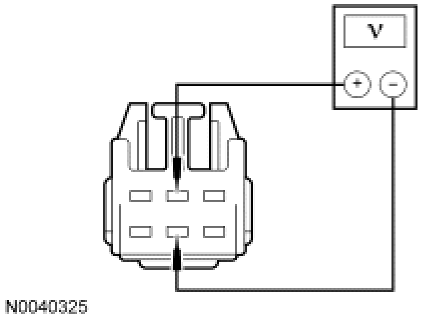

Fig. 53: Checking Front Height Power Seat Motor For Correct Operation
Courtesy of FORD MOTOR CO.

- Measure the voltage between power seat motor C357-2, circuit CPS25 (WH/VT) and C357-5, circuit CPS24 (GY), harness side while toggling DSM active commands FRONT MOTOR UP and FRONT MOTOR DOWN, ON and OFF.
- **Is the voltage greater than 10 volts when command ON in both directions and no voltage present when commanded OFF?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J23.

J23 CHECK CIRCUITS CPS25 (WH/VT) AND CPS24 (GY) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299b
- Key in ON position.

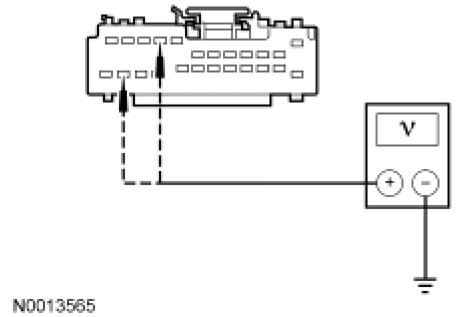

Fig. 54: Checking Circuits CPS25 (WH/VT) & CPS24 (GY) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299b-9, circuit CPS25 (WH/VT), harness side and ground; and between DSM C3299b-23, circuit CPS24 (GY), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J24.

J24 CHECK CIRCUITS CPS25 (WH/VT) AND CPS24 (GY) FOR AN OPEN

- Key in OFF position.

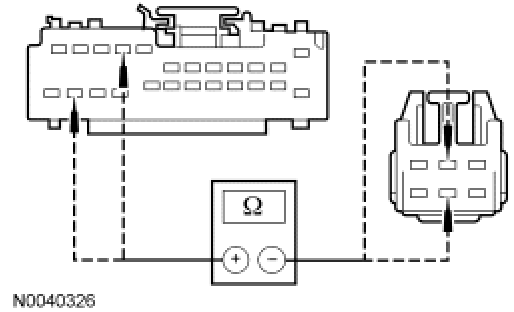

Fig. 55: Checking Circuits CPS25 (WH/VT) & CPS24 (GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-9, circuit CPS25 (WH/VT), harness side and power seat motor C357-2, circuit CPS25 (WH/VT), harness side; and between DSM C3299b-23, circuit CPS24 (GY), harness side and power seat motor C357-5, circuit CPS24 (GY), harness side.

- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT PMI. REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J25 CHECK FOR VOLTAGE AT THE REAR HEIGHT MOTOR USING DSM SEAT TRACK MOTOR PIDs

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Power Seat Motor C357

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM
  - Rear Motor Up (REAR_UP)
  - Rear Motor Down (REAR_DWN)

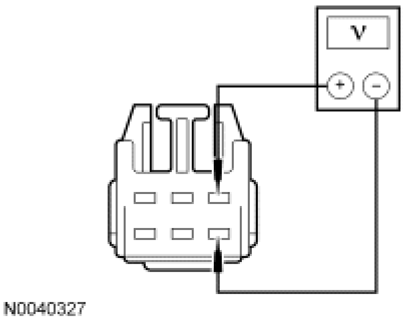

Fig. 56: Checking Rear Height Motor For Correct Operation
Courtesy of FORD MOTOR CO.

- Measure the voltage between power seat motor C357-1, circuit CPS27 (BU/BN), harness side and C357-4, circuit CPS26 (YE/BU), harness side while toggling DSM active commands REAR MOTOR UP and REAR MOTOR DOWN, ON and OFF.
- **Is the voltage greater than 10 volts when command ON in both directions and no voltage present when commanded OFF?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J26.

J26 CHECK CIRCUITS CPS27 (BU/BN) AND CPS26 (YE/BU) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299b
- Key in ON position.

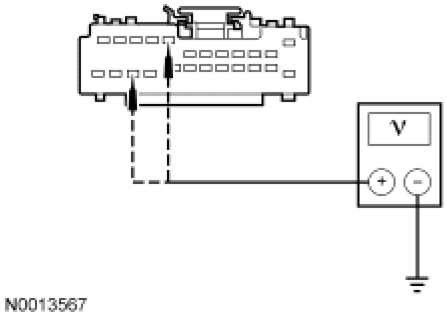

Fig. 57: Checking Circuits CPS27 (BU/BN) & CPS26 (YE/BU) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299b-8, circuit CPS27 (BU/BN), harness side and ground; and between DSM C3299b-22, circuit CPS26 (YE/BU), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J27.

J27 CHECK CIRCUITS CPS27 (BU/BN) AND CPS26 (YE/BU) FOR AN OPEN

- Key in OFF position.

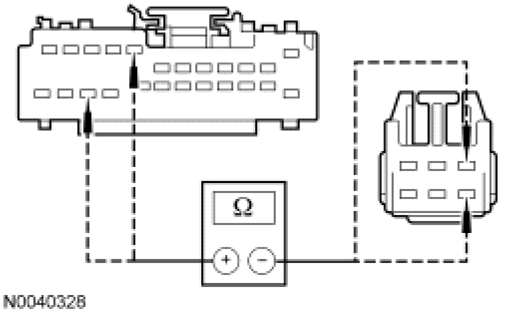

Fig. 58: Checking Circuits CPS27 (BU/BN) & CPS26 (YE/BU) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-8, circuit CPS27 (BU/BN), harness side and power seat motor C357-1, circuit CPS27 (BU/BN), harness side; and between DSM C3299b-22, circuit CPS26 (YE/BU), harness side and rear height power seat motor C357-4, circuit CPS26 (YE/BU), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT PMI. REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs. DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J28 CHECK FOR VOLTAGE AT THE HORIZONTAL MOTOR USING DSM SEAT TRACK MOTOR PIDs

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Power Seat Motor C357

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM
  - Horizontal Motor Forward (HORZ_FWD)

- Horizontal Motor Backward (HORZ_BWD)

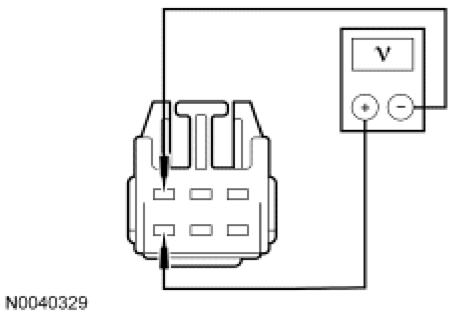

Fig. 59: Checking Horizontal Motor For Correct Operation
Courtesy of FORD MOTOR CO.

- Measure the voltage between power seat motor C357-3, circuit CPS22 (BN) and C357-6, circuit CPS23 (GN/VT), harness side while toggling DSM active commands HORIZONTAL MOTOR FORWARD and HORIZONTAL MOTOR BACKWARD, ON and OFF.
- **Is the voltage greater than 10 volts when command ON in both directions and no voltage present when commanded OFF?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J29.

J29 CHECK CIRCUITS CPS22 (BN) AND CPS23 (GN/VT) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299b
- Key in ON position.

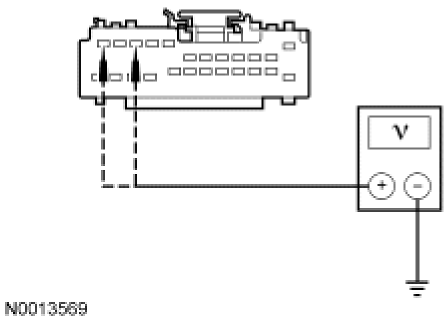

Fig. 60: Checking Circuits CPS22 (BN) & CPS23 (GN/VT) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299b-10, circuit CPS23 (GN/VT), harness side and ground;

and between DSM C3299b-12, circuit CPS22 (BN), harness side and ground.

- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J30.

J30 CHECK CIRCUITS CPS23 (GN/VT) AND CPS22 (BN) FOR AN OPEN

- Key in OFF position.

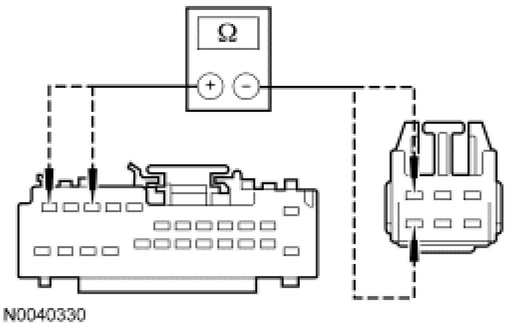

Fig. 61: Checking Circuits CPS23 (GN/VT) & CPS22 (BN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-10, circuit CPS23 (GN/VT), harness side and power seat motor C357-6, circuit CPS23 (GN/VT), harness side; and between DSM C3299b-12, circuit CPS22 (BN), harness side and horizontal power seat motor C357-3, circuit CPS22 (BN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT PMI. REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

J31 CHECK FOR VOLTAGE AT THE RECLINER MOTOR USING DSM SEAT TRACK MOTOR PIDs

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

- Disconnect the driver seat side air bag C327.
- Disconnect: Driver Seat Power Recliner Motor C3187

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM
  - Recline Motor Forward (RECL_FWD)
  - Recline Motor Backward (RECL_BWD)

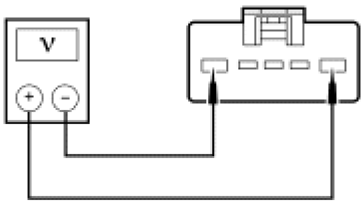

Fig. 62: Checking Driver Seat Power Recliner Motor For Correct Operation
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat power recliner motor C3187-1, circuit CPS29 (WH/BN) and C3187-5, circuit CPS30 (VT/BN), harness side while toggling DSM active commands RECLINE MOTOR FORWARD and RECLINE MOTOR BACKWARD, ON and OFF.
- **Is the voltage greater than 10 volts when command ON in both directions and no voltage present when commanded OFF?**

  YES : INSTALL a new driver seat recliner motor. REFER to **Seat Recliner Motor**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J32.

J32 CHECK CIRCUITS CPS29 (WH/BN) AND CPS30 (VT/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C3299b
- Key in ON position.

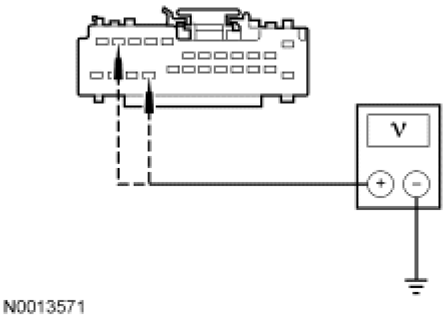

Fig. 63: Checking Circuits CPS29 (WH/BN) & CPS30 (VT/BN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DSM C3299b-11, circuit CPS29 (WH/BN), harness side and ground; and between DSM C3299b-21, circuit CPS30 (VT/BN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to J33.

J33 CHECK CIRCUITS CPS29 (WH/BN) AND CPS30 (VT/BN) FOR AN OPEN

- Key in OFF position.

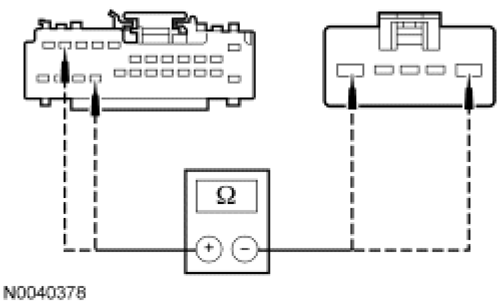

Fig. 64: Checking Circuits CPS29 (WH/BN) & CPS30 (VT/BN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DSM C3299b-11, circuit CPS29 (WH/BN), harness side and recliner power seat motor C3187-1, circuit CPS29 (WH/BN), harness side; and between DSM C3229b-21, circuit CPS30 (VT/BN), harness side and recliner power seat motor C3187-5, circuit CPS30 (VT/BN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT PMI. REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test K: The Memory Seat Does Not Operate Correctly - Does Not Operate Using the Memory SET Switch

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Memory Seats for schematic and connector information.

Normal Operation

The driver seat control switch is powered by battery voltage on circuit SBB15 (VT/RD) and is supplied ground on circuit GD126 (BK/WH). When pressed, the seat control switch supplies the voltage and ground to the applicable driver seat module (DSM) inputs. The DSM then supplies voltage and ground to the appropriate power seat track motor or power recline motor based on the inputs received from the seat control switch. When pressed in the opposite direction, the seat control switch reverses the polarity to the DSM inputs, and the DSM likewise reverses polarity of the appropriate power seat track motor or power recliner motor circuits causing the seat or backrest to move in the opposite direction. There are 3 power seat track motors that combine to move the seat horizontally (forward/rearward) and vertically (front up/down and rear up/down). The seat backrest power recliner mechanism uses a single motor to move the seat backrest forward and rearward.

Battery voltage is also supplied to the DSM on circuit SBB15 (WH/RD) and SBB32 (VT/RD). Ground is supplied to the DSM on circuit GD126 (BK/WH).

Each motor, in the memory power seat track and power recliner mechanism contains a Hall-effect position sensor. The DSM supplies a signal feed circuit to each position sensor and a shared reference signal return circuit. Each position sensor sends a signal voltage back to the DSM used to monitor the position of the power seat and seat backrest. The DSM uses this information to return the seat to a stored pre-programmed position when pressing the memory SET switch or a remote entry transmitter. The memory SET switch is hard-wired to the driver door module (DDM) and communicates memory SET commands to the DSM via medium-speed controller area network (MS-CAN). For information on programming memory positions or recalling a stored memory position, refer to **Memory Position Programming**.

The following pinpoint test diagnoses a memory seat that does not operate correctly using the memory SET switch. If the memory seat does not move in all directions using the seat control switch, go to **Pinpoint Test J**.

DTC Description	Fault Trigger Conditions
• B1342 - ECU is Faulted	If a programming error is detected, the DTC is set.
• B1530 - Memory SET Switch Circuit Short to Ground	If a short to ground is sensed on the switch input circuit during the DSM Self-Test, the DTC is set. If activity

- B1534 - Memory 1 Switch Circuit Short to Ground - B1538 - Memory 2 Switch Circuit Short to Ground	is sensed on the input circuit for greater than 2 minutes, the DTC is set as continuous. With the DTC set, any input signal on the circuit is ignored.
- B1663 - Seat Driver Front Up/Down Motor Stalled - B1664 - Seat Driver Rear Up/Down Motor Stalled - B1665 - Seat Driver Forward/Backward Motor Stalled	During self-test the driver seat module (DSM) attempts to operate the appropriate seat track motor and uses the motor's position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no movement continues to be monitored after 250 milliseconds, the DSM disables the output.
B1666 - Seat Driver Recline Motor Stalled	During self-test the DSM attempts to operate the recliner motor and uses the recliner motor position sensor to monitor movement. If no motor movement is sensed, the DTC is set. The DSM will retry motor operation on the next activation of the seat control switch. If no motor movement is still monitored after 250 milliseconds, the DSM disables the output.
- B1952 - Seat Rear Up/Down Position Feedback Circuit Short to Battery - B1956 - Seat Front Up/Down Position Feedback Circuit Short to Battery - B1960 - Seat Recline Forward/Backward Position Feedback Circuit Short to Battery - B1964 - Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Battery	If a short to voltage or an open condition is present on the affected motor's position sensor (Hall effect) feedback circuit, the DTC is set. After a DTC is set, a memory recall is not possible but the seat control switch can operate the associated motor in one-second increments.
- B1953 - Seat Rear Up/Down Position Feedback Circuit Short to Ground - B1957 - Seat Front Up/Down Position Feedback Circuit Short to Ground - B1961 - Seat Recline Forward/Backward Position Feedback Circuit Short to Ground - B1965 - Seat Horizontal Forward/Rearward Position Feedback Circuit Short to Ground	If a short to ground condition is present on the affected motor's position sensor (Hall effect) feedback circuit, the DTC is set. After a DTC is set, a memory recall is not possible but the seat control switch can operate the associated motor in one-second increments.
	If a short to ground or open

• B2084 - Memory SET Indicator Short to Ground	condition is present on the memory SET switch indicator output circuit, the DTC is set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Memory SET switch
- Remote entry transmitter
- Seat track
- Seat recliner motor
- DSM

PINPOINT TEST K: THE MEMORY SEAT DOES NOT OPERATE CORRECTLY - DOES NOT OPERATE USING THE MEMORY SET SWITCH

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

NOTE: **Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.**

K1 CHECK DSM GEAR SELECTED (TRANS GEAR) PID

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM

  NOTE: **D6_PRK applies to both park and overdrive.**

  Operate the transmission gear selector in all positions while monitoring the following DSM PID TRANS GEAR states:

  - D6_PRK
  - REV
  - NTRL
  - D6_PRK
  - DRIVE1
- **Do the PID states agree with the selected positions?**

YES : Go to K2.

NO : To diagnose a transmission gear selector (PRNDL) status concern, REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article.

K2 CHECK DSM IGNITION SWITCH STATUS (IGN_SW) PID

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM

  Cycle the ignition switch in all positions while monitoring the following DSM IGN_SW PID states:

  - Off
  - Accessory
  - Run
  - Start
- **Do the PID states agree with the selected positions?**

  YES : Go to K3.

  NO : To diagnose an ignition switch status concern, REFER to **STEERING COLUMN SWITCHES** article.

K3 RETRIEVE THE DTCs

NOTE: During the DDM Self-Test, document when the memory SET LED illuminates and turns off.

- Using the switches, attempt to operate the memory seat and memory exterior mirrors in all directions through the full range of travel.
- Place the memory seat and memory exterior mirrors in central travel positions.
- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DSM/Retrieve DTCs
- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DDM/Retrieve DTCs
- **Are any DSM or DDM DTCs retrieved or does the memory SET LED fail to illuminate during the DDM Self-Test?**

  YES : If the memory SET LED fails to illuminate during the DDM Self-Test, go to K5.

  If one or all of the following DDM DTCs are retrieved; B1530, B1534, B1538 and B2084, go to K5.

  If DTCs B1952, B1956, B1960 and B1964 are all retrieved, go to K10.

  If DTCs B1953, B1957, B1961 and B1965 are all retrieved, go to K10.

  If DTC B1663, go to K11.

  If DTC B1664, go to K14.

  If DTC B1665, go to K17.

If DTC B1666, go to K20.

If DTC B1952, go to K14.

If DTC B1953, go to K15.

If DTC B1956, go to K11.

If DTC B1957, go to K12.

If DTC B1960, go to K20.

If DTC B1961, go to K21.

If DTC B1964, go to K17.

If DTC B1965, go to K18.

If DTC B1342, INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT programmable module installation (PMI). REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs.

NO : Go to K4.

K4 CHECK DDM MEMORY SET SWITCH STATUS (MEMORY_SW) PID STATES

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DDM
- While activating the memory switch SET, recall 1 and recall 2 buttons, monitor the DDM MEMORY_SW PID states:
  - Inactive
  - Set
  - Memory 1
  - Memory 2
- **Do the PID states agree with the switch button positions?**

  YES : Go to K10.

  NO : Go to K5.

K5 CHECK THE MEMORY SET SWITCH

- Key in OFF position.
- Disconnect: Memory SET Switch C503

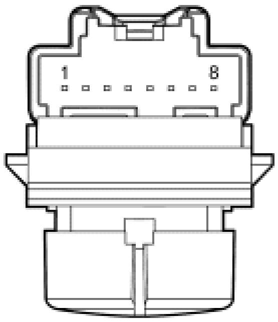

Fig. 65: Checking Memory Set Switch
Courtesy of FORD MOTOR CO.

- Use the following table and illustration to check the memory SET switch. Measure the resistance between the memory SET switch pins, component side, while pressing the indicated switch buttons and compare the results to the table.

Switch Button	Pins	Ohms
Memory Switch 1	7 and 2	Less than 5
Memory Switch 2	7 and 6	Less than 5
Memory SET Switch	7 and 5	Less than 5

NOTE: Refer to multi-meter user's article for testing diodes.

- Use the following table and preceding illustration. Using the diode testing meter function, connect the meter leads to the memory SET switch pins, component side. Measure the voltages and compare the results to the table, to check the switch LED indicator.

Positive Lead	Negative Lead	Volts
Pin 1	Pin 7	Greater than 0.3
Pin 7	Pin 1	OL

- **Is the memory SET switch OK?**

  YES : Go to K6.

  NO : INSTALL a new memory SET switch. REFER to **Memory Set Switch**. REPEAT the self-

test. CLEAR the DTCs.

K6 CHECK GROUND CIRCUIT GD126 (BK/WH) TO THE MEMORY SET SWITCH

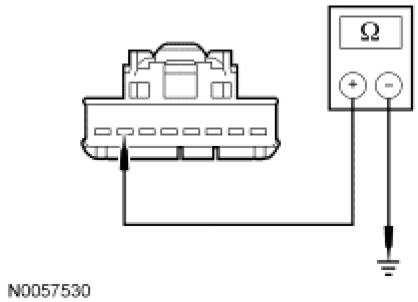

Fig. 66: Measuring Resistance Between Memory SET Switch C503-7, Circuit GD133 (BK) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between memory SET switch C503-7, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to K7.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

K7 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH), CPS16 (YE) AND CPS55 (YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: DSM C568a
- Disconnect: DSM C568b
- Key in ON position.

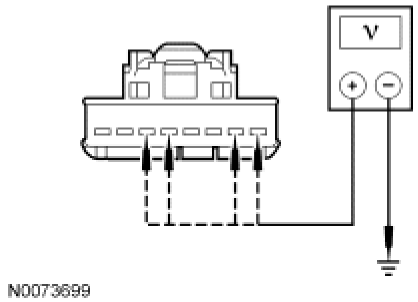

Fig. 67: Checking Circuits CPS14 (GY/VT), CPS15 (VT/WH), CPS16 (YE) & CPS55 (YE) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the following memory SET switch pins, harness side and ground:

Connector - Pin	Circuit
C503-1	CPS55 (YE)
C503-2	CPS15 (VT/WH)
C503-5	CPS14 (GY/VT)
C503-6	CPS16 (YE)

- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to K8.

K8 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH), CPS16 (YE) AND CPS55 (YE) FOR A SHORT TO GROUND

- Key in OFF position.

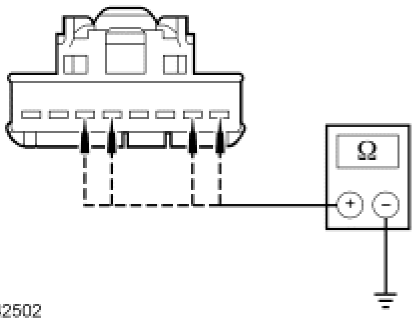

Fig. 68: Check Circuits CPS15 (VT/WH), CPS16 (YE), CPS14 (GY/VT) And CPS55 (YE) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following memory SET switch pins, harness side and ground:

Connector - Pin	Circuit
C503-1	CPS55 (YE)
C503-2	CPS15 (VT/WH)
C503-5	CPS14 (GY/VT)
C503-6	CPS16 (YE)

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to K9.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

K9 CHECK CIRCUITS CPS14 (GY/VT), CPS15 (VT/WH), CPS16 (YE) AND CPS55 (YE) FOR AN OPEN

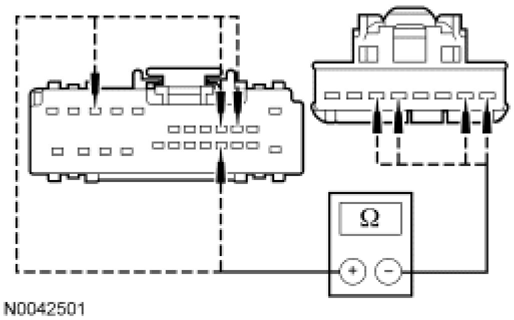

Fig. 69: Checking Circuits CPS15 (VT/WH), CPS16 (YE), CPS14 (GY/VT) And CPS55 (YE) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the following memory SET switch pins and DDM pins:

Memory SET switch connector	Circuit	DDM connector
C503-2	CPS15 (VT/WH)	C568b-4
C503-5	CPS14 (GY/VT)	C568b-3
C503-6	CPS16 (YE)	C568b-16
C503-1	CPS55 (YE)	C568a-10

- **Are the resistances less than 5 ohms?**

  YES : Go to K10.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

K10 CHECK DSM SENSOR PIDs

- Place the seat in a central position, using the seat control switch.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DSM

NOTE: **If the DSM detects a fault while carrying out this step, the associated motor may operate in one-second intervals.**

- Using the switch, operate the memory seat in all directions through the full range of travel while monitoring the following DSM PIDs:
  - Driver Power Seat Front Up/Down Sense (SFNT_MT)
  - Driver Power Seat Forward/Backward Sense (SFWD_MT)
  - Driver Power Seat Rear Up/Down Sense (SREARMT)
  - Driver Power Seat Recline Sense (SRCL_MT)
- **Does each PID indicate the sensor is operational throughout each motor's full range of travel?**

  YES : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT PMI. REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs.

  NO : If the PID indicates driver seat front vertical position sensor is not present, go to K11.

  If the PID indicates driver seat rear vertical position sensor is not present, go to K14.

  If the PID indicates driver seat horizontal position sensor is not present, go to K17.

  If the PID indicates driver seat recline position sensor is not present, go to K20.

K11 CHECK CIRCUITS VPS10 (BU/GN) AND RPS13 (GN/OG) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: DSM C3299b
- Disconnect: Memory Seat Position Sensor C358

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.

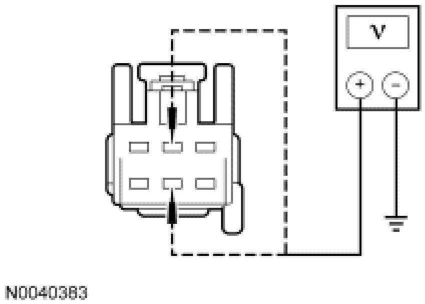

Fig. 70: Checking Circuits VPS10 (BU/GN) And RPS13 (GN/OG) For Short To Power
Courtesy of FORD MOTOR CO.

- Measure the voltage between memory seat position sensor C358-2, circuit VPS10 (BU/GN), harness side and ground; and between memory seat position sensor 358-5, circuit RPS13 (GN/OG), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to K12.

K12 CHECK CIRCUITS VPS10 (BU/GN) AND RPS13 (GN/OG) FOR A SHORT TO GROUND

- Key in OFF position.

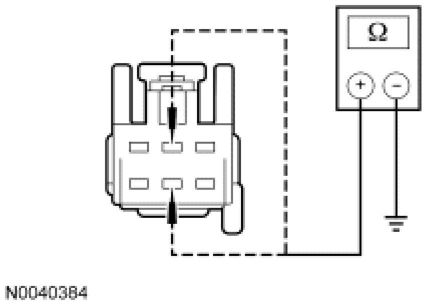

Fig. 71: Checking Circuits VPS10 (BU/GN) And RPS13 (GN/OG) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between memory seat position sensor C358-2, circuit VPS10 (BU/GN), harness side and ground; and between memory seat position sensor 358-5, circuit RPS13 (GN/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to K13.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K13 CHECK CIRCUITS VPS10 (BU/GN) AND RPS13 (GN/OG) FOR AN OPEN

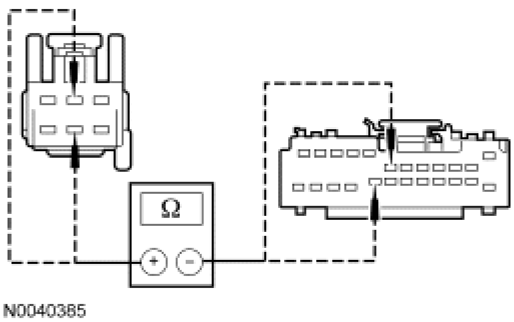

Fig. 72: Checking Circuits VPS10 (BU/GN) And RPS13 (GN/OG) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between memory seat position sensor C358-2, circuit VPS10 (BU/GN), harness side and DSM C3299b-7, circuit VPS10 (BU/GN), harness side; and between memory seat position sensor 358-5, circuit RPS13 (GN/OG), harness side and DSM C3299b-20, circuit RPS13 (GN/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K14 CHECK CIRCUITS VPS11 (GN/BN) AND RPS13 (GN/OG) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: DSM C3299b
- Disconnect: Memory Seat Position Sensor C358

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may**

result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

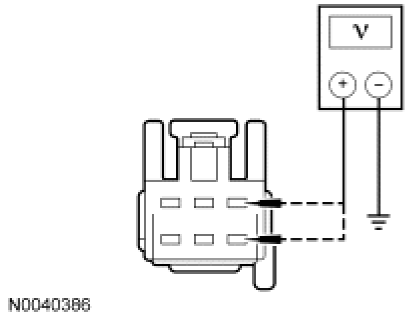

Fig. 73: Checking Circuits VPS11 (GN/BN) And RPS13 (GN/OG) For Short To Power
Courtesy of FORD MOTOR CO.

- Measure the voltage between memory seat position sensor C358-1, circuit VPS11 (GN/BN), harness side and ground; and between driver seat position sensor C358-4, circuit RPS13 (GN/OG), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to K15.

K15 CHECK CIRCUITS VPS11 (GN/BN) AND RPS13 (GN/OG) FOR A SHORT TO GROUND

- Key in OFF position.

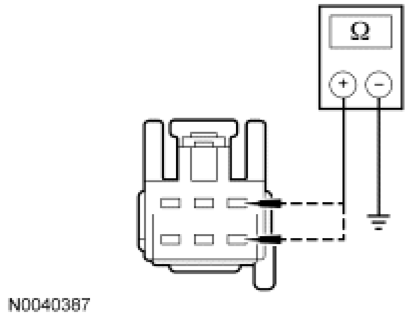

Fig. 74: Checking Circuits VPS11 (GN/BN) And RPS13 (GN/OG) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between memory seat position sensor C358-1, circuit VPS11 (GN/BN), harness side and ground; and between memory seat position sensor C358-4, circuit RPS13

(GN/OG), harness side and ground.

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to K16.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K16 CHECK CIRCUITS VPS11 (GN/BN) AND RPS13 (GN/OG) AND FOR AN OPEN

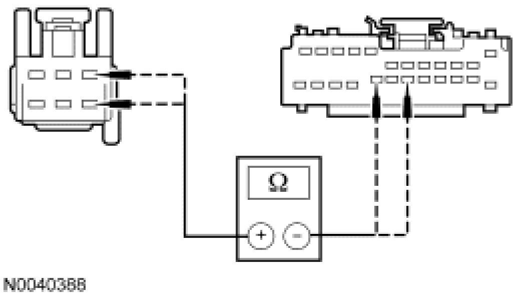

Fig. 75: Checking Circuits VPS11 (GN/BN) And RPS13 (GN/OG) And For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between memory position sensor C358-1, circuit VPS11 (GN/BN), harness side and DSM C3299b-18, circuit VPS11 (GN/BN), harness side; and between memory seat position sensor C358-4, circuit RPS13 (GN/OG), harness side and DSM C3299b-20, circuit RPS13 (GN/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit(s) in question. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K17 CHECK CIRCUITS VPS09 (BN/BU) AND RPS13 (GN/OG) AND FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.

- Disconnect: DSM C3299b
- Disconnect: Memory Seat Position Sensor C358

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.

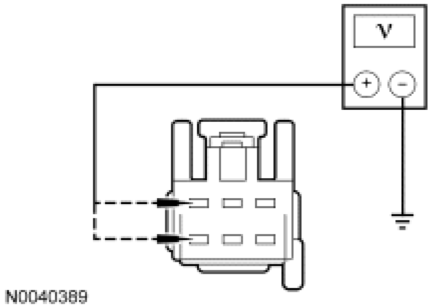

Fig. 76: Checking Circuits VPS09 (BN/BU) And RPS13 (GN/OG) And For Short To Power
Courtesy of FORD MOTOR CO.

- Measure the voltage between memory seat position sensor C358-3, circuit VPS09 (BN/BU), harness side and ground; and between memory seat position sensor C358-6, circuit RPS13 (GN/OG), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to K18.

K18 CHECK CIRCUITS VPS09 (BN/BU) AND RPS13 (GN/OG) FOR A SHORT TO GROUND

- Key in OFF position.

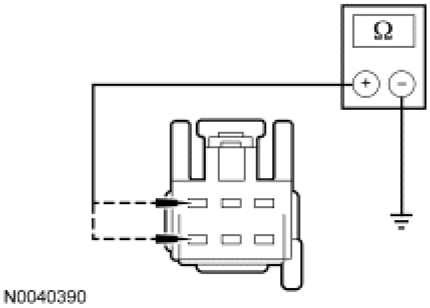

Fig. 77: Checking Circuits VPS09 (BN/BU) And RPS13 (GN/OG) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between memory seat position sensor C358-3, circuit VPS09 (BN/BU), harness side and ground; and between memory seat position sensor C358-6, circuit RPS13 (GN/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to K19.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K19 CHECK CIRCUITS VPS09 (BN/BU) AND RPS13 (GN/OG) FOR AN OPEN

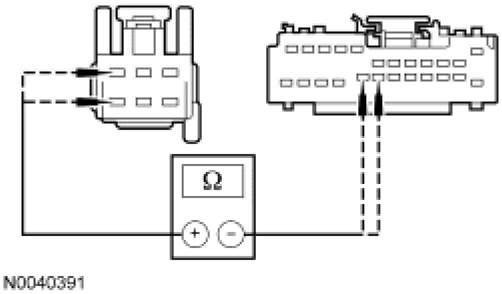

Fig. 78: Checking Circuits VPS09 (BN/BU) And RPS13 (GN/OG) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between memory seat position sensor C358-3, circuit VPS09 (BN/BU), harness side and DSM C3299b-19, circuit VPS09 (BN/BU), harness side; and between memory seat position sensor C358-6, circuit RPS13 (GN/OG), harness side and DSM C3299b-20, circuit RPS13 (GN/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new driver seat track assembly. REFER to **Seat Track**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K20 CHECK CIRCUITS RPS13 (GN/OG) AND LPS12 (VT/RD) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: DSM C3299b
- Disconnect: Driver Seat Recliner Motor C3187

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

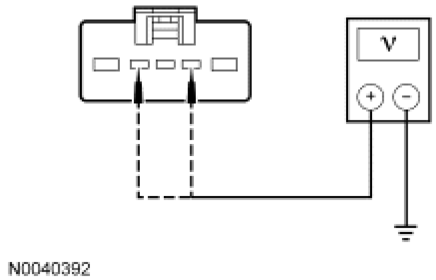

Fig. 79: Checking Circuits RPS13 (GN/OG) & LPS12 (VT/RD) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat recliner motor C3187-2, circuit RPS13 (GN/OG), harness side and ground; and between driver seat recliner motor C3187-4, circuit LPS12 (VT/RD), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to K21.

K21 CHECK CIRCUITS RPS13 (GN/OG) AND LPS12 (VT/RD) FOR A SHORT TO GROUND

- Key in OFF position.

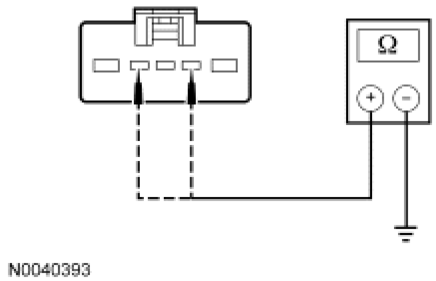

Fig. 80: Checking Circuits RPS13 (GN/OG) & LPS12 (VT/RD) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat recliner motor C3187-2, circuit RPS13 (GN/OG), harness side and ground; and between driver seat recliner motor C3187-4, circuit LPS12 (VT/RD), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to K22.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

K22 CHECK CIRCUITS RPS13 (GN/OG) AND LPS12 (VT/RD) FOR AN OPEN

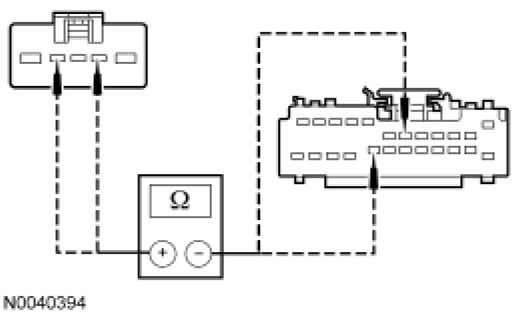

Fig. 81: Checking Circuits RPS13 (GN/OG) And LPS12 (VT/RD) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat recliner motor C3187-2, circuit RPS13 (GN/OG), harness side and DSM C3299b-20, circuit RPS13 (GN/OG), harness side; and between driver seat recliner motor C3187-4, circuit LPS12 (VT/RD), harness side and DSM C3299b-6, circuit LPS12 (VT/RD), harness side.

- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new driver seat recliner motor. REFER to **Seat Recliner Motor**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test L: Easy Exit/Easy Entry is Inoperative/Does Not Operate Correctly

Normal Operation

The driver seat module (DSM) receives a key out command over the medium-speed controller area network (MS-CAN) and powers the driver seat rearward about 50.8 mm (2 in).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Key-in-ignition warning switch
- Instrument cluster (IC) module
- DSM

PINPOINT TEST L: EASY EXIT/EASY ENTRY IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

L1 CHECK THE DRIVER POWER SEAT OPERATION

- Key in ON position.
- Check the message center to verify the easy entry/exit feature is enabled.
  - The easy entry/exit feature can be enabled/disabled using a scan tool in module programming. When enabled, the feature becomes a user accessible item on the message center allowing the user to turn the feature on and off. Refer to the Owner's Literature or **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article for information on the message center.
- Using the seat control switch, verify the driver power seat operates fully forward and rearward.
- Verify the driver power seat operates forward and rearward.
- **Does the power seat operate forward and rearward correctly?**

  YES : Go to L2.

  NO : REFER to the Symptom Chart for diagnosis of inoperative driver power seat horizontal movement.

L2 CHECK THE EASY EXIT OPERATION

- Position the driver seat at least 50.8 mm (2 in) from the rear stop point.

- Key in OFF position.
- Remove the key from the ignition switch.
- **Does the driver power seat move rearward approximately 50.8 mm (2 in)?**

  YES : Go to L5.

  NO : Go to L3.

L3 CHECK THE INSTRUMENT CLUSTER MODULE IGNITION KEY IN/OUT (IGN_KEY) PID STATES

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/Instrument Cluster (IC) Module
- Monitor the instrument cluster module IGN_KEY PID states with the ignition key in and with the key removed.
- **Does the instrument cluster module PID states agree with the switch positions?**

  YES : Go to L4.

  NO : To diagnose the key-in-ignition warning switch fault, REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

L4 CHECK FOR DTCs FROM THE DSM

- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DSM/Retrieve DTCs
- **Are any DSM DTCs present?**

  YES : REFER to the Driver Seat Module (DSM) DTC Chart for DSM DTC diagnosis.

  NO : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT programmable module installation (PMI). REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs.

L5 CHECK THE EASY ENTRY OPERATION

- Insert the ignition key.
- **Does the driver power seat move forward approximately 50.8 mm (2 in)?**

  YES : The system is operating correctly at this time. RETEST the system for intermittent operation. If no fault is found, INSTRUCT the customer on the correct operation of the system.

  NO : INSTALL a new DSM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CARRY OUT PMI. REFER to **MODULE CONFIGURATION** article. REPEAT the self-test. CLEAR the DTCs.

Pinpoint Test M: The Power Lumbar is Inoperative - Driver

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Memory Seats for schematic and connector information.

Normal Operation

The seat control switch is powered by battery voltage on circuit SBB15 (WH/RD) and is supplied ground on

circuit GD126 (BK/WH). When the knob of the seat control switch is pressed, voltage and ground are supplied to the power lumbar motor. When pressing the lumbar knob in the opposite direction, the lumbar control switch reverses the polarity to the power lumbar motor, which moves the lumbar mechanism in the opposite direction.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Lumbar control switch
- Lumbar motor

PINPOINT TEST M: THE POWER LUMBAR IS INOPERATIVE - DRIVER

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

M1 CHECK CIRCUIT SBB15 (WH/RD) FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag C327.
- Disconnect: Seat Control Switch C3297

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Measure the voltage between seat control switch C3297-5, circuit SBB15 (WH/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to M2.

  NO : VERIFY battery junction box (BJB) fuse 15 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M2 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN

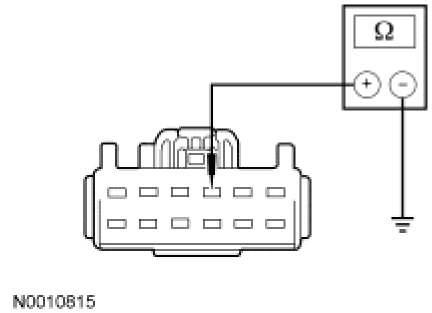

Fig. 82: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3297-3, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to M3.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M3 CHECK THE LUMBAR MOTOR

- Connect: Seat Control Switch C3297
- Disconnect: Power Lumbar Motor C3215

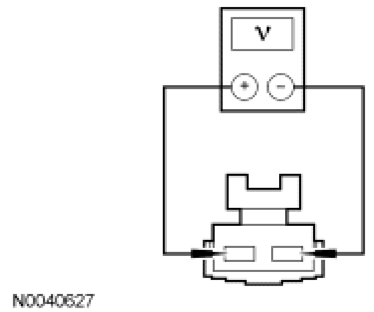

Fig. 83: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- For power seat, measure the voltage between power lumbar motor C3215-1, circuit CPS18 (BN/GN), harness side and power lumbar motor C3215-2, circuit CPS19 (GY/VT), harness side.
- Operate the seat control switch in both directions.
- **Is the voltage greater than 10 volts in both directions?**

  YES : INSTALL a new power lumbar assembly. REFER to **Lumbar Assembly**. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : Go to M4.

M4 CHECK CIRCUITS CPS19 (GY/VT) AND CPS18 (BN/GN) FOR A SHORT TO GROUND

- Disconnect: Seat Control Switch C3297

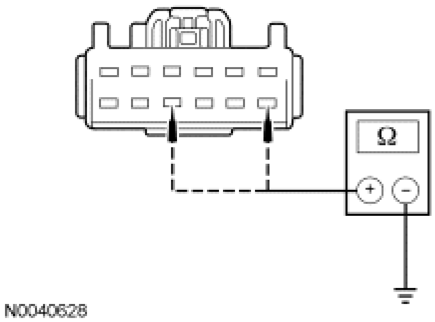

Fig. 84: Checking Circuits CPS19 (GY/VT) & CPS18 (BN/GN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3297-7, circuit CPS18 (BN/GN), harness side and ground; and between seat control switch C3297-10, circuit CPS19 (GY/VT), harness side and ground.
- **Are the resistances greater than 10,000 ohms.**

YES : Go to M5.

NO : REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

M5 CHECK CIRCUITS CPS19 (GY/VT), CPS18 (GN/RD) AND CPS18 (BN/GN) FOR AN OPEN

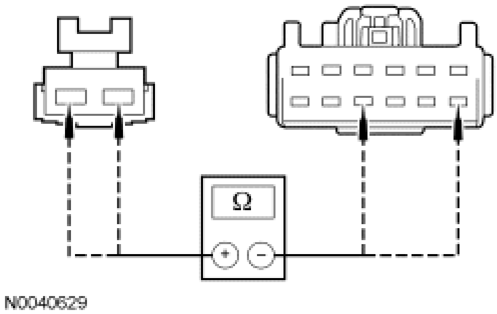

Fig. 85: Checking Circuits CPS19 (GY/VT), CPS18 (GN/RD) & CPS18 (BN/GN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3297-7, circuit CPS18 (BN/GN), harness side and power lumbar motor C3215-1, circuit CPS18 (BN/GN), harness side; and between seat control switch C3297-10, circuit CPS19 (GY/VT), harness side and power lumbar motor C3215-2, circuit CPS19 (GY/VT), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test N: The Power Lumbar is Inoperative - Passenger

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Seats for schematic and connector information.

Normal Operation

The seat control switch is powered by battery voltage on circuit SBP31 (WH/RD) and is supplied ground on circuit GD139 (BK/YE). When the knob of the seat control switch is pressed, voltage and ground are supplied to the power lumbar motor. When pressing the lumbar knob in the opposite direction, the lumbar control switch reverses the polarity to the power lumbar motor, which moves the lumbar mechanism in the opposite direction.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Lumbar control switch
- Lumbar motor

PINPOINT TEST N: THE POWER LUMBAR IS INOPERATIVE - PASSENGER

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**
NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

N1 CHECK CIRCUIT SBB31 (WH/RD) FOR AN OPEN

- Key in OFF position.

- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: Seat Control Switch C3190

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Measure the voltage between seat control switch C3190-5 , circuit SBB31 (WH/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to N2.

  NO : VERIFY battery junction box (BJB) fuse 31 (30A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

N2 CHECK CIRCUIT GD139 (BK/YE) FOR AN OPEN

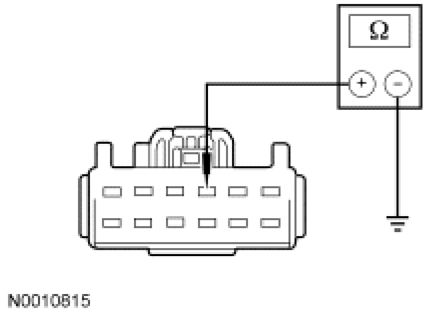

Fig. 86: Checking Circuit GD139 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3190-3, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to N3.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

N3 CHECK THE LUMBAR MOTOR

- Connect: Seat Control Switch C3190
- Disconnect: Power Lumbar Motor C3216

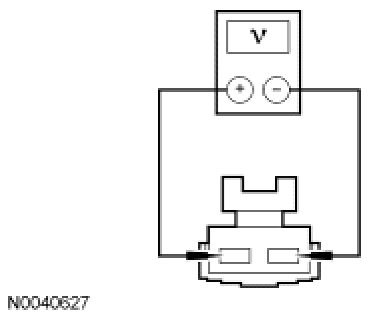

Fig. 87: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- For power seat, measure the voltage between power lumbar motor C3216-1, circuit CPS20 (VT), harness side and power lumbar motor C3216-2, circuit CPS21 (WH/OG), harness side.
- Operate the seat control switch in both directions.
- **Is the voltage greater than 10 volts in both directions?**

  YES : INSTALL a new power lumbar assembly. REFER to **Lumbar Assembly**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to N4.

N4 CHECK CIRCUITS CPS20 (VT) AND CPS21 (YE/BK) FOR A SHORT TO GROUND

- Disconnect: Seat Control Switch C3190

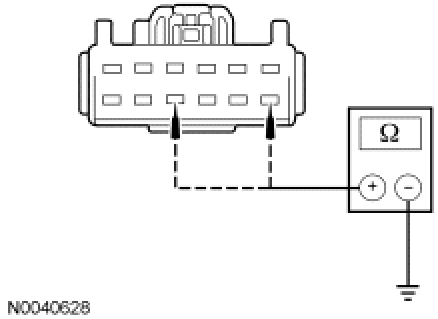

Fig. 88: Checking Circuits CPS20 (VT) & CPS21 (YE/BK) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3190-7, circuit CPS20 (VT), harness side and ground; and between seat control switch C3190-10, circuit CPS21 (WH/OG), harness side and

ground.

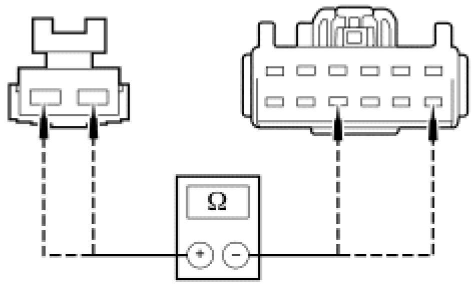
- **Are the resistances greater than 10,000 ohms.**

  YES : Go to N5.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

N5 CHECK CIRCUITS CPS20 (VT), CPS20 (WH/OG) AND CPS21 (YE/BK) FOR AN OPEN



N0040629

Fig. 89: Checking Circuits CPS20 (VT), CPS20 (WH/OG) & CPS21 (YE/BK) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between seat control switch C3190-7, circuit CPS20 (VT), harness side and power lumbar motor C3215-1, circuit CPS20 (WH/OG), harness side; and between seat control switch C3190-10, circuit CPS21 (YE/BK), harness side and power lumbar motor C3215-2, circuit CPS21 (YE/BK), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new seat control switch. REFER to **Seat Control Switch**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test O: The Heated Seat is Inoperative - Driver

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

The heated seat module receives ignition voltage on circuit CBP19 (BN/WH), battery voltage on circuit SBB11 (BU/RD) and is supplied ground on circuit GD139 (BK/YE). When ignition switched voltage is supplied and the driver heated seat button on the HVAC module is pressed, a momentary ground signal is sent to the heated seat module on circuit CHS29 (WH/BU) to command the system ON or OFF. Upon receiving a signal, the heated seat module will decrease one setting (the sequence is HI, LO, OFF, HI, etc.). The heated seat module supplies voltage to the cushion and backrest heater mats on circuit CHS02 (YE/BU). Ground to the heater mats is provided on circuit GD126 (BK/WH). The cushion and backrest heater mats are connected in series and operate together. Temperature is maintained by the heated seat module using a sensor contained within the cushion heater mat. The heated seat module supplies a reference voltage to the temperature sensor on circuit RHS05 (YE/VT) and monitors the signal from the temperature sensor on circuit VHS26 (VT) for controlling current flow to the heater mats. The heated seat module is designed to remain ON, heating the seat and maintaining temperature until switched OFF.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Heater mat
- Heated seat module
- HVAC module

PINPOINT TEST O: THE HEATED SEAT IS INOPERATIVE - DRIVER

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

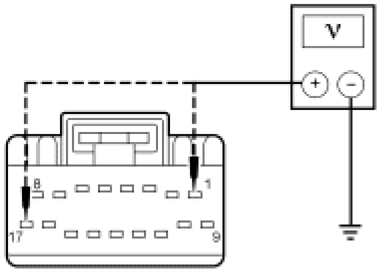
NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

O1 CHECK CIRCUIT SBB11 (BU/RD) FOR VOLTAGE TO THE HEATED SEAT MODULE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: Heated Seat Module C3304

WARNING:	**Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.



A0089169

Fig. 90: Checking Circuit SBB11 (BU/RD) For Voltage To Heated Seat Module
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3304-1, circuit SBB11 (BU/RD) harness side and ground and C3304-17, circuit SBB11 (BU/RD) harness side and ground.
- **Are the voltages greater than 10 volts?**

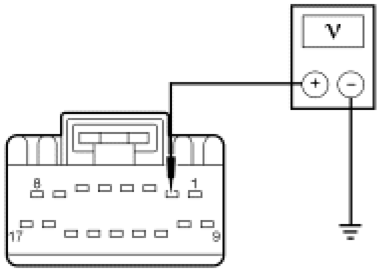
  YES : Go to O2.

  NO : VERIFY battery junction box (BJB) fuse 11 (20A Fusion and Milan) (30A MKZ) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O2 CHECK CIRCUIT CBP19 (BN/WH) FOR VOLTAGE TO THE HEATED SEAT MODULE

- Key in ON position.



A0089170

Fig. 91: Checking Circuit CBP19 (BN/WH) For Voltage To Heated Seat Module
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3304-2, circuit CBP19 (BN/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to O3.

  NO : VERIFY smart junction box (SJB) fuse 28 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O3 CHECK HEATED SEAT MODULE GROUND CIRCUIT GD139 (BK/YE) FOR AN OPEN

- Key in OFF position.

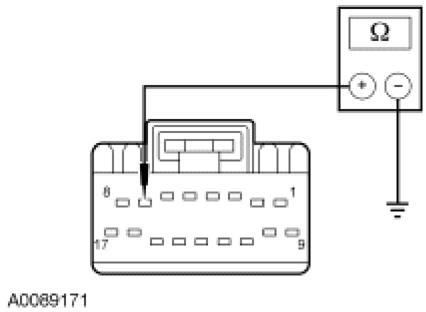


Fig. 92: Checking Heated Seat Module Ground Circuit GD139 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3304-7, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to O4.

  NO : REPAIR circuit GD139 (BK/YE). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O4 CHECK CIRCUIT CHS02 (YE/BU) FOR SHORT TO VOLTAGE

- Disconnect: Driver Seat Cushion Heater C364
- Key in ON position.

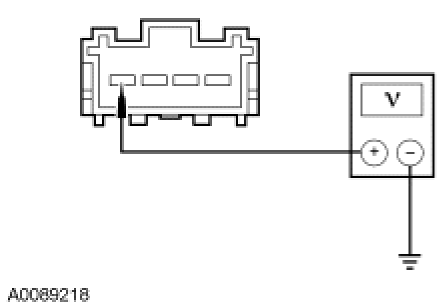

Fig. 93: Checking Circuit CHS02 (YE/BU) For Short To Voltage - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the voltage between driver seat cushion heater C3298-1, circuit CHS02 (YE/BU), harness side and ground.

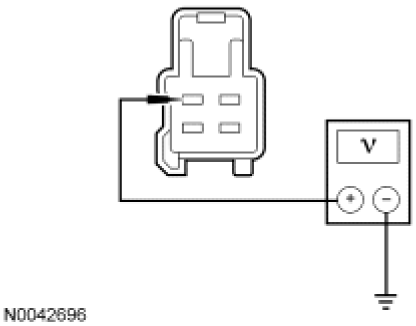

Fig. 94: Checking Circuit CHS02 (YE/BU) For Short To Voltage - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the voltage between driver seat cushion heater C364-1, circuit CHS02 (YE/BU), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit CHS02 (YE/BU). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to O5.

O5 CHECK CIRCUIT CHS02 (YE/BU) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.

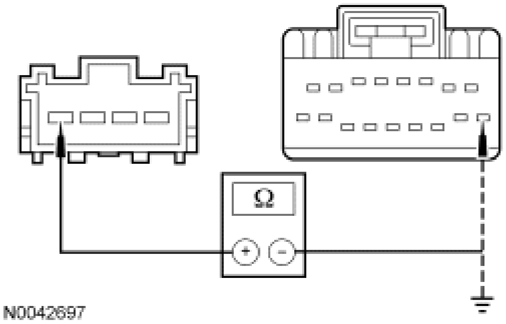

Fig. 95: Checking Circuit CHS02 (YE/BU) For Open Or Short To Ground - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between driver seat cushion heater C3298-1, circuit CHS02 (YE/BU), harness side and ground; and between C3298-1, circuit CHS02 (YE/BU), harness side and heated seat module C3304-9, circuit CHS02 (YE/BU) harness side.

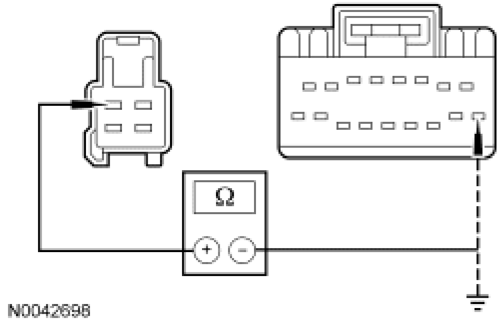

Fig. 96: Checking Circuit CHS02 (YE/BU) For Open Or Short To Ground - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between driver seat cushion heater C364-1, circuit CHS02 (YE/BU), harness side and ground; and between C364-1, circuit CHS02 (YE/BU), harness side and heated seat module C3304-9, circuit CHS02 (YE/BU) harness side.
- **Is the resistance greater than 10,000 ohms between the driver seat cushion heater and ground and less than 5 ohms between the driver seat cushion heater and the heated seat module?**

  YES : Go to O6.

  NO : REPAIR circuit CHS02 (YE/BU). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O6 CHECK CIRCUIT CHS11 (VT/GN) FOR A SHORT TO VOLTAGE

- Disconnect: Driver Seat Backrest Heater C365
- Key in ON position.

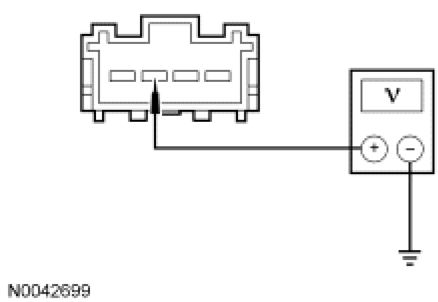

Fig. 97: Checking Circuit CHS11 (VT/GN) For A Short To Voltage - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the voltage between driver seat cushion heater C3298-2, circuit CHS11 (VT/GN), harness side and ground.

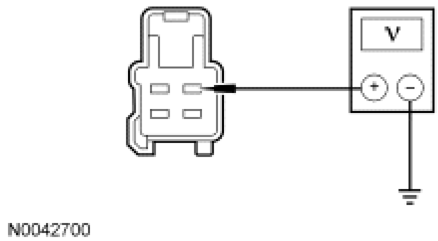

Fig. 98: Checking Circuit CHS11 (VT/GN) For A Short To Voltage - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the voltage between driver seat cushion heater C364-2, circuit CHS11 (VT/GN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit CHS11 (VT/GN). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to O7.

O7 CHECK CIRCUIT CHS11 (VT/GN) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.

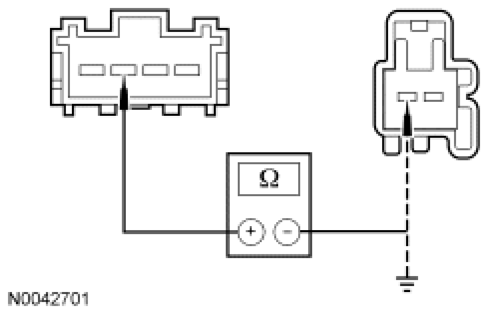

Fig. 99: Checking Circuit CHS11 (VT/GN) For An Open Or Short To Ground - MKZ
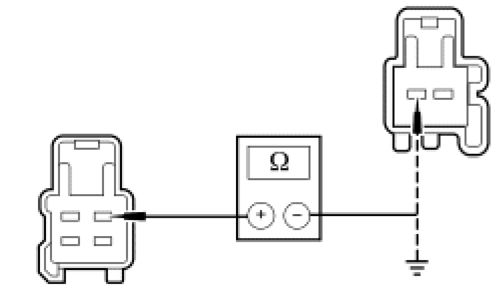
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between driver seat cushion heater C3298-2, circuit CHS11 (VT/GN), harness side and ground; and between C3298-2, circuit CHS11 (VT/GN), harness side and driver seat backrest heater C365-1, circuit CHS11 (VT/GN) harness side.



N0042702

Fig. 100: Checking Circuit CHS11 (VT/GN) For An Open Or Short To Ground - Fusion & Milan
Courtesy of FORD MOTOR CO.

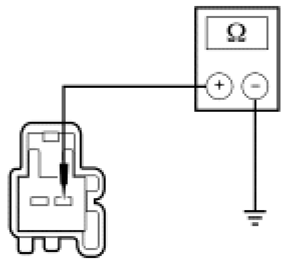
- For Fusion and Milan, measure the resistance between driver seat cushion heater C364-2, circuit CHS11 (VT/GN), harness side and ground; and between C364-2, circuit CHS11 (VT/GN), harness side and driver seat backrest heater C365-1, circuit CHS11 (VT/GN) harness side.
- **Is the resistance greater than 10,000 ohms between the driver seat cushion heater and ground and less than 5 ohms between the driver seat cushion heater and driver seat backrest heater?**

  YES : Go to O8.

  NO : REPAIR circuit CHS11 (VT/GN). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O8 CHECK CIRCUIT GD126 (BK/WH) FOR AN OPEN



N0040603

Fig. 101: Checking Circuit GD126 (BK/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat backrest heater C365-2, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to O9.

  NO : REPAIR circuit GD126 (BK/WH). TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O9 CHECK CUSHION HEATER FOR SHORT TO GROUND OR AN OPEN

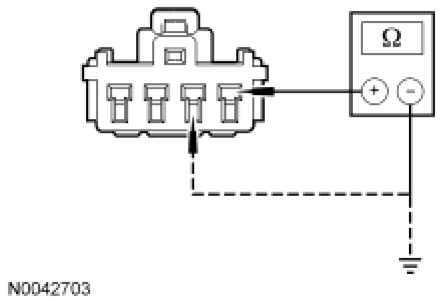


Fig. 102: Checking Cushion Heater For Short To Ground Or Open - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between driver seat cushion heater C3298 pin 1, circuit CHS02 (YE/BU), component side and C3298 pin 2, circuit CHS11 (VT/GN), component side; and between C3298 pin 1, circuit CHS02 (YE/BU), component side and ground.

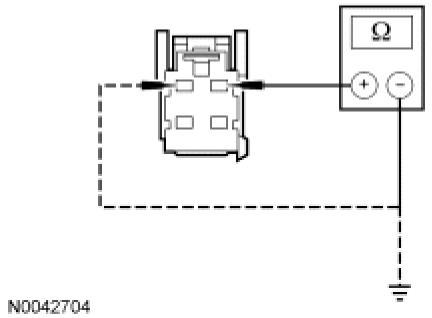

Fig. 103: Checking Cushion Heater For Short To Ground Or Open - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between driver seat cushion heater C364 pin 1, circuit CHS02 (YE/BU), component side and C364 pin 2, circuit CHS11 (VT/GN), component side; and between C364 pin 1, circuit CHS02 (YE/BU), component side and ground.
- **Is the resistance greater than 1.6 ohms and less than 10 ohms between driver seat cushion heater pin 1 and pin 2; and greater than 10,000 ohms between driver seat cushion heater pin 1 and ground?**

  YES : Go to O10.

  NO : INSTALL a new driver seat cushion heater. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to

SUPPLEMENTAL RESTRAINT SYSTEM article.

O10 CHECK THE SEAT BACKREST HEATER FOR AN OPEN

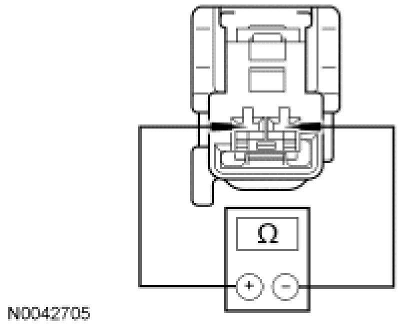

Fig. 104: Checking Seat Backrest Heater
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat backrest heater C365 pin 1, circuit CHS11 (VT/GN), component side and C365 pin 2, circuit GD126 (BK/WH), component side.
- **Is the resistance between 0.6 and 0.9 ohm?**

  YES : Go to O11.

  NO : INSTALL a new driver seat backrest heater. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O11 CHECK THE HEATED SEAT TEMPERATURE SENSOR AND CIRCUITS FOR A SHORT TO VOLTAGE

- Key in ON position.

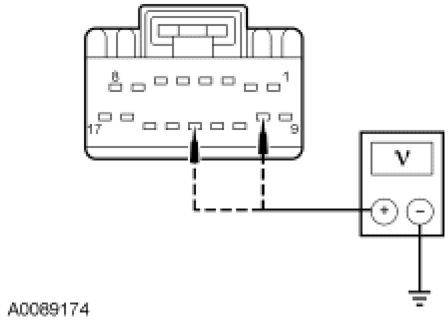

Fig. 105: Checking Heated Seat Temperature Sensor And Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and ground and between C3304-10, circuit VHS26 (VT), harness side and ground.

- **Is any voltage present?**

  YES : REPAIR the affected circuit RHS05 (YE/VT) or VHS26 (VT). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to O12.

O12 CHECK THE HEATED SEAT TEMPERATURE SENSOR AND CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.

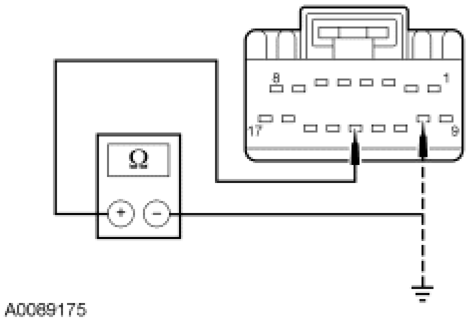

Fig. 106: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and C3304-10, circuit VHS26 (VT), harness side; and between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and ground.
- **Is the resistance less than 300,000 ohms and greater than 50 ohms between heated seat module pin 13 and pin 10 and greater than 10,000 ohms between heated seat module pin 13 and ground?**

  YES : Go to O15.

  NO : Go to O13.

O13 CHECK CIRCUIT RHS05 (YE/VT) FOR AN OPEN OR SHORT TO GROUND

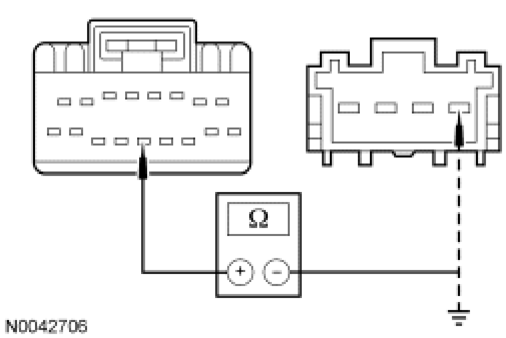

Fig. 107: Checking Circuit RHS05 (YE/VT) For Open Or Short To Ground - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and the driver seat cushion heater C3298-4, circuit RHS05 (YE/VT), harness side; and between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and ground.

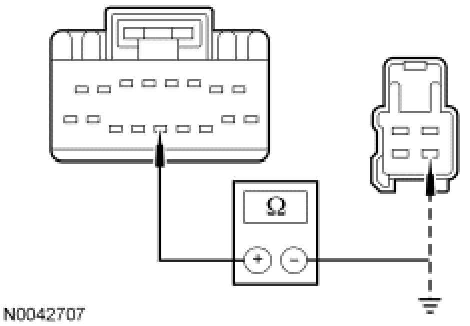

Fig. 108: Checking Circuit RHS05 (YE/VT) For Open Or Short To Ground - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and the driver seat cushion heater C364-4, circuit RHS05 (YE/VT), harness side; and between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and ground.
- **Is the resistance less than 5 ohms between the heated seat module and the driver seat cushion heater and greater than 10,000 ohms between the heated seat module and ground?**

YES : Go to O14.

NO : REPAIR circuit RHS05 (YE/VT). TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O14 CHECK CIRCUIT VHS26 (VT) FOR AN OPEN OR SHORT TO GROUND

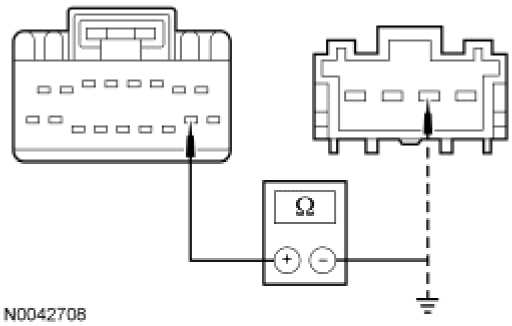

Fig. 109: Checking Circuit VHS26 (VT) For Open Or Short To Ground - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between heated seat module C3304-10, circuit VHS26 (VT), harness side and driver seat cushion heater C3298-3, circuit VHS26 (VT), harness side; and between heated seat module C3304-10, circuit VHS26 (VT), harness side and ground.

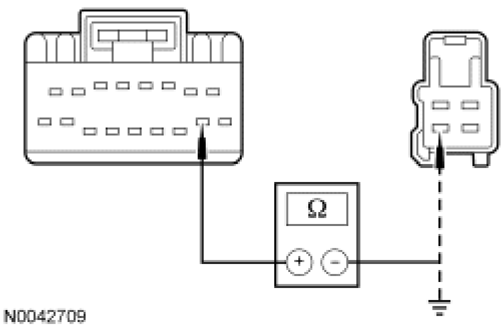

Fig. 110: Checking Circuit VHS26 (VT) For Open Or Short To Ground - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between heated seat module C3304-10, circuit VHS26 (VT), harness side and driver seat cushion heater C364-3, circuit VHS26 (VT), harness side; and between heated seat module C3304-10, circuit VHS26 (VT), harness side and ground.
- **Is the resistance less than 5 ohms between the heated seat module and the driver seat cushion heater and greater than 10,000 ohms between the heated seat module and ground?**

  YES : INSTALL a new driver seat cushion heater. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR circuit VHS26 (VT). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O15 CHECK CIRCUIT CHS29 (WH/BU) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: HVAC Module C2356b (MKZ) or C228b (Fusion and Milan)
- Key in ON position.

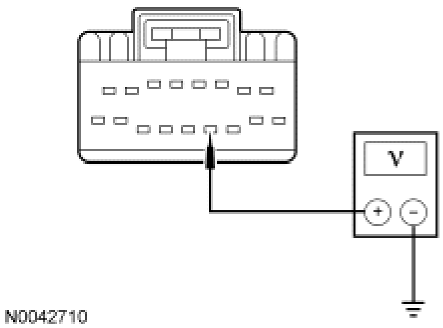

Fig. 111: Checking Circuit CHS29 (WH/BU) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3304-12, circuit CHS29 (WH/BU), harness side and ground.
- **Is the voltage less than 0.2 volt?**

  YES : Go to O16.

  NO : REPAIR circuit CHS29 (WH/BU). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O16 CHECK CIRCUIT CHS29 (WH/BU) FOR A SHORT TO GROUND

- Key in OFF position.

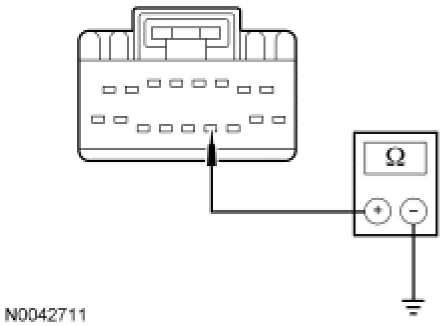

Fig. 112: Checking Circuit CHS29 (WH/BU) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3304-12, circuit CHS29 (WH/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to O17.

  NO : REPAIR circuit CHS29 (WH/BU). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327.

CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O17 CHECK CIRCUIT CHS29 (WH/BU) FOR AN OPEN

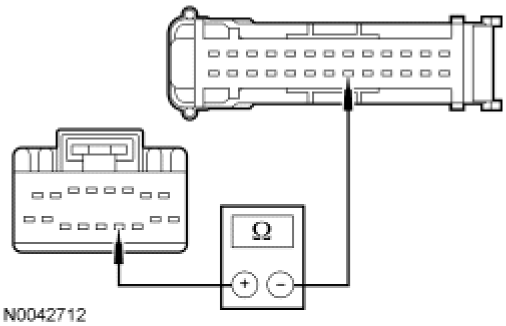

Fig. 113: Checking Circuit CHS29 (WH/BU) For An Open
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between heated seat module C3304-12, circuit CHS29 (WH/BU), harness side and HVAC module C2356b-6, circuit CHS29 (WH/BU), harness side.

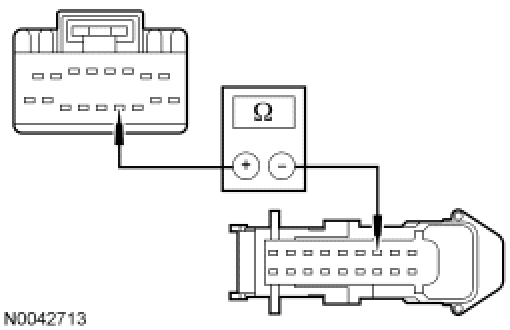

Fig. 114: Checking Circuit CHS29 (WH/BU) For Open - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between heated seat module C3304-12, circuit CHS29 (WH/BU), harness side and HVAC module C228b-7, circuit CHS29 (WH/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to O18.

  NO : REPAIR circuit CHS29 (WH/BU). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

O18 CHECK THE HVAC MODULE OUTPUT

- Connect: HVAC Module C2356b (MKZ) or C228b (Fusion and Milan)

- Connect: Heated Seat Module C3304
- Key in ON position.

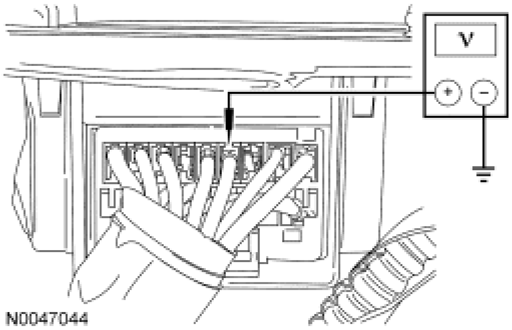

Fig. 115: Checking HVAC Module Output
Courtesy of FORD MOTOR CO.

NOTE:	**The following measurement must be taken by back-probing the heated seat module C3304.**

NOTE:	**The voltage on circuit CHS29 (WH/BU) should drop momentarily when the driver heated seat control button is pressed.**

- Measure the voltage between heated seat module C3304-12, circuit CHS29 (WH/BU), harness side and ground by back-probing heated seat module connector. Press the driver heated seat control button on the HVAC module and note the voltage.
- **Is the voltage greater than 10 volts before pressing the driver heated seat control button, then momentarily drops when the heated seat control button is pressed?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the voltage is greater than 10 volts but did not drop when the driver heated seat button was pressed, INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  If the voltage is less than 10 volts, INSTALL a new heated seat module. REFER to **Heated Seat Module**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test P: The Heated Seat is Inoperative - Passenger

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

The heated seat module receives ignition voltage on circuit CBP19 (BN/WH), battery voltage on circuit SBB11 (BU/RD) and is supplied ground on circuit GD139 (BK/YE). When ignition switched voltage is supplied and the passenger heated seat button on the HVAC module is pressed, a momentary ground signal is sent to the heated seat module on circuit CHS30 (GN/YE) to command the system ON or OFF. Upon receiving a signal, the heated seat module will decrease one setting (the sequence is HI, LO, OFF, HI, etc.). The heated seat module supplies voltage to the cushion and backrest heater mats on circuit CHS07 (GY/BU). Ground to the heater mats is provided on circuit GD139 (BK/YE). The cushion and backrest heater mats are connected in series and operate together. Temperature is maintained by the heated seat module using a sensor contained within the cushion heater mat. The heated seat module supplies a reference voltage to the temperature sensor on circuit RHS05 (YE/VT) and monitors the signal from the temperature sensor on circuit VHS27 (WH/OG) for controlling current flow to the heater mats. The heated seat module is designed to remain ON, heating the seat and maintaining temperature until switched OFF.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Heater mat
- Heated seat module
- HVAC module

PINPOINT TEST P: THE HEATED SEAT IS INOPERATIVE - PASSENGER

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

P1 CHECK CIRCUIT SBB11 (BU/RD) FOR VOLTAGE TO THE HEATED SEAT MODULE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: Heated Seat Module C3304

WARNING:	**Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may**

result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

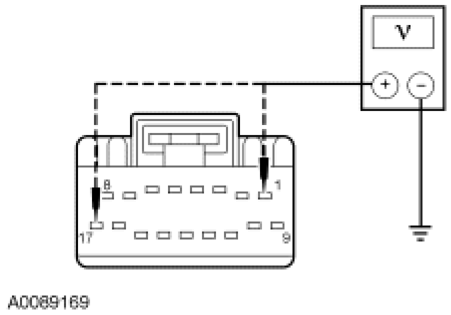

Fig. 116: Checking Circuit SBB11 (BU/RD) For Voltage To Heated Seat Module
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3304-1, circuit SBB11 (BU/RD) harness side and ground and C3304-17, circuit SBB11 (BU/RD) harness side and ground.
- **Are the voltages greater than 10 volts?**

  YES : Go to P2.

  NO : VERIFY battery junction box (BJB) fuse 11 (20A Fusion and Milan) (30A MKZ) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P2 CHECK CIRCUIT CBP19 (BN/WH) FOR VOLTAGE TO THE HEATED SEAT MODULE

- Key in ON position.

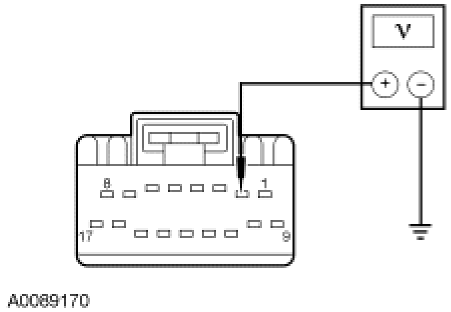

Fig. 117: Checking Circuit CBP19 (BN/WH) For Voltage To Heated Seat Module
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3304-2, circuit CBP19 (BN/WH), harness side and ground.

- **Is the voltage greater than 10 volts?**

  YES : Go to P3.

  NO : VERIFY smart junction box (SJB) fuse 28 (10A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P3 CHECK HEATED SEAT MODULE GROUND CIRCUIT GD139 (BK/YE) FOR AN OPEN

- Key in OFF position.

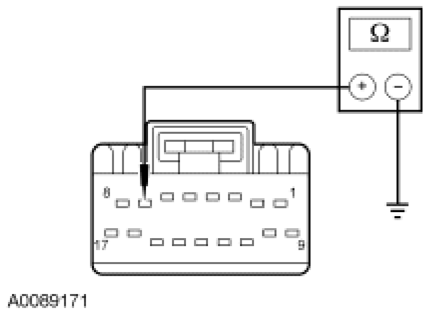

Fig. 118: Checking Heated Seat Module Ground Circuit GD139 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3304-7, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to P4.

  NO : REPAIR circuit GD139 (BK/YE). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P4 CHECK CIRCUIT CHS07 (GY/BU) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Cushion Heater C334/C3320
- Key in ON position.

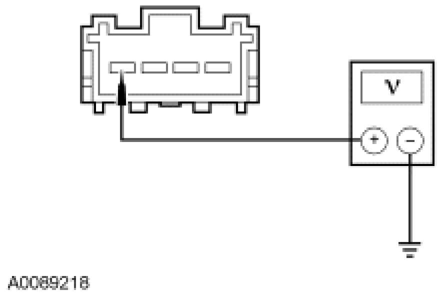

Fig. 119: Checking Circuit CHS07 (GY/BU) For A Short To Voltage - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the voltage between passenger seat cushion heater C3320-1, circuit CHS07 (GY/BU), harness side and ground.

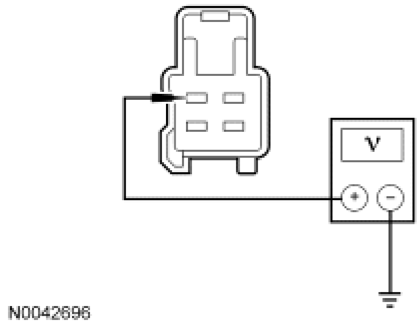

Fig. 120: Checking Circuit CHS07 (GY/BU) For A Short To Voltage - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the voltage between passenger seat cushion heater C334-1, circuit CHS07 (GY/BU), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit CHS07 (GY/BU). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to P5.

P5 CHECK CIRCUIT CHS07 (GY/BU) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.

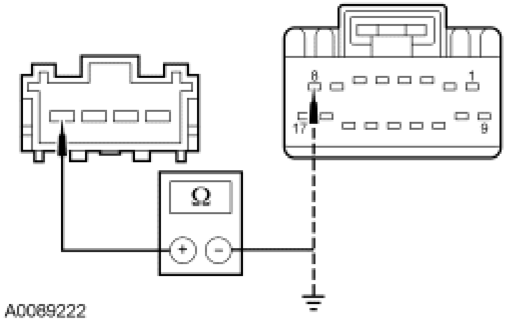

Fig. 121: Checking Circuit CHS07 (GY/BU) For An Open Or Short To Ground - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between passenger seat cushion heater C3320-1, circuit CHS07 (GY/BU), harness side and ground; and between C3320-1, circuit CHS07 (GY/BU), harness side and heated seat module C3304-8, circuit CHS07 (GY/BU) harness side.

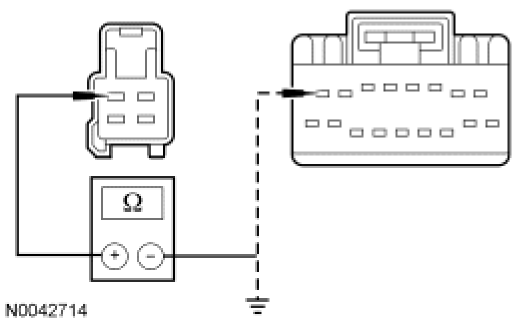

Fig. 122: Checking Circuit CHS07 (GY/BU) For An Open Or Short To Ground - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between passenger seat cushion heater C334-1, circuit CHS07 (GY/BU), harness side and ground; and between C334-1, circuit CHS07 (GY/BU), harness side and heated seat module C3304-8, circuit CHS07 (GY/BU) harness side.
- **Is the resistance greater than 10,000 ohms between the passenger seat cushion heater and ground and less than 5 ohms between the passenger seat cushion heater and the heated seat module?**

  YES : Go to P6.

  NO : REPAIR circuit CHS07 (GY/BU). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P6 CHECK CIRCUIT CHS12 (YE/GN) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Backrest Heater C335
- Key in ON position.

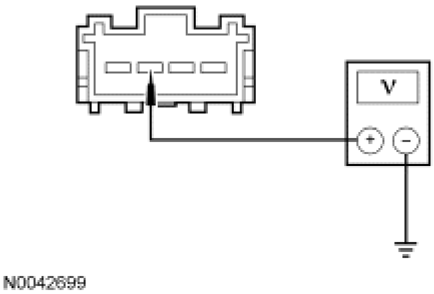

Fig. 123: Checking Circuit CHS12 (YE/GN) For A Short To Voltage - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the voltage between passenger seat cushion heater C3320-2, circuit CHS12 (YE/GN), harness side and ground.

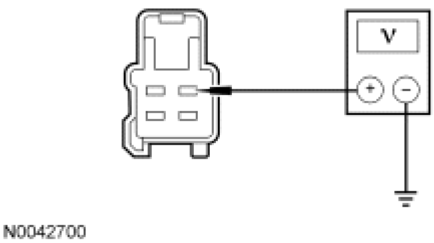

Fig. 124: Checking Circuit CHS12 (YE/GN) For A Short To Voltage - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the voltage between passenger seat cushion heater C334-2, circuit CHS12 (YE/GN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit CHS12 (YE/GN). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to P7.

P7 CHECK CIRCUIT CHS12 (YE/GN) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.

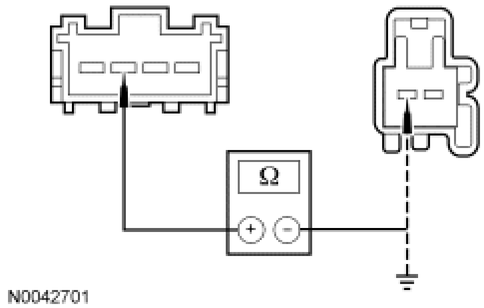

Fig. 125: Checking Circuit CHS12 (YE/GN) For An Open Or Short To Ground - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between passenger seat cushion heater C3320-2, circuit CHS12 (YE/GN), harness side and ground; and between C3320-2, circuit CHS12 (YE/GN), harness side and passenger seat backrest heater C335-1, circuit CHS12 (YE/GN) harness side.

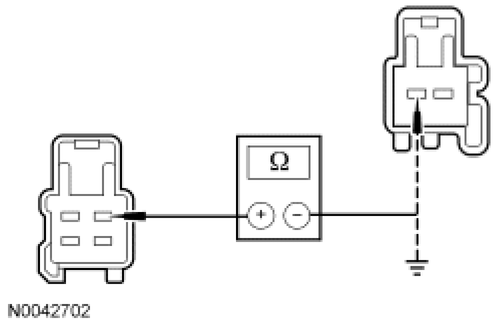

Fig. 126: Checking Circuit CHS12 (YE/GN) For An Open Or Short To Ground - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between passenger seat cushion heater C334-2, circuit CHS12 (YE/GN), harness side and ground; and between C334-2, circuit CHS12 (YE/GN), harness side and passenger seat backrest heater C335-1, circuit CHS12 (YE/GN) harness side.
- **Is the resistance greater than 10,000 ohms between the passenger seat cushion heater and ground and less than 5 ohms between the passenger seat cushion heater and passenger seat backrest heater?**

  YES : Go to P8.

  NO : REPAIR circuit CHS12 (YE/GN). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P8 CHECK CIRCUIT GD139 (BK/YE) FOR AN OPEN

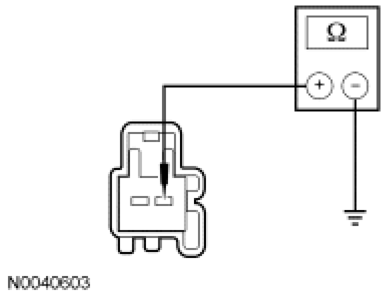

Fig. 127: Checking Circuit GD139 (BK/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat backrest heater C335-2, circuit GD139 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to P9.

  NO : REPAIR circuit GD139 (BK/YE). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P9 CHECK CUSHION HEATER FOR A SHORT TO GROUND OR AN OPEN

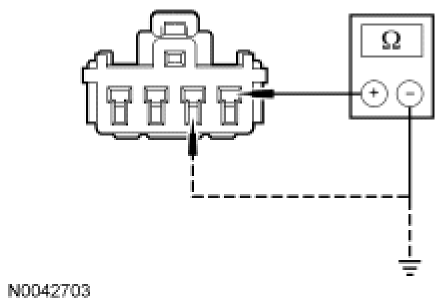

Fig. 128: Checking Cushion Heater For Short To Ground Or Open - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between passenger cushion heater C3320 pin 1, circuit CHS07 (GY/BU), component side and C3320 pin 2, circuit CHS12 (YE/GN), component side; and between C334 pin 1, circuit CHS07 (GY/BU), component side and ground.

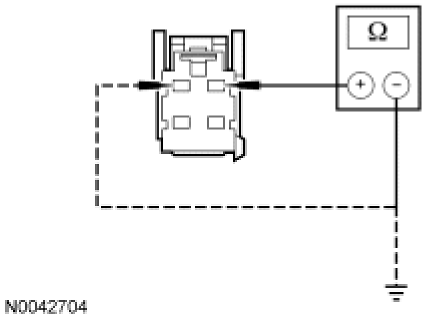

Fig. 129: Checking Cushion Heater For Short To Ground Or Open - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between passenger seat cushion heater C334 pin 1, circuit CHS07 (GY/BU), component side and C334 pin 2, circuit CHS12 (YE/GN), component side; and between C334 pin 1, circuit CHS07 (GY/BU), component side and ground.
- **Is the resistance greater than 1.6 ohms and less than 10 ohms between the passenger seat cushion heater pin 1 and pin 2 and greater than 10,000 ohms between the passenger seat cushion heater pin 1 and ground?**

  YES : Go to P10.

  NO : INSTALL a new passenger seat cushion heater. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P10 CHECK THE SEAT BACKREST HEATER FOR AN OPEN

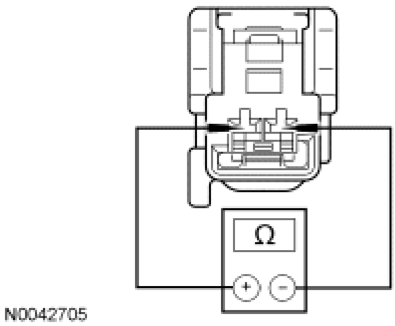

Fig. 130: Checking Seat Backrest Heater
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger seat backrest heater C335 pin 1, circuit CHS12 (YE/GN), component side and C335 pin 2, circuit GD139 (BK/YE), component side.
- **Is the resistance between 0.6 and 0.9 ohm?**

  YES : Go to P11.

  NO : INSTALL a new driver seat backrest heater. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P11 CHECK THE HEATED SEAT TEMPERATURE SENSOR AND CIRCUITS FOR A SHORT TO VOLTAGE

- Key in ON position.

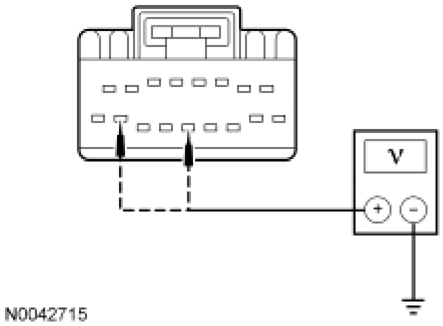

Fig. 131: Checking Heated Seat Temperature Sensor And Circuits For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and ground and between C3304-16, circuit VHS27 (WH/OG), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the affected circuit RHS05 (YE/VT) or VHS27 (WH/OG). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to P12.

P12 CHECK THE HEATED SEAT TEMPERATURE SENSOR AND CIRCUITS FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.

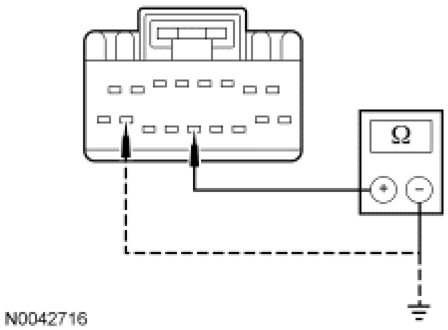

Fig. 132: Checking Heated Seat Temperature Sensor And Circuits For Open Or Short To Ground

Courtesy of FORD MOTOR CO.

- Measure the resistance between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and C3304-16, circuit VHS27 (WH/OG), harness side; and between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and ground.
- **Is the resistance less than 300,000 ohms and greater than 50 ohms between heated seat module pin 13 and pin 16 and greater than 10,000 ohms between heated seat module pin 13 and ground?**

  YES : Go to P15.

  NO : Go to P13.

P13 CHECK CIRCUIT RHS05 (YE/VT) FOR AN OPEN OR SHORT TO GROUND

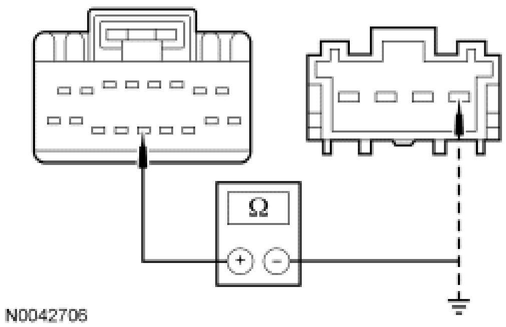

Fig. 133: Checking Circuit RHS05 (YE/VT) For Open Or Short To Ground - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and the passenger seat cushion heater C3320-4, circuit RHS05 (YE/VT), harness side; and between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and ground.

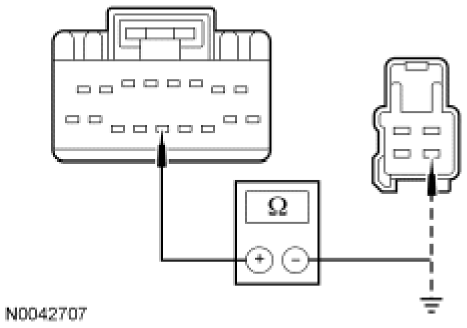

Fig. 134: Checking Circuit RHS05 (YE/VT) For Open Or Short To Ground - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and the passenger seat cushion heater C334-4, circuit RHS05 (YE/VT), harness side; and between heated seat module C3304-13, circuit RHS05 (YE/VT), harness side and ground.

- **Is the resistance less than 5 ohms between the heated seat module and passenger seat cushion heater and greater than 10,000 ohms between the heated seat module and ground?**

  YES : Go to P14.

  NO : REPAIR circuit RHS05 (YE/VT). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P14 CHECK CIRCUIT VHS27 (WH/OG) FOR AN OPEN OR SHORT TO GROUND

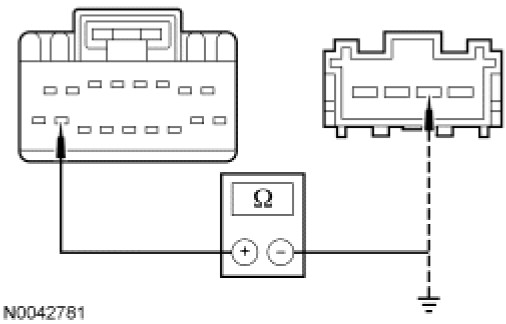

Fig. 135: Checking Circuit VHS27 (WH/OG) For Open Or Short To Ground - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between heated seat module C3304-16, circuit VHS27 (WH/OG), harness side and passenger seat cushion heater C3320-3, circuit VHS27 (WH/OG), harness side; and between heated seat module C3304-16, circuit VHS27 (WH/OG), harness side and ground.

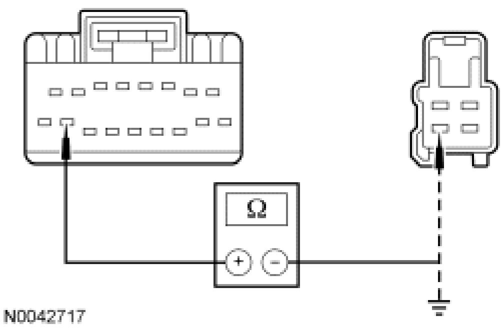

Fig. 136: Checking Circuit VHS27 (WH/OG) For Open Or Short To Ground - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between heated seat module C3304-16, circuit VHS27 (WH/OG), harness side and passenger seat cushion heater C334-3, circuit VHS27 (WH/OG), harness side; and between heated seat module C3304-16, circuit VHS27 (WH/OG), harness side and ground.
- **Is the resistance less than 5 ohms between the heated seat module and passenger seat cushion heater and greater than 10,000 ohms between the heated seat module and ground?**

YES : INSTALL a new passenger seat cushion heater. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : REPAIR circuit VHS27 (WH/OG). TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P15 CHECK CIRCUIT CHS30 (GY/YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: HVAC Module C2356b (MKZ) or C228b (Fusion and Milan)
- Key in ON position.

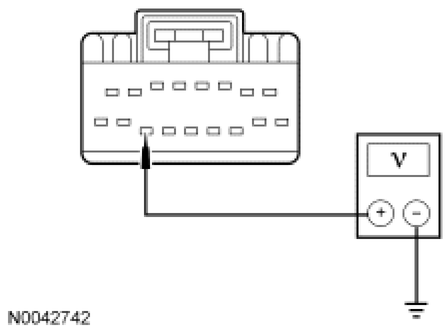

Fig. 137: Checking Circuit CHS30 (GY/YE) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between passenger heated seat module C3304-15, circuit CHS30 (GY/YE), harness side and ground.
- **Is the voltage less than 0.2 volt?**

YES : Go to P16.

NO : REPAIR circuit CHS30 (GY/YE). TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P16 CHECK CIRCUIT CHS30 (GY/YE) FOR A SHORT TO GROUND

- Key in OFF position.

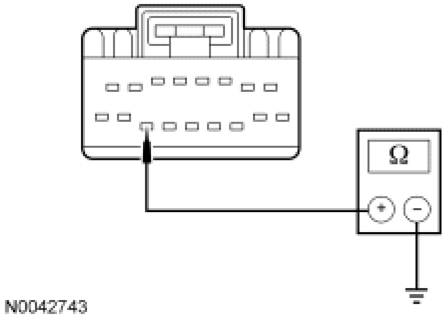

Fig. 138: Checking Circuit CHS30 (GY/YE) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger heated seat module C3304-15, circuit CHS30 (GY/YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to P17.

  NO : REPAIR circuit CHS30 (GY/YE). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P17 CHECK CIRCUIT CHS30 (GY/YE) FOR AN OPEN

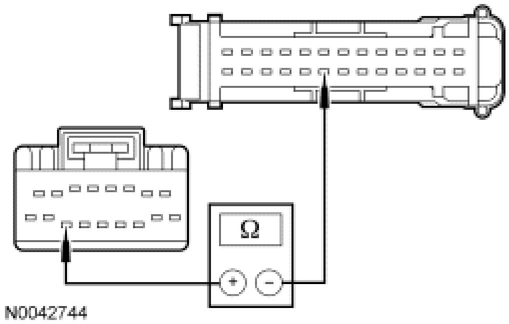

Fig. 139: Checking Circuit CHS30 (GY/YE) For Open - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between passenger heated seat module C3304-15, circuit CHS30 (GY/YE), harness side and HVAC module C2356b-19, circuit CHS30 (GY/YE), harness side.

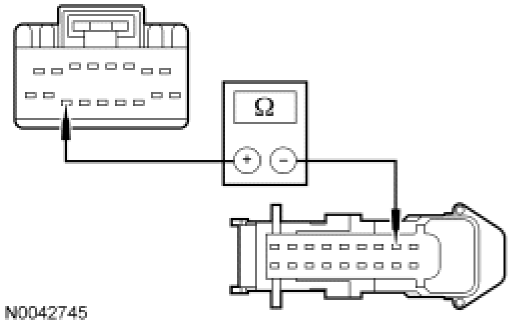

Fig. 140: Checking Circuit CHS30 (GY/YE) For Open - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between passenger heated seat module C3304-15, circuit CHS30 (GY/YE), harness side and HVAC module C228b-8, circuit CHS30 (GY/YE), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to P18.

  NO : REPAIR circuit CHS30 (GY/YE). TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

P18 CHECK THE HVAC MODULE OUTPUT

- Connect: HVAC Module C2356b (MKZ) or C228b (Fusion and Milan)
- Connect: Heated Seat Module C3304
- Key in ON position.

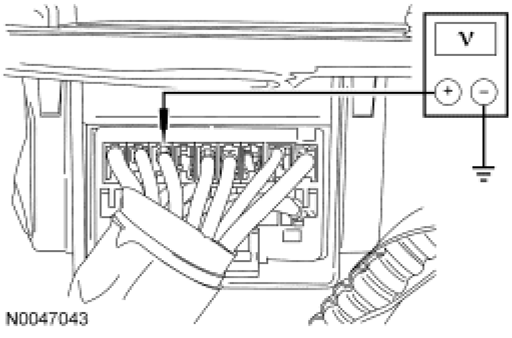

Fig. 141: Checking HVAC Module Output
Courtesy of FORD MOTOR CO.

NOTE:	**The following measurement must be taken by back-probing the heated seat module C3304.**

NOTE:	**The voltage on circuit CHS30 (GY/YE) should drop momentarily when**

the passenger heated seat control button is pressed.

- Measure the voltage between passenger heated seat module C3304-15, circuit CHS30 (GY/YE), harness side and ground by back-probing heated seat module connector. Press the passenger heated seat control button on the HVAC module and note the voltage.
- **Is the voltage greater than 10 volts before pressing the passenger heated seat control button, then momentarily drops when the heated seat control button is pressed?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the voltage is greater than 10 volts but did not drop when the passenger heated seat button was pressed, INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  If the voltage is less than 10 volts, INSTALL a new heated seat module. REFER to **Heated Seat Module**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test Q: The Heated Seat is Inoperative - Driver Seat Does Heat But the Heated Seat Indicator Does Not Illuminate When Pressed

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Upon receiving a signal from the HVAC module, the heated seat module will decrease one setting (the sequence is HI, LO, OFF, HI, etc.). When the driver heated seat is set to HI, both LED indicators above the driver heated seat control button will illuminate. When the driver heated seat is set to LO, only the left LED on the driver heated seat indicator will illuminate. When the driver heated seat is set to OFF, neither driver heated seat LED will illuminate.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heated seat module
- HVAC module

PINPOINT TEST Q: THE HEATED SEAT IS INOPERATIVE - DRIVER SEAT DOES HEAT BUT THE HEATED SEAT INDICATOR DOES NOT ILLUMINATE WHEN PRESSED

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

Q1 CHECK CIRCUITS CHS04 (YE/GY) AND CHS13 (VT/BN) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: HVAC Module C2356b (MKZ) or C228b (Fusion and Milan)
- Disconnect: Heated Seat Module C3304

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

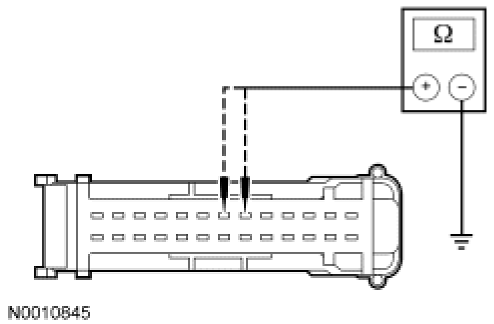

Fig. 142: Checking Circuits CHS04 (YE/GY) And CHS13 (VT/BN) For Short To Ground - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between HVAC module C2356b-7, circuit CHS04 (YE/GY), harness side and ground; and between HVAC module C2356b-8, circuit CHS13 (VT/BN), harness side and ground.

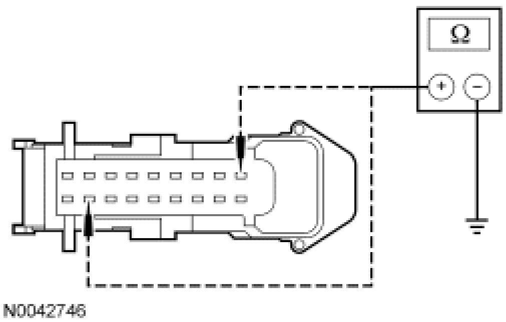

Fig. 143: Checking Circuits CHS04 (YE/GY) And CHS13 (VT/BN) For Short To Ground - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between HVAC module C228b-11, circuit CHS04 (YE/GY), harness side and ground; and between HVAC module C228b-9, circuit CHS13 (VT/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to Q2.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Q2 CHECK CIRCUITS CHS04 (YE/GY) AND CHS13 (VT/BN) FOR AN OPEN

- Key in ON position.

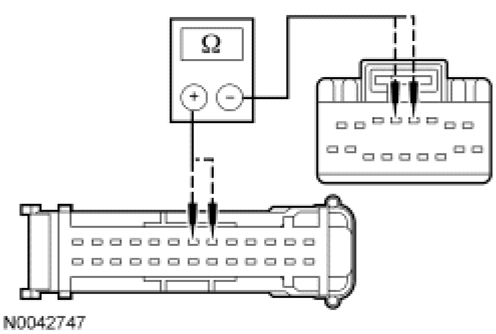

Fig. 144: Checking Circuits CHS04 (YE/GY) And CHS13 (VT/BN) For Open - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between HVAC module C2356b-7, circuit CHS04 (YE/GY), harness side and heated seat module C3304-5, circuit CHS04 (YE/GY), harness side; and between HVAC module C2356b-8, circuit CHS13 (VT/BN), harness side and heated seat module C3304-4, circuit CHS13 (VT/BN), harness side.

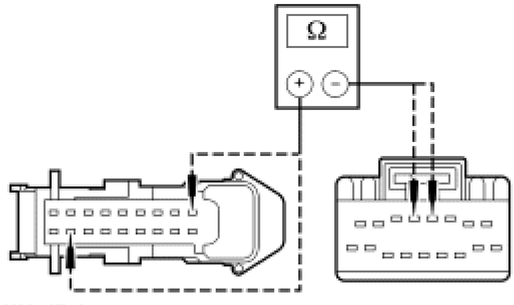

Fig. 145: Checking Circuits CHS04 (YE/GY) And CHS13 (VT/BN) For Open - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between HVAC module C228b-11, circuit CHS04 (YE/GY), harness side and heated seat module C3304-5, circuit CHS04 (YE/GY), harness side; and between HVAC module C228b-9, circuit CHS13 (VT/BN), harness side and heated seat module C3304-4, circuit CHS13 (VT/BN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to Q3.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Q3 CHECK THE HEATED SEAT MODULE HI INDICATOR ON THE HVAC MODULE

- Connect: HVAC Module C2356b (MKZ) or C228b (Fusion and Milan)
- Key in ON position.

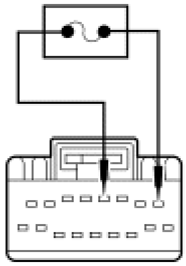

Fig. 146: Checking Heated Seat Module HI Indicator On EATC Module
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between heated seat module C3304-4, circuit CHS13 (VT/BN), harness side and C3304-1, circuit SBB11 (BU/RD), harness side.
- **Do both driver heated seat indicator LEDs illuminate on the HVAC module?**

YES : Go to Q4.

NO : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Q4 CHECK THE HEATED SEAT MODULE LOW INDICATOR ON THE HVAC MODULE

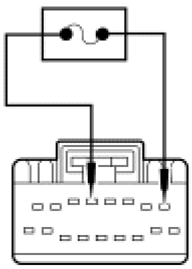

Fig. 147: Checking Heated Seat Module Low Indicator On EATC Module
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between heated seat module C3304-5, circuit CHS04 (YE/GY), harness side and C3304-1, circuit SBB11 (BU/RD), harness side.
- **Does only the left driver heated seat indicator LED illuminate on the HVAC module?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test R: The Heated Seat is Inoperative - Passenger Seat Does Heat But the Heated Seat Indicator Does Not Illuminate When Pressed

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Upon receiving a signal from the HVAC module, the heated seat module will decrease one setting (the sequence is HI, LO, OFF, HI, etc.). When the passenger heated seat is set to HI, both LED indicators above the passenger heated seat control button will illuminate. When the passenger heated seat is set to LO, only the left LED on the passenger heated seat indicator will illuminate. When the passenger heated seat is set to OFF, neither passenger heated seat LED will illuminate.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Heated seat module
- HVAC module

PINPOINT TEST R: THE HEATED SEAT IS INOPERATIVE - PASSENGER SEAT DOES HEAT BUT THE HEATED SEAT INDICATOR DOES NOT ILLUMINATE WHEN PRESSED

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

R1 CHECK CIRCUITS CHS09 (GY) AND CHS14 (GN) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: HVAC Module C2356b (MKZ) or C228b (Fusion and Milan)
- Disconnect: Heated Seat Module C3304

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

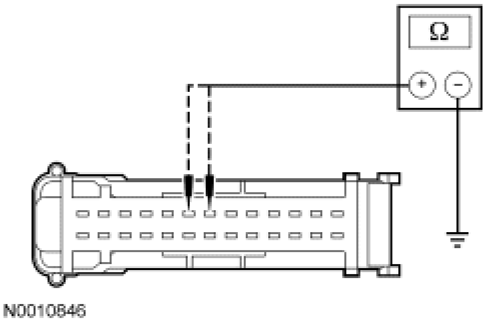

Fig. 148: Checking Circuits CHS09 (GY) And CHS14 (GN) For Short To Ground - MKZ
Courtesy of FORD MOTOR CO.

- For MKZ, measure the resistance between HVAC module C2356b-20, circuit CHS09 (GY), harness side and ground; and between HVAC module C2356b-21, circuit CHS14 (GN), harness side and ground.

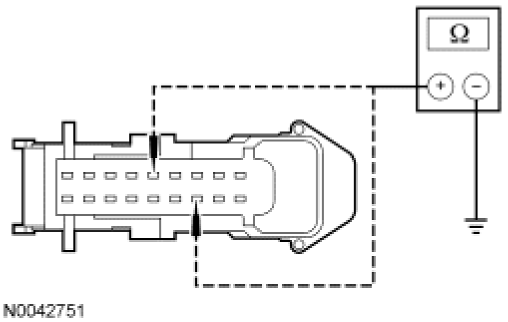

Fig. 149: Checking Circuits CHS09 (GY) And CHS14 (GN) For Short To Ground - Fusion & Milan
Courtesy of FORD MOTOR CO.

- For Fusion and Milan, measure the resistance between HVAC module C228b-5, circuit CHS09 (GY), harness side and ground; and between HVAC module C228b-16, circuit CHS14 (GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to R2.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

R2 CHECK CIRCUITS CHS09 (GY) AND CHS14 (GN) FOR AN OPEN

- Key in ON position.

Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module C2356b-20, circuit CHS09 (GY), harness side and heated seat module C3304-3, circuit CHS09 (GY), harness side; and between HVAC module C2356b-21, circuit CHS14 (GN), harness side and heated seat module C3304-6, circuit CHS14 (GN), harness side.

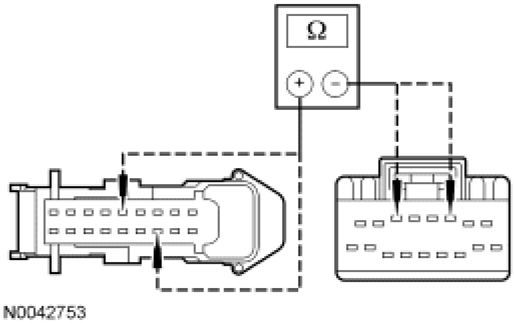

Fig. 151: Checking Circuits CHS09 (GY) And CHS14 (GN) For Open (2 Of 2)
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module C228b-5, circuit CHS09 (GY), harness side and heated seat module C3304-3, circuit CHS09 (GY), harness side; and between HVAC module C228b-16, circuit CHS14 (GN), harness side and heated seat module C3304-6, circuit CHS14 (GN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to R3.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

R3 CHECK THE HEATED SEAT MODULE HI INDICATOR ON THE HVAC MODULE

- Connect: HVAC Module C2356b (MKZ) or C228b (Fusion and Milan)
- Key in ON position.

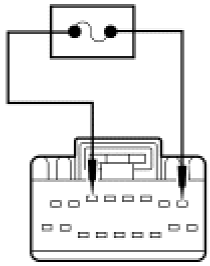

Fig. 152: Checking Heated Seat Module HI Indicator On EATC Module
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between heated seat module C3304-6, circuit CHS14 (GN), harness side and C3304-1, circuit SBB11 (BU/RD), harness side.
- **Do both passenger heated seat indicator LEDs illuminate on the HVAC module?**

  YES : Go to R4.

  NO : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

R4 CHECK THE HEATED SEAT MODULE LOW INDICATOR ON THE HVAC MODULE

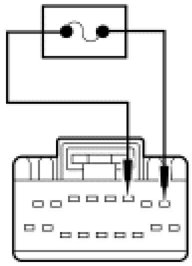

Fig. 153: Checking Heated Seat Module Low Indicator On EATC Module
Courtesy of FORD MOTOR CO.

- Connect a fused jumper lead between passenger heated seat module C3304-3, circuit CHS09 (GY), harness side and C3304-1, circuit SBB11 (BU/RD), harness side.
- **Does only the left passenger heated seat indicator LED illuminate on the HVAC module?**

  YES : INSTALL a new heated seat module. REFER to **Heated Seat Module**. TEST the system for normal operation.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test S: DTC B103B/B1111 - Thermo-Electric Driver Overcurrent Low/Driver Thermo-Electric Device Control Overtemperature Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B103B Thermo-Electric Driver Overcurrent Low - If DCSM outputs to the driver seat backrest or cushion TED (circuit pins G, H, J or K at the DCSM connector) or any components within these circuit loops are shorted to ground or a TED resistance of less than 0.9 ohm is sensed, the DCSM will shut down the driver seat system and set this DTC.
- DTC B1111 Driver Thermo-Electric Device Control Overtemperature Fault - If the DCSM TED driver integrated circuit temperature exceeds 175°C (347°F), the DCSM will shut down the driver seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly

- DCSM

PINPOINT TEST S: DTC B103B/B1111 - THERMO-ELECTRIC DRIVER OVERCURRENT LOW/DRIVER THERMO-ELECTRIC DEVICE CONTROL OVERTEMPERATURE FAULT

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

S1 CHECK THE TED CIRCUITS FOR SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305a

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Measure the resistance between the following DCSM pins, harness side and ground.

Connector-Pin	Circuit
C3305a-G	CHS02 (YE/BU)
C3305a-H	RHS02 (BU/OG)
C3305a-J	CHS01 (GY/VT)
C3305a-K	RHS01 (WH/VT)

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to S2.

  NO : If the resistances of C3305a-G, circuit CHS02 (YE/BU) and/or C3305a-H, circuit RHS02 (BU/OG) to ground were **not** greater than 10,000 ohms to ground, go to S6.

If resistances of C3305a-J, circuit CHS01 (GY/VT) and/or C3305a-K, circuit RHS01 (WH/VT) to ground were **not** greater than 10,000 ohms to ground, go to S7.

S2 CHECK THE TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the following DCSM pins, harness side and ground.

Connector-Pin	Circuit
C3305a-G	CHS02 (YE/BU)
C3305a-H	RHS02 (BU/OG)
C3305a-J	CHS01 (GY/VT)
C3305a-K	RHS01 (WH/VT)

- **Are the voltages less than 1 volt?**

  YES : Go to S3.

  NO : If the voltages measured at C3305a-G and/or C3305a-H were **not** less than 1 volt, go to S8.

  If voltages measured at C3305a-J and/or C3305a-K were **not** less than 1 volt, go to S9.

S3 CHECK THE TED RESISTANCE

- Key in OFF position.

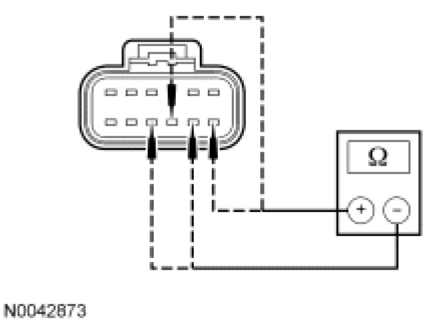

Fig. 154: Checking TED Resistance
Courtesy of FORD MOTOR CO.

NOTE: **Make sure the thermo-electric devices (TEDs) are at room temperature and there is no air blowing across the TEDs. Do not handle a TED when measuring resistance. These conditions can cause incorrect readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3305a-G, circuit CHS02 (YE/BU), harness side and DCSM C3305a-H, circuit RHS02 (BU/OG), harness side; and between DCSM C3305a-J, circuit CHS01 (GY/VT), harness side and C3305a-K, circuit RHS01 (WH/VT), harness die and ground.
- **Are the resistances between 0.9 and 10 ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the resistance between DCSM C3305a-G and C3305a-H was **not** between 0.9 and 10 ohms, go to S5.

  If the resistance between DCSM C3305a-J and C3305a-K was **not** between 0.9 and 10 ohms, go to S4.

S4 CHECK THE RESISTANCE OF THE BACKREST TED

- Disconnect: Backrest TED C3310

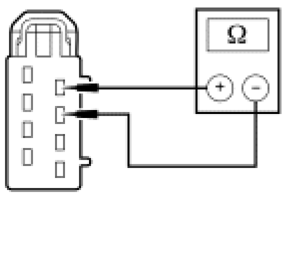

Fig. 155: Checking Resistance Of Backrest TED
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3310 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327.

CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S5 CHECK THE RESISTANCE OF THE CUSHION TED

- Disconnect: Cushion TED C3300

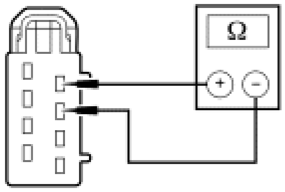

Fig. 156: Checking Resistance Of Cushion TED
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3300 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S6 CHECK THE CUSHION TED CIRCUITS FOR SHORT TO GROUND

- Disconnect: Cushion TED C3300

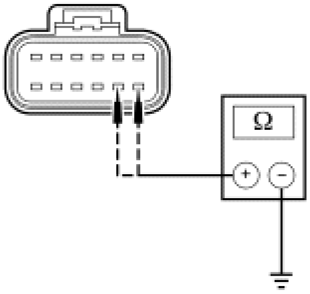

Fig. 157: Checking Cushion TED Circuits For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305a-G, circuit CHS02 (YE/BU), harness side and ground and between C3305a-H, circuit RHS02 (BU/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S7 CHECK THE BACKREST TED CIRCUITS FOR SHORT TO GROUND

- Disconnect: Backrest TED C3310

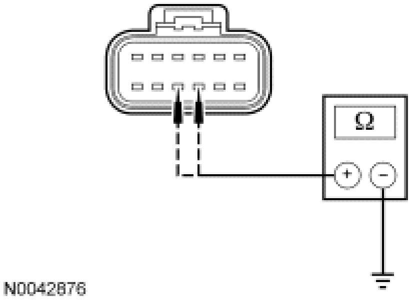

Fig. 158: Checking Backrest TED Circuits For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305a-J, circuit CHS01 (GY/VT), harness side and ground and between C3305a-K, circuit RHS01 (WH/VT), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S8 CHECK THE CUSHION TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Cushion TED C3300
- Key in ON position.

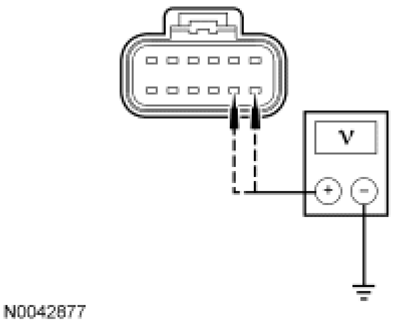

Fig. 159: Checking Cushion TED Circuits For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305a-G, circuit CHS02 (YE/BU), harness side and ground and between C3305a-H, circuit RHS02 (BU/OG), harness side and ground.
- **Are the voltages less than 1 volt?**

  YES : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

S9 CHECK THE BACKREST TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Backrest TED C3310
- Key in ON position.

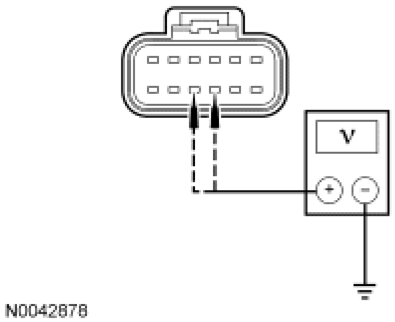

Fig. 160: Checking Backrest TED Circuits For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305a-J, circuit CHS01 (GY/VT), harness side and ground and between C3305a-K, circuit RHS01 (WH/VT), harness side and ground.
- **Are the voltages less than 1 volt?**

  YES : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test T: DTC B103C - Thermo-Electric Driver Open Load

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B103C Thermo-Electric Driver Open Load - If DCSM outputs to the driver seat backrest or cushion TED (circuit pins G, H, J or K at the DCSM connector) or any components within these circuit loops are open, disconnected or a TED resistance greater than 90K ohms is sensed, the DCSM continues normal operation and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST T: DTC B103C - THERMO-ELECTRIC DRIVER OPEN LOAD

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

T1 CHECK THE TED CIRCUITS FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305a
- Disconnect: Cushion TED C3300
- Disconnect: Backrest TED C3310

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Measure the resistance of the following circuits.

DCSM Connector-Pin	Circuit	TED Connector-Pin
C3305a-G	CHS02 (YE/BU)	C3300-1
C3305a-H	RHS02 (BU/OG)	C3300-3
C3305a-J	CHS01 (GY/VT)	C3310-1
C3305a-K	RHS01 (WH/VT) (VT/BK)	C3310-3

- **Are the resistances less than 5 ohms?**

  YES : Go to T2.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

T2 CHECK THE TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the following DCSM pins, harness side and ground.

Connector-Pin	Circuit
C3305a-G	CHS02 (YE/BU)
C3305a-H	RHS02 (BU/OG)
C3305a-J	CHS01 (GY/VT)
C3305a-K	RHS01 (WH/VT)

- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to

SUPPLEMENTAL RESTRAINT SYSTEM article.

NO : Go to T3.

T3 CHECK THE RESISTANCE OF THE TEDS

- Key in OFF position.

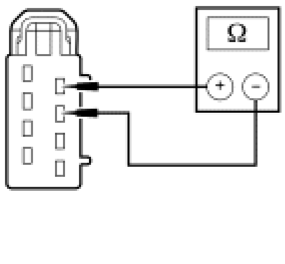

Fig. 161: Checking Resistance Of TED
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3310 pin 1 and pin 3, component side and between cushion TED C3310 pin 1 and pin 3, component side.
- **Are the resistances between 0.9 and 10 ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the resistance of the backrest TED was **not** between 0.9 and 10 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  If the resistance of the cushion TED was **not** between 0.9 and 10 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test U: DTC B103D - Blower Driver Overtemperature

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B103D Blower Driver Overtemperature - If the DCSM outputs to the driver seat blower or any components within these circuit loops are shorted to ground or cause an excessive current draw, the DCSM will overheat, shut down the driver seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST U: DTC B103D - BLOWER DRIVER OVERTEMPERATURE

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

U1 CHECK THE BLOWER CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.

- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305c
- Disconnect: Cushion TED C3300
- Disconnect: Backrest TED C3310

> WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

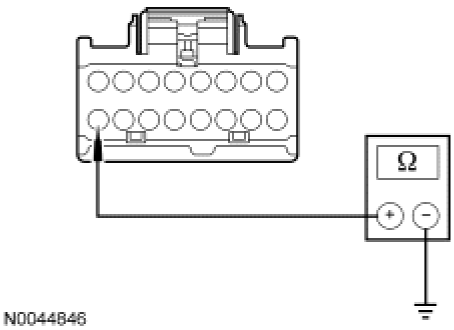

Fig. 162: Checking Blower Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to U2.

  NO : REPAIR the affected circuit. REPEAT the self-test.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

U2 CHECK FOR A SHORT BETWEEN BLOWER CIRCUITS RHS03 (GY/OG) AND CHS03 (GN/BN)

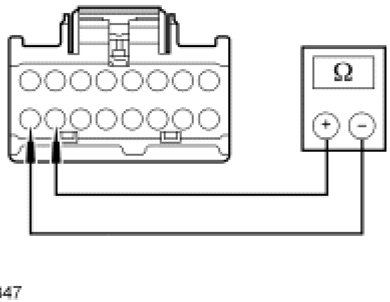

Fig. 163: Checking For A Short Between Blower Circuits RHS03 (GY/OG) & CHS03 (GN/BN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-15, circuit RHS03 (GY/OG), harness side and C3305c-16, circuit CHS03 (GN/BN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to U3.

  NO : REPAIR the affected circuits. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

U3 CHECK THE BLOWER RESISTANCE

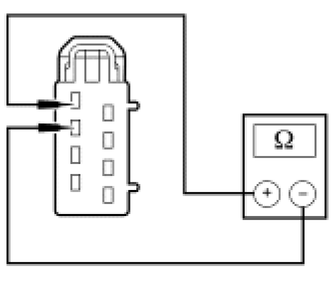

Fig. 164: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3300 pin 2 and pin 4, component side and between backrest TED C3310 pin 2 and pin 4, component side.

- **Are the resistances between 6K ohms and 9K ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the resistance of the cushion TED was **not** between 6,000 and 9,000 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  If the resistance of the backrest TED was **not** between 6,000 and 9,000 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test V: DTC B1113/B111B - Passenger Thermo-Electric Device Control Overtemperature Fault/Passenger Thermo-Electric Driver Overcurrent Low

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible

algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B1113 Passenger Thermo-Electric Device Control Overtemperature Fault - If the DCSM TED driver integrated circuit temperature exceeds 175°C (347°F), the DCSM will shut down the passenger seat system and set this DTC.
- DTC B111B Passenger Thermo-Electric Driver Overcurrent Low - If DCSM outputs to the passenger seat backrest or cushion TED (circuit pins A, B, C or D at the DCSM connector) or any components within these circuit loops are shorted to ground or a TED resistance of less than 0.9 ohms is sensed, the DCSM will shut down the passenger seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST V: DTC B1113/B111B - PASSENGER THERMO-ELECTRIC DEVICE CONTROL OVERTEMPERATURE FAULT/PASSENGER THERMO-ELECTRIC DRIVER OVERCURRENT LOW

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

V1 CHECK THE TED CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: DCSM C3305a

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Measure the resistance between the following DCSM pins, harness side and ground.

Connector-Pin	Circuit

C3305a-A	CHS07 (GY/BU)
C3305a-B	RHS07 (BU)
C3305a-C	CHS06 (BU/BN)
C3305a-D	RHS06 (WH)

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to V2.

  NO : If the resistances of C3305a-A and/or C3305a-B to ground were **not** greater than 10,000 ohms to ground, go to V6.

  If resistances of C3305a-C and/or C3305a-D to ground were **not** greater than 10,000 ohms to ground, go to V7.

V2 CHECK THE TED CIRCUITS FOR A SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the following DCSM pins, harness side and ground.

Connector-Pin	Circuit
C3305a-A	CHS07 (GY/BU)
C3305a-B	RHS07 (BU)
C3305a-C	CHS06 (BU/BN)
C3305a-D	RHS06 (WH)

- **Are the voltages less than 1 volt?**

  YES : Go to V3.

  NO : If the voltages measured at C3305a-A and/or C3305a-B were **not** less than 1 volt, go to V8.

  If voltages measured at C3305a-C and/or C3305a-D were **not** less than 1 volt, go to V9.

V3 CHECK THE TED RESISTANCE

- Key in OFF position.

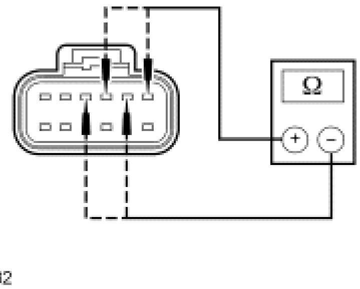

Fig. 165: Checking TED Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**Make sure the thermo-electric devices (TEDs) are at room temperature and there is no air blowing across the TEDs. Do not handle a TED when measuring resistance. These conditions can cause incorrect readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3305a-A, circuit CHS07 (GY/BU), harness side and DCSM C3305a-B, circuit RHS07 (BU), harness side; and between DCSM C3305a-C, circuit CHS06 (BU/BN), harness side and C3305a-D, circuit RHS06 (WH), harness die and ground.
- **Are the resistances between 0.9 and 10 ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

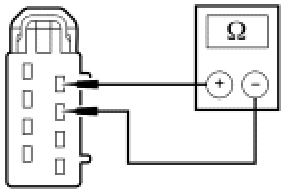
  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the resistance between DCSM C3305a-A and C3305a-B was **not** between 0.9 and 10 ohms, go to V5.

  If the resistance between DCSM C3305a-C and C3305a-D was **not** between 0.9 and 10 ohms, go to V4.

V4 CHECK THE RESISTANCE OF THE BACKREST TED

- Disconnect: Backrest TED C3311



N0042874

Fig. 166: Checking Resistance Of Backrest TED
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3311 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

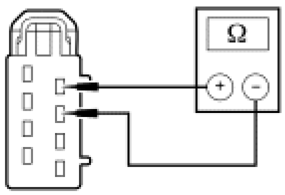
  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

V5 CHECK THE RESISTANCE OF THE CUSHION TED

- Disconnect: Cushion TED C3303



N0042874

Fig. 167: Checking Resistance Of Cushion TED
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3303 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

V6 CHECK THE CUSHION TED CIRCUITS FOR A SHORT TO GROUND

- Disconnect: Cushion TED C3303

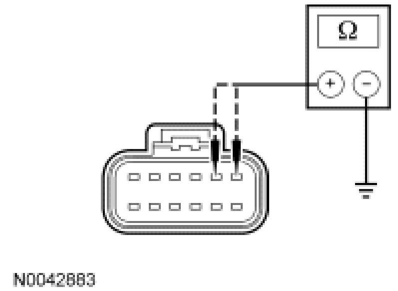


Fig. 168: Checking Cushion TED Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305a-A, circuit CHS07 (GY/BU), harness side and ground and between C3305a-B, circuit RHS07 (BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

V7 CHECK THE BACKREST TED CIRCUITS FOR A SHORT TO GROUND

- Disconnect: Backrest TED C3311

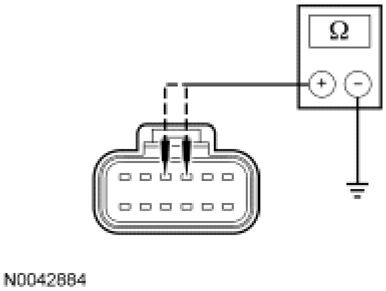

Fig. 169: Checking Backrest TED Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305a-C, circuit CHS06 (BU/BN), harness side and ground and between C3305a-D, circuit RHS06 (WH), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

V8 CHECK THE CUSHION TED CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Cushion TED C3303
- Key in ON position.

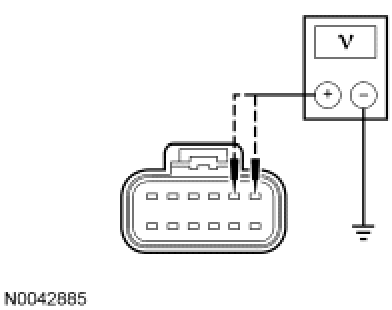

Fig. 170: Checking Cushion TED Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305a-A, circuit CHS07 (GY/BU), harness side and ground

and between C3305a-B, circuit RHS07 (BU), harness side and ground.

- **Are the voltages less than 1 volt?**

  YES : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

V9 CHECK THE BACKREST TED CIRCUITS FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Backrest TED C3311
- Key in ON position.

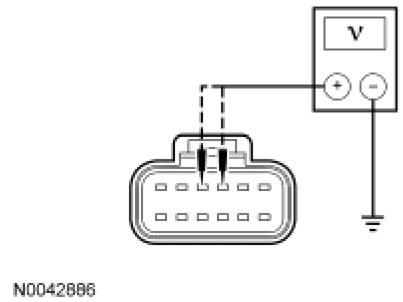

Fig. 171: Checking Backrest TED Circuits For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305a-C, circuit CHS06 (BU/BN), harness side and ground and between C3305a-D, circuit RHS06 (WH), harness side and ground.
- **Is any voltage present?**

  YES : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test W: DTC B111C - Passenger Thermo-Electric Driver Open Load

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B111C Passenger Thermo-Electric Driver Open Load - If DCSM outputs to the passenger seat backrest or cushion TED (circuit pins A, B, C or D at the DCSM connector) or any components within these circuit loops are open, disconnected or a TED resistance greater than 90K ohms is sensed, the DCSM continues normal operation and sets this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST W: DTC B111C - PASSENGER THERMO-ELECTRIC DRIVER OPEN LOAD

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**
NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

W1 CHECK THE TED CIRCUITS FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: DCSM C3305a
- Disconnect: Cushion TED C3303
- Disconnect: Backrest TED C3311

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Measure the resistance of the following circuits.

DCSM Connector-Pin	Circuit	TED Connector-Pin
C3305a-A	CHS07 (GY/BU)	C3303-1
C3305a-B	RHS07 (BU)	C3303-3
C3305a-C	CHS06 (BU/BN)	C3311-1
C3305a-D	RHS06 (WH) (GN/BK)	C3311-3

- **Are the resistances less than 5 ohms?**

  YES : Go to W2.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

W2 CHECK THE TED CIRCUITS FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the following DCSM pins, harness side and ground.

Connector-Pin	Circuit

C3305a-A	CHS07 (GY/BU)
C3305a-B	RHS07 (BU)
C3305a-C	CHS06 (BU/BN)
C3305a-D	RHS06 (WH)

- **Is any voltage present?**

  YES : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to W3.

W3 CHECK THE RESISTANCE OF THE TEDS

- Key in OFF position.

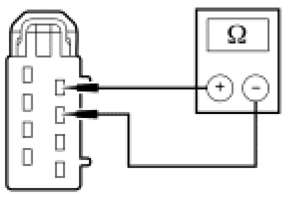

Fig. 172: Checking Resistance Of TED
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3311 pin 1 and pin 3, component side and between cushion TED C3311 pin 1 and pin 3, component side.
- **Are the resistances between 0.9 and 10 ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the resistance of the backrest TED was **not** between 0.9 and 10 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

If the resistance of the cushion TED was **not** between 0.9 and 10 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test X: DTC B111D - Passenger Blower Driver Overtemperature

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B111D Passenger Blower Driver Overtemperature - If the DCSM outputs to the passenger seat blower or any components within these circuit loops are shorted to ground or cause an excessive current draw, the DCSM will overheat, shut down the passenger seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- TED assembly
- DCSM

PINPOINT TEST X: DTC B111D - PASSENGER BLOWER DRIVER OVERTEMPERATURE

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

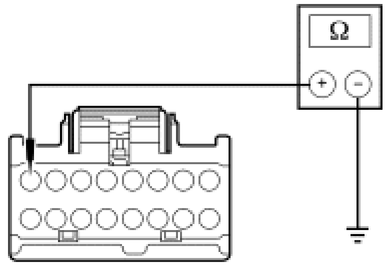
NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

X1 CHECK THE BLOWER CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: DCSM C3305c
- Disconnect: Cushion TED C3303
- Disconnect: Backrest TED C3311

WARNING: Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.



N0044848

Fig. 173: Checking Blower Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to X2.

  NO : REPAIR the affected circuit. REPEAT the self-test.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

X2 CHECK FOR A SHORT BETWEEN BLOWER CIRCUITS RHS08 (VT/WH) AND CHS08 (BN/YE)

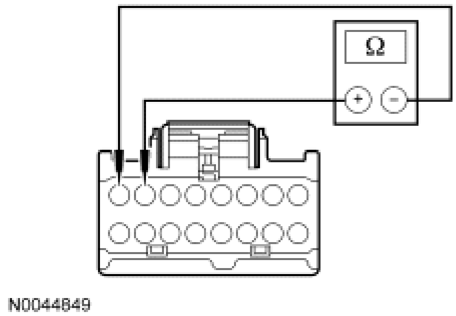


Fig. 174: Checking For A Short Between Blower Circuits RHS08 (VT/WH) & CHS08 (BN/YE)
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-7, circuit RHS08 (VT/WH), harness side and C3305c-8, circuit CHS08 (BN/YE), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to X3.

  NO : REPAIR the affected circuits. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

X3 CHECK THE BLOWER RESISTANCE

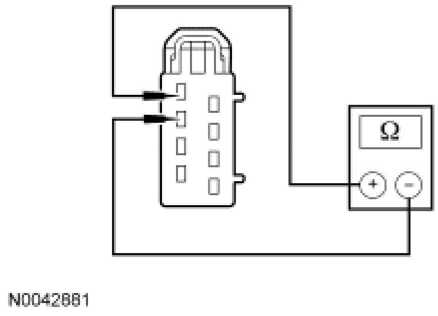

Fig. 175: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3303 pin 2 and pin 4, component side and between backrest TED C3311 pin 2 and pin 4, component side.
- **Are the resistances between 6K ohms and 9K ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  NO : If the resistance of the cushion TED was **not** between 6,000 and 9,000 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  If the resistance of the backrest TED was **not** between 6,000 and 9,000 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test Y: DTC B2729 - Driver Cushion Over-Temp Detected

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B2729 Cushion Over-Temp Detected - In the heating mode, if the driver seat cushion TED

temperature exceeds 85°C (185°F) for more than 34 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the driver seat system and set this DTC.

- DTC B2729 Cushion Over-Temp Detected - In the cooling mode, if the driver seat cushion TED temperature exceeds 70°C (158°F) for more than 34 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the driver seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted cushion TED filter
- Crushed or restricted cushion foam pad
- Crushed or restricted climate controlled seat manifold
- Cushion TED assembly
- DCSM

PINPOINT TEST Y: DTC B2729 - DRIVER CUSHION OVER-TEMP DETECTED

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

Y1 CHECK THE DCSM FOR DTCs

- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DCSM Retrieve DTCs
- **Was DTC B2729 retrieved during the self-test?**

  YES : Go to Y2.

  NO : Go to Y4.

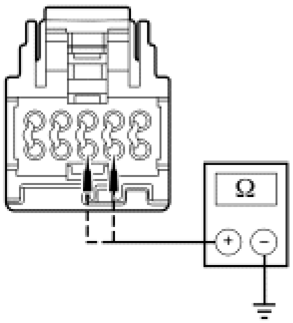
Y2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305b
- Disconnect: Cushion TED C3300

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental**

deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.



N0042889

Fig. 176: Checking TED Thermistor Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

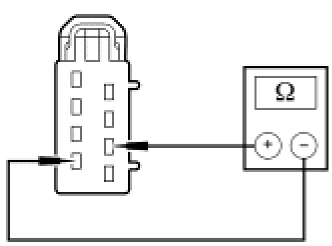
- Measure the resistance between DCSM C3305b-7, circuit VHS26 (VT), harness side and ground and between DCSM C3305b-8, circuit RHS05 (YE/VT), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to Y3.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Y3 CHECK THE TED THERMISTOR



N0042890

Fig. 177: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3300 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance

0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected open circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Y4 CONFIRM THE FAULT

- Verify with the customer that the concern is the seat shuts OFF in heat mode.

NOTE: **A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault.**

- Attempt to recreate the fault. Start the vehicle and set the driver seat to high heat for at least 15 minutes.
- **Is the customer concern with the seat shutting OFF in heat mode or was the fault recreated?**

  YES : Go to Y5.

  NO : Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between HEAT and COOL modes. REPEAT the self-test. CLEAR the DTCs.

Y5 CHECK OPERATION OF THE SEAT

- Key in ON position.

- With the engine running, set both front seats to high cool (3 LEDs illuminated on HVAC module).
- Compare the airflow from the driver seat cushion and compare it to the airflow from the passenger seat cushion.
- **Is the airflow exhausting from the driver seat cushion comparable to the airflow exhausting from the passenger seat cushion?**

  YES : Go to Y14.

  NO : Go to Y6.

Y6 CHECK THE CUSHION BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER

- Key in OFF position.
- Inspect the blower of the cushion TED assembly for an obstruction or for a restricted filter.
- **Is the blower obstructed or the filter restricted?**

  YES : REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to Y7.

Y7 CHECK THE CUSHION FAN OPERATION

- Key in ON position.
- With the engine running, set both front seats to high cool (3 LEDs illuminated on HVAC module).
- Inspect the cushion blower for operation.
- **Does the cushion blower operate?**

  YES : Go to Y14.

  NO : Go to Y8.

Y8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305c
- Disconnect: Cushion TED C3300

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

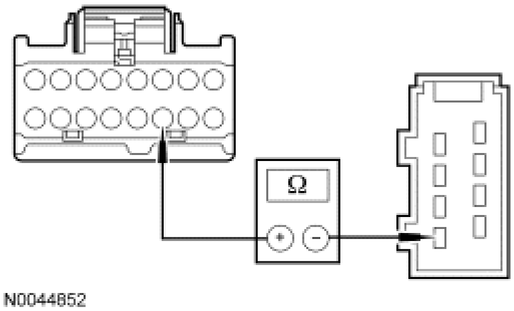


Fig. 178: Checking Blower Speed Control Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-11, circuit VHS18 (BN/GN), harness side and cushion TED C3300-7, circuit VHS18 (BN/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to Y9.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Y9 CHECK BLOWER CIRCUIT RHS03 (GY/OG) FOR A SHORT TO VOLTAGE

- Key in ON position.

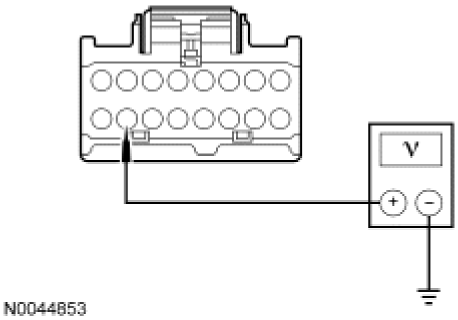

Fig. 179: Checking Blower Circuit RHS03 (GY/OG) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305c-15, circuit RHS03 (GY/OG), harness side and ground.
- **Is voltage greater than 1 volt?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to

SUPPLEMENTAL RESTRAINT SYSTEM article.

NO : Go to Y10.

Y10 CHECK BLOWER CIRCUIT CHS03 (GN/BN) FOR A SHORT TO GROUND

- Key in OFF position.

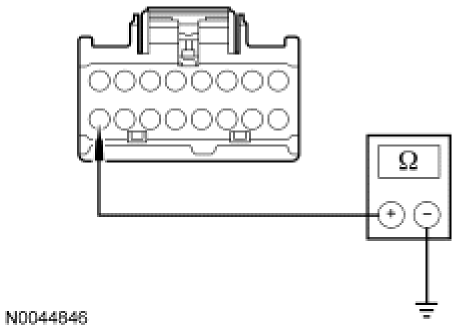

Fig. 180: Checking Blower Circuit CHS03 (GN/BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to Y11.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Y11 CHECK BLOWER CIRCUITS CHS03 (GN/BN) AND RHS03 (GY/OG) FOR AN OPEN

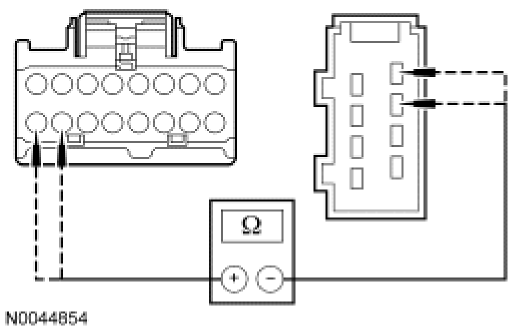

Fig. 181: Checking Blower Circuits CHS03 (GN/BN) & RHS03 (GY/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and cushion TED C3300-2, circuit CHS03 (GN/BN), harness side; and between DCSM C3305c-15,

circuit RHS03 (GY/OG), harness side and cushion TED C3300-4, circuit RHS03 (GY/OG), harness side.

- **Are the resistances less than 5 ohms?**

  YES : Go to Y12.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Y12 CHECK THE BLOWER RESISTANCE

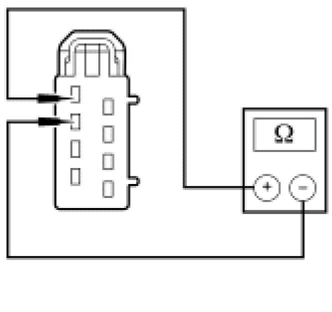

Fig. 182: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3300 pin 2 and pin 4, component side.
- **Is the resistance between 6K ohms and 9K ohms?**

  YES : Go to Y13.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Y13 CHECK THE BLOWER SPEED CONTROL RESISTANCE

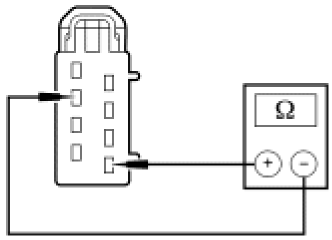

Fig. 183: Checking Blower Speed Control Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3300 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to Y14.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Y14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT CUSHION

- Remove the seat. Refer to **Seat - Front**.
- Remove the seat cushion trim cover. Refer to **Seat Cushion Cover - Front**.
- Inspect the seat cushion for the following:
  - Is the TED correctly installed?
  - Is the seat cushion foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test Z: DTC B272A - Passenger Cushion Over-Temp Detected

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B272A Passenger Cushion Over-Temp Detected - In the cooling mode, if the passenger seat cushion TED temperature exceeds 70°C (158°F) for more than 34 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the passenger seat system and set this DTC.
- DTC B272A Passenger Cushion Over-Temp Detected - In the heating mode, if the passenger seat cushion TED temperature exceeds 85°C (185°F) for more than 34 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the passenger seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted cushion TED filter

- Crushed or restricted cushion foam pad
- Crushed or restricted climate controlled seat manifold
- Cushion TED assembly
- DCSM

PINPOINT TEST Z: DTC B272A - PASSENGER CUSHION OVER-TEMP DETECTED

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

Z1 CHECK THE DCSM FOR DTCs

- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DCSM Retrieve DTCs
- **Was DTC B272A retrieved during the self-test?**

  YES : Go to Z2.

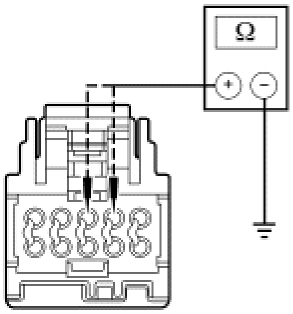
  NO : Go to Z4.

Z2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: DCSM C3305b
- Disconnect: Cushion TED C3303

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.



N0042894

Fig. 184: Checking TED Thermistor Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

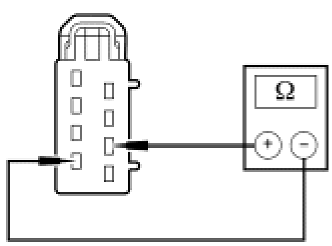
- Measure the resistance between DCSM C3305b-2, circuit VHS27 (WH/OG), harness side and ground and between DCSM C3305b-3, circuit RHS10 (BU/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to Z3.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Z3 CHECK THE TED THERMISTOR



N0042890

Fig. 185: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3303 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140

	ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected open circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Z4 CONFIRM THE FAULT

- Verify with the customer that the concern is the seat shuts OFF in heat mode.

NOTE: A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault.

- Attempt to recreate the fault. Start the vehicle and set the passenger seat to high heat for at least 15 minutes.
- **Is the customer concern with the seat shutting OFF in heat mode or was the fault recreated?**

  YES : Go to Z5.

  NO : Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between HEAT and COOL modes. REPEAT the self-test. CLEAR the DTCs.

Z5 CHECK OPERATION OF THE SEAT

- Key in ON position.
- With the engine running, set both front seats to high cool (3 LEDs illuminated on HVAC module).
- Compare the airflow from the passenger seat cushion and compare it to the airflow from the driver seat cushion.
- **Is the airflow exhausting from the passenger seat cushion comparable to the airflow exhausting from the driver seat cushion?**

  YES : Go to Z14.

NO : Go to Z6.

Z6 CHECK THE CUSHION BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER

- Key in OFF position.
- Inspect the blower of the cushion TED assembly for an obstruction or for a restricted filter.
- **Is the blower obstructed or the filter restricted?**

  YES : REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to Z7.

Z7 CHECK THE CUSHION FAN OPERATION

- Key in ON position.
- With the engine running, set both front seats to high cool (3 LEDs illuminated on HVAC module).
- Inspect the cushion blower for operation.
- **Does the cushion blower operate?**

  YES : Go to Z14.

  NO : Go to Z8.

Z8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: DCSM C3305c
- Disconnect: Cushion TED C3303

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

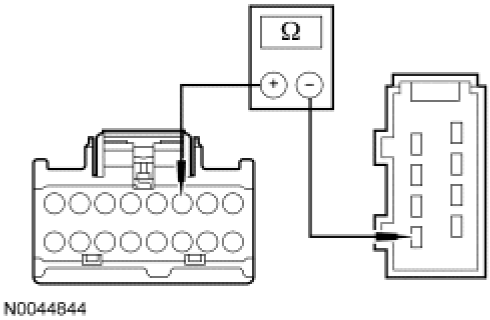


Fig. 186: Checking Circuit For Open

Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-3, circuit VHS23 (BN/BU), harness side and cushion TED C3303-7, circuit VHS23 (BN/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to Z9.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Z9 CHECK BLOWER CIRCUIT RHS08 (VT/WH) FOR A SHORT TO VOLTAGE

- Key in ON position.

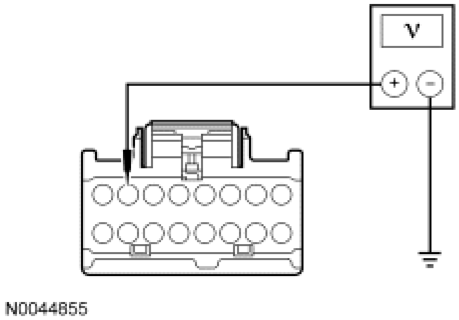

Fig. 187: Checking Blower Circuit RHS08 (VT/WH) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305c-7, circuit RHS08 (VT/WH), harness side and ground.
- **Is voltage greater than 1 volt?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to Z10.

Z10 CHECK BLOWER CIRCUIT CHS08 (BN/YE) FOR A SHORT TO GROUND

- Key in OFF position.

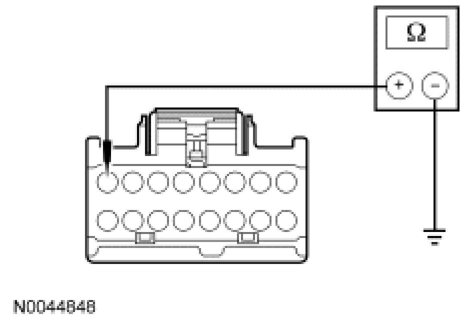

Fig. 188: Checking Blower CircuitCHS08 (BN/YE) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to Z11.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Z11 CHECK BLOWER CIRCUITS CHS08 (BN/YE) AND RHS08 (VT/WH) FOR AN OPEN

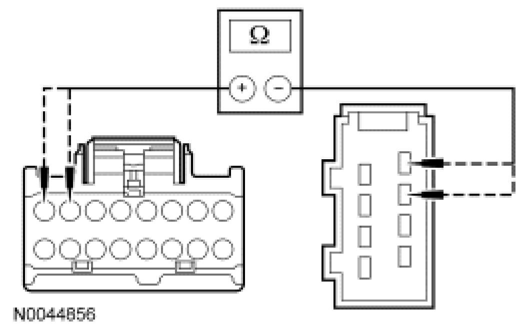

Fig. 189: Checking Blower Circuits CHS08 (BN/YE) & RHS08 (VT/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and cushion TED C3303-2, circuit CHS08 (BN/YE), harness side; and between DCSM C3305c-7, circuit RHS08 (VT/WH), harness side and cushion TED C3311-4, circuit RHS08 (VT/WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to Z12.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Z12 CHECK THE BLOWER RESISTANCE

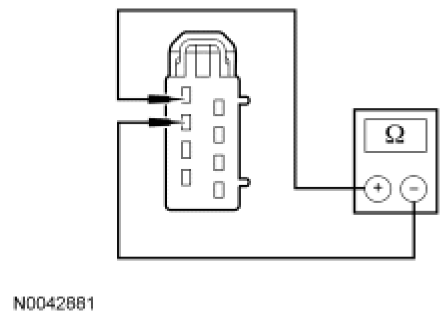

Fig. 190: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between cushion TED C3303 pin 2 and pin 4, component side.
- **Is the resistance between 6K ohms and 9K ohms?**

YES : Go to Z13.

NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Z13 CHECK THE BLOWER SPEED CONTROL RESISTANCE

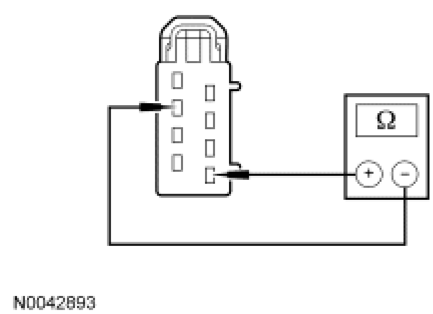

Fig. 191: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between cushion TED C3303 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to Z14.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Z14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT CUSHION

- Key in OFF position.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat cushion trim cover. Refer to **Seat Cushion Cover - Front**.
- Inspect the seat cushion for the following:
  - Is the TED correctly installed?
  - Is the seat cushion foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AA: DTC B272B - Passenger Back Over-Temp Detected

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B272B Passenger Back Over-Temp Detected - In the cooling mode, if the passenger seat backrest TED temperature exceeds 70°C (158°F) for more than 34 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the passenger seat system and set this DTC.
- DTC B272B Passenger Back Over-Temp Detected - In the heating mode, if the passenger seat backrest TED temperature exceeds 85°C (185°F) for more than 34 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the passenger seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted backrest TED filter
- Crushed or restricted backrest foam pad
- Crushed or restricted climate controlled seat manifold
- Backrest TED assembly
- DCSM

PINPOINT TEST AA: DTC B272B - PASSENGER BACK OVER-TEMP DETECTED

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AA1 CHECK THE DCSM FOR DTCs

- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DCSM Retrieve DTCs
- **Was DTC B2730 retrieved during the self-test?**

  YES : Go to AA2.

  NO : Go to AA4.

AA2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: DCSM C3305b
- Disconnect: Backrest TED C3311

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

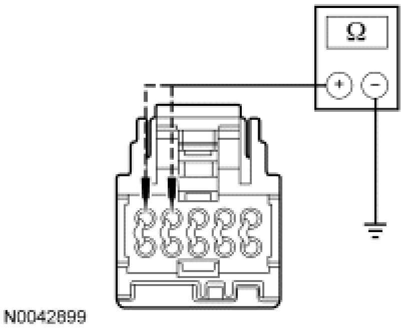

Fig. 192: Checking TED Thermistor Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305b-4, circuit VHS36 (YE/BU), harness side and ground and between DCSM C3305b-5, circuit RHS20 (GN/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AA3.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AA3 CHECK THE TED THERMISTOR

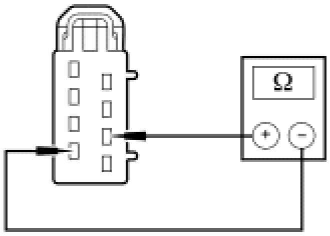

Fig. 193: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3311 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected open circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AA4 CONFIRM THE FAULT

- Verify with the customer that the concern is the seat shuts OFF in heat mode.

NOTE: **A crushed seat backrest foam pad or a crushed climate controlled**

seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault.

- Attempt to recreate the fault. Start the vehicle and set the front passenger seat to high heat for at least 15 minutes.
- **Is the customer concern with the seat shutting OFF in heat mode or was the fault recreated?**

  YES : Go to AA5.

  NO : Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between HEAT and COOL modes. REPEAT the self-test. CLEAR the DTCs.

AA5 CHECK OPERATION OF THE SEAT

- Key in ON position.
- With the engine running, set both front seats to high cool (3 LEDs illuminated on HVAC module).
- Compare the airflow from the front passenger seat backrest and compare it to the airflow from the driver seat backrest.
- **Is the airflow exhausting from the front passenger seat backrest comparable to the airflow exhausting from the driver seat backrest?**

  YES : Go to AA14.

  NO : Go to AA6.

AA6 CHECK THE BACKREST BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER

- Key in OFF position.
- Inspect the blower of the backrest TED assembly for an obstruction or for a restricted filter.
- **Is the blower obstructed or the filter restricted?**

  YES : REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AA7.

AA7 CHECK THE BACKREST FAN OPERATION

- Key in ON position.
- With the engine running, set both front seats to high cool (3 LEDs illuminated on HVAC module).
- Inspect the backrest blower for operation.
- **Does the backrest blower operate?**

  YES : Go to AA14.

  NO : Go to AA8.

AA8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.

- Disconnect: DCSM C3305c
- Disconnect: Backrest TED C3311

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

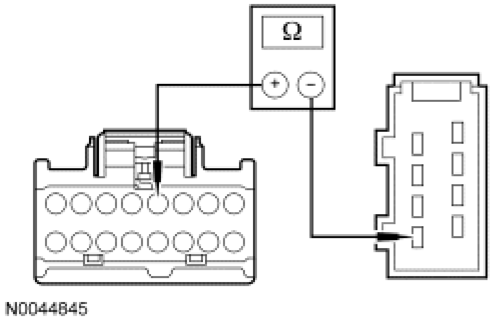

Fig. 194: Checking Blower Speed Control Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-4, circuit VHS21 (BU/WH), harness side and backrest TED C3310-7, circuit VHS21 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to AA9.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AA9 CHECK BLOWER CIRCUIT RHS08 (VT/WH) FOR A SHORT TO VOLTAGE

- Key in ON position.

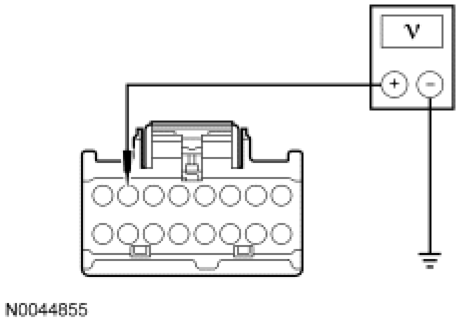

Fig. 195: Checking Blower Circuit RHS08 (VT/WH) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305c-7, circuit RHS08 (VT/WH), harness side and ground.
- **Is voltage greater than 1 volt?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AA10.

AA10 CHECK BLOWER CIRCUIT CHS08 (BN/YE) FOR A SHORT TO GROUND

- Key in OFF position.

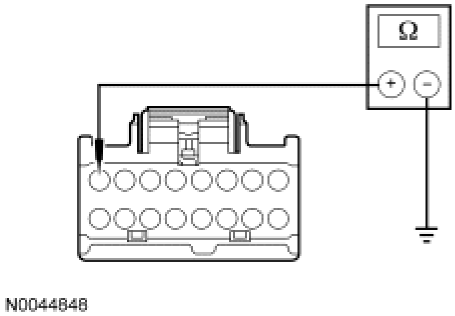

Fig. 196: Checking Blower Circuit CHS08 (BN/YE) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AA11.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AA11 CHECK BLOWER CIRCUITS CHS08 (BN/YE) AND RHS08 (VT/WH) FOR AN OPEN

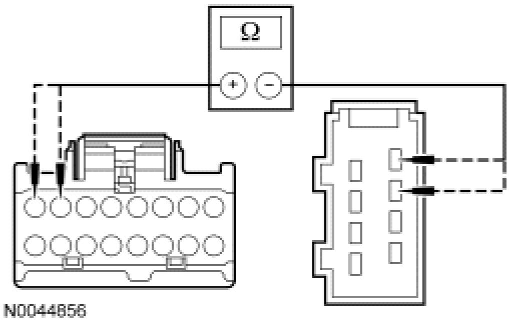

Fig. 197: Checking Blower Circuits CHS08 (BN/YE) & RHS08 (VT/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and backrest TED C3311-2, circuit CHS08 (GY/RD), harness side; and between DCSM C3305c-7, circuit RHS08 (VT/WH), harness side and backrest TED C3311-4, circuit RHS08 (VT/WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to AA12.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AA12 CHECK THE BLOWER RESISTANCE

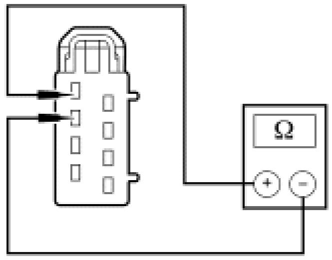

Fig. 198: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between backrest TED C3311 pin 2 and pin 4, component side.
- **Is the resistance between 6K ohms and 9K ohms?**

YES : Go to AA13.

NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AA13 CHECK THE BLOWER SPEED CONTROL RESISTANCE

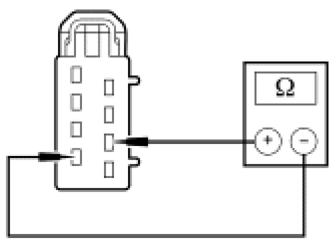

Fig. 199: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between backrest TED C3311 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

YES : Go to AA14.

NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AA14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT BACKREST

- Key in OFF position.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat backrest trim cover. Refer to **Seat Backrest Cover - Front, Without Fold Flat**.
- Inspect the seat backrest for the following:
  - Is the TED correctly installed?
  - Is the seat backrest foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?

- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AB: DTC B272C - Driver Differential Temperature Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

A differential fault occurs when the cushion and backrest TEDs on an affected seat are reporting very different temperatures to the DCSM. This may result from an airflow restriction or a circuit fault of either TED area. If a TED and manifold is clear of obstruction and is operational, the other TED and circuitry on the seat should be checked. It is important to note that a TED with a higher temperature may be operating correctly and not the

area of concern. The other TED may be indicating a much lower temperature, causing the DTC to set.

- DTC B272C Driver Differential Temperature Fault - If there is a temperature differential between the driver backrest and cushion TED of 60°C (108°F) or more for more than 4 seconds, the TED is disconnected or the duct is blocked, this DTC will set. When this happens the first time in a key cycle, the DCSM puts the driver seat system into recovery mode (see principles of operation). If the system is able to recover, it will function normally. If the system is able to recover and it occurs a second time in the same key cycle, the DCSM will shut down the driver seat system.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted cushion or backrest TED filter
- Crushed or restricted cushion or backrest foam pad
- Crushed or restricted cushion or backrest climate controlled seat manifold
- Cushion or backrest TED assembly
- DCSM

PINPOINT TEST AB: DTC B272C - DRIVER DIFFERENTIAL TEMPERATURE FAULT

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AB1 CHECK THE DCSM FOR DTCs

- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DCSM Retrieve DTCs
- **Was DTC B2729 or B2730 retrieved during the self-test or as a continuous DTC?**

  YES : For DTC B2729, go to **Pinpoint Test Y**. For DTC B2730, go to **Pinpoint Test AD**.

  NO : Go to AB2.

AB2 MONITOR THE DCSM TED TEMPERATURE PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM
  - Passenger Cushion Thermal Electric Device (TED) Temperature (PCSHTMP)
  - Passenger Back TED Temperature (PBKTMP)
  - Seat cushion thermal electric device temperature (CSHTEMP)
  - Seat back thermal electric device temperature (BK_TEMP)

NOTE:	**Make sure the temperature of the climate controlled seats has stabilized before monitoring the PIDs. Not allowing stabilization can cause incorrect readings and lead to incorrect identification of**

components that are not faulty.

- Monitor the TED temperature PIDs with the climate controlled seats OFF. Compare the PID values of the driver seat to those of the front passenger seat, this can help identify if there is a concern with the driver seat cushion or backrest PID value readings.
- **Are both driver seat TED temperature PIDs within 10°C (18°F) of the ambient temperature?**

  YES : Go to AB3.

  NO : If the driver seat cushion PID varies 10°C (18°F) or more from ambient temperature, go to AB16.

  If the driver seat backrest PID varies 10°C (18°F) or more from ambient temperature, go to AB32.

AB3 CONFIRM THE FAULT IS IN THE SEAT CUSHION OR THE BACKREST

- Key in OFF position.
- Key in ON position.

NOTE: A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault.

NOTE: If the seat shuts down before a 15 minute heat cycle has timed-out, carry out the DCSM self-test and go to the Dual Climate Controlled Seat Module (DCSM) DTC Chart to continue diagnostics.

- After cycling the ignition switch and with the engine running, set the driver seat to high heat (3 LEDs illuminated on HVAC module). Allow the seat to heat for at least 15 minutes while monitoring the TED temperature PIDs of the driver seat. If necessary, when the seat times-out after 15 minutes, set the driver seat to high heat once again.
- **Do the driver seat cushion TED and backrest TED PIDs vary more than 60°C (108°F) from each other?**

  YES : If the driver seat cushion PID is 60°C (108°F) hotter than the backrest PID, go to AB5.

  If the driver seat backrest PID is 60°C (108°F) hotter than the cushion PID, go to AB20.

  NO : Go to AB4.

AB4 CHECK THE TEDs COOLING PERFORMANCE

- Check the TEDs cooling performance on the affected seat. Refer to Component Test - Thermo-electric Device (TED) Cooling Performance.
- **Did the TEDs pass the component test?**

  YES : The DTC may have been set by extreme cabin temperatures or excessive sunload on the seat causing the system to enter recovery mode. Occupant size and weight characteristics can also be a factor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If a concern cannot be found or duplicated, RETURN the vehicle to the customer.

NO : CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED, manifold, plenum, air ducts and foam pad). CHECK for airflow restrictions (TED inlets and outlets, TED-to-manifold or plenum connections, filters and ducts) and REPAIR as needed. CHECK for an intermittent wiring fault. REPAIR as needed. REPEAT the self-test. CLEAR the DTCs.

AB5 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT CUSHION

- Key in OFF position.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat cushion trim cover. Refer to **Seat Cushion Cover - Front**.
- Inspect the seat cushion for the following:
  - Is the cushion blower obstructed?
  - Is the blower filter restricted or plugged?
  - Is the TED correctly installed?
  - Is the seat cushion foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : Go to AB6.

  NO : CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB6 CHECK THE BACKREST TED- CIRCUIT FOR SHORT TO VOLTAGE

- Key in OFF position.
- Position the driver seat in the vehicle and connect the seat-to-floor connectors.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305a

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.

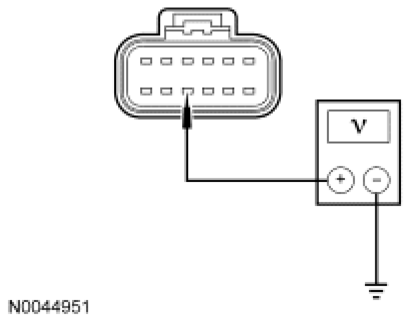

Fig. 200: Checking Backrest TED- Circuit For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305a-K, circuit RHS01 (WH/VT), harness side and ground.
- **Is the voltage less than 0.5 volt?**

  YES : Go to AB7.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB7 CHECK THE BACKREST TED+ CIRCUIT FOR SHORT TO GROUND

- Key in OFF position.

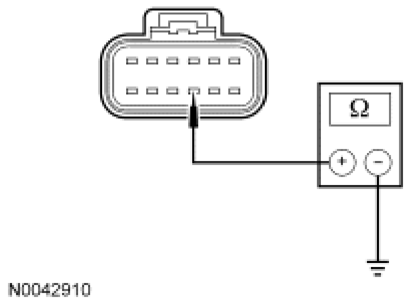

Fig. 201: Checking Backrest TED+ Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305a-J, circuit CHS01 (GY/VT), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AB8.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327.

CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB8 CHECK RESISTANCE OF THE BACKREST TED AND WIRING

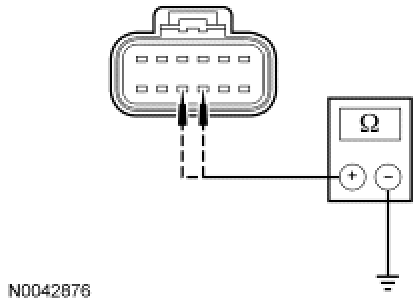

Fig. 202: Checking Resistance Of Backrest TED And Wiring
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305a-J, circuit CHS01 (GY/VT), harness side and DCSM C3305a-K, circuit RHS01 (WH/VT), harness side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : Go to AB10.

  NO : Go to AB9.

AB9 CHECK RESISTANCE OF THE BACKREST TED

- Disconnect: Backrest TED C3310

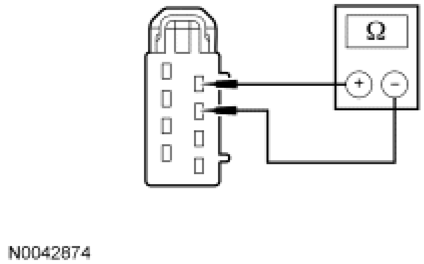

Fig. 203: Checking Resistance Of Backrest TED
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3310 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB10 CHECK BLOWER CIRCUIT CHS03 (GN/BN) AND SPEED CONTROL CIRCUIT VHS18 (BN/GN) FOR A SHORT TO VOLTAGE

- Disconnect: DCSM C3305c
- Key in ON position.

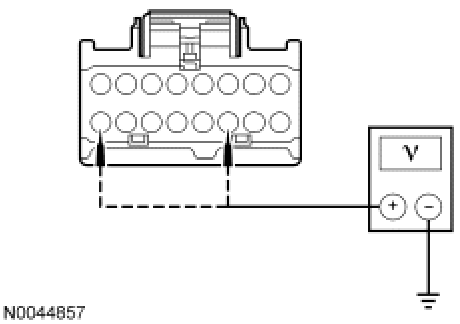

Fig. 204: Checking Blower Circuit CHS03 (GN/BN) & Speed Control Circuit VHS18 (BN/GN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and ground and between DCSM C3305c-11, circuit VHS18 (BN/GN), harness side and ground.
- **Are the voltages less than 1 volt?**

  YES : Go to AB11.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB11 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.

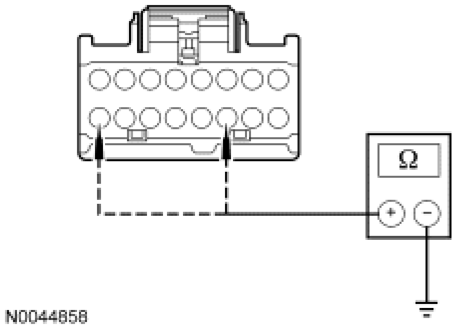

Fig. 205: Checking Blower & Speed Control Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and ground and between DCSM C3305c-11, circuit VHS18 (BN/GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AB12.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB12 CHECK THE BLOWER AND WIRING

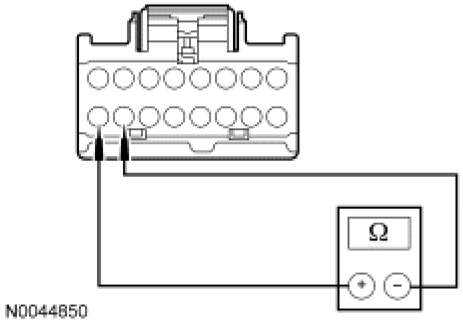

Fig. 206: Checking Blower & Wiring
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to DCSM C3305c-16, circuit CHS03 (GN/BN) and the negative lead to DCSM C3305c-15, circuit RHS03 (GY/OG) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and DCSM C3305c-15, circuit RHS03 (GY/OG), harness side.

- **Is the resistance between 6K ohms and 9K ohms?**

  YES : Go to AB14.

  NO : Go to AB13.

AB13 CHECK THE BLOWER

- Disconnect: Cushion TED C3300

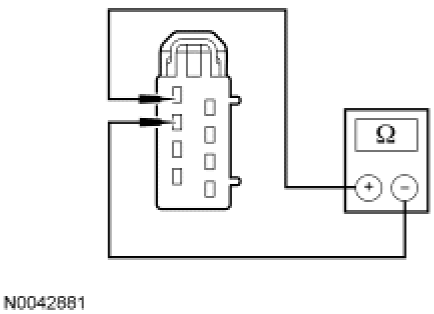

Fig. 207: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3300 pin 2 and pin 4, component side.
- **Is the resistance between 6K ohms and 9K ohms?**

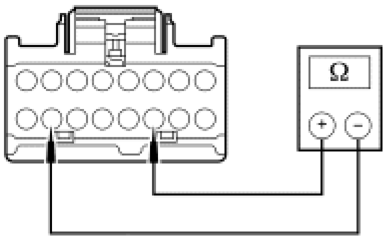
  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB14 CHECK THE BLOWER SPEED CONTROL AND CIRCUIT



N0044859

Fig. 208: Checking Blower Speed Control And Circuit
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to C3305c-11, circuit VHS18 (BN/GN), harness side and the negative lead to C3305c-15, circuit RHS03 (GY/OG), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

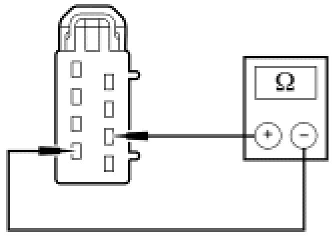
- Measure the resistance between DCSM C3305c-11, circuit VHS18 (BN/GN) harness side and DCSM C3305c-15, circuit RHS03 (GY/OG), harness side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AB16.

  NO : Go to AB15.

AB15 CHECK THE BLOWER SPEED CONTROL

- Disconnect: Cushion TED C3300



N0042890

Fig. 209: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3300 pin 7 and pin 4, component side.

- **Is the resistance between 290K ohms and 420K ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB16 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305b

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.

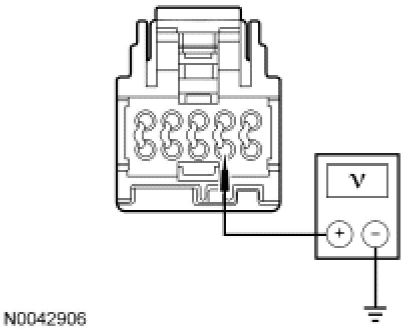


Fig. 210: Checking Thermistor Circuit For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305b-7, circuit VHS26 (VT), harness side and ground.

- **Is the voltage less than 0.5 volt?**

  YES : Go to AB17.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB17 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.

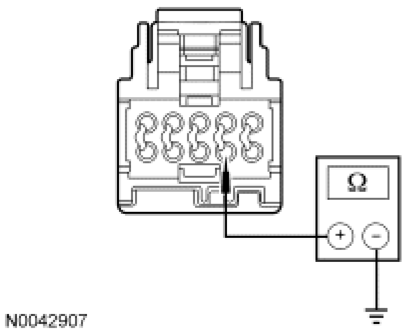

Fig. 211: Checking Thermistor Circuit For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305b-7, circuit VHS26 (VT), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AB18.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB18 CHECK THE THERMISTOR AND WIRING

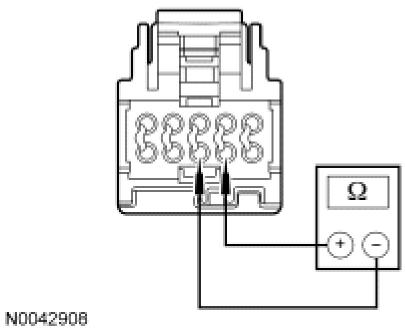

Fig. 212: Checking Thermistor & Wiring

Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305b-7, circuit VHS26 (VT), harness side and DCSM C3305b-8, circuit RHS05 (YE/VT), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AB19.

AB19 CHECK THE THERMISTOR

- Disconnect: Cushion TED C3300

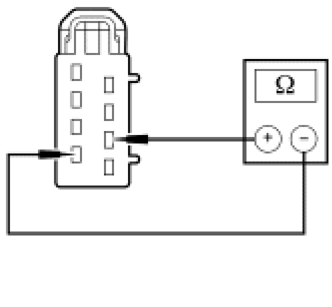

Fig. 213: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB20 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT BACKREST

- Key in OFF position.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat backrest trim cover. Refer to **Seat Backrest Cover - Front, Without Fold Flat**.
- Inspect the seat backrest for the following:
  - Is the backrest blower obstructed?
  - Is the blower filter restricted or plugged?
  - Is the TED correctly installed?
  - Is the seat backrest foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

YES : Go to AB21.

NO : CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB21 CHECK CUSHION TED CIRCUIT RHS02 (BU/OG) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Position the driver seat in the vehicle and connect the seat-to-floor connectors.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305a

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.

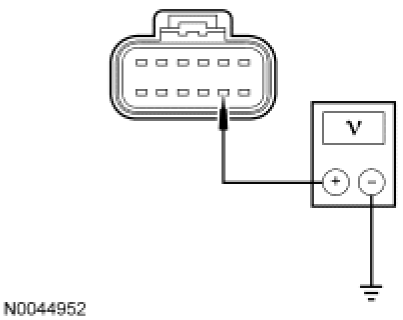

Fig. 214: Checking Cushion TED Circuit RHS02 (BU/OG) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305a-H, circuit RHS02 (BU/OG), harness side and ground.
- **Is the voltage less than 0.5 volt?**

YES : Go to AB22.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327.

CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB22 CHECK THE CUSHION TED+ CIRCUIT FOR SHORT TO GROUND

- Key in OFF position.

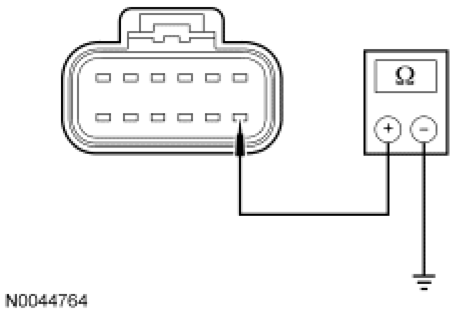

Fig. 215: Checking Cushion TED+ Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305a-G, circuit CHS02 (YE/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AB23.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB23 CHECK THE RESISTANCE OF THE CUSHION TED AND WIRING

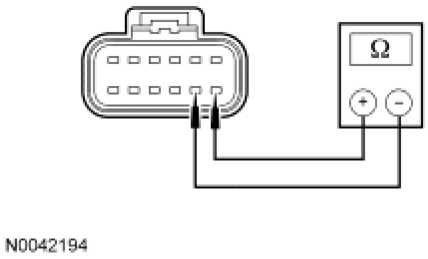

Fig. 216: Checking Resistance Of Cushion TED & Wiring
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305a-G circuit CHS02 (YE/BU), harness side and DCSM C3305a-H, circuit RHS02 (BU/OG), harness side.

- **Is the resistance between 0.9 and 10 ohms?**

  YES : Go to AB25.

  NO : Go to AB24.

AB24 CHECK THE RESISTANCE OF THE CUSHION TED

- Disconnect: Cushion TED C3300

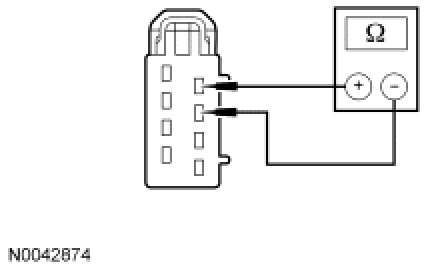

Fig. 217: Checking Resistance Of Cushion TED
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3300 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB25 CHECK BLOWER CIRCUIT CHS03 (GN/BN) AND SPEED CONTROL CIRCUIT VHS16 (BU/GN) FOR A SHORT TO VOLTAGE

- Disconnect: DCSM C3305c
- Key in ON position.

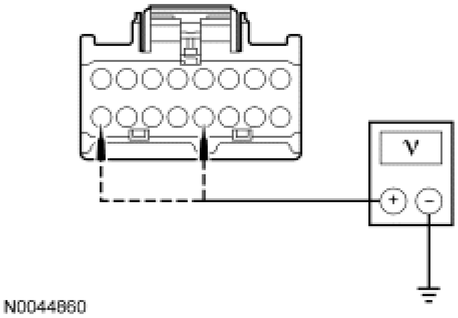

Fig. 218: Checking Blower Circuit CHS03 (GN/BN) & Speed Control Circuit VHS16 (BU/GN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and ground and between DCSM C3305c-12, circuit VHS16 (BU/GN), harness side and ground.
- **Are the voltages less than 1 volt?**

  YES : Go to AB26.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB26 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.

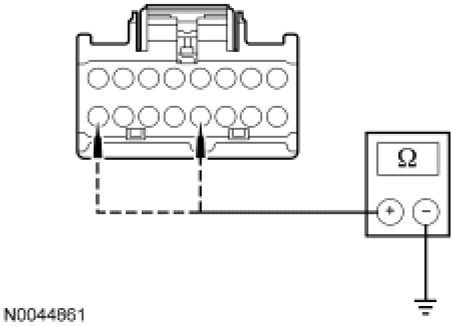

Fig. 219: Checking Blower And Speed Control Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and ground and between DCSM C3305c-12, circuit VHS16 (BU/GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AB27.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB27 CHECK THE BLOWER AND WIRING

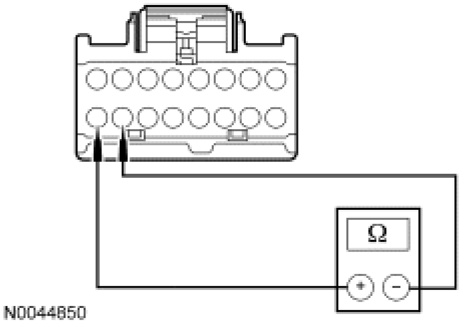

Fig. 220: Checking Blower & Wiring
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to DCSM C3305c-16, circuit CHS03 (GN/BN) and the negative lead to DCSM C3305c-15, circuit RHS03 (GY/OG) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and DCSM C3305c-15, circuit RHS03 (GY/OG), harness side.
- **Is the resistance between 6K ohms and 9K ohms?**

  YES : Go to AB29.

  NO : Go to AB28.

AB28 CHECK THE BLOWER

- Disconnect: Backrest TED C3310

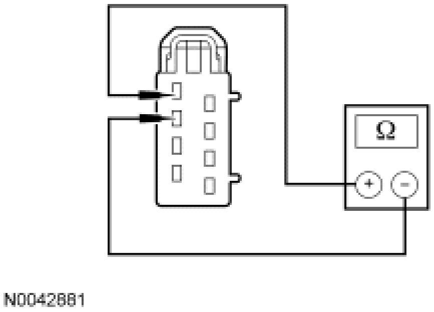

Fig. 221: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between backrest TED C3310 pin 2 and pin 4, component side.
- **Is the resistance between 6K ohms and 9K ohms?**

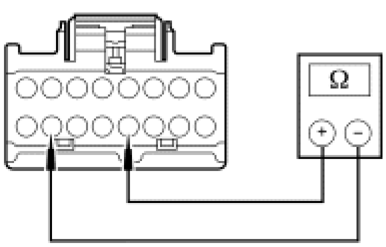
  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB29 CHECK THE BLOWER SPEED CONTROL AND CIRCUIT



N0044862

Fig. 222: Checking Blower Speed Control And Circuit
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to C3305c-12, circuit VHS16 (BU/GN), harness side and the negative lead to C3305c-15, circuit RHS03 (GY/OG), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3305c-12, circuit VHS16 (BU/GN) harness side and DCSM C3305c-15, circuit RHS03 (GY/OG), harness side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AB31.

  NO : Go to AB30.

AB30 CHECK THE BLOWER SPEED CONTROL

- Disconnect: Backrest TED C3310

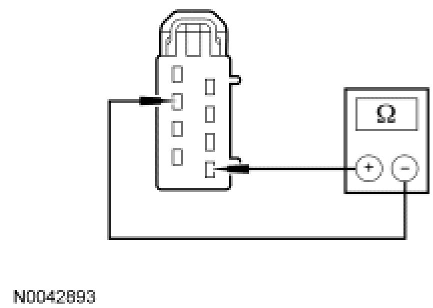


Fig. 223: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between backrest TED C3310 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB31 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE

- Disconnect: DCSM C3305b
- Key in ON position.

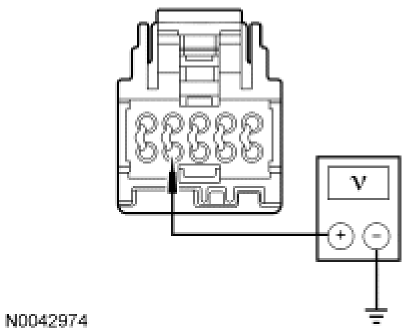

Fig. 224: Checking Thermistor Circuit For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305b-9, circuit VHS35 (VT/OG), harness side and ground.
- **Is the voltage less than 0.5 volt?**

  YES : Go to AB32.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB32 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305b

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

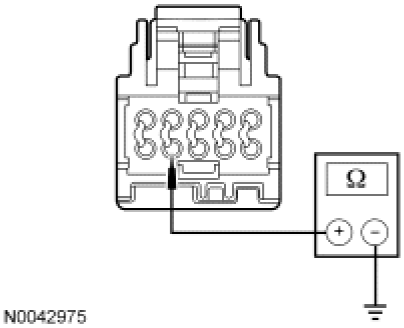

Fig. 225: Checking Thermistor Circuit For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305b-9, circuit VHS35 (VT/OG), harness side and ground.
- **Is the resistance greater than 10,000 volts?**

  YES : Go to AB33.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AB33 CHECK THE THERMISTOR AND WIRING

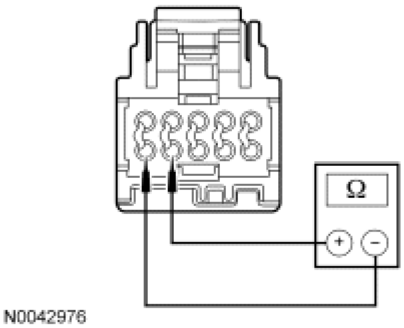

Fig. 226: Checking Thermistor & Wiring
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305b-9, circuit VHS35 (VT/OG), harness side and DCSM C3305b-10, circuit RHS15 (GY/BN), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms

10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : INSTALL a new DCSM and CARRY OUT PMI. REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AB34.

AB34 CHECK THE THERMISTOR

- Disconnect: Backrest TED C3310

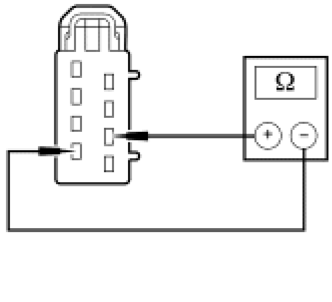

Fig. 227: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms

20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AC: DTC B272D - Passenger Differential Temperature Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible

algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

A differential fault occurs when the cushion and backrest TEDs on an affected seat are reporting very different temperatures to the DCSM. This may result from an airflow restriction or a circuit fault of either TED area. If a TED and manifold is clear of obstruction and is operational, the other TED and circuitry on the seat should be checked. It is important to note that a TED with a higher temperature may be operating correctly and not the area of concern. The other TED may be indicating a much lower temperature, causing the DTC to set.

- DTC B272D Passenger Differential Temperature Fault - If there is a temperature differential between the passenger backrest and cushion TED of 60°C (108°F) or more for more than 4 seconds, the TED is disconnected or the duct is blocked, this DTC will set. When this happens the first time in a key cycle, the DCSM puts the passenger seat system into recovery mode (see principles of operation). If the system is able to recover, it will function normally. If the system is able to recover and it occurs a second time in the same key cycle, the DCSM will shut down the passenger seat system.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted cushion or backrest TED filter
- Crushed or restricted cushion or backrest foam pad
- Crushed or restricted cushion or backrest climate controlled seat manifold
- Cushion or backrest TED assembly
- DCSM

PINPOINT TEST AC: DTC B272D - PASSENGER DIFFERENTIAL TEMPERATURE FAULT

NOTE:	**The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE:	**The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AC1 CHECK THE DCSM FOR DTCs

- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DCSM Retrieve DTCs
- **Was DTC B272A or B272B retrieved during the self-test or as a continuous DTC?**

  YES : For DTC B272A, go to **Pinpoint Test Z**. For DTC B272B, go to **Pinpoint Test AA**.

  NO : Go to AC2.

AC2 MONITOR THE DCSM TED TEMPERATURE PIDs

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM
  - Passenger cushion thermal electric device (TED) temperature (PCSHTMP)
  - Passenger back TED temperature (PBKTMP)

- Seat cushion thermal electric device temperature (CSHTEMP)
- Seat back thermal electric device temperature (BK_TEMP)

NOTE: Make sure the temperature of the climate controlled seats has stabilized before monitoring the PIDs. Not allowing stabilization can cause incorrect readings and lead to incorrect identification of components that are not faulty.

- Monitor the TED temperature PIDs with the climate controlled seats OFF. Compare the PIDs of the front passenger seat to those of the driver seat, this can help identify if there is a concern with the front passenger seat cushion or backrest PID readings.
- **Are both front passenger seat TED temperature PIDs within 10°C (18°F) of the ambient temperature?**

  YES : Go to AC3.

  NO : If the front passenger seat cushion PID varies 10°C (18°F) or more from ambient temperature, go to AC16.

  If the front passenger seat backrest PID varies 10°C (18°F) or more from ambient temperature, go to AC32.

AC3 CONFIRM THE FAULT IS IN THE SEAT CUSHION OR THE BACKREST

- Key in OFF position.
- Key in ON position.

NOTE: A crushed seat cushion foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault.

NOTE: If the seat shuts down before a 15-minute heat cycle has timed-out, carry out the DCSM self-test and go to the Dual Climate Controlled Seat Module (DCSM) DTC Chart to continue diagnostics.

- After cycling the ignition switch and with the engine running, set the driver seat to high heat (3 LEDs illuminated on HVAC module). Allow the seat to heat for at least 15 minutes while monitoring the TED temperature PIDs of the driver seat. If necessary, when the seat times-out after 15 minutes, set the driver seat to high heat once again.
- **Do the driver seat cushion TED and backrest TED PIDs vary more than 60°C (108°F) from each other?**

  YES : If the front passenger seat cushion PID is 60°C (108°F) hotter than the backrest PID, go to AC5.

  If the front passenger seat backrest PID is 60°C (108°F) hotter than the cushion PID, go to AC20.

NO : Go to AC4.

AC4 CHECK THE TEDs COOLING PERFORMANCE

- Check the TEDs cooling performance on the affected seat. Refer to Component Test - Thermo-electric Device (TED) Cooling Performance.
- **Did the TEDs pass the component test?**

  YES : The DTC may have been set by extreme cabin temperatures or excessive sunload on the seat causing the system to enter recovery mode. Occupant size and weight characteristics can also be a factor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If a concern cannot be found or duplicated, RETURN the vehicle to the customer.

  NO : CHECK the affected seat cushion or backrest for correct installation of the climate controlled seat components (TED, manifold, plenum, air ducts and foam pad). CHECK for airflow restrictions (TED inlets and outlets, TED-to-manifold or plenum connections, filters and ducts) and REPAIR as needed. CHECK for an intermittent wiring fault. REPAIR as needed. REPEAT the self-test. CLEAR the DTCs.

AC5 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT CUSHION

- Key in OFF position.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat cushion trim cover. Refer to **Seat Cushion Cover - Front**.
- Inspect the seat cushion for the following:
  - Is the cushion blower obstructed?
  - Is the blower filter restricted or plugged?
  - Is the TED correctly installed?
  - Is the seat cushion foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : Go to AC6.

  NO : CORRECTLY install the cushion TED or INSTALL a new seat cushion foam pad and/or climate controlled seat manifold. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC6 CHECK THE BACKREST TED- CIRCUIT FOR SHORT TO VOLTAGE

- Key in OFF position.
- Position the front passenger seat in the vehicle and connect the seat-to-floor connectors.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: DCSM C3305a

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.

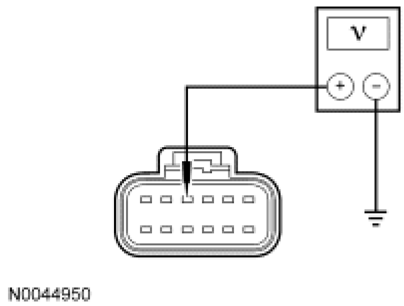

Fig. 228: Checking Backrest TED- Circuit For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305a-D, circuit RHS06 (WH), harness side and ground.
- **Is the voltage less than 0.5 volt?**

  YES : Go to AC7.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC7 CHECK BACKREST TED CIRCUIT CHS06 (BU/BN) FOR SHORT TO GROUND

- Key in OFF position.

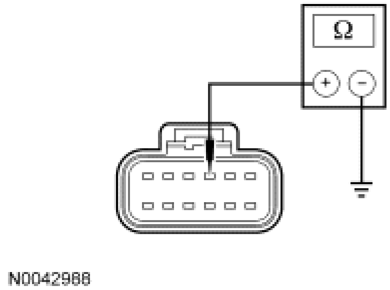

Fig. 229: Checking Backrest TED Circuit CHS06 (BU/BN) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305a-C, circuit CHS06 (BU/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AC8.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC8 CHECK RESISTANCE OF THE BACKREST TED AND WIRING

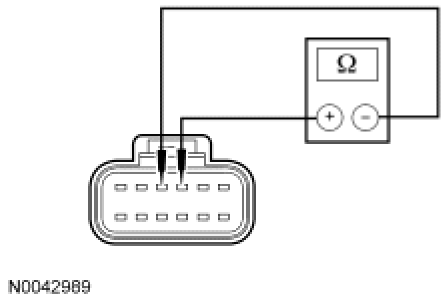

Fig. 230: Checking Resistance Of Backrest TED And Wiring
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305a-C, circuit CHS06 (BU/BN), harness side and DCSM C3305a-D, circuit RHS06 (WH), harness side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : Go to AC10.

  NO : Go to AC9.

AC9 CHECK RESISTANCE OF THE BACKREST TED

- Disconnect: Backrest TED C3311

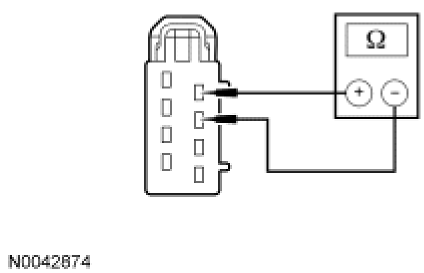

Fig. 231: Checking Resistance Of Backrest TED
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3311 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC10 CHECK BLOWER CIRCUIT CHS08 (BN/YE) AND SPEED CONTROL CIRCUIT VHS23 (BN/BU) FOR A SHORT TO VOLTAGE

- Disconnect: DCSM C3305c
- Key in ON position.

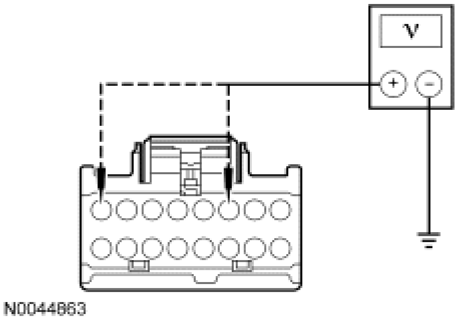

Fig. 232: Checking Blower Circuit CHS08 (BN/YE) & Speed Control Circuit VHS23 (BN/BU) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and ground and between DCSM C3305c-3, circuit VHS23 (BN/BU), harness side and ground.
- **Are the voltages less than one volt?**

  YES : Go to AC11.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC11 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.

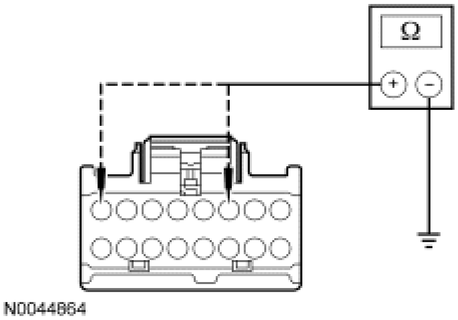

Fig. 233: Checking Blower And Speed Control Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and ground and between DCSM C3305c-3, circuit VHS23 (BN/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AC12.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC12 CHECK THE BLOWER AND WIRING

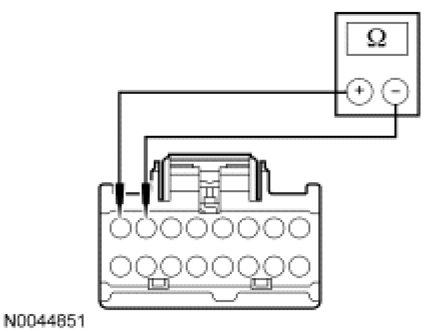

Fig. 234: Checking Blower & Wiring
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to DCSM C3305c-8, circuit CHS08 (BN/YE) and the negative lead to DCSM C3305c-7, circuit RHS08 (VT/WH) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and DCSM C3305c-7, circuit RHS08 (VT/WH), harness side.
- **Is the resistance between 6K ohms and 9K ohms?**

YES : Go to AC14.

NO : Go to AC13.

AC13 CHECK THE BLOWER

- Disconnect: Cushion TED C3303

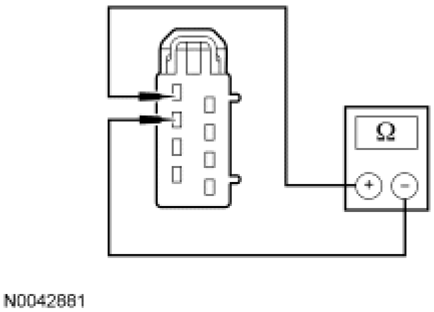

Fig. 235: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3303 pin 2 and pin 4, component side.
- **Is the resistance between 6K ohms and 9K ohms?**

YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC14 CHECK THE BLOWER SPEED CONTROL AND CIRCUIT

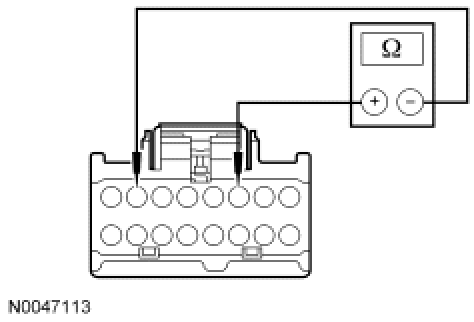

Fig. 236: Checking Blower Speed Control And Circuit
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to C3305c-3, circuit VHS23 (BN/BU), harness side and the negative lead to C3305c-7, circuit RHS08 (VT/WH), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between DCSM C3305c-3, circuit VHS23 (BN/BU) harness side and DCSM C3305c-7, circuit RHS08 (VT/WH), harness side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AC16.

  NO : Go to AC15.

AC15 CHECK THE BLOWER SPEED CONTROL

- Disconnect: Cushion TED C3303

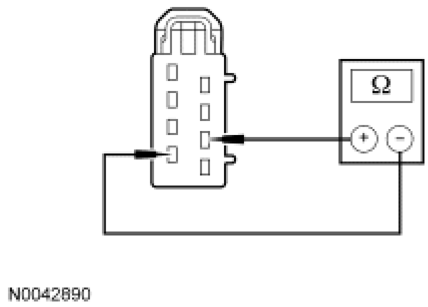

Fig. 237: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between cushion TED C3303 pin 7 and pin 4, component side.

- **Is the resistance between 290K ohms and 420K ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC16 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: DCSM C3305b

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.

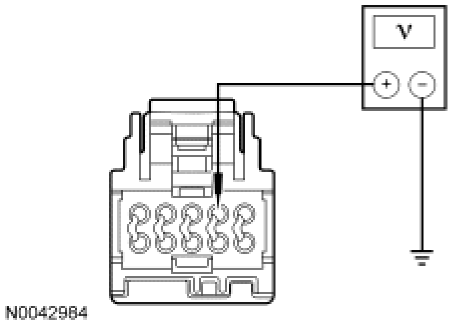

Fig. 238: Checking Thermistor Circuit For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305b-2, circuit VHS27 (WH/OG), harness side and ground.
- **Is the voltage less than 0.5 volt?**

  YES : Go to AC17.

NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC17 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.

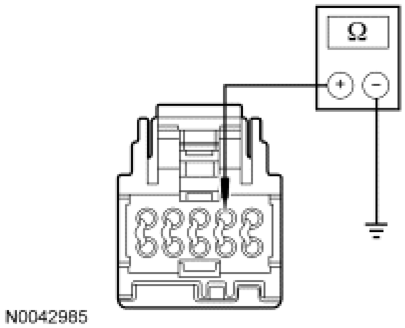

Fig. 239: Checking Thermistor Circuit For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305b-2, circuit VHS27 (WH/OG), harness side and ground.
- **Is the resistance greater than 10,000 volts?**

  YES : Go to AC18.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC18 CHECK THE THERMISTOR AND WIRING

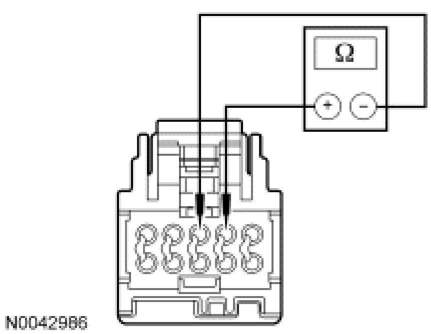

Fig. 240: Checking Thermistor & Wiring
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305b-2, circuit VHS27 (WH/OG), harness side and

DCSM C3305b-3, circuit RHS10 (BU/OG), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AC19.

AC19 CHECK THE THERMISTOR

- Disconnect: Cushion TED C3303

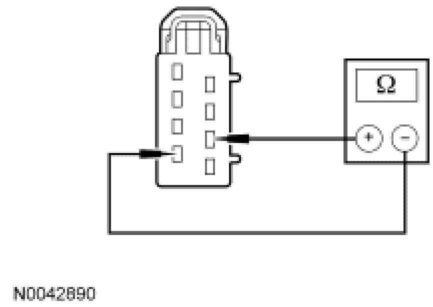

Fig. 241: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC20 CHECK THE TED INSTALLATION AND FOR A CRUSHED SEAT BACKREST

- Key in OFF position.
- Remove the seat. Refer to **Seat - Front**.
- Remove the seat backrest trim cover. Refer to **Seat Backrest Cover - Front, Without Fold Flat**.
- Inspect the seat backrest for the following:
  - Is the backrest blower obstructed?
  - Is the blower filter restricted or plugged?
  - Is the TED correctly installed?
  - Is the seat backrest foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : Go to AC21.

  NO : CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. REPOWER the SRS. REFER to **SUPPLEMENTAL**

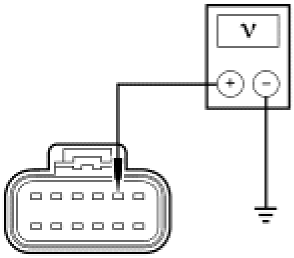
RESTRAINT SYSTEM article.

AC21 CHECK CUSHION TED CIRCUIT RHS07 (BU) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Position the front passenger seat in the vehicle and connect the seat-to-floor connectors.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: DCSM C3305a

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.



N0044870

Fig. 242: Checking Cushion TED Circuit RHS07 (BU) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305a-B, circuit RHS07 (BU), harness side and ground.
- **Is the voltage less than 0.5 volt?**

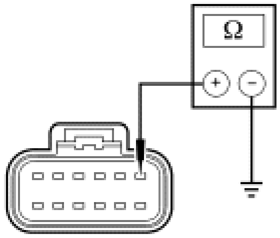
  YES : Go to AC22.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC22 CHECK CUSHION TED CIRCUIT CHS07 (GY/BU) FOR A SHORT TO GROUND

- Key in OFF position.



N0042978

Fig. 243: Checking Cushion TED Circuit CHS07 (GY/BU) For A Short To Ground
Courtesy of FORD MOTOR CO.

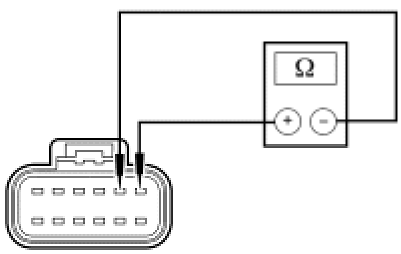
- Measure the resistance between DCSM C3305a-A, circuit CHS07 (GY/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AC23.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC23 CHECK THE RESISTANCE OF THE CUSHION TED AND WIRING



N0042979

Fig. 244: Checking Resistance Of Cushion TED And Wiring
Courtesy of FORD MOTOR CO.

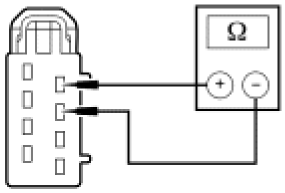
- Measure the resistance between DCSM C3305a-A circuit CHS07 (GY/BU), harness side and DCSM C3305a-B, circuit RHS07 (BU), harness side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : Go to AC25.

  NO : Go to AC24.

AC24 CHECK THE RESISTANCE OF THE CUSHION TED

- Disconnect: Cushion TED C3303



N0042874

Fig. 245: Checking Resistance Of Cushion TED
Courtesy of FORD MOTOR CO.

- Measure the resistance between cushion TED C3303 pin 1 and pin 3, component side.
- **Is the resistance between 0.9 and 10 ohms?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

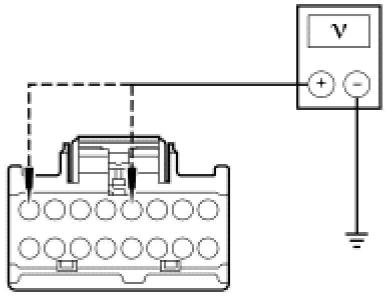
  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC25 CHECK BLOWER CIRCUIT CHS08 (BN/YE) AND SPEED CONTROL CIRCUIT VHS21 (BU/WH) FOR A SHORT TO VOLTAGE

- Disconnect: DCSM C3305c
- Key in ON position.



N0044866

Fig. 246: Checking Blower Circuit CHS08 (BN/YE) & Speed Control Circuit VHS21 (BU/WH) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and ground and between DCSM C3305c-4, circuit VHS21 (BU/WH), harness side and ground.

- **Are the voltages less than one volt?**

  YES : Go to AC26.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC26 CHECK THE BLOWER AND SPEED CONTROL CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.

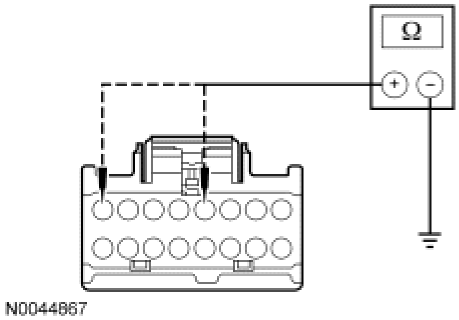


Fig. 247: Checking Blower & Speed Control Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and ground and between DCSM C3305c-4, circuit VHS21 (BU/WH), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AC27.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC27 CHECK THE BLOWER AND WIRING

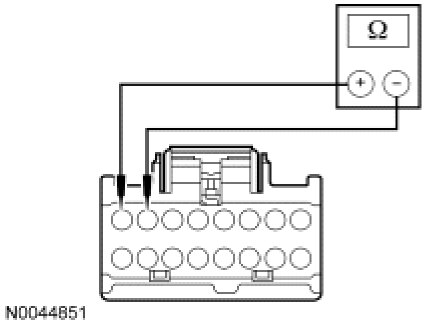

Fig. 248: Checking Blower & Wiring

Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to DCSM C3305c-8, circuit CHS08 (BN/YE) and the negative lead to DCSM C3305c-7, circuit RHS08 (VT/WH) when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and DCSM C3305c-7, circuit RHS08 (VT/WH), harness side.
- **Is the resistance between 6K ohms and 9K ohms?**

  YES : Go to AC29.

  NO : Go to AC28.

AC28 CHECK THE BLOWER

- Disconnect: Backrest TED C3311

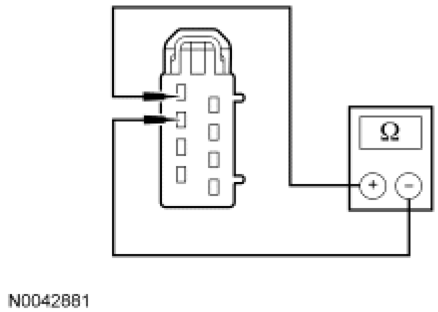

Fig. 249: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE: The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between backrest TED C3311 pin 2 and pin 4, component side.
- **Is the resistance between 6K ohms and 9K ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313.

REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC29 CHECK THE BLOWER SPEED CONTROL AND CIRCUIT

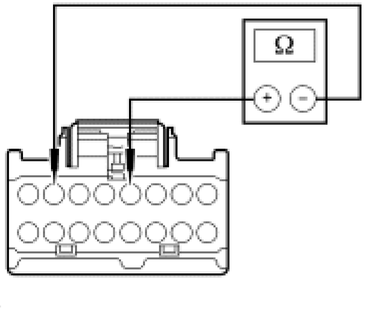

Fig. 250: Checking Blower Speed Control And Circuit
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to C3305c-4, circuit VHS21 (BU/WH), harness side and the negative lead to C3305c-7, circuit RHS08 (VT/WH), harness side when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between DCSM C3305c-4, circuit VHS21 (BU/WH) harness side and DCSM C3305c-7, circuit RHS08 (VT/WH), harness side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AC31.

  NO : Go to AC30.

AC30 CHECK THE BLOWER SPEED CONTROL

- Disconnect: Backrest TED C3311

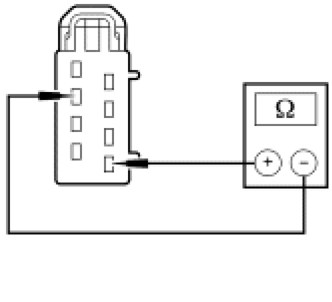

Fig. 251: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads**

incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.

- Measure the resistance between backrest TED C3311 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC31 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO VOLTAGE

- Disconnect: DCSM C3305b
- Key in ON position.

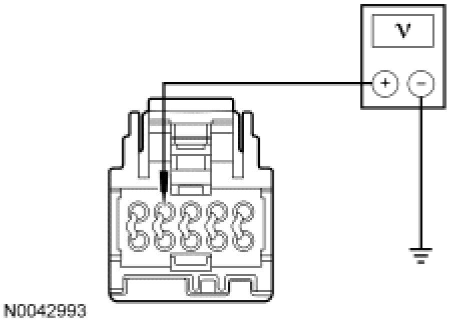

Fig. 252: Checking Thermistor Circuit For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305b-4, circuit VHS36 (YE/BU), harness side and ground.
- **Is the voltage less than 0.5 volt?**

  YES : Go to AC32.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC32 CHECK THE THERMISTOR CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

- Disconnect the passenger seat side air bag C313.

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

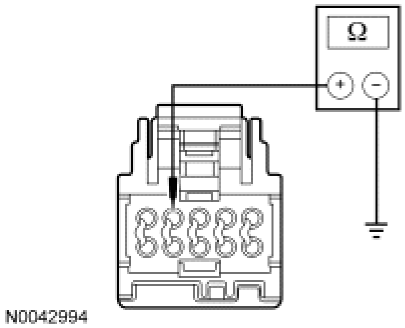

Fig. 253: Checking Thermistor Circuit For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305b-4, circuit VHS36 (YE/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AC33.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AC33 CHECK THE THERMISTOR AND WIRING

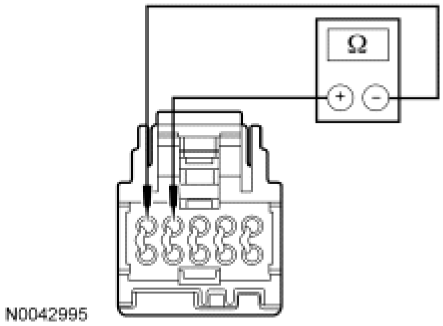

Fig. 254: Checking Thermistor & Wiring
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305b-4, circuit VHS36 (YE/BU), harness side and DCSM C3305b-5, circuit RHS20 (GN/BU), harness side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : INSTALL a new DCSM and CARRY OUT PMI. REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AC34.

AC34 CHECK THE THERMISTOR

- Disconnect: Backrest TED C3311

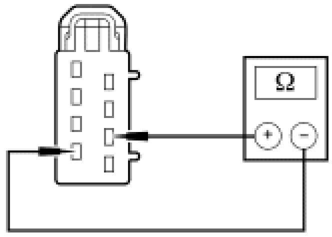

Fig. 255: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected circuit(s). REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AD: DTC B272E - Driver Ignition Run/Blower Circuit Short to Ground

NOTE: This DTC sets for an open or short to voltage. See DTC setting description below.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault

occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- HVAC module
- Backrest or cushion TED
- DCSM

PINPOINT TEST AD: DTC B272E - DRIVER IGNITION RUN/BLOWER CIRCUIT SHORT TO GROUND

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AD1 CHECK DCSM CLIMATE-CONTROLLED SEAT HEAT COMMAND (TED_HEAT_D) PID

- Access the cushion and backrest TEDs and remove the filters to watch the TED fans.
- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM PID TED_HEAT_D

  NOTE: **The DCSM active command TED_HEAT_D is limited to 15 seconds in the ON state.**

- Operate the climate controlled seat using the active command while monitoring the cushion and backrest TEDs for fan movement.
- **Did both fans turn on?**

  YES : CARRY OUT the network test. If DTCs are retrieved from the HVAC module, REFER to the DTC Chart in the Diagnosis and Testing portion of **MULTIFUNCTION ELECTRONIC MODULES** article. If no DTCs are retrieved, CARRY OUT the HVAC Module Cold Boot Process in the Diagnosis and Testing portion of **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

NO : Go to AD2.

AD2 CHECK FOR AN INTERMITTENT CONNECTION AT THE DCSM

- Key in OFF position.
- Disconnect: DCSM C3305c
- Connect: DCSM C3305c
- With the engine running and using the switches on the HVAC module, turn the driver climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the driver climate controlled seat system for 2 minutes.
- **Did the climate controlled seat operate correctly?**

  YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3305c and REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AD3.

AD3 CHECK FOR AN INTERMITTENT CONNECTION AT THE CUSHION TED

- Key in OFF position.
- Disconnect: Cushion TED C3300
- Connect: Cushion TED C3300
- With the engine running and using the switches on the HVAC module, turn the driver climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the driver climate controlled seat system for 2 minutes.
- **Did the climate controlled seat operate correctly?**

  YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3300 and REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AD4.

AD4 CHECK FOR AN INTERMITTENT CONNECTION AT THE BACKREST TED

- Key in OFF position.
- Disconnect: Backrest TED C3310
- Connect: Backrest TED C3310
- With the engine running and using the switches on the HVAC module, turn the driver climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the driver climate controlled seat system for 2 minutes.
- **Did the climate controlled seat operate correctly?**

  YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3310 and REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AD5.

AD5 CHECK BLOWER CIRCUIT CHS03 (GN/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.

- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305c
- Disconnect: Cushion TED C3300
- Disconnect: Backrest TED C3310

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.

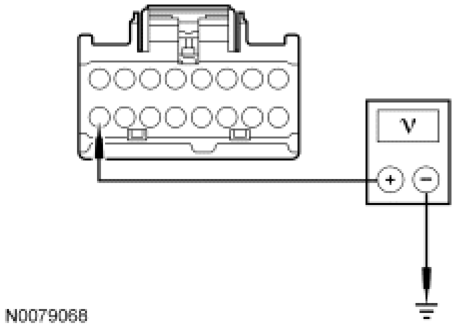

Fig. 256: Checking Blower Circuit CHS03 (GN/BN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AD6.

AD6 CHECK CUSHION TED BLOWER CIRCUITS CHS03 (GN/BN) AND RHS03 (GY/OG) FOR AN OPEN

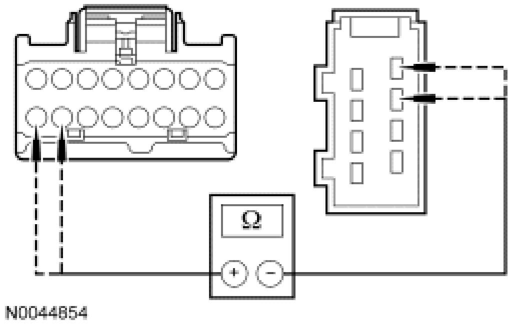

Fig. 257: Checking Cushion TED Blower Circuits CHS03 (GN/BN) & RHS03 (GY/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and cushion TED C3300-2, circuit CHS03 (GN/BN), harness side; and between DCSM C3305c-15, circuit RHS03 (GY/OG), harness side and cushion TED C3300-4, circuit RHS03 (GY/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to AD7.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AD7 CHECK BACKREST TED BLOWER CIRCUITS CHS03 (GN/BN) AND RHS03 (GY/OG) FOR AN OPEN

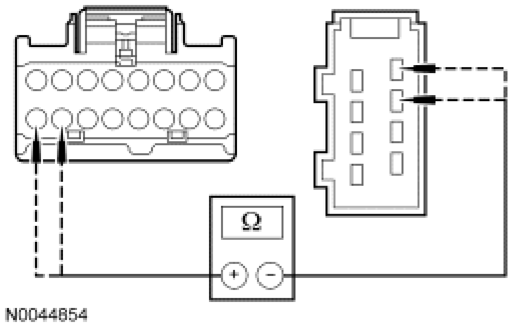

Fig. 258: Checking Backrest TED Blower Circuits CHS03 (GN/BN) & RHS03 (GY/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and backrest TED C3310-2, circuit CHS03 (GN/BN), harness side; and between DCSM C3305c-15, circuit RHS03 (GY/OG), harness side and cushion TED C3310-4, circuit RHS03 (GY/OG), harness side.

- **Are the resistances less than 5 ohms?**

  YES : Go to AD8.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AD8 CHECK BLOWER RESISTANCE

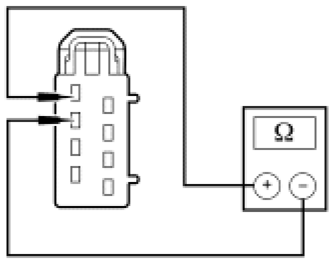

Fig. 259: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3300 pin 2 and pin 4, component side and between backrest TED C3310 pin 2 and pin 4, component side.
- **Are the resistances between 6,000 ohms and 9,000 ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the resistance of the cushion TED was **not** between 6,000 and 9,000 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  If the resistance of the backrest TED was **not** between 6,000 and 9,000 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AE: DTC B272F - Passenger Ignition Run/Blower Circuit Short to Ground

NOTE: This DTC sets for an open or short to voltage. See DTC setting description below.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- HVAC module
- Backrest or cushion TED
- DCSM

PINPOINT TEST AE: DTC B272F - PASSENGER IGNITION RUN/BLOWER CIRCUIT SHORT TO GROUND

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

AE1 CHECK DCSM PASSENGER TED HEAT MODE (TED_HEAT_P) PID

- Access the cushion and backrest TEDs and remove the filters to watch the TED fans.
- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM PID TED_HEAT_P

NOTE: The DCSM active command TED_HEAT_P is limited to 15 seconds in the ON state.

- Operate the climate controlled seat using the active command while monitoring the cushion and backrest TEDs for fan movement.
- **Did both fans turn on?**

  YES : CARRY OUT the network test. If DTCs are retrieved from the HVAC module, REFER to the DTC Chart in the Diagnosis and Testing portion of **MULTIFUNCTION ELECTRONIC MODULES** article. If no DTCs are retrieved, CARRY OUT the HVAC Module Cold Boot Process in the Diagnosis and Testing portion of **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

  NO : Go to AE2.

AE2 CHECK FOR AN INTERMITTENT CONNECTION AT THE DCSM

- Key in OFF position.
- Disconnect: DCSM C3305c
- Connect: DCSM C3305c
- With the engine running and using the switches on the HVAC module, turn the passenger climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the passenger climate controlled seat system for 2 minutes.
- **Did the climate controlled seat operate correctly?**

  YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3305c and REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AE3.

AE3 CHECK FOR AN INTERMITTENT CONNECTION AT THE CUSHION TED

- Key in OFF position.
- Disconnect: Cushion TED C3303
- Connect: Cushion TED C3303
- With the engine running and using the switches on the HVAC module, turn the passenger climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the passenger climate controlled seat system for 2 minutes.
- **Did the climate controlled seat operate correctly?**

  YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3303 and REPAIR

the circuit. REPEAT the self-test. CLEAR the DTCs.

NO : Go to AE4.

AE4 CHECK FOR AN INTERMITTENT CONNECTION AT THE BACKREST TED

- Key in OFF position.
- Disconnect: Backrest TED C3311
- Connect: Backrest TED C3311
- With the engine running and using the switches on the HVAC module, turn the passenger climate controlled seat system on while monitoring the cushion and backrest fans for movement.
  - If there is fan movement, run the passenger climate controlled seat system for 2 minutes.
- **Did the climate controlled seat operate correctly?**

  YES : The fault is intermittent. CHECK for causes of the intermittent fault at C3311 and REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AE5.

AE5 CHECK BLOWER CIRCUIT CHS08 (BN/YE) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the passenger seat side air bag C313.
- Disconnect: DCSM C3305c
- Disconnect: Cushion TED C3303
- Disconnect: Backrest TED C3311

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Key in ON position.

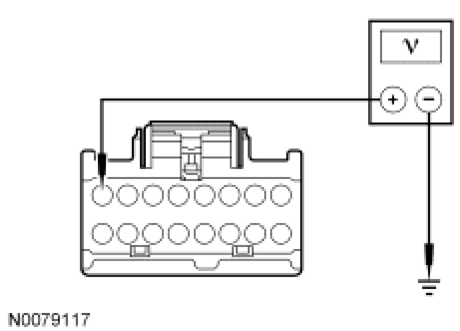

Fig. 260: Checking Blower Circuit CHS08 (BN/YE) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : Go to AE6.

AE6 CHECK CUSHION TED BLOWER CIRCUITS CHS08 (BN/YE) AND RHS08 (VT/WH) FOR AN OPEN

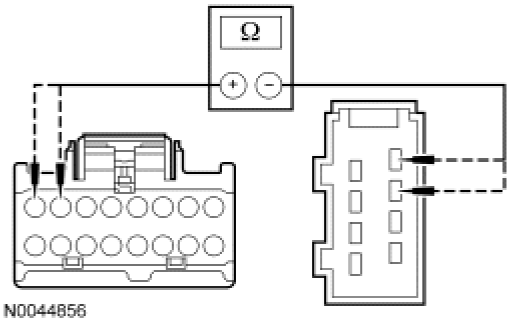

Fig. 261: Checking Cushion TED Blower Circuits CHS08 (BN/YE) & RHS08 (VT/WH) For An Open
Courtesy of FORD MOTOR CO.

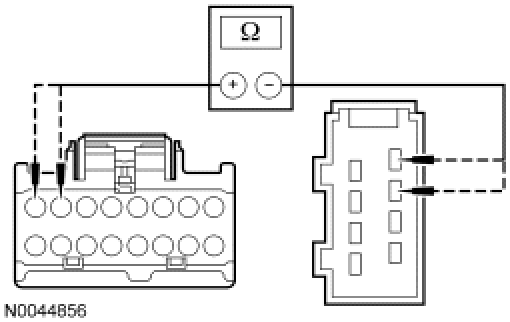
- Measure the resistance between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and cushion TED C3303-2, circuit CHS08 (BN/YE), harness side; and between DCSM C3305c-7, circuit RHS08 (VT/WH), harness side and cushion TED C3303-4, circuit RHS08 (VT/WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to AE7.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AE7 CHECK BACKREST TED BLOWER CIRCUITS CHS08 (BN/YE)/CHS08 (GY/RD) AND RHS08 (VT/WH) FOR AN OPEN



N0044856

Fig. 262: Checking Backrest TED Blower Circuits CHS08 (BN/YE)/CHS08 (GY/RD) & RHS08 (VT/WH) For An Open
Courtesy of FORD MOTOR CO.

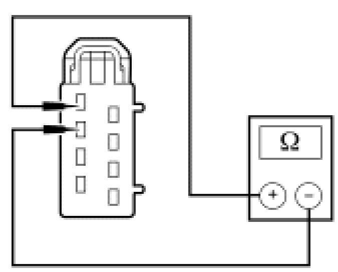
- Measure the resistance between DCSM C3305c-8, circuit CHS08 (BN/YE), harness side and backrest TED C3311-2, circuit CHS08 (GY/RD), harness side; and between DCSM C3305c-7, circuit RHS08 (VT/WH), harness side and backrest TED C3311-4, circuit RHS08 (VT/WH), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to AE8.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AE8 CHECK BLOWER RESISTANCE



N0042881

Fig. 263: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between cushion TED C3303 pin 2 and pin 4, component side and between backrest TED C3311 pin 2 and pin 4, component side.

- **Are the resistances between 6,000 ohms and 9,000 ohms?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : If the resistance of the cushion TED was **not** between 6,000 and 9,000 ohms, INSTALL a new cushion TED. REFER to **Seat Cushion Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  If the resistance of the backrest TED was **not** between 6,000 and 9,000 ohms, INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AF: DTC B2730 - Back Over-Temp Detected (Driver)

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

- DTC B2730 Back Over-Temp Detected (Driver) - In the cooling mode, if the driver seat backrest TED temperature exceeds 70°C (158°F) for more than 34 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the driver seat system and set this DTC.
- DTC B2730 Back Over-Temp Detected (Driver) - In the heating mode, if the driver seat backrest TED temperature exceeds 85°C (185°F) for more than 34 seconds, the TED is disconnected or the duct is blocked, the DCSM will shut down the driver seat system and set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Restricted backrest TED filter
- Crushed or restricted backrest foam pad
- Crushed or restricted climate controlled seat manifold
- Backrest TED assembly
- DCSM

PINPOINT TEST AF: DTC B2730 - BACK OVER-TEMP DETECTED (DRIVER)

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AF1 CHECK THE DCSM FOR DTCs

- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DCSM Retrieve DTCs
- **Was DTC B2730 retrieved during the self-test?**

  YES : Go to AF2.

  NO : Go to AF4.

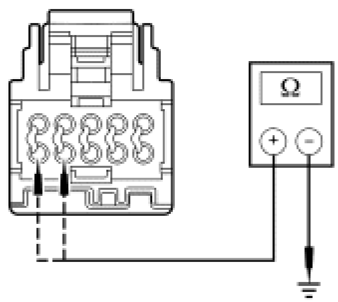
AF2 CHECK THE TED THERMISTOR CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305b
- Disconnect: Backrest TED C3310

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may**

result in serious personal injury in the event of an accidental deployment.

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.



N0065349

Fig. 264: Checking TED Thermistor Circuits For A Short To Ground
Courtesy of FORD MOTOR CO.

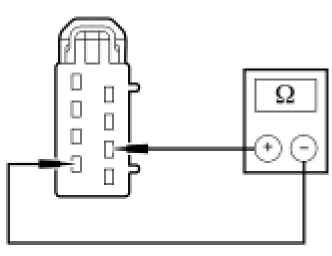
- Measure the resistance between DCSM C3305b-9, circuit VHS35 (VT/OG), harness side and ground; and between DCSM C3305b-10, circuit RHS15 (GY/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to AF3.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AF3 CHECK THE TED THERMISTOR



N0042890

Fig. 265: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

- Measure the resistance between backrest TED C3310 pin 5 and pin 8, component side. Note the ambient temperature and refer to the following table.

Temperature	Resistance
0-10°C (32-50°F)	2,782-1,663 ohms
10-20°C (50-68°F)	1,837-1,140 ohms
20-30°C (68-86°F)	1,260-806 ohms
30-40°C (86-104°F)	893-570 ohms
40-50°C (104-122°F)	630-428 ohms

- **Is the resistance within the limits indicated?**

  YES : REPAIR the affected open circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AF4 CONFIRM THE FAULT

- Verify with the customer that the concern is the seat shuts OFF in heat mode.

NOTE: **A crushed seat backrest foam pad or a crushed climate controlled seat manifold may be the cause of the fault. It may be necessary to sit on the seat or place something of reasonable size and weight on the seat to recreate the fault.**

- Attempt to recreate the fault. Start the vehicle and set the driver seat to high heat for at least 15 minutes.
- **Is the customer concern with the seat shutting OFF in heat mode or was the fault recreated?**

  YES : Go to AF5.

  NO : Fault not present. Fault may have been set due to a past failure or incorrect use of the climate controlled seat system by repeated switching between HEAT and COOL modes. REPEAT the self-test. CLEAR the DTCs.

AF5 CHECK OPERATION OF THE SEAT

- Key in ON position.
- With the engine running, set both front seats to high cool (3 LEDs illuminated on HVAC module).
- Compare the airflow from the driver seat backrest and compare it to the airflow from the passenger seat backrest.
- **Is the airflow exhausting from the driver seat backrest comparable to the airflow exhausting from the passenger seat backrest?**

  YES : Go to AF14.

  NO : Go to AF6.

AF6 CHECK THE BACKREST BLOWER FOR AN OBSTRUCTION OR RESTRICTED FILTER

- Key in OFF position.
- Inspect the blower of the backrest TED assembly for an obstruction or for a restricted filter.
- **Is the blower obstructed or the filter restricted?**

  YES : REMOVE the obstruction or INSTALL a new filter. REPEAT the self-test. CLEAR the DTCs.

  NO : Go to AF7.

AF7 CHECK THE BACKREST FAN OPERATION

- Key in ON position.
- With the engine running, set both front seats to high cool (3 LEDs illuminated on HVAC module).
- Inspect the backrest blower for operation.
- **Does the backrest blower operate?**

  YES : Go to AF14.

  NO : Go to AF8.

AF8 CHECK THE BLOWER SPEED CONTROL CIRCUIT FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect the driver seat side air bag module C327.
- Disconnect the passenger seat side air bag module C313.
- Disconnect: DCSM C3305c
- Disconnect: Backrest TED C3310

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Connect the battery ground cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

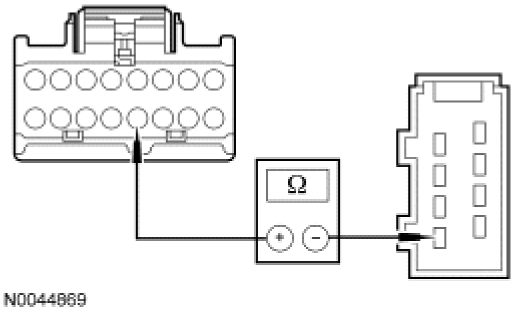


Fig. 266: Checking Blower Speed Control Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-12, circuit VHS16 (BU/GN), harness side and backrest TED C3310-7, circuit VHS16 (BU/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to AF9.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AF9 CHECK BLOWER CIRCUIT RHS03 (GY/OG) FOR A SHORT TO VOLTAGE

- Key in ON position.

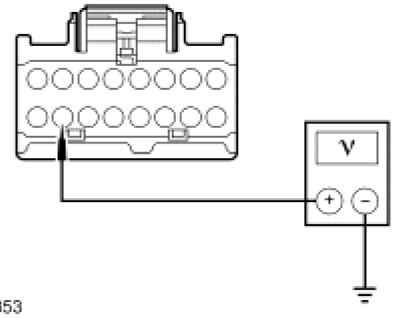

Fig. 267: Checking Blower Circuit RHS03 (GY/OG) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between DCSM C3305c-15, circuit RHS03 (GY/OG), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to

SUPPLEMENTAL RESTRAINT SYSTEM article.

NO : Go to AF10.

AF10 CHECK BLOWER CIRCUIT CHS03 (GN/BN) FOR A SHORT TO GROUND

- Key in OFF position.

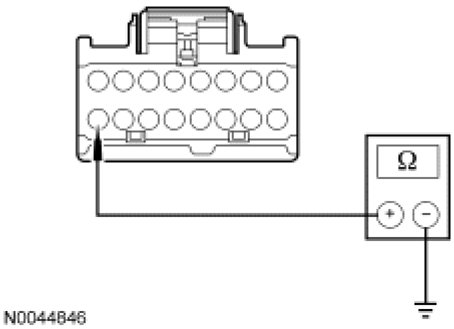

Fig. 268: Checking Blower Circuit CHS03 (GN/BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to AF11.

  NO : REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AF11 CHECK BLOWER CIRCUITS CHS03 (GN/BN) AND RHS03 (GY/OG) FOR AN OPEN

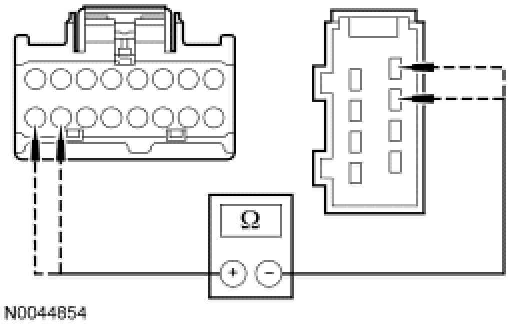

Fig. 269: Checking Blower Circuits CHS03 (GN/BN) & RHS03 (GY/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between DCSM C3305c-16, circuit CHS03 (GN/BN), harness side and backrest TED C3310-2, circuit CHS03 (GN/BN), harness side; and between DCSM C3305c-15,

circuit RHS03 (GY/OG), harness side and backrest TED C3310-4, circuit RHS03 (GY/OG), harness side.

- **Are the resistances less than 5 ohms?**

  YES : Go to AF12.

  NO : REPAIR the affected circuit. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AF12 CHECK THE BLOWER RESISTANCE

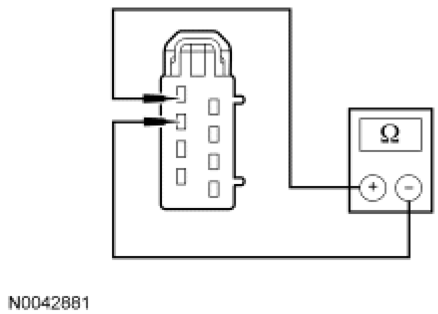

Fig. 270: Checking Blower Resistance
Courtesy of FORD MOTOR CO.

NOTE: **The ohmmeter must be connected with the positive lead to pin 2 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between backrest TED C3310 pin 2 and pin 4, component side.
- **Is the resistance between 6K ohms and 9K ohms?**

  YES : Go to AF13.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AF13 CHECK THE BLOWER SPEED CONTROL RESISTANCE

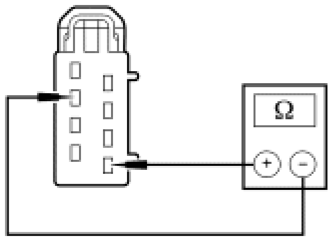

Fig. 271: Checking Blower Speed Control
Courtesy of FORD MOTOR CO.

NOTE:	**The ohmmeter must be connected with the positive lead to pin 7 and the negative lead to pin 4 when measuring. Ohmmeter leads incorrectly connected will result in false readings and lead to incorrect identification of components that are not faulty.**

- Measure the resistance between backrest TED C3310 pin 7 and pin 4, component side.
- **Is the resistance between 290K ohms and 420K ohms?**

  YES : Go to AF14.

  NO : INSTALL a new backrest TED. REFER to **Seat Backrest Thermo-Electric Device**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

AF14 CHECK THE TED INSTALLATION AND FOR CRUSHED SEAT BACKREST

- Remove the seat. Refer to **Seat - Front**.
- Remove the seat backrest trim cover. Refer to **Seat Backrest Cover - Front, Without Fold Flat**.
- Inspect the seat backrest for the following:
  - Is the TED correctly installed?
  - Is the seat backrest foam pad crushed or restricted?
  - Is the climate controlled seat manifold crushed or restricted?
- **Is the TED correctly installed and are there no signs of damage to the foam pad and manifold?**

  YES : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

  DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NO : CORRECTLY install the backrest TED or INSTALL a new seat backrest foam pad and/or climate controlled seat manifold. REPEAT the self-test. CLEAR the DTCs.

DISCONNECT the battery ground cable. CONNECT driver seat side air bag module C327. CONNECT passenger seat side air bag module C313. REPOWER the SRS. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Pinpoint Test AG: A Single Climate Controlled Seat is Inoperative - Switch Indicators May or May Not Illuminate

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Climate Controlled Seats for schematic and connector information.

Normal Operation

Both the driver and front passenger climate controlled seats are independently controlled electronically by the dual climate controlled seat module (DCSM) mounted to the bottom of the passenger seat cushion. The climate controlled seat system only operates with the engine running, however, if using a scan tool to command the DCSM, diagnostic testing can be carried out with the ignition switch key ON engine OFF (KOEO). The system receives voltage from battery junction box (BJB) fuse 12 (30A) supplying battery voltage on circuit SBB12 (GN/RD) into DCSM C3305a pin F. The system also receives voltage from BJB fuse 11 (30A) supplying battery voltage on circuit SBB11 (BU/RD) into DCSM C3305a pin E. If voltage is disconnected from either pin E or F of DCSM C3305a with the voltage connection remaining on the other circuit, both seats will remain operational because the voltage supply circuits are connected internally in the DCSM. However, if a fault occurs setting a DTC specific to either climate controlled seat, only the affected seat will be disabled by the module and the other will remain operational.

Each driver and front passenger seat cushion is equipped with a thermo-electric device (TED) assembly that includes a seat blower (fan motor, serviced as an assembly with the TED). Similarly, each driver and front passenger seat backrest is also equipped with its own TED assembly with blower. Cabin air is drawn through the blower and distributed to each of the TED modules located in the seat cushion and backrest. The TEDs then heat or cool the air. The air is then directed into the foam pad and manifold where it is distributed along the surface of the cushion and backrest of the seat. Once the system is activated, the DCSM uses a set of flexible algorithms to control the heating/cooling modes and the blower speed dependent on the HVAC module seat switch settings.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Medium-speed controller area network (MS-CAN)
- HVAC module
- DCSM

PINPOINT TEST AG: A SINGLE CLIMATE CONTROLLED SEAT IS INOPERATIVE - SWITCH INDICATORS MAY OR MAY NOT ILLUMINATE

NOTE:	**The air bag warning indicator illuminates when the correct restraints control**

module (RCM) fuse is removed and the ignition switch is ON.

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

AG1 CHECK OPERATION OF BOTH CLIMATE CONTROLLED SEATS AND VERIFY THE SYMPTOM

- Check the operation of both climate controlled seats and verify the symptom.
- **Is only a single climate controlled seat inoperative?**

  YES : Go to AG2.

  NO : If both seats are inoperative Go to **Symptom Chart**.

AG2 CHECK FOR DCSM AND HVAC DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self-Test/DCSM Retrieve DTCs
- Enter the following diagnostic mode on the diagnostic tool: Self-Test/HVAC Retrieve DTCs
- **Were any DTCs retrieved during the self-tests?**

  YES : For DCSM DTCs, go to the Dual Climate Controlled Seat Module (DCSM) DTC Chart.

  For HVAC DTCs, REFER to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article to diagnose the HVAC module fault.

  NO : Go to AG3.

AG3 CHECK OPERATION OF THE DCSM USING PIDs

NOTE: **The purpose of this step is to verify the DCSM is able to receive and process inbound command messages from the communication bus and demonstrate if the DCSM is operational. This indicates the HVAC module may not be sending the commands correctly.**

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM

  Driver Seat

  - Seat cushion thermal electric device temperature (CSHTEMP)
  - Seat back thermal electric device temperature (BK_TEMP)
  - Climate-controlled seat heat command (TED_HEAT_D)

  Front Passenger Seat

  - Passenger Cushion Thermal Electric Device (TED) Temperature (PCSHTMP)
  - Passenger Back TED Temperature (PBKTMP)
  - Passenger TED Heat Mode (TED_HEAT_P)

NOTE: The DCSM active commands TED_HEAT_D (driver seat) and TED_HEAT_P (passenger seat) are limited to 15 seconds in the ON state, then turn OFF.

- Operate the affected climate controlled seat using the active command while monitoring the appropriate PIDs for that seat.
  - When the command is in process the TED temperature PIDs on the affected seat should momentarily increase. If no temperature increase is noted, remove the cushion blower filter and repeat the active command while physically monitoring the cushion blower for fan movement.
- **Do the PID states or cushion blower movement indicate climate controlled seat operation when using the active command?**

  YES : Go to AG4.

  NO : INSTALL a new DCSM and CARRY OUT programmable module installation (PMI). REFER to **Dual Climate Controlled Seat Module (DCSM)**. REPEAT the self-test. CLEAR the DTCs.

AG4 USE THE HVAC SWITCH AND MONITOR THE DCSM PID FOR A RESPONSE

- Enter the following diagnostic mode on the diagnostic tool: DataLogger/DCSM
  - Driver State Seat Mode (DCCSMOD) (driver seat)
  - Passenger State Seat Mode (PCCSMOD) (passenger seat)
- Key in START position.

NOTE: Operation of the climate controlled seats repeatedly ON and OFF or repeatedly switching between heat and cool modes may cause DCSM DTCs to set, disabling one or both seat system and may require DTCs to be cleared before seat operation may continue. It is recommended to allow time between modes for seat temperatures to return toward ambient temperatures before continuing.

- Attempt to operate the affected climate controlled seat in all modes using the appropriate switch on the HVAC while monitoring the DCSM PID DCCSMOD (driver seat) or PCCSMOD (passenger seat).
- **Do all the PID states match the climate controlled seat settings selected on the HVAC module?**

  YES : If the fault is intermittent, CHECK for causes of the intermittent fault. INSPECT the connectors, terminals and wiring. ATTEMPT to recreate the fault by flexing the wire harness and operating the system. CHECK the electrical connectors for corrosion, poor pin contact or pushed-out pins. REPAIR any intermittent concerns found and TIGHTEN any loose DCSM connector pins. REPEAT the self-test. CLEAR the DTCs.

  NO : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. REPEAT the self-test. CLEAR the DTCs.

Component Test

Component Testing - Thermo-electric Device (TED) Cooling Performance

NOTE: This test is intended to check the cooling mode performance of an operational climate controlled seat backrest or cushion thermo-electric device (TED) and verify it is cooling inlet air at the TED (ambient cabin air) between 6-8°C (10-14° F).

NOTE: Make sure the vehicle is out of direct sunlight and is in an area with a stable air temperature when testing the climate controlled seat system.

NOTE: For correct temperature measurements, the seat being tested should be occupied.

1. Enter DataLogger and monitor the following DCSM PIDs:
    - CSHTEMP (Seat cushion thermal electric device temperature)
    - BK_TEMP (Seat back thermal electric device temperature)
    - PCSHTMP (Passenger Cushion Thermal Electric Device [TED] Temperature)
    - PBKTMP (Passenger Back TED Temperature)
    - DCCSMOD (Driver State Seat Mode)
    - PCCSMOD (Passenger State Seat Mode)
2. Any initial PID value of greater than 205°C (401°F) or less than 2°C (36°F) indicates a system hardware failure. Do not proceed with this test. Go to **Symptom Chart** or Dual Climate Controlled Seat Module (DCSM) DTC Chart for diagnosis.

    NOTE: Typical backrest and cushion TED shown, others similar.

3. Gain access to the seat backrest and cushion TEDs and use a suitable thermo-couple temperature measuring device to monitor the air inlet temperature.
    - Access the backrest TED.
        - Release the backrest trim cover J-clips at the sides and bottom.
        - Pull out at the bottom and detach the 2 lower hard back panel pin-type retainers.
        - Position the backrest trim cover out of the way.
    - Place the temperature probe near each TEDs air filter.

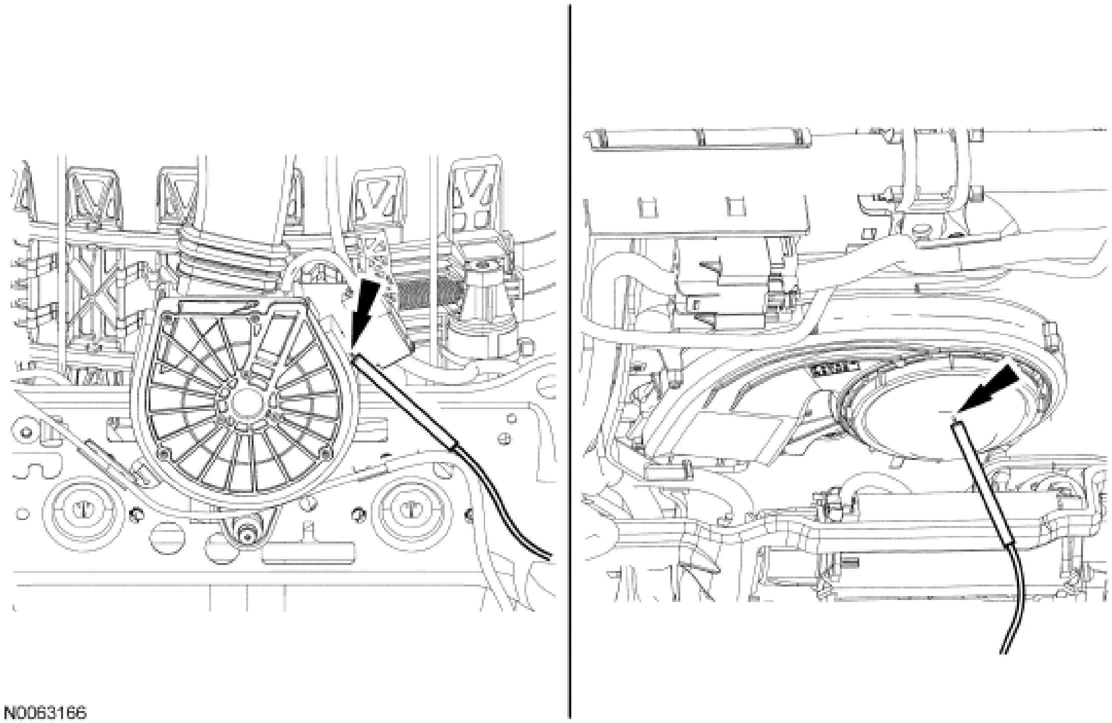

Fig. 272: Using Scan Tool To Measure Cushion TED PID Temperature
Courtesy of FORD MOTOR CO.

NOTE: The engine must be running to operate the climate controlled seat system and carry out this test.

4. Operate system in high cool mode and measure the temperature at the cushion TED filter using the thermo-couple device.
    - Obtain and record the air inlet temperature at the TED.
5. Use a scan tool to measure the cushion TED PID temperature and record the value.
    - Monitor the MODE PID and verify the system is operating. If during testing the PID value changes to Blower Only state, the system has entered into recovery mode and voltage to the TEDs is disabled. If this occurs, the seat has failed the test. Do not continue. Return to the diagnostic routine.
6. Subtract the cushion TED PID temperature from the cushion air inlet temperature and record the temperature difference value.
7. Continue to operate the system in high cool mode and use the thermo-couple device to measure the temperature at the backrest TED filter.
    - Obtain and record the air inlet temperature at the TED.
        - Secure the temperature probe at the backrest TED air filter and close the backrest trim cover before measuring.
8. Use a scan tool to measure the backrest TED PID temperature and record the value.
    - Monitor the MODE PID and verify the system is operating. If during testing the PID value changes to Blower Only state, the system has entered into recovery mode and voltage to the TEDs is

disabled. If this occurs, the seat has failed the test. Do not continue. Return to the diagnostic routine.

9. Subtract the backrest TED PID temperature from the backrest air inlet temperature and record the value.
10. Compare the cushion and backrest calculated temperature values. Both values should be between 6°-8°C (10.8°-14.4°F) and approximately equal (±1°C [±1.8°F]).
11. If the calculated temperature values are not within these specifications, check the climate controlled seat components for air duct or filter restrictions, blockages, duct or electrical disconnections and for incorrect assembly. Repair as needed. If OK, carry out the DCSM self-test and if any DTC is retrieved, go to Dual Climate Controlled Seat Module (DCSM) DTC Chart for diagnostic direction. Return to the diagnostic routine.

GENERAL PROCEDURES

MEMORY POSITION PROGRAMMING

Programming Memory Positions

NOTE: Memory positions can be stored at any time.

NOTE: Verify good battery condition before diagnosing the memory seat system. Poor battery condition may interfere with memory seat operation, even if vehicle starting is possible.

NOTE: To program the Remote Keyless Entry (RKE) transmitter, refer to HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS article.

1. To set memory position(s) move the memory driver seat, memory exterior mirrors (if equipped), memory adjustable pedals (if equipped) and memory tilt steering column (if equipped) to the preferred position using the appropriate switch(es).

NOTE: Once the memory SET switch button is pressed, there is a 5-second time limit to input a memory position. If a memory position input is not received within the time limit, the operation is aborted and the memory SET switch LED (if equipped) is turned OFF.

NOTE: If one of the following other inputs is received during the time limit, the operation is aborted and the memory SET switch LED (if equipped) is turned OFF:

- **Driver seat control switch**
- **Memory SET switch button**
- **Adjustable pedal control switch (if equipped)**
- **Exterior mirror control switch (if equipped)**
- **Power tilt steering column switch (if equipped)**

2. Press the memory SET switch button, activating the memory SET switch LED (if equipped).
3. Within 5 seconds (before the LED goes out) (if equipped), press memory SET switch button 1 or 2.
4. Repeat Steps 1 through 3 to initiate another memory position setting.

Recalling a Stored Memory Position

NOTE: **A memory recall can be initiated only if the vehicle is in PARK or NEUTRAL gear and the ignition switch is not in START. A memory recall in progress will not be affected by moving the ignition switch to START or by moving the gearshift lever out of PARK or NEUTRAL.**

NOTE: **Input from the driver seat control switch, memory SET switch, adjustable pedal control switch (if equipped), exterior mirror control switch (if equipped) or power tilt steering column switch (if equipped) during a memory recall will abort the memory recall.**

1. The driver can recall the desired memory driver seat, memory exterior mirror (if equipped), memory adjustable pedal (if equipped) and memory tilt steering column (if equipped) positions by depressing either memory SET switch button 1 or 2. Depressing memory SET switch button 1 will initiate a recall of the positions stored for Memory 1. Depressing memory SET switch button 2 will initiate a recall of the positions stored for Memory 2.

REMOVAL AND INSTALLATION

SEAT - FRONT

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

NOTE: **Passenger seat shown, driver seat similar.**

NOTE: **The seat track-to-floor bolts must be tightened in the sequence described in this procedure.**

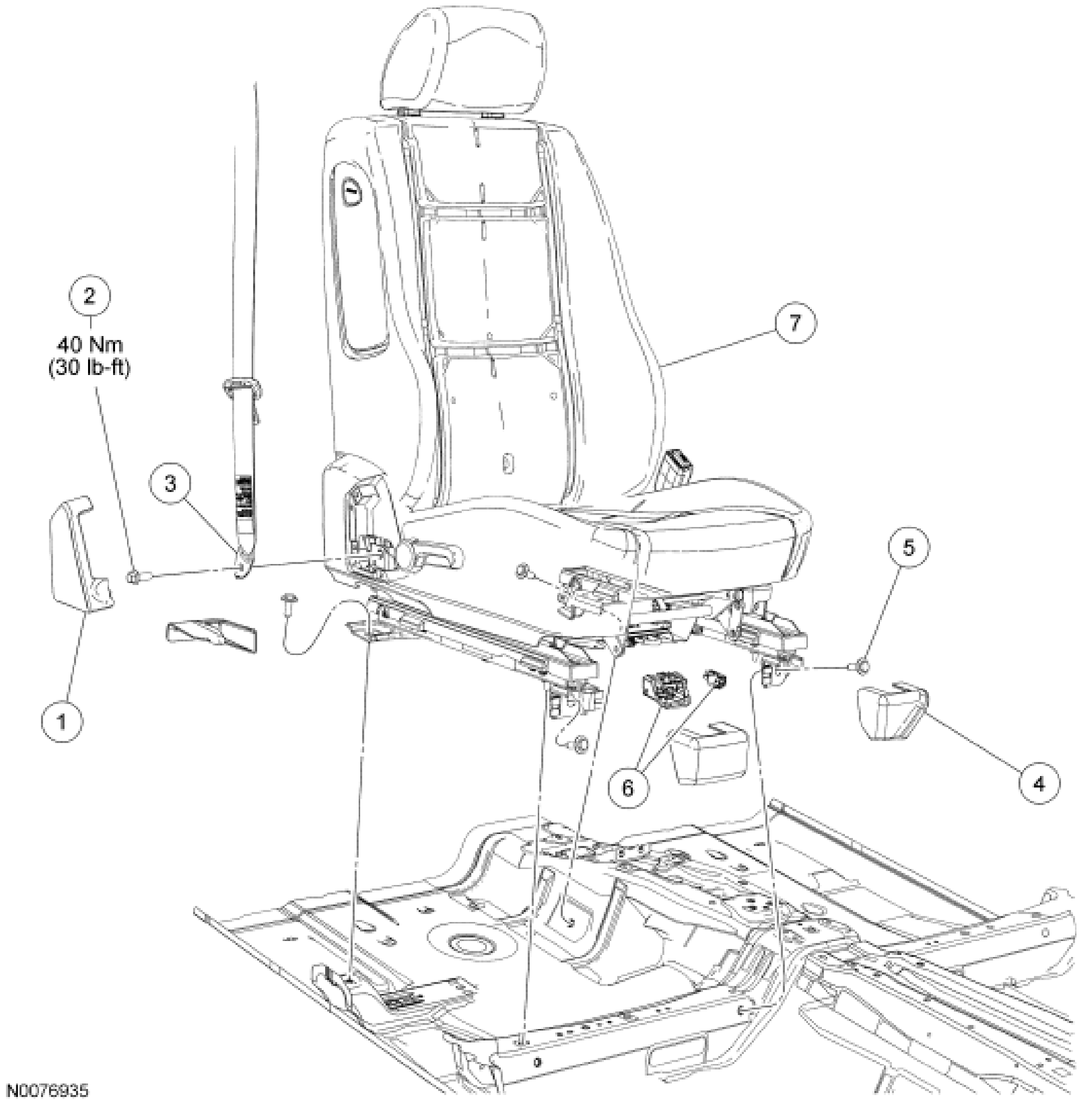

Fig. 273: Exploded View Of Front Seat With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	621A44	Safety belt retractor belt anchor bolt cover (part of 62184) (passenger only)
2	W505274	Safety belt retractor belt anchor bolt (passenger only)
3	-	Safety belt retractor belt anchor (part of 611B08) (passenger only)
4	-	Seat-to-floor bolt cover (4 required)
5	W707858	Seat-to-floor bolt (4 required)
6	-	Electrical connectors (part of 14A698)
7	-	Front seat assembly

REMOVAL

WARNING: Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTE: The air bag warning lamp illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

Seats without fold-flat backrest

1. Remove the head restraint.
    1. Using an appropriate tool, push in the hole while lifting up and release the head restraint from the head restraint guide.
    2. Push in on the head restraint guide release tab and remove the head restraint.

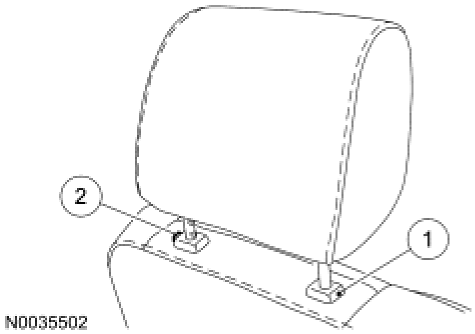

Fig. 274: Identifying Head Restraint Guide Release Tabs
Courtesy of FORD MOTOR CO.

Seats with fold-flat backrest

2. Fold the seat backrest down to the fold-flat position.

Passenger seat

3. Remove the safety belt retractor belt anchor bolt cover from the cushion side shield to access the safety belt anchor bolt.
    - If equipped with power seats, position the passenger seat track downward to access the safety belt retractor anchor bolt.
4. Remove the bolt and separate the safety belt anchor from the seat.

All seats

5. Position the seat to gain access to all 4 seat-to-floor bolts.
    - If equipped with power seats, fully raise the seat to aid seat service.
6. Depower the SRS. For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
7. Remove the 4 seat track-to-floor bolt covers and bolts.
8. Lift the seat to disengage to 2 locator pins from the floor and tip the seat to access the electrical connectors.

WARNING: **Use care when handling the front passenger seat and track assembly. Dropping the assembly, placing excessive weight on or sitting on a front passenger seat that is not secured in the vehicle may result in damaged seat components. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.**

9. Disconnect the seat harness electrical connectors and remove the seat.
    - If equipped, slide and disengage the side air bag module electrical connector locking clip, release the tab and disconnect the side air bag module electrical connector.

CAUTION: **Use care when disconnecting the seat harness electrical connector. Excessive force on the assurance lever can break the connector mounting.**

- Disconnect the seat harness electrical connector.
    - Release the locking tab and rotate the assurance lever fully to disengage the seat harness electrical connector.
    - Slightly tip the connector away and disconnect.

INSTALLATION

WARNING: **Make sure the front passenger seat is correctly installed and fastened to the vehicle. Do not force the alignment to the floorpan mounting holes. If the seat does not align to the floorpan mounting holes, repair the seat or floorpan as needed. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increase the risk of serious personal injury or death in a crash.**

WARNING: **After any crash, inspect the front passenger seat-to-floorpan mounting area for deformation and restore to its original condition, if deformed. Correct alignment of the occupant classification sensor (OCS) rails to the seat and floorpan is critical for correct OCS system operation. Incorrect operation of the OCS system increases the risk of serious personal injury**

or death in a crash.

Manual seats

1. Align both seat track rails to be flush with the rear edge of the seat track base to synchronize.

   All seats

2. Position the seat in the vehicle.
3. Tip the seat and connect the electrical connectors.
   - Connect the seat harness electrical connector.
     - Make sure the electrical connector assurance lever is in the fully released position.
     - Tip the body harness connector into the seat connector and partially insert.
     - Rotate the assurance lever while pushing the connectors together until the handle is locked.
   - If equipped, connect the side air bag module electrical connector, then slide and engage the side air bag electrical connector locking clip.
4. Align the 2 forward seat mounting locators to the guide holes in the floor and position the seat in place.
5. Install the seat-to-floor bolts by hand and tighten in the following sequence.
   1. Tighten to 47 Nm (35 lb-ft).
   2. Tighten to 47 Nm (35 lb-ft).
   3. Tighten to 47 Nm (35 lb-ft).
   4. Tighten to 47 Nm (35 lb-ft).

Fig. 275: Identifying Seat-To-Floor Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

6. Install the 4 seat-to-floor bolt covers.
   - Make sure the safety belts and buckles are accessible to the occupants after installation.
7. Repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to Supplemental Restraint System (SRS) Depowering and Repowering in the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Seats without fold-flat backrest

8. Install the head restraint.

Passenger seat

NOTE: If equipped with power seats, position the passenger seat track downward for safety belt retractor belt anchor and bolt installation.

9. Position the safety belt retractor belt anchor to the seat and install the bolt.
   - Tighten to 40 Nm (30 lb-ft).
10. Install the safety belt retractor belt anchor bolt cover.
    - Make sure the safety belts and buckles are accessible to the occupants after installation.
    - Make sure the safety belt retractor operates without excessive effort or binding.
11. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT - EXPLODED VIEW, FRONT

1. For additional information, refer to the procedures.

SEAT BACKREST - FRONT, WITHOUT FOLD FLAT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: The air bag warning lamp illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Driver seat shown, passenger seat similar.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the manual height adjust handle, if equipped.
   - Remove the height adjust handle cover.
   - Remove the 2 screws and height adjust handle.
3. Remove the spring clip and manual recliner handle, if equipped.
4. Remove the manual lumbar control knob, if equipped.
   - Adjust the manual lumbar to the full relaxed position.
   - Pull outward and remove the manual lumbar knob.
5. Detach and position aside the cushion side shield.
   - Pull the side shield away from the seat cushion at the front edge and release the forward and side retainers.
   - Pull the side shield rearward to release the rear retainer and position the cushion side shield aside.
     - Return any detached retainers to the side shield.
     - For installation, position the rear retainer clip on the cushion side shield through the hole in the backrest trim cover flap before attaching to the rear edge of the seat.
6. Release the cushion trim cover hook-and-loop strips from the rear corners of the cushion, release the J-clip and detach the push pin to gain access to the backrest recliner to cushion bolts.
7. Release the trim cover hook-and-loop strap from around the safety belt buckle assembly.

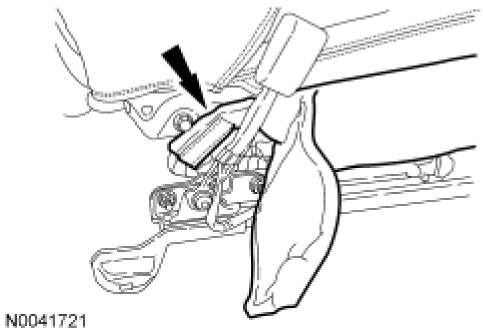

Fig. 280: Locating Trim Cover Hook And Loop Strap
Courtesy of FORD MOTOR CO.

8. Release the 2 trim cover J-clips from the rear of the cushion frame and disconnect the side air bag wiring harness electrical connector.
9. Detach the side air bag wiring harness electrical connector pin-type retainer from the cushion frame.

NOTE: **Electrical connectors vary with power seat options.**

10. Disconnect the backrest power feed electrical connector(s) and route out the wire harness.
    - Release the wire harness retainers.

Seat with manual lumbar

11. Remove the 2 rivets and separate the manual lumbar control from the cushion frame.
12. Detach the lumbar control from the cable and remove.
    - Detach any cable retainers from the cushion frame.
        - Note the manual lumbar cable routing for installation.

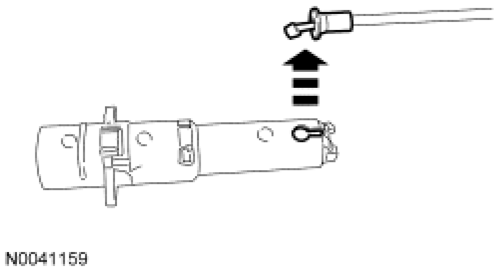

Fig. 281: Removing Cable From Lumbar Control
Courtesy of FORD MOTOR CO.

All seats

13. Remove the 4 recliner-to-cushion frame bolts and remove the backrest assembly.
    - Route out the wire harness(es) and manual lumbar cable, if equipped.

    - Note routing for installation.
  - To install, tighten to 55 Nm (41 lb-ft).

14. To install, reverse the removal procedure.
15. Install the front seat and repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat

16. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT BACKREST - FRONT, WITH FOLD FLAT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **The air bag warning lamp illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

NOTE: **Only the front passenger seat can come equipped with optional fold-flat backrest.**

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the spring clip and manual recliner handle.
3. Remove the cushion side shield in the following sequence.

   1. Pull out on the side and rear of the cushion side shield, releasing the retainers.
   2. Separate the wire harness pin-type retainers from the cushion side shield.
   3. Remove the cushion side shield.
4. Remove the RH recliner outboard cover retainer cover.
5. Pull the head of the RH recliner outboard cover retainer up to release, then remove the retainer.

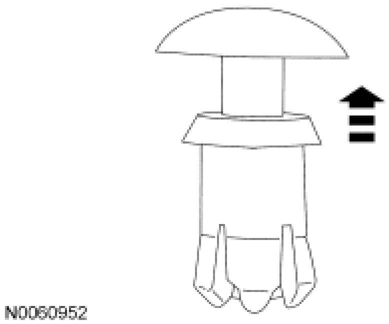

Fig. 282: Pulling Head Of Recliner Outboard Cover Retainer Up To Release
Courtesy of FORD MOTOR CO.

6. Remove the RH recliner outboard cover in the following sequence.
   1. Pull out on the RH recliner outboard cover at the front and rear to release the cover retainers and at the bottom, pull the cover away from the recliner.
   2. Slide the RH recliner outboard cover back to separate from the recliner.
7. Route out the side air bag wire harness and remove the RH recliner outboard cover.

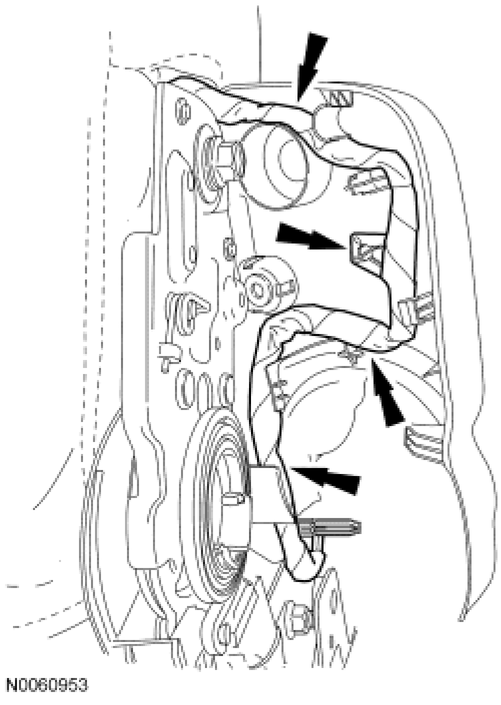

Fig. 283: Locating RH Recliner Outboard Cover
Courtesy of FORD MOTOR CO.

8. Separate the cable at the RH recliner in the following sequence.
    1. Release the cable housing from the RH recliner.
    2. Separate the cable from the RH recliner.
9. Pull the head of the LH recliner outboard cover retainer up to release, then remove the retainer.

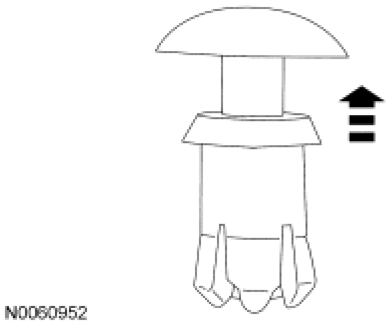

Fig. 284: Pulling Head Of Recliner Outboard Cover Retainer Up To Release
Courtesy of FORD MOTOR CO.

10. Remove the LH recliner outboard cover in the following sequence.
    1. Pull out on the LH recliner outboard cover at the front and rear to release the cover retainers and at the bottom, pull the cover away from the recliner.
    2. Slide the LH recliner outboard cover back to separate from the recliner.
        - If not equipped with heated seats, remove the LH recliner outboard cover.

Seats with heat

11. Route out the heated seat wire harness and remove the LH recliner outboard cover.

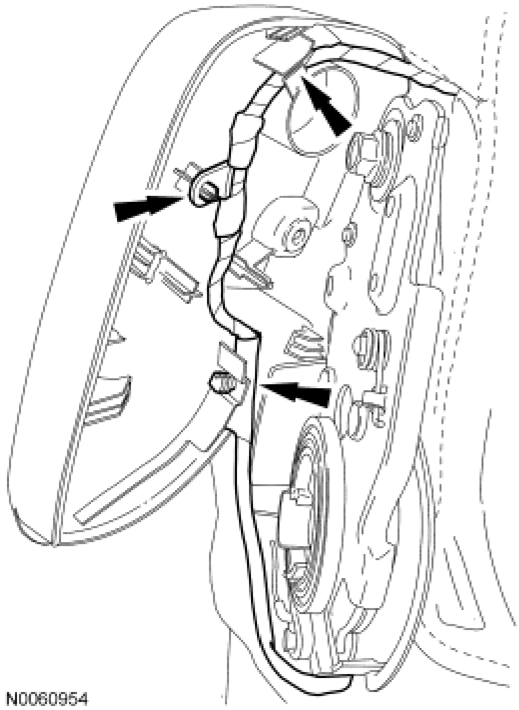

Fig. 285: Locating LH Recliner Outboard Cover
Courtesy of FORD MOTOR CO.

All seats

12. Release the cushion trim cover retainer from around the safety belt buckle and separate the hook-and-loop strip.

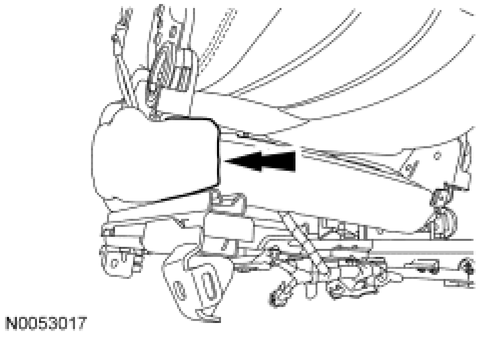

Fig. 286: Locating Cushion Trim Cover Retainer
Courtesy of FORD MOTOR CO.

13. Separate the cable at the LH recliner in the following sequence.
    1. Separate the cable from the LH recliner.
    2. Squeeze the cable housing tabs together and separate from the LH recliner.
14. Release the first cushion trim cover J-clip from the rear of the cushion frame.
15. Disconnect and detach the electrical connectors.

- Slide and disengage the side air bag module electrical connector locking clip, release the tab and disconnect the side air bag module electrical connector. Detach any pin-type retainers.
- If equipped, disconnect the heated seat electrical connector and detach any pin-type retainers.

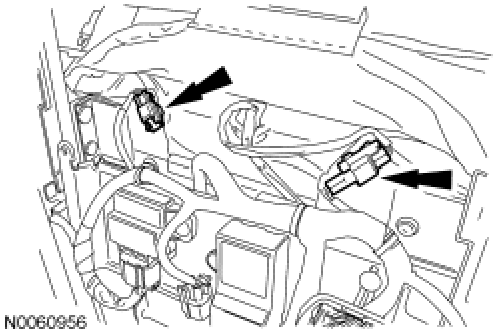

Fig. 287: Locating Heated Seat Electrical Connector & Pin-Type Retainers
Courtesy of FORD MOTOR CO.

16. Detach and route out the side air bag wire harness.

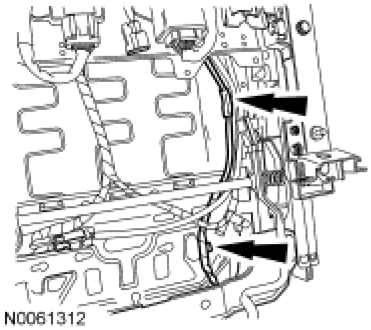

Fig. 288: Locating Side Air Bag Wire Harness
Courtesy of FORD MOTOR CO.

17. Route out the side air bag wire harness from the seat track and cushion.

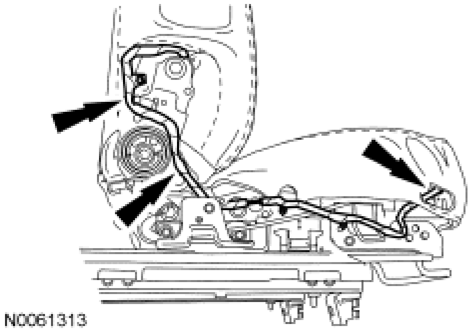

Fig. 289: Locating Side Air Bag Wire Harness From Seat Track & Cushion
Courtesy of FORD MOTOR CO.

All seats

18. Remove the 4 recliner-to-cushion frame bolts and remove the backrest assembly.
    - To install, tighten to 55 Nm (41 lb-ft).
19. To install, reverse the removal procedure.
20. Install the front seat and repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.
21. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT BACKREST COVER - FRONT, WITHOUT FOLD FLAT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

WARNING: **Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: The air bag warning lamp illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without**

Fold Flat.

3. Detach the side air bag bolt cover.

NOTE: Note the position of the side air bag module locator hook in the side air bag module bracket (on the seat back frame) for installation.

4. Remove the bolt and lift up and out to detach the side air bag module from the seat backrest.
    - To install, tighten to 10 Nm (89 lb-in).
5. Slide and disengage the side air bag module electrical connector locking clip, and then release the tab and disconnect the side air bag module electrical connector and remove the side air bag module.
6. Detach the 2 pin-type retainers and trim cover flaps from the recliners.

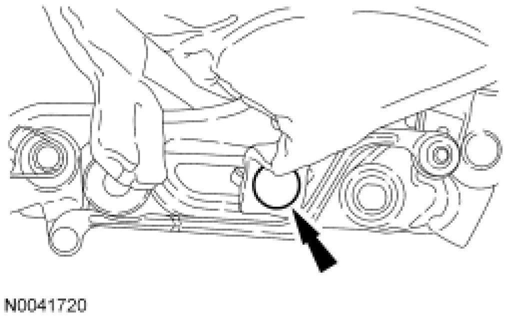

Fig. 290: Locating Pin-Type Retainers
Courtesy of FORD MOTOR CO.

CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

7. Release the outer and inner backrest trim cover lower J-clips and partially invert the trim cover to the hook-and-loop strips.

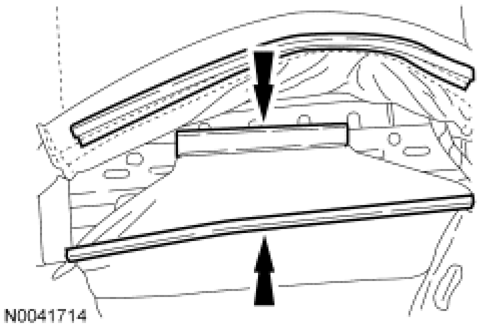

Fig. 291: Locating Outer And Inner Backrest Trim Cover Lower J-Clips
Courtesy of FORD MOTOR CO.

NOTE: The head restraint guides are not interchangeable. Note location for

installation.

8. Reach up into the backrest and squeeze the head restraint guide ends together to release. Pull the 2 head restraint guides out of the backrest frame.

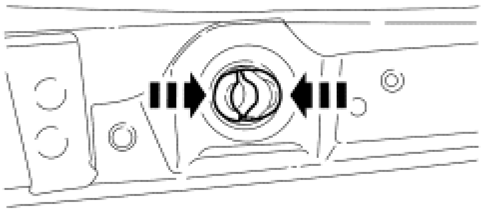

Fig. 292: Removing Head Restraint Guides From Backrest Frame
Courtesy of FORD MOTOR CO.

9. Remove all rows of hog rings from the backrest trim cover and separate the hook-and-loop strips while inverting the trim cover up the backrest.
10. Remove the rear upper hog rings and backrest trim cover.
    - To install, make sure the climate controlled seat backrest manifold is correctly aligned to the foam pad, if equipped.

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Inspect the seat side air bag module and mounting surfaces for any damage or foreign material before installing the seat side air bag module. If any damage is found, install new components. If any foreign material is found, remove it. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

NOTE: **A backrest trim cover for a seat with a side air bag module is different than a backrest trim cover for a seat without a side air bag module. Make sure the correct backrest trim cover is being installed.**

11. To install, reverse the removal procedure.
12. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold**

Flat.

13. Install the front seat and repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat

14. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT BACKREST COVER - FRONT, WITH FOLD FLAT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

NOTE: If a side air bag deployment took place, a new side air bag module and bolt must be installed. The side air bag module bracket on the backrest frame should be inspected and replaced if necessary.

NOTE: The air bag warning lamp illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Only the front passenger seat can come equipped with optional fold-flat backrest.

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Fold the seat backrest down to the fold-flat position.
3. Remove the spring clip and manual recliner handle.
4. Remove the cushion side shield in the following sequence.
    1. Pull out on the side and rear of the cushion side shield, releasing the retainers.
    2. Separate the wire harness pin-type retainers from the cushion side shield.
    3. Remove the cushion side shield.
5. Remove the RH recliner outboard cover retainer cover.
6. Pull the head of the RH recliner outboard cover retainer up to release, then remove the retainer.

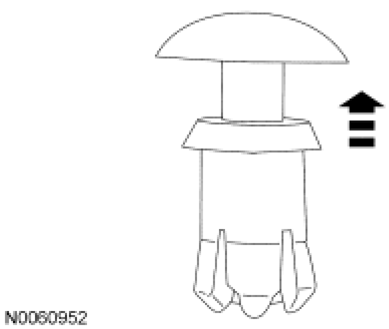

Fig. 293: Pulling Head Of Recliner Outboard Cover Retainer Up To Release
Courtesy of FORD MOTOR CO.

7. Remove the RH recliner outboard cover in the following sequence.
    1. Pull out on the RH recliner outboard cover at the front and rear to release the cover retainers and at the bottom, pull the cover away from the recliner.
    2. Slide the RH recliner outboard cover back to separate from the recliner.
8. Route out the side air bag wire harness and remove the RH recliner outboard cover.

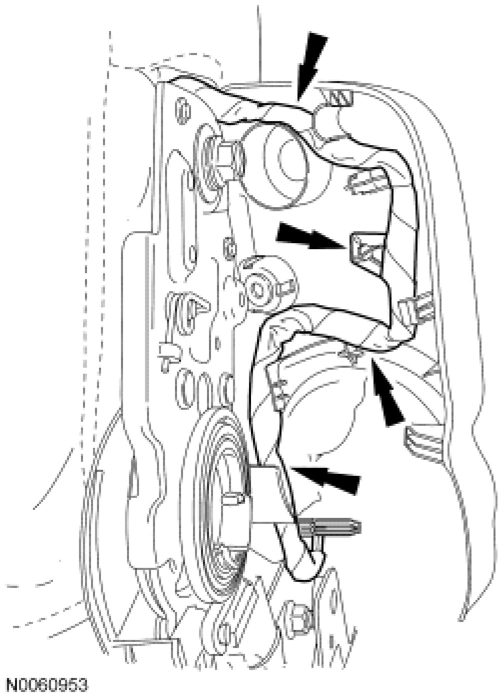

Fig. 294: Locating RH Recliner Outboard Cover
Courtesy of FORD MOTOR CO.

9. Pull the head of the LH recliner outboard cover retainer up to release, then remove the retainer.

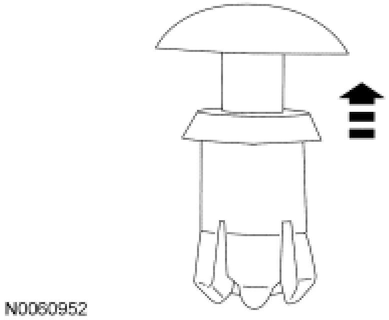

Fig. 295: Pulling Head Of Recliner Outboard Cover Retainer Up To Release
Courtesy of FORD MOTOR CO.

10. Remove the LH recliner outboard cover in the following sequence.
    1. Pull out on the LH recliner outboard cover at the front and rear to release the cover retainers and at the bottom, pull the cover away from the recliner.
    2. Slide the LH recliner outboard cover back to separate from the recliner.
        - If not equipped with heated seats, remove the LH recliner outboard cover.
11. If equipped with heated seats, route out the heated seat wire harness and remove the LH recliner outboard cover.

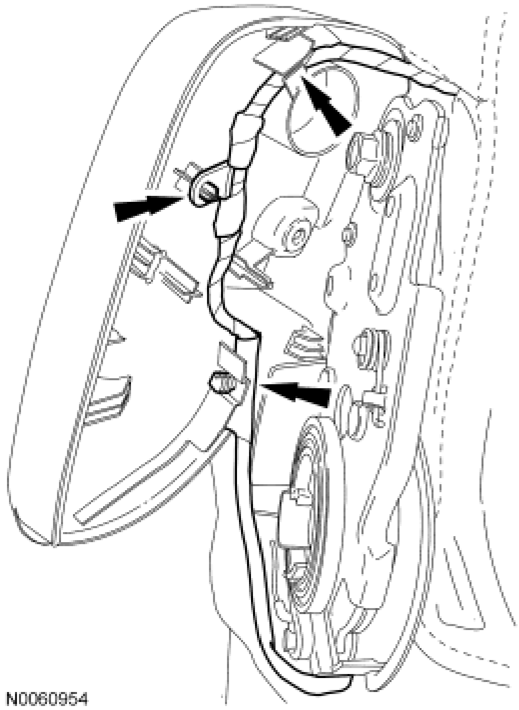

Fig. 296: Locating LH Recliner Outboard Cover
Courtesy of FORD MOTOR CO.

12. Release the cushion trim cover retainer from around the safety belt buckle and separate the hook-and-loop strip.

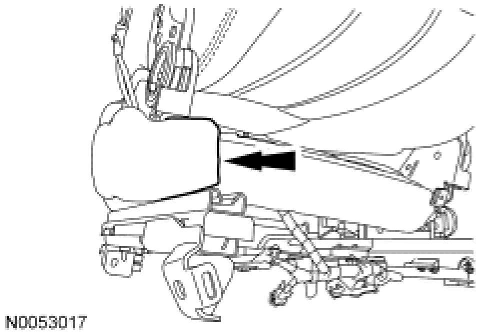

Fig. 297: Locating Cushion Trim Cover Retainer
Courtesy of FORD MOTOR CO.

13. Release the first cushion trim cover J-clip from the rear of the cushion frame.
14. Disconnect and detach the electrical connectors.
    - Slide and disengage the side air bag module electrical connector locking clip, release the tab and disconnect the side air bag module electrical connector. Detach any pin-type retainers.
    - If equipped, disconnect the heated seat electrical connector and detach any pin-type retainers.

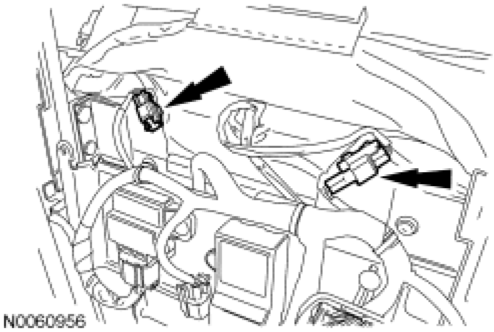

Fig. 298: Locating Heated Seat Electrical Connector & Pin-Type Retainers
Courtesy of FORD MOTOR CO.

15. Detach the side air bag bolt cover.
16. Remove the bolt, lift up and out to separate the side air bag module from the seat backrest.
17. Slide and disengage the side air bag module electrical connector locking clip, release the tab and disconnect the side air bag module electrical connector.
18. Detach and route out the side air bag wire harness.

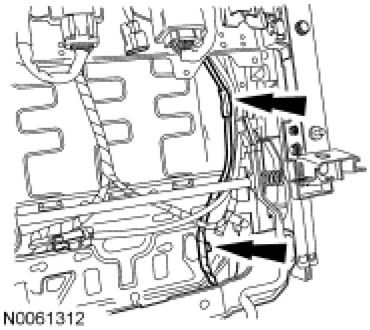

Fig. 299: Locating Side Air Bag Wire Harness
Courtesy of FORD MOTOR CO.

19. Route out the side air bag wire harness from the seat track and cushion.

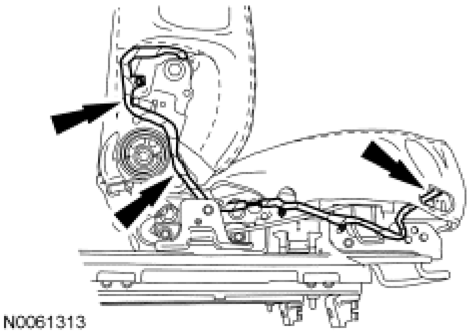

Fig. 300: Locating Side Air Bag Wire Harness From Seat Track & Cushion
Courtesy of FORD MOTOR CO.

20. Remove the 4 recliner-to-backrest frame bolts and remove the backrest assembly.
21. Remove the head restraint.
    1. Using an appropriate tool, push in the hole while lifting up and release the head restraint from the head restraint guide.
    2. Push in on the head restraint guide release tab and remove the head restraint.

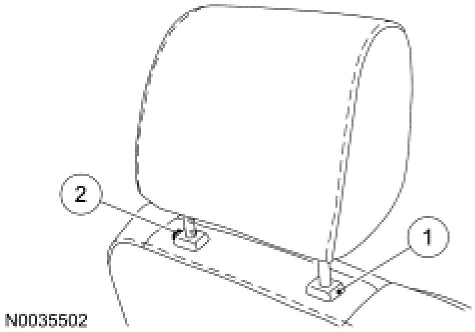

Fig. 301: Identifying Head Restraint Guide Release Tabs
Courtesy of FORD MOTOR CO.

22. Release the outer and inner backrest trim cover lower J-clips.

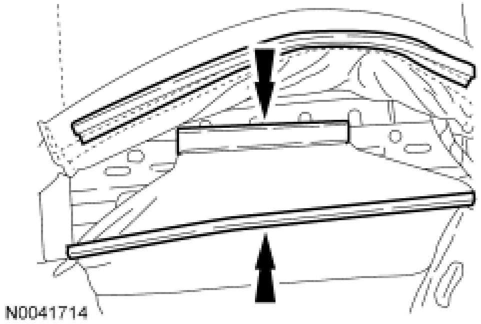

Fig. 302: Locating Outer And Inner Backrest Trim Cover Lower J-Clips
Courtesy of FORD MOTOR CO.

23. Separate the hook-and-loop strips on each side, at the bottom of the backrest trim cover.

CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

24. Place a hand between the backrest trim cover and backrest foam pad and carefully separate the hook-and-loop strips.
25. Invert the backrest trim cover to the hog rings.
26. Remove the hog rings attaching the backrest trim cover to the backrest foam pad in front and the backrest frame wire in the rear.
    - Feed the side air bag wire harness through the side of the backrest trim cover.

- If equipped with heat, feed the wire harness through the side of the backrest trim cover.

27. Invert the backrest trim cover up as far as it will go.
28. Remove the pin-type retainers and the hard back panel.

NOTE: The head restraint guides are not interchangeable. Note location for installation.

29. Reach up into the backrest and squeeze the head restraint guide ends together to release. Pull the 2 head restraint guides out of the backrest frame.

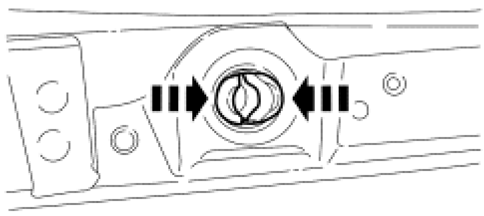

Fig. 303: Removing Head Restraint Guides From Backrest Frame
Courtesy of FORD MOTOR CO.

30. Remove the backrest trim cover.

INSTALLATION

1. Position the backrest trim cover to the backrest foam pad.

NOTE: The head restraint guides are not interchangeable.

2. Install the 2 head restraint guides through the backrest trim cover and into the backrest frame.
3. Position the hard back panel and install the pin-type retainers.
4. Roll the backrest trim cover down and install hog rings attaching the backrest trim cover to the backrest foam pad in front and the backrest frame wire in the rear.
   - Feed the side air bag wire harness through the side of the backrest trim cover.
   - If equipped with heat, feed the wire harness through the side of the backrest trim cover.
5. Attach the hook-and-loop strips at the bottom of the backrest trim cover.
6. Attach the inner and outer backrest trim cover lower J-clips.
7. Install the head restraint.

WARNING: If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air

bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

WARNING: **Inspect the seat side air bag module and mounting surfaces for any damage or foreign material before installing the seat side air bag module. If any damage is found, install new components. If any foreign material is found, remove it. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

8. Connect the side air bag module electrical connector, then slide and engage the side air bag electrical connector locking clip.
9. Install the side air bag module to the mounting bracket on the backrest frame.
   - Position the side air bag module locator hook in the side air bag bracket.
10. Align the bolt hole and install the side air bag bolt.
    - Tighten to 10 Nm (89 lb-in).
11. Install the side air bag bolt cover.
12. Position the backrest assembly and install the 4 recliner-to-backrest frame bolts.
    - Tighten to 55 Nm (41 lb-ft).
13. Route the side air bag wire harness down the side of the seat and through the cushion frame hole.

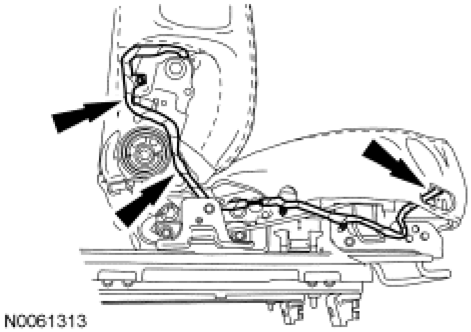

Fig. 304: Locating Side Air Bag Wire Harness From Seat Track & Cushion
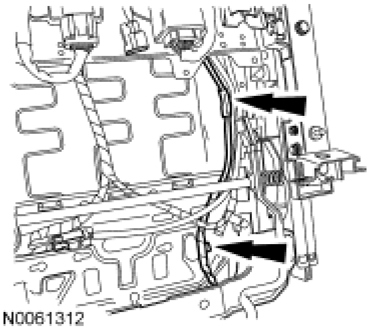
Courtesy of FORD MOTOR CO.

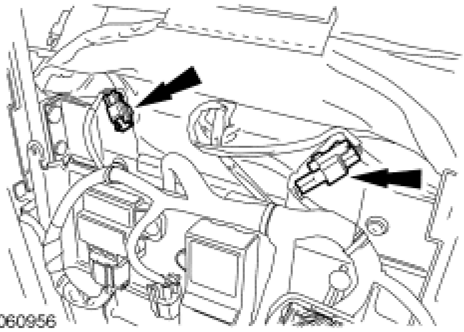
14. Route and attach the side air bag wire harness.



N0061312

Fig. 305: Locating Side Air Bag Wire Harness
Courtesy of FORD MOTOR CO.

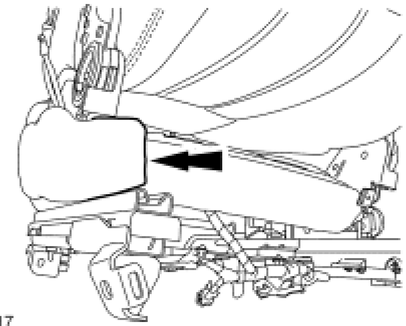
15. Connect the heated seat and side air bag electrical connectors.
    - If equipped, connect the heated seat electrical connector, route the wire harness and attach any pin-type retainers.
    - Connect the side air bag module electrical connector, then slide and engage the side air bag electrical connector locking clip. Route the wire harness and attach any pin-type retainers.



N0060956

Fig. 306: Locating Heated Seat Electrical Connector & Pin-Type Retainers
Courtesy of FORD MOTOR CO.

16. Attach the first cushion trim cover J-clip to the rear of the cushion frame.
17. Attach the hook-and-loop strip and fasten the cushion trim cover around the safety belt buckle.



N0053017

Fig. 307: Locating Cushion Trim Cover Retainer
Courtesy of FORD MOTOR CO.

18. Install the LH recliner outboard cover and retainer to the recliner.
    - If equipped, route the heated seat wire harness to the LH recliner outboard cover.

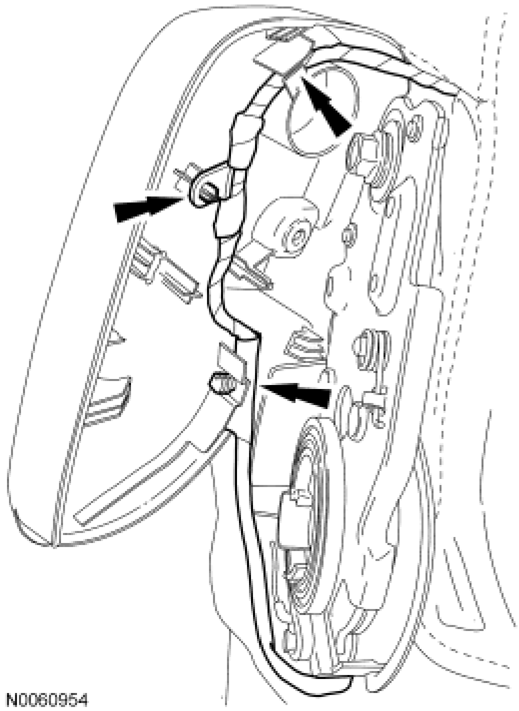


Fig. 308: Locating LH Recliner Outboard Cover
Courtesy of FORD MOTOR CO.

19. Install the RH recliner outboard cover, retainer and retainer cover.
    - Route the side air bag wire harness to the RH recliner outboard cover.

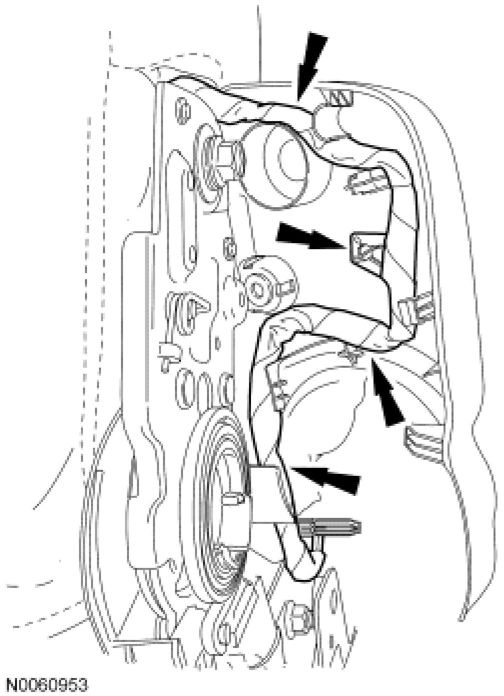

Fig. 309: Locating RH Recliner Outboard Cover
Courtesy of FORD MOTOR CO.

20. Install the cushion side shield.
    - Position the cushion side shield and engage the side and rear retainers.
        - Attach the side air bag wire harness pin-type retainers to the cushion side shield.
21. Put the spring clip on the manual recliner handle. Align it to the recliner and push in, seating the spring clip.
22. Install the front seat and repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.
23. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT CUSHION COVER - FRONT

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat** or **Seat Backrest - Front, With Fold Flat**.

   NOTE: Trim cover J-clip configurations vary with seat option.

3. Release all the remaining J-clips attaching the trim cover to the cushion frame.

   CAUTION: Use care when separating the seat cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.

4. Release the hook-and-loop strips, remove the hog rings (if equipped), separate the cushion trim cover from the cushion foam pad and remove.
5. To install, reverse the removal procedure.
6. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat** or **Seat Backrest - Front, With Fold Flat**.
7. Install the front seat and repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

   Passenger seat

8. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT TRACK

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat** or **Seat Backrest - Front, With Fold Flat**.

Passenger seat with failed horizontal motor

3. To remove the occupant classification sensor (OCS) rails, remove the 2 seat track horizontal drive unit bolts. This will allow the power seat tracks to move manually for access to the 8 OCS rail bolts.

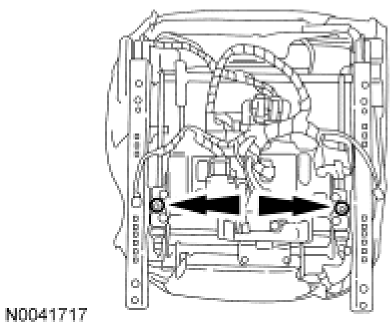

Fig. 310: Locating Bolts
Courtesy of FORD MOTOR CO.

Passenger seat receiving a new seat track

4. Remove the inboard and outboard OCS rails. For additional information, refer to Occupant Classification Sensor in **SUPPLEMENTAL RESTRAINT SYSTEM** article.

Power seat

5. If equipped, disconnect the seat control switch and remove the cushion side shield.

Heated seat

NOTE: Passenger seat shown, driver seat similar.

6. Disconnect the cushion heater mat electrical connector.

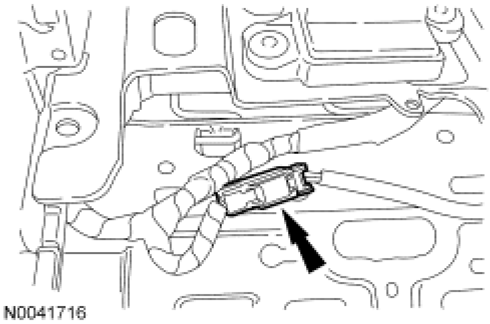

Fig. 311: Locating Cushion Heater Mat Electrical Connector
Courtesy of FORD MOTOR CO.

All seats

7. Detach the hook-and-loop strips from around the safety belt buckle assembly.
8. Detach all wiring harness pin-type retainers from the cushion frame.
9. Release the cushion trim cover J-clips and remove the seat cushion foam pad and cushion trim cover.

Climate controlled seat

CAUTION: Inspect the climate controlled seat cushion manifold and foam pad for crush or obstruction before installation and repair as needed.

NOTE: Covering the thermo-electric device (TED) openings is recommended to prevent foreign material from entering the TED.

10. Disconnect the TED assembly electrical connector.

All seats

11. Remove the 4 cushion frame-to-seat track nuts and separate the cushion frame and seat track.
    - To install, tighten to 36 Nm (27 lb-ft).
12. Detach any remaining wiring harness retainers attached to the cushion frame and remove the seat track.
13. To install, reverse the removal procedure.
14. If a new seat track is installed, install the inboard and outboard OCS rails. For additional information, refer to Occupant Classification Sensor in **SUPPLEMENTAL RESTRAINT SYSTEM** article.
15. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat** or **Seat Backrest - Front, With Fold Flat**.
16. Install the front seat and repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

Passenger seat

17. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT RECLINER MOTOR

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

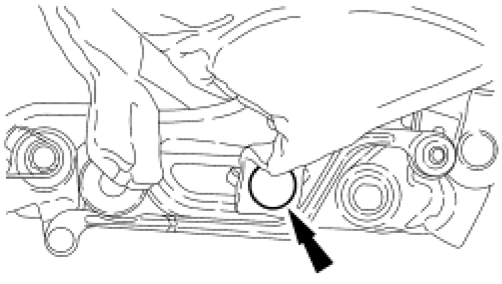
REMOVAL

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: The manual recliners and power recliners are serviced as part of the backrest frame.

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat**.
3. Detach the 2 pin-type retainers and trim cover flaps from the recliners.



N0041720

Fig. 312: Locating Pin-Type Retainers
Courtesy of FORD MOTOR CO.

CAUTION: Use care when separating the seat back trim cover from the hook-

and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

4. Release the 2 outer and inner backrest trim cover lower J-clips, hook-and-loop strips and partially invert the trim cover.

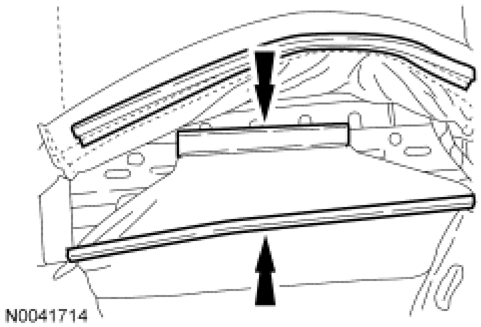


Fig. 313: Locating Outer And Inner Backrest Trim Cover Lower J-Clips
Courtesy of FORD MOTOR CO.

5. Remove the one-way push clip on the RH side of the power recliner. Slide the recliner shaft out from the LH side of the seat enough to clear the RH recliner and power recline motor.
6. Disconnect the electrical connector, remove the screw and the power recline motor.

INSTALLATION

All seats

CAUTION: Avoid rotating the recliner shaft until the recliner is fully installed or the recliners will not be synchronized.

1. Install the recliner motor in the following sequence:
   1. Position the recliner shaft through the recliner motor and RH recliner.
   2. Install a new one-way push clip onto the recliner shaft at the RH recliner.
   3. Slightly turn the recliner motor to align the bolt hole with the hole in the RH recliner and install the recliner motor bolt.
      - Tighten to 6 Nm (53 lb-in).
   4. Connect the recliner motor electrical connector.
2. Roll the backrest trim cover down, attach the hook-and-loop strips and connect the inner and outer backrest trim cover lower J-clips.
3. Attach the 2 pin-type retainers and trim cover flaps to the recliners.
4. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat**.
5. Install the front seat and repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

Passenger seat

6. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT RECLINER - FRONT, WITH FOLD FLAT

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: **The air bag warning lamp illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

NOTE: **Only the front passenger seat can come equipped with optional fold-flat recliners.**

NOTE: **Recliners on seats that do not fold-flat are not serviced separately, they are serviced with the backrest frame.**

LH or RH recliner

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Fold the seat backrest down to the fold-flat position.
3. Remove the spring clip and manual recliner handle.
4. Remove the cushion side shield in the following sequence.
    1. Remove the cushion side shield screw.
    2. Pull out on the side and the rear of the cushion side shield, releasing the retainers.
    3. Remove the cushion side shield.
5. Remove the RH recliner outboard cover in the following sequence.
    1. Remove the scrivet.
    2. Release the clips at the front and rear of the recliner cover.

   3. Remove the RH recliner outboard cover.
6. Separate the cable at the RH recliner in the following sequence.
   1. Release the cable housing from the RH recliner.
   2. Separate the cable from the RH recliner.

RH recliner only

7. Remove the 2 recliner-to-cushion frame bolts, 2 recliner-to-backrest frame bolts and remove the RH recliner.
   - To install, tighten to 55 Nm (41 lb-ft).

LH recliner only

8. Remove the LH recliner outboard cover in the following sequence.
   1. Remove the scrivet.
   2. Release the clips at the front and rear of the recliner cover.
   3. Separate the side air bag module and heated seat (if equipped) wire harnesses from the recliner cover.
   4. Remove the LH recliner outboard cover.
9. Release the cushion trim cover retainer from around the safety belt buckle and separate the hook-and-loop strip.

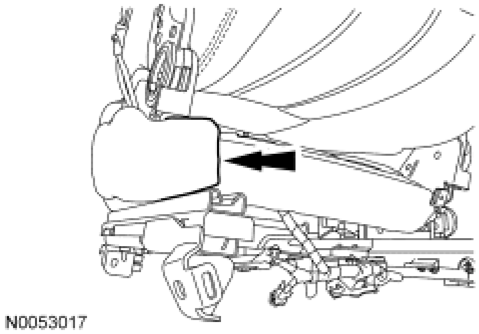

Fig. 314: Locating Cushion Trim Cover Retainer
Courtesy of FORD MOTOR CO.

10. Separate the cable at the LH recliner in the following sequence.
    1. Separate the cable from the LH recliner.
    2. Squeeze the cable housing tabs together and separate from the LH recliner.
11. Remove the 2 recliner-to-cushion frame bolts, 2 recliner-to-backrest frame bolts and remove the LH recliner.
    - To install, tighten to 55 Nm (41 lb-ft).

All seats

12. To install, reverse the removal procedure.
13. Install the front seat and repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.
14. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

LUMBAR ASSEMBLY

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning lamp illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat**.
3. Detach the side air bag bolt cover.

   NOTE: Note the position of the side air bag module locator hook in the side air bag module bracket (on the seat back frame) for installation.

4. Remove the bolt and lift up and out to detach the side air bag module from the seat backrest.
   - To install, tighten to 10 Nm (89 lb-in).
5. Slide and disengage the side air bag module electrical connector locking clip, and then release the tab and disconnect the side air bag module electrical connector and remove the side air bag module.
6. Detach the 2 pin-type retainers and trim cover flaps from the recliners.

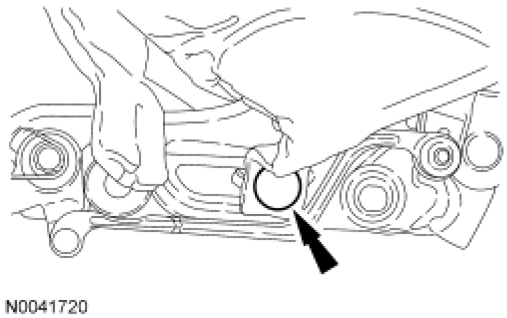

Fig. 315: Locating Pin-Type Retainers
Courtesy of FORD MOTOR CO.

CAUTION: Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

7. Release the 2 outer and inner backrest trim cover lower J-clips and partially invert the trim cover to the hook-and-loop strips.

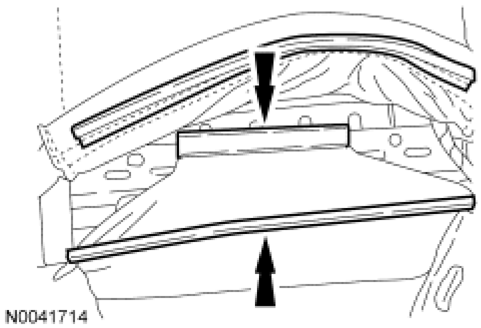

Fig. 316: Locating Outer And Inner Backrest Trim Cover Lower J-Clips
Courtesy of FORD MOTOR CO.

NOTE: The head restraint guides are not interchangeable. Note location for installation.

8. Reach up into the backrest and squeeze the head restraint guide ends together to release. Pull the 2 head restraint guides out of the backrest frame.

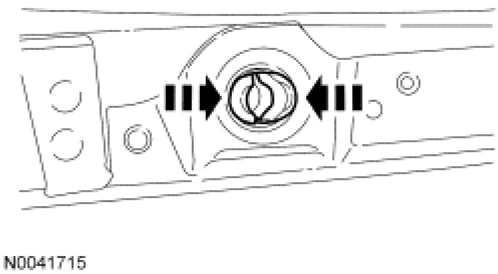

Fig. 317: Removing Head Restraint Guides From Backrest Frame
Courtesy of FORD MOTOR CO.

CAUTION: Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

9. Remove all rows of hog rings from the backrest trim cover and separate the hook-and-loop strips while inverting the trim cover up the backrest.
10. Remove the rear upper hog rings attaching the trim cover to the backrest frame and remove the trim cover.
11. Remove the foam pad from the backrest frame.
    - If equipped with climate controlled seats, remove the hog rings from the upper support spring.
    - If equipped with heated seats, detach pin-type retainer and backrest heater mat wiring harness from the backrest frame.
12. Release the 2 lumbar spring clips from the backrest frame and remove the lumbar.
    - Route out the manual lumbar cable, if equipped.
        - Note the routing of the lumbar cable for installation.
    - Disconnect the electrical connector from the power lumbar motor, if equipped.

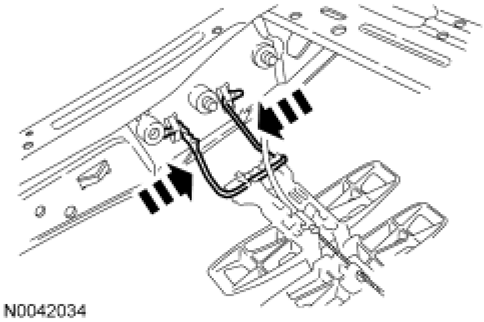

Fig. 318: Releasing Lumbar Spring Clips
Courtesy of FORD MOTOR CO.

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a**

new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

WARNING: **Inspect the seat side air bag module and mounting surfaces for any damage or foreign material before installing the seat side air bag module. If any damage is found, install new components. If any foreign material is found, remove it. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

NOTE: **A backrest trim cover for a seat with a side air bag module is different than a backrest trim cover for a seat without a side air bag module. Make sure the correct backrest trim cover is being installed.**

13. To install, reverse the removal procedure.
14. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat**.
15. Install the front seat and repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat

16. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT BACKREST THERMO-ELECTRIC DEVICE

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: **The air bag warning lamp illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: The backrest thermo-electric device (TED) filter is detachable from the TED assembly housing and can be replaced without TED removal.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat**.
3. Detach the side air bag bolt cover.

NOTE: Note the position of the side air bag module locator hook in the side air bag module bracket (on the seat back frame) for installation.

4. Remove the bolt and lift up and out to detach the side air bag module from the seat backrest.
   - To install, tighten to 10 Nm (89 lb-in).
5. Slide and disengage the side air bag module electrical connector locking clip, and then release the tab and disconnect the side air bag module electrical connector and remove the side air bag module.
6. Detach the 2 pin-type retainers and trim cover flaps from the recliners.

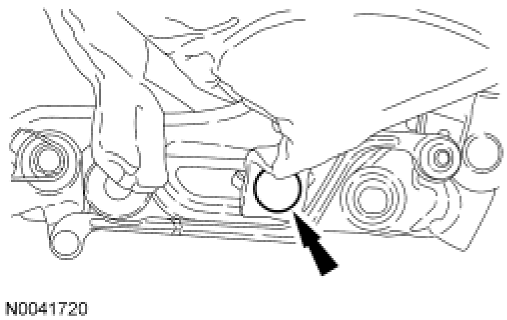

Fig. 319: Locating Pin-Type Retainers
Courtesy of FORD MOTOR CO.

CAUTION: Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

7. Release the 2 outer and inner backrest trim cover lower J-clips and partially invert the trim cover to the hook-and-loop strips.

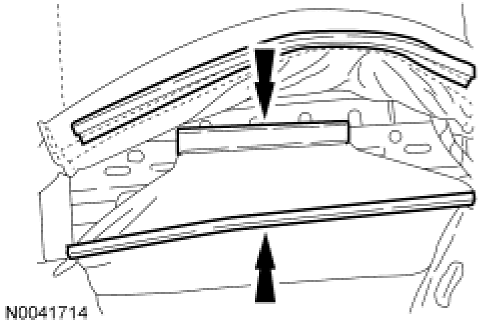

Fig. 320: Locating Outer And Inner Backrest Trim Cover Lower J-Clips
Courtesy of FORD MOTOR CO.

NOTE: The head restraint guides are not interchangeable. Note location for installation.

8. Reach up into the backrest and squeeze the head restraint guide ends together to release. Pull the 2 head restraint guides out of the backrest frame.

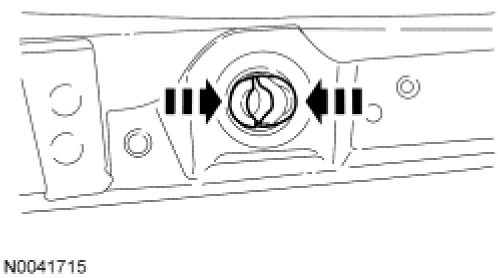

Fig. 321: Removing Head Restraint Guides From Backrest Frame
Courtesy of FORD MOTOR CO.

CAUTION: Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

9. Separate the hook-and-loop strips and invert the trim cover up the backrest to the rear upper hog rings.
10. Remove the rear upper hog rings and trim cover.

CAUTION: Inspect the climate controlled seat backrest manifold for crush and obstruction before installation. If damaged, install a new backrest manifold.

11. If necessary, remove the climate controlled seat backrest manifold from the foam pad.
    - To install, align the backrest manifold and insert into the valleys of the foam pad.
        - Check for correct fit between the manifold, foam pad and TED assembly, to make sure there

is no air flow obstruction or cushion crush.

12. Remove the hog rings from the upper support spring and remove the foam pad.

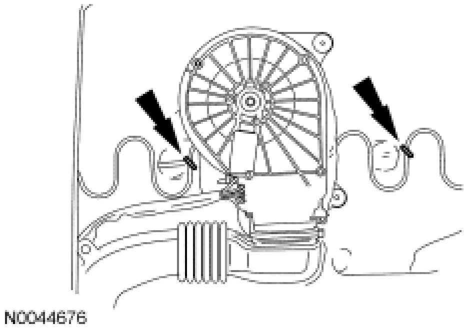

Fig. 322: Locating Hog Rings
Courtesy of FORD MOTOR CO.

13. Disconnect the backrest TED assembly electrical connector and detach the wiring harness retainers.

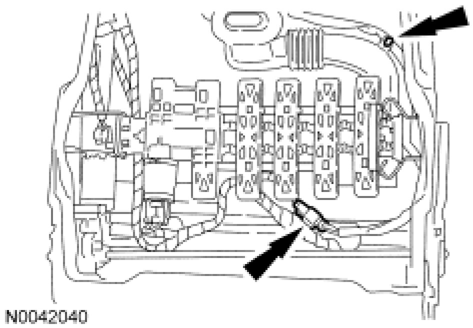

Fig. 323: Locating Backrest TED Assembly Electrical Connector And Wiring Harness Retainer
Courtesy of FORD MOTOR CO.

14. Remove the TED exhaust duct.
    - Cut and remove the tie strap.
        - During installation, install a new tie strap.
    - Remove the pin-type retainer and separate the exhaust duct from the TED.
15. Disconnect the backrest upper support spring from the backrest frame and remove the spring support with the TED attached.
16. If necessary, detach the backrest TED filter from the TED.

NOTE: Note the TED position on the support spring for installation.

17. Use an appropriate tool and separate the TED from the upper backrest support spring.

CAUTION: Cover the TED openings before removing any rivets to prevent foreign material from entering the TED.

18. Remove the 3 rivets and bracket from the TED.

WARNING: If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

WARNING: Inspect the seat side air bag module and mounting surfaces for any damage or foreign material before installing the seat side air bag module. If any damage is found, install new components. If any foreign material is found, remove it. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.

NOTE: A backrest trim cover for a seat with a side air bag module is different than a backrest trim cover for a seat without a side air bag module. Make sure the correct backrest trim cover is being installed.

19. To install, reverse the removal procedure.
20. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat**.
21. Install the front seat and repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat

22. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT CUSHION THERMO-ELECTRIC DEVICE

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: The cushion thermo-electric device (TED) filter is detachable from the TED assembly housing from underneath the seat cushion.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
   - Fully raise the seat before depowering the SRS to aid cushion TED assembly access.
2. Disconnect the TED electrical connector.

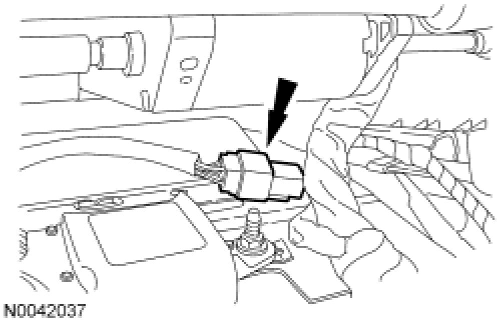

Fig. 324: Locating TED Electrical Connector
Courtesy of FORD MOTOR CO.

CAUTION: Inspect the climate controlled seat cushion manifold and foam pad for crush or obstruction before installation and repair as needed. Failure to do so may cause the climate control to work inefficiently.

3. Remove the 3 nuts and TED assembly from the cushion frame.
   - To install, tighten to 6 Nm (53 lb-in).
   - To install, check for correct fit between the cushion manifold, foam pad and TED assembly, to make sure there is no airflow obstruction, cushion crush or foreign material.
4. To install, reverse the removal procedure.
5. Install the front seat and repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

   Passenger seat

6. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

DUAL CLIMATE CONTROLLED SEAT MODULE (DCSM)

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL

NOTE: The air bag warning lamp illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: When installing a new dual climate controlled seat module (DCSM), it is necessary to carry out programmable module installation (PMI). For additional information, refer to MODULE CONFIGURATION article.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Before removing the DCSM, carry out the appropriate steps in the PMI procedure. For additional information, refer to **MODULE CONFIGURATION** article.
2. Remove the front passenger seat. For additional information, refer to **Seat - Front**.
3. Remove the DCSM from the cushion electrical bracket.
   - Release the locking wedges and disconnect the 3 DCSM electrical connectors.
   - Remove the 2 rivets and DCSM.

INSTALLATION

1. Install the DCSM to the seat.
   - Position the DCSM to the electrical bracket and install 2 new rivets.
   - Connect the 3 DCSM electrical connectors and locking wedges.
2. Install the front seat and repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.
3. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.
4. After installing the DCSM, carry out the appropriate steps in the PMI procedure. For additional information, refer to **MODULE CONFIGURATION** article.

HEATED SEAT MODULE

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Remove the front passenger seat. For additional information, refer to **Seat - Front**.
2. Remove the heated seat module from the cushion electrical bracket.
    - Disconnect the heated seat module electrical connector.
    - Remove the rivet and heated seat module.
3. To install, reverse the removal procedure.
4. Install the front passenger seat and repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.
5. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT CONTROL SWITCH

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

REMOVAL AND INSTALLATION

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of

faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the spring clip and manual recliner handle, if equipped.
3. Pull and remove the manual lumbar control knob and seat control switch button(s), if equipped.
4. Detach and position aside the cushion side shield in the following sequence.
    1. Pull the side shield away from the seat cushion at the front edge and release the forward and side retainers.
    2. Pull the side shield rearward to release the rear retainer and position the cushion side shield aside.
        - Return any detached retainers to the side shield.
        - To install, position the rear retainer clip on the cushion side shield through the hole in the backrest trim cover flap before attaching to the rear edge of the seat.
5. Disconnect the seat control switch, release the cushion side shield retainers and remove the seat control switch.
6. To install, reverse the removal procedure.
7. Install the front seat and repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat

8. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

MEMORY SET SWITCH

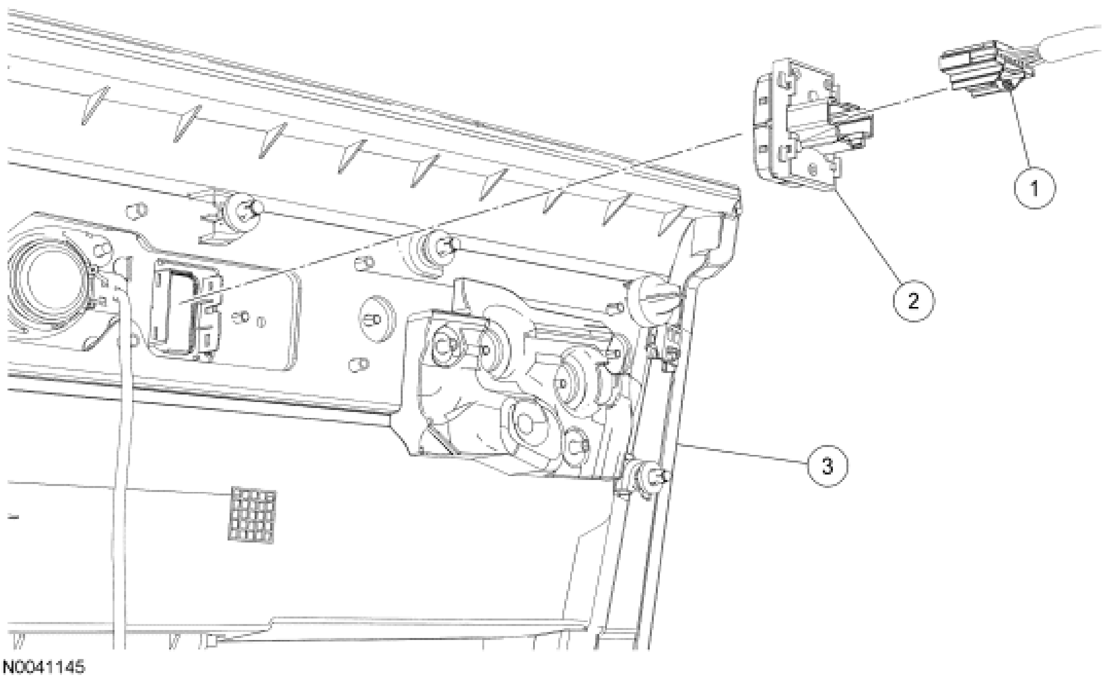

Fig. 325: Exploded View Of Memory Set Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Electrical connector (part of 14631)
2	14776	Memory SET switch
3	-	Driver interior door panel assembly

REMOVAL AND INSTALLATION

1. Remove the driver interior door panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Disconnect the electrical connector, release the 4 tabs and remove the memory SET switch.
3. To install, reverse the removal procedure.

SEAT - EXPLODED VIEW, REAR

NOTE: Seat backrest with armrest shown, seat backrest without armrest similar.

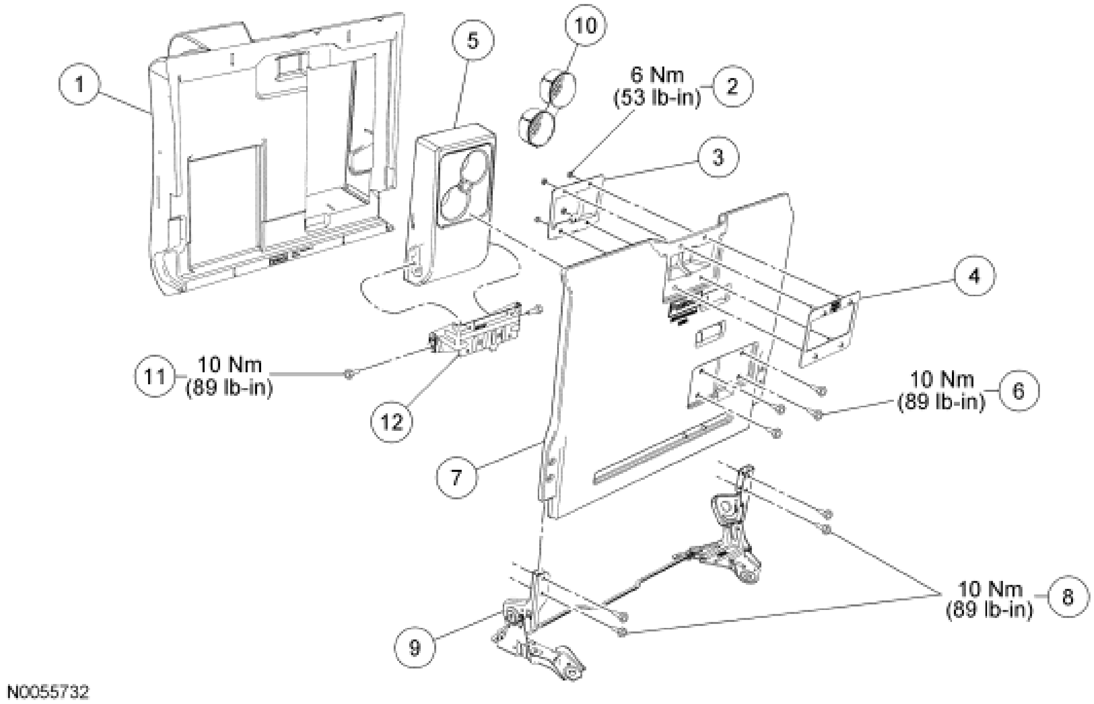

Fig. 326: Exploded View Of Rear Seat With Torque Specifications - 60 Percent
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	66801/66601	Backrest foam pad/trim cover
2	N620480	Striker-to-backrest frame nut (4 required)
3	-	Backrest latch striker (part of 613A39)
4	-	Striker support plate (part of 613A39)
5	67112	Armrest assembly (if equipped)
6	N605892	Armrest-to-backrest bolt (if equipped) (4 required)
7	613A39	Backrest frame
8	N605892	Backrest-to-pivot bolts (4 required)
9	-	Backrest pivot assembly (part of 613A39)
10	67112	Rubber insert, armrest cup holder (if equipped)
11	W712494	Armrest pivot bolt (if equipped) (2 required)
12	67210	Armrest bracket (if equipped)

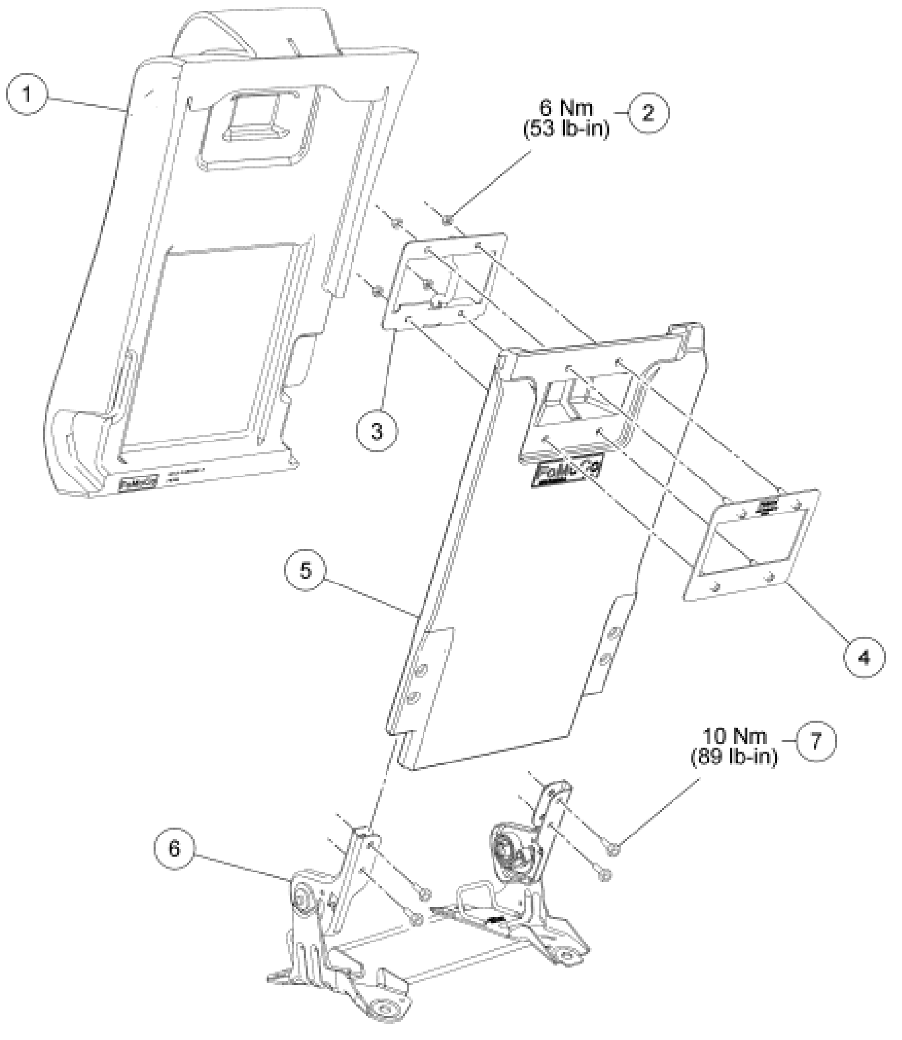

Fig. 327: Exploded View Of Rear Seat With Torque Specifications - 40 Percent
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	66800/66600	Backrest foam pad/trim cover
2	N620480	Striker-to-backrest frame nut (4 required)
3	-	Backrest latch striker (part of 613A38)
4	-	Striker support plate (part of 613A38)
5	613A38	Backrest frame
6	-	Backrest pivot assembly (part of 613A38)
7	N605892	Backrest-to-pivot bolt (4 required)

1. For additional information, refer to the procedures.

SEAT BACKREST - REAR

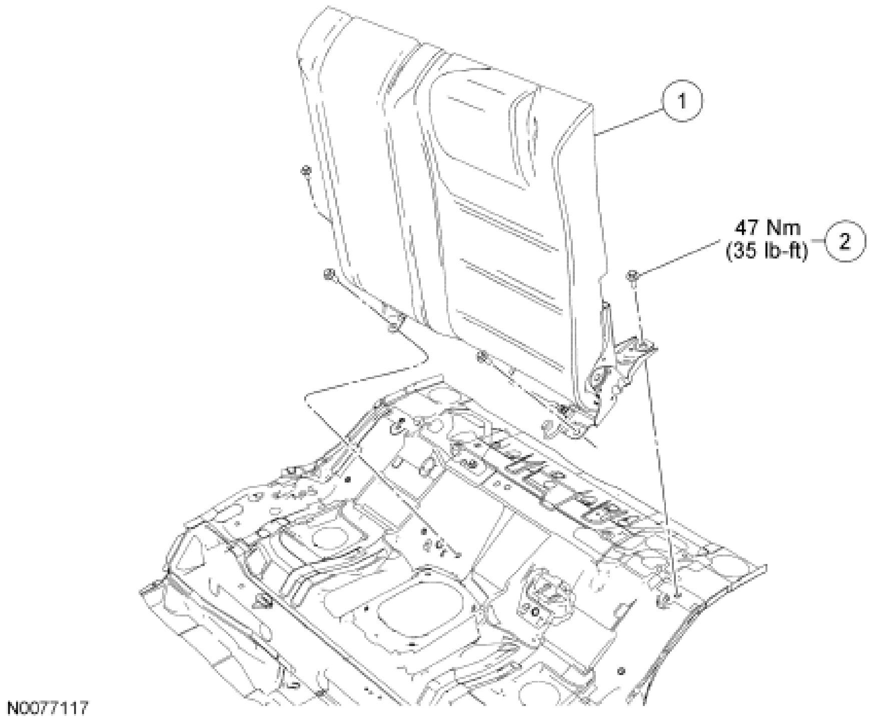

Fig. 328: Exploded View Of Rear Seat Backrest With Torque Specification - 60 Percent
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Backrest assembly
2	W707858	Backrest-to-floor bolt (4 required)

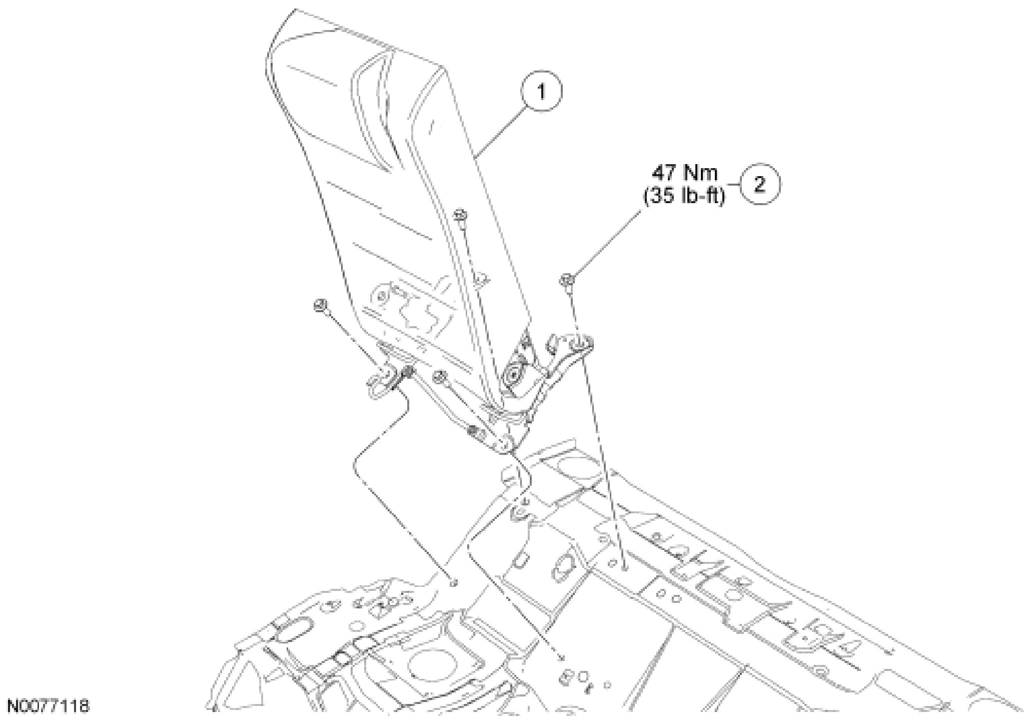

Fig. 329: Exploded View Of Rear Seat Backrest With Torque Specification - 40 Percent
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Backrest assembly
2	W707858	Backrest-to-floor bolt (4 required).

REMOVAL

NOTE: LH side shown, RH side similar.

1. Remove the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.
2. Remove the 2 forward backrest-to-floor bolts from the affected rear backrest assembly.

NOTE: If the center safety belt retractor locks and the safety belt webbing prevents the backrest from lowering, raise the backrest upward to release the safety belt retractor and belt webbing.

3. Release the backrest latch in the luggage compartment area and position the backrest downward.
4. Position aside the floor trim cover behind the backrest to gain access to the rearward backrest-to-floor bolts and remove the 2 bolts.
5. Raise the rear seat backrest and hinge assembly upward from the 2 locator pins on the floor and remove the backrest.

INSTALLATION

Backrest

NOTE: Make sure the rear seat safety belt webbing is positioned in front of the backrest assembly for installation and is not positioned underneath the backrest pivot assembly.

1. Position the rear seat backrest pivot assembly to the 2 locator pins on the floor.

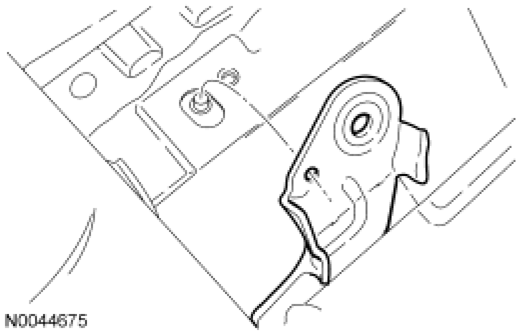

Fig. 330: Identifying Rear Seat Backrest Pivot Assembly Position
Courtesy of FORD MOTOR CO.

2. Install the 2 rearward backrest-to-floor bolts.
   - Tighten to 47 Nm (35 lb-ft).
3. Position the backrest upright and install the 2 forward backrest-to-floor bolts.
   - Tighten to 47 Nm (35 lb-ft).
4. Check backrest latch and latch release operation.
   - Raise the backrest and check for good backrest fit and latch closure when upright.

Backrest latch alignment

5. If backrest latch alignment is needed, remove the parcel shelf to access the rear backrest latch nuts. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
6. Loosen the 2 rear backrest latch nuts and adjust the latch position as necessary for good backrest fit and latch closure when upright.
   - Tighten to 48 Nm (35 lb-ft).

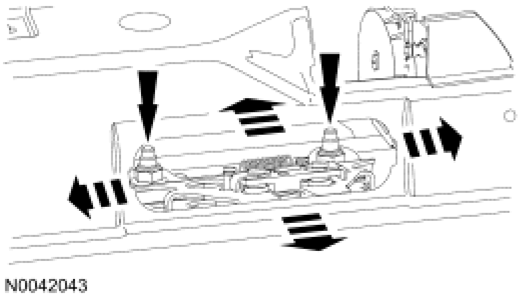

Fig. 331: Adjusting Latch Position
Courtesy of FORD MOTOR CO.

7. Install the parcel shelf. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

   Backrest

8. Check the rear seat active restraints for operation and accessibility.
   - Make sure the safety belts and buckles are accessible to the occupants after installation.
   - Verify the safety belt retractor operates without excessive effort or binding.

SEAT BACKREST COVER - REAR, 40 PERCENT

REMOVAL AND INSTALLATION

1. Remove the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.
2. Remove the 40 percent rear seat backrest. For additional information, refer to **Seat Backrest - Rear**.
3. Release the lower J-strip, 4 J-clips and remove the staples from each side.

CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

4. Partially invert the trim cover separating the hook-and-loop strips and remove the first row of hog rings.
5. Continue to invert the backrest trim cover separating the hook-and-loop strips and removing all rows of hog rings working up the backrest.
6. Remove the backrest trim cover.
7. To install, reverse the removal procedure.
8. Install the 40 percent rear seat backrest assembly. For additional information, refer to **Seat Backrest - Rear**.
9. Install the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.

SEAT BACKREST COVER - REAR, 60 PERCENT

REMOVAL AND INSTALLATION

All seats

1. Remove the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.
2. Remove the 60 percent rear seat backrest. For additional information, refer to **Seat Backrest - Rear**.
3. Release the trim cover lower J-strip.

   Seats equipped with armrest

4. Invert the trim cover enough to gain access to the armrest-to-backrest bolts.
5. Remove the 4 armrest-to-backrest bolts and support plate.
   - For installation, adjust the armrest horizontally as needed for good fit.
   - To install, tighten to 10 Nm (89 lb-in).
6. Separate the armrest assembly from the backrest and position aside.
   - For assembly, align the armrest bracket locator tab to the backrest frame.
7. Release the 4 pin-type retainers, separate the armrest trim cover panel from the backrest and remove the armrest assembly.
   - For a broken retainer, push the remaining end through and into the backrest frame and install a new pin-type retainer during assembly.

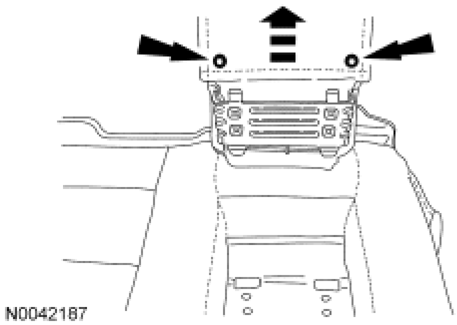

Fig. 332: Removing Armrest Assembly
Courtesy of FORD MOTOR CO.

8. Remove the pin-type retainer from the backrest trim cover armrest pocket.

   All seats

9. Release the 4 lower trim cover J-clips at both sides of the backrest and remove the staples.

CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

10. Continue to invert the backrest trim cover separating the hook-and-loop strips and removing all rows of hog rings working up the backrest.
11. Remove the backrest trim cover.
12. To install, reverse the removal procedure.
13. Install the 60 percent rear seat backrest assembly. For additional information, refer to **Seat Backrest - Rear**.
14. Install the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.

SEAT ARMREST - REAR

REMOVAL AND INSTALLATION

1. Remove the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.
2. Remove the 60 percent rear seat backrest. For additional information, refer to **Seat Backrest - Rear**.
3. Release the lower J-strip and partially invert the backrest trim cover to access the armrest-to-backrest bolts.
4. Remove the 4 armrest-to-backrest bolts and support plate.
   - For installation, adjust the armrest horizontally as needed for good fit.
   - To install, tighten to 10 Nm (89 lb-in).
5. Separate the armrest and bracket assembly from the backrest and position aside.
   - For installation, align the armrest bracket locator tab to the backrest frame.
6. Release the 4 pin-type retainers, separate the armrest trim cover panel from the backrest and remove the armrest assembly.
   - For a broken retainer, push the remaining end through and into the backrest frame and install a new pin-type retainer during installation.

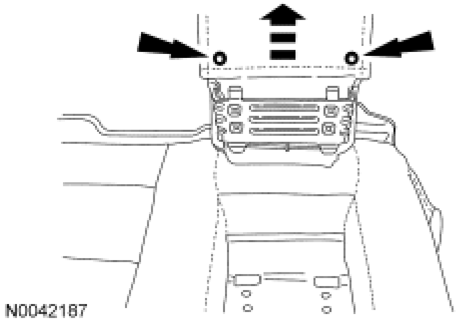

Fig. 333: Removing Armrest Assembly
Courtesy of FORD MOTOR CO.

7. To install, reverse the removal procedure.
8. Install the 60 percent rear seat backrest assembly. For additional information, refer to **Seat Backrest - Rear**.
9. Install the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.

SEAT BACKREST LATCH - REAR

NOTE: **LH side shown, RH side similar.**

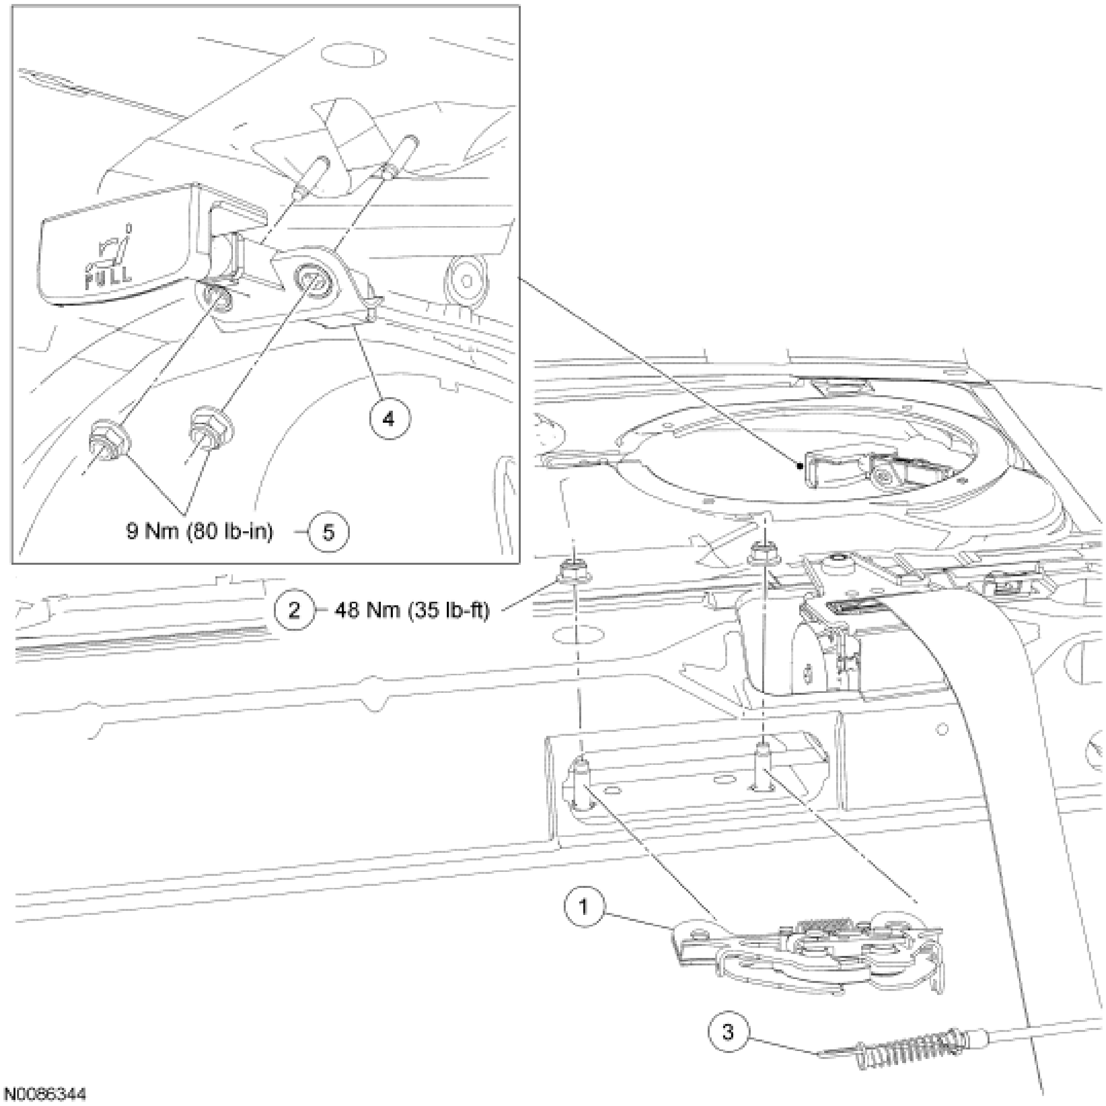

Fig. 334: Exploded View Of Rear Seat Backrest Latch With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	613D61	Backrest latch assembly
2	W520103	Latch-to-body nut (2 required)
3	601L60	Latch release cable assembly
4	624A94	Latch release handle bracket
5	W520101	Latch release handle bracket nuts (2 required)

REMOVAL

NOTE: LH side shown, RH side similar.

1. Remove the parcel shelf from the rear of the vehicle to access the rear backrest latch nuts. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

NOTE: Make sure the affected backrest is released.

2. Access the luggage compartment, detach the trim pin-type retainer and position the trim aside.
3. Remove the 2 nuts and detach the latch release handle bracket.
4. Detach the 2 pin-type retainers and latch cable assembly.
   - Note the cable routing for installation.
5. Detach the release cable from the latch and remove.
6. Remove the backrest latch.
   - Remove the 2 nuts and backrest latch.

INSTALLATION

1. Position the backrest latch to the 2 studs.
2. Install the 2 latch nuts and hand tighten.
3. Attach the release cable to the latch.
4. Route the release cable, position the release handle and bracket to the 2 studs and install the 2 nuts.
   - Tighten to 9 Nm (80 lb-in).
   - Install the 2 release cable pin-type retainers.
   - Position the trim and install the pin-type retainer.
5. Adjust the latch position as necessary for good backrest fit and latch closure when upright.
   - Tighten to 48 Nm (35 lb-ft).

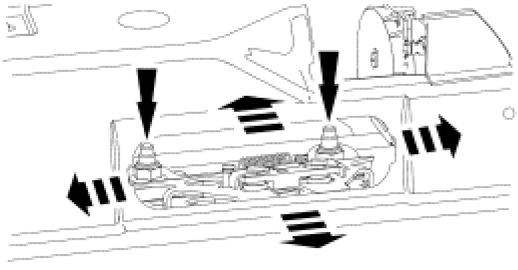

Fig. 335: Adjusting Latch Position
Courtesy of FORD MOTOR CO.

6. Install the parcel shelf. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

SEAT CUSHION - REAR

NOTE: Backrest pad and frame removed for clarity.

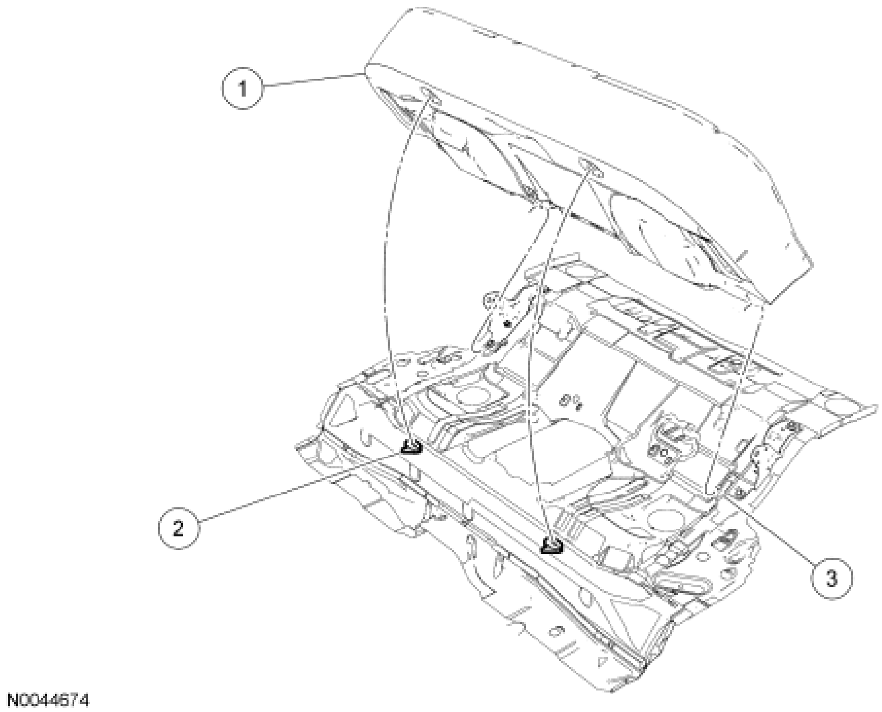

Fig. 336: Exploded View Of Rear Seat Cushion
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Cushion assembly
2	624A14	Cushion latch (2 required)
3	-	Cushion rear retainer (2 required, part of rear backrest pivot assemblies)

REMOVAL AND INSTALLATION

CAUTION: Do not force the latches or cushion to release. Applying excessive force to release the rear seat cushion latches can damage them.

NOTE: Make sure the 2 rear cushion latches are fully disengaged before raising the seat cushion to avoid damaging the latches.

1. Fully release the 2 latches and slightly raise the rear seat cushion front edge to disengage from the floor.
2. Push the rear seat cushion slightly rearward to disengage the rear edge of the cushion from the rear retainers and remove.
   - To install, position the rear seat cushion frame wire over the rear retainers.
3. To install, reverse the removal procedure.

- Make sure the safety belts and buckles are accessible to the occupants after installation.

SEAT CUSHION COVER - REAR

1. Remove the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.
2. Release the drawstring and remove the hog rings.

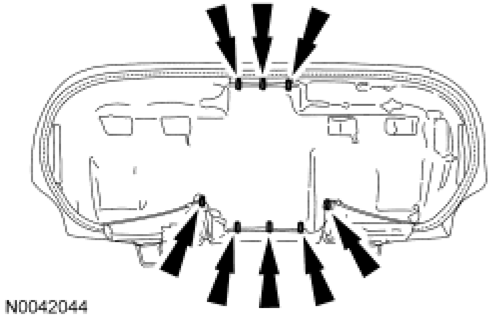

Fig. 337: Locating Hog Rings
Courtesy of FORD MOTOR CO.

CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

3. Partially invert the trim cover and release the hook-and-loop strips up to the hog rings.
4. Remove the hog rings and continue to release the hook-and-loop strips and separate the trim cover from the foam pad.

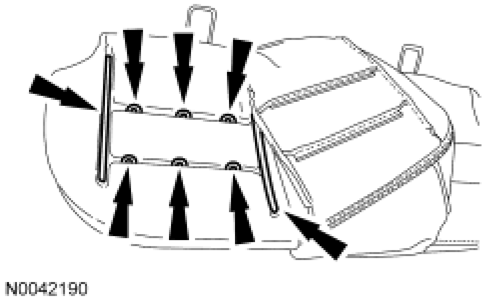

Fig. 338: Locating Hog Rings And Loop Strips
Courtesy of FORD MOTOR CO.

5. To install, reverse the removal procedure.
6. Install the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.

SEAT BOLSTER - REAR

NOTE: LH side shown, RH side similar.

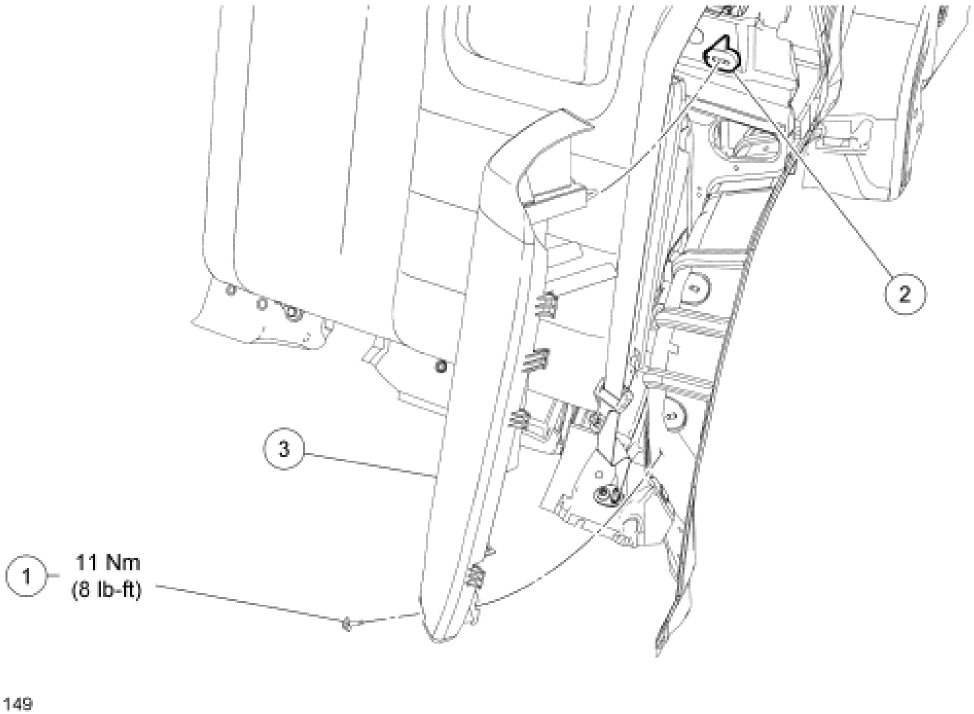

Fig. 339: Exploded View Of Rear Seat Bolster With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W710330	Bolster bolt
2	-	Bolster latch
3	66893	Rear seat side bolster

REMOVAL

NOTE: Do not apply excessive forward force to the side bolsters or damage may occur.

1. Remove the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.
2. Remove the bolt from the affected side bolster.
3. Release and lower the rear seat backrest at the affected side.
4. If removing the LH side bolster, fashion a tool for releasing the LH side bolster as shown:

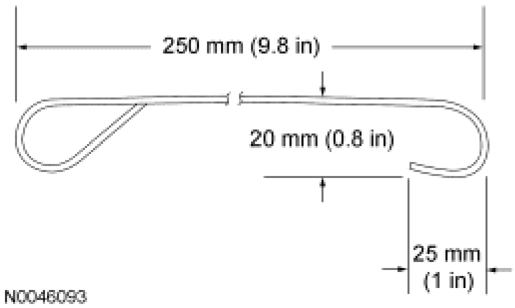

Fig. 340: Identifying Seat Bolster With Specification
Courtesy of FORD MOTOR CO.

NOTE: **LH side shown, RH side similar.**

NOTE: **The latch release tabs are accessible through a small service notch located on the rear inboard edge of each side bolster (behind the bolster trim cover sew seam).**

5. Locate the service notch behind the rear inboard edge of the affected side bolster to access the latch release tab.

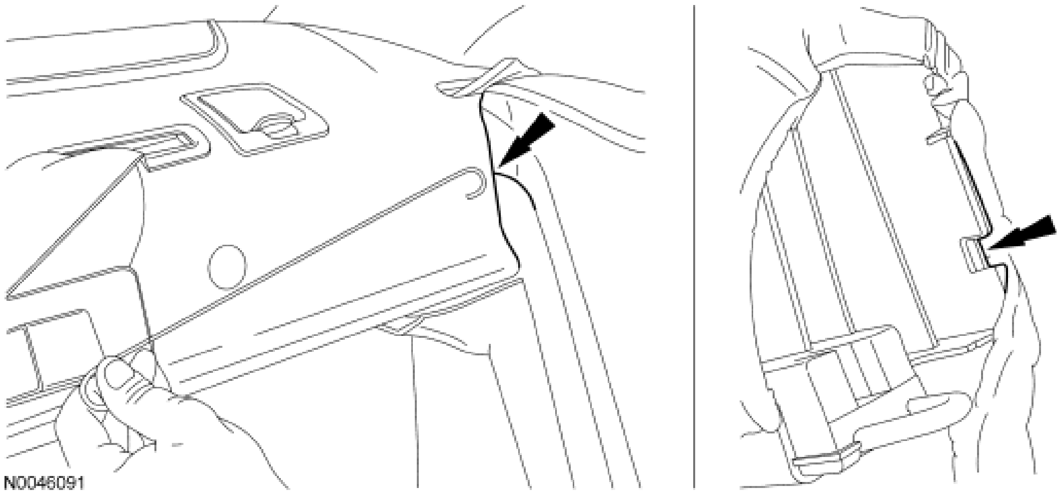

Fig. 341: Locating Service Notch
Courtesy of FORD MOTOR CO.

NOTE: **Do not force the latch or side bolster to release. Applying excessive force can damage the latch.**

NOTE: **Latch shown with bolster removed for clarity.**

6. To remove the LH side bolster, use a hooked pick or fashion a hooked tool to pull the latch release toward the RH side of the vehicle and release the side bolster.

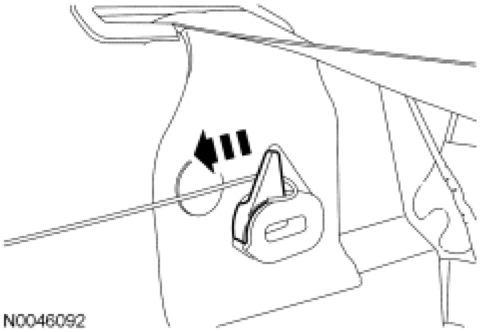

Fig. 342: Removing LH Side Bolster
Courtesy of FORD MOTOR CO.

NOTE:	**Do not force the latch or side bolster to release. Applying excessive force can damage the latch.**

NOTE:	**Latch shown with bolster removed for clarity.**

7. To remove the RH side bolster, use a flat-blade screwdriver to push the latch release toward the RH side of the vehicle and release the side bolster.

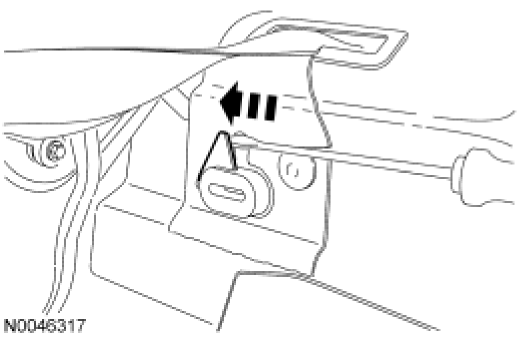

Fig. 343: Removing RH Side Bolster
Courtesy of FORD MOTOR CO.

8. With the affected bolster latch released, pull the side bolster forward and remove.

INSTALLATION

1. Position the side bolster, align and insert to the latch.
2. Align the bolt holes and install the side bolster bolt.
    - Tighten to 11 Nm (8 lb-ft).
3. Install the rear seat cushion. Refer to **Seat Cushion - Rear**.
    - Make sure the safety belts and buckles are accessible to the occupants after installation.

DISASSEMBLY AND ASSEMBLY

SEAT BACKREST - FRONT, WITHOUT FOLD FLAT

Special Tools

Illustration	Tool Name	Tool Number

22	-	Rivet, manual lumbar control (2 required, if equipped)
23	14C693	Wiring harness, power seat backrest (if equipped)
24	-	Pal nut, recliner torque shaft (2 required)
25	613A68	Recliner torque shaft
26	W790022	Bolt, recliner motor (if equipped)
27	14547	Recliner motor (if equipped)
28	64646	Upper support spring
29	-	Rivet, climate controlled seat thermo-electric device (TED) (3 required, if equipped)
30	19N550	TED assembly (if equipped)
31	18D583	Bracket, TED assembly (if equipped)
32	18D507	Exhaust duct, climate controlled seat TED assembly (if equipped)
33	-	Filter, climate controlled seat TED assembly (if equipped)
34	-	Tie strap
35	W790002	Pin-type retainer

DISASSEMBLY

WARNING: **Always carry or place a live air bag module with the air bag and**

deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Front seat backrest trim covers installed on seats equipped with seat side air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

NOTE: If a side air bag deployment took place, a new side air bag module and bolt must be installed. The side air bag module bracket on the backrest frame should be inspected and replaced if necessary.

NOTE: The air bag warning lamp illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: The manual recliners and power recliners are serviced as part of the backrest frame.

NOTE: Driver seat shown, passenger seat similar.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat**.
3. Detach the side air bag bolt cover.

NOTE: Note the position of the side air bag module locator hook in the side air bag module bracket (on the seat back frame) for installation.

4. Remove the bolt and lift up and out to detach the side air bag module from the seat backrest.
5. Slide and disengage the side air bag module electrical connector locking clip, and then release the tab and disconnect the side air bag module electrical connector and remove the side air bag module.
6. Detach the 2 pin-type retainers and trim cover flaps from the recliners, if equipped.

CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

7. Release the outer and inner backrest trim cover lower J-clips and partially invert the trim cover to the hook-and-loop strips.

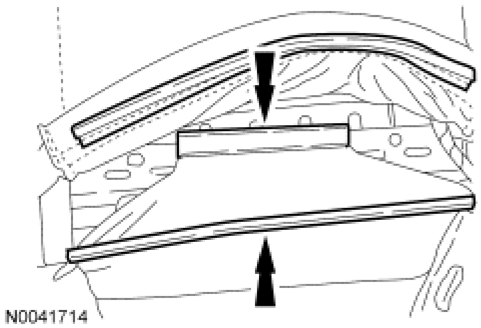

Fig. 345: Locating Outer And Inner Backrest Trim Cover Lower J-Clips
Courtesy of FORD MOTOR CO.

NOTE: The head restraint guides are not interchangeable. Note location for installation.

8. Reach up into the backrest and squeeze the head restraint guide ends together to release. Pull the 2 head restraint guides out of the backrest frame.

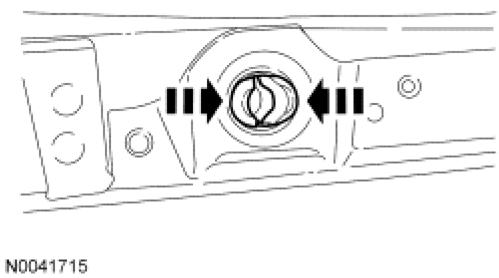

Fig. 346: Removing Head Restraint Guides From Backrest Frame
Courtesy of FORD MOTOR CO.

CAUTION: Use care when separating the seat back trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

9. Remove all rows of hog rings from the backrest trim cover, if equipped and separate the hook-and-loop strips while inverting the trim cover up the backrest.
10. Remove the rear upper hog rings and backrest trim cover.

Heated seat

11. Detach pin-type retainer and backrest heater mat wiring harness from the backrest frame.

All seats

12. Separate the backrest foam pad from the backrest frame.
    - If equipped with climate controlled seats, remove the hog rings from the upper support spring.
    - If necessary, remove the backrest heater mat (if equipped) or the backrest climate controlled seat manifold (if equipped) from the foam pad.

NOTE: Note the side air bag module wire harness routing for assembly.

13. Release the side air bag module wire harness pin-type retainers and remove the side air bag module wiring harness from the backrest frame.
14. Release the 2 lumbar spring clips from the backrest frame and remove the lumbar assembly.
    - Route out the lumbar cable from the backrest frame, if equipped.
        - Note the routing of the lumbar cable for installation.
    - Disconnect the electrical connector from the power lumbar motor, if equipped.

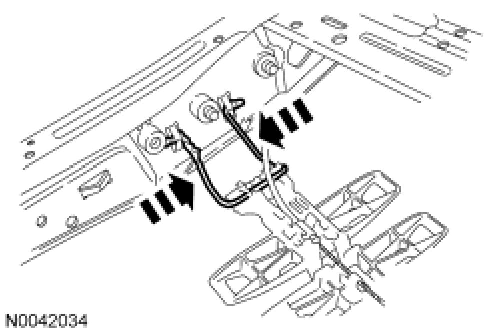

Fig. 347: Releasing Lumbar Spring Clips
Courtesy of FORD MOTOR CO.

Climate controlled seat

15. Disconnect the backrest thermo-electric device (TED) assembly electrical connector and detach the wiring harness retainers.

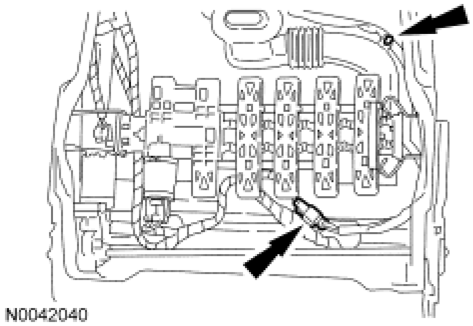

Fig. 348: Locating Backrest TED Assembly Electrical Connector And Wiring Harness Retainer
Courtesy of FORD MOTOR CO.

16. Remove the TED exhaust duct.
    - Cut and remove the tie strap.
    - Remove the retainer and separate the exhaust duct from the TED.

NOTE: Note the TED position on the support spring for installation. If needed, use an appropriate tool and separate the TED from the upper backrest support spring.

17. Disconnect the backrest upper support spring from the backrest frame and remove the spring support with the TED attached.

Seat with power recliner

18. Remove the one-way push clip on the RH side of the power recliner. Slide the recliner shaft out from the LH side of the seat enough to clear the RH recliner and power recline motor.
19. Disconnect the electrical connector, remove the bolt and the power recline motor.

All seats

20. Remove the 2 nuts and side air bag mounting bracket.
21. Detach any pin-type retainers, route out and remove the wiring harness, if equipped.

ASSEMBLY

All seats

1. Route and install the backrest wiring harness, if removed.
2. Install the side air bag mounting bracket and 2 nuts, if removed.
    - Tighten to 6 Nm (53 lb-in).

Seat with power recliner

NOTE: The recliners are synchronized. Avoid rotating the recliner shaft until fully installed.

3. Install the recliner motor.
    1. Position the recliner shaft through the recliner motor and RH recliner.
    2. Install a new one-way push clip onto the recliner shaft at the RH recliner.
    3. Slightly turn the recliner motor to align the bolt hole with the hole in the RH recliner and install the recliner motor bolt.
        - Tighten to 6 Nm (53 lb-in).
    4. Connect the recliner motor electrical connector.

Climate controlled seat

CAUTION: Before assembly, inspect the climate controlled seat components for damage, crush, obstruction and foreign material and repair as needed.

4. Install the upper support spring and TED assembly to the backrest frame.
    - Attach the TED and bracket to the backrest upper support spring as noted in disassembly, if removed.
5. Connect the exhaust duct to the TED and install a new tie strap.
6. Connect the TED electrical connector.

All seats

7. Attach the lumbar assembly spring clips and install the lumbar assembly to the backrest frame.
    - Route the lumbar cable to the backrest as in disassembly, if equipped.
    - Connect the power lumbar motor electrical connector, if equipped.
8. Install the side air bag wiring harness.
    - Route the side air bag wiring harness to the backrest frame as noted in disassembly and install the push pin-type retainers.
9. Position the backrest foam pad to the backrest frame.
    - If removed, install a new backrest heater mat.
        - For installation, peel away the paper from the adhesive strips, align and apply the new heater mat to the backrest foam pad being sure to tuck the heater mat into the foam pad creases.
        - The heater mat must lay flat on the foam pad with no wrinkles.

Climate controlled seat

CAUTION: Before assembly, inspect the climate controlled seat components for damage, crush, obstruction and foreign material and repair as needed.

10. If removed, align the backrest manifold and insert into the valleys of the foam pad.
    - Check for correct fit between the manifold, foam pad and TED assembly, to make sure there is no air flow obstruction or cushion crush.

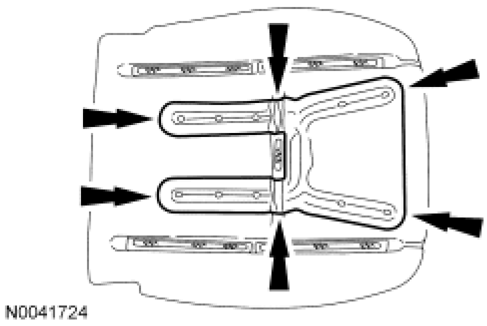

Fig. 349: Locating Backrest Manifold Position
Courtesy of FORD MOTOR CO.

11. Install new hog rings to the upper support spring and foam pad.

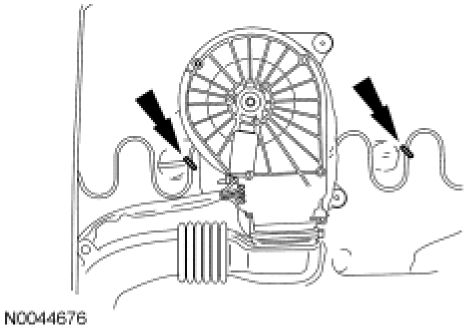

Fig. 350: Locating Hog Rings
Courtesy of FORD MOTOR CO.

All seats

NOTE: A backrest trim cover for a seat with a side air bag module is different than a backrest trim cover for a seat without a side air bag module. Make sure the correct backrest trim cover is being installed.

12. Position the backrest trim cover to the backrest frame and foam pad and install new rear upper hog rings to the backrest frame.
13. Roll the backrest trim cover downward and attach the hook-and-loop strips.
    - If removed, install new hog rings as noted during disassembly.

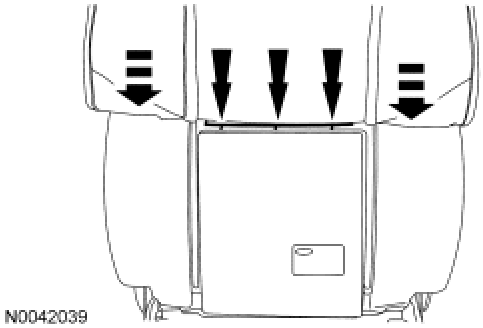

Fig. 351: Attaching Hook And Loop Strips
Courtesy of FORD MOTOR CO.

NOTE: **The head restraint guides are keyed to the backrest frame and are not interchangeable.**

14. Install the 2 head restraint guides to the backrest.
15. Connect the inner and outer backrest trim cover J-strips.
16. Install the 2 pin-type retainers and trim cover flaps to the recliners, if equipped.

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Inspect the seat side air bag module and mounting surfaces for any damage or foreign material before installing the seat side air bag module. If any damage is found, install new components. If any foreign material is found, remove it. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

17. Connect the side air bag module electrical connector and then slide and engage the side air bag electrical connector locking clip.
18. Install the side air bag module to the mounting bracket on the backrest frame.
    - Position the side air bag module locator hook in the side air bag bracket the seat back frame.
19. Align the bolt hole and install the side air bag bolt.
    - Tighten to 10 Nm (89 lb-in).
20. Install the side air bag bolt cover.
21. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat**.

22. Install the front seat and repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

    Passenger seat

23. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

DISASSEMBLY

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Front seat backrest trim covers installed on seats equipped with seat side**

air bags cannot be repaired. A new trim cover must be installed. Cleaning is permissible. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.

NOTE: If a side air bag deployment took place, a new side air bag module and bolt must be installed. A new side air bag module bracket on the backrest frame should be inspected and installed if necessary.

NOTE: The air bag warning lamp illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front, With Fold Flat**.
3. Detach the side air bag bolt cover.
4. Remove the bolt, lift up and out to separate the side air bag module from the seat backrest.
5. Slide and disengage the side air bag module electrical connector locking clip, release the tab and disconnect the side air bag module electrical connector.
6. Remove the 4 recliner-to-backrest frame bolts and remove the recliners.
7. Remove the head restraint in the following sequence.
    1. Using an appropriate tool, push in the hole while lifting up and release the head restraint from the head restraint guide.
    2. Push in on the head restraint guide release tab and remove the head restraint.

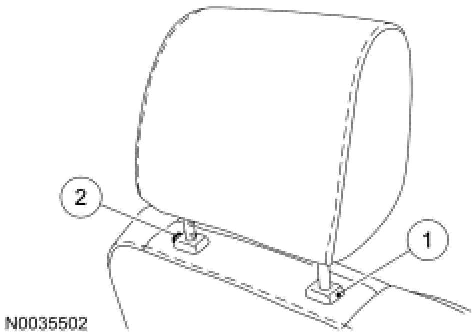

Fig. 353: Identifying Head Restraint Guide Release Tabs
Courtesy of FORD MOTOR CO.

8. Release the outer and inner backrest trim cover lower J-clips.

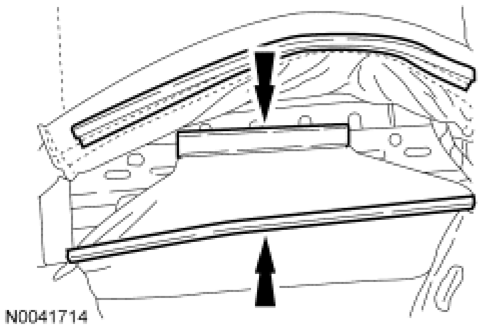

Fig. 354: Locating Outer And Inner Backrest Trim Cover Lower J-Clips
Courtesy of FORD MOTOR CO.

9. Separate the hook-and-loop strips on each side, at the bottom of the backrest trim cover.

CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

10. Place a hand between the backrest trim cover and backrest foam pad and carefully separate the hook-and-loop strips.
11. Invert the backrest trim cover to the hog rings.
12. Remove the hog rings attaching the backrest trim cover to the backrest foam pad in front and the backrest frame wire in the rear.
    - Feed the side air bag and heated seat (if equipped) wire harnesses through the side of the backrest trim cover.
13. Invert the backrest trim cover up as far as it will go.
14. Remove the pin-type retainers and the hard back panel.

NOTE: The head restraint guides are not interchangeable. Note location for installation.

15. Reach up into the backrest and squeeze the head restraint guide ends together to release. Pull the 2 head restraint guides out of the backrest frame.

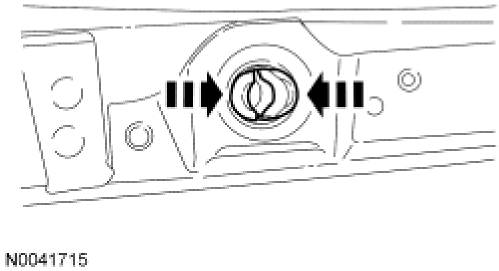

Fig. 355: Removing Head Restraint Guides From Backrest Frame

Courtesy of FORD MOTOR CO.

16. Remove the backrest trim cover.
17. Separate the backrest frame from the backrest foam pad.
18. Release the 2 static lumbar spring clips from the backrest frame and remove the static lumbar assembly.
19. Remove the 2 nuts and side air bag mounting bracket.

Seats with heat

20. If necessary, remove the backrest heater mat from the backrest foam pad.

ASSEMBLY

Seats with heat

1. If necessary, attach the backrest heater mat to the backrest foam pad.

All seats

2. Position the side air bag mounting bracket and install the 2 nuts.
   - Tighten to 6 Nm (53 lb-in).
3. Install the static lumbar assembly.
4. Position the backrest frame into the backrest foam pad.
5. Position the backrest trim cover to the backrest foam pad.

NOTE: The head restraint guides are not interchangeable.

6. Install the 2 head restraint guides through the backrest trim cover and into the backrest frame.
7. Position the hard back panel and install the pin-type retainers.
8. Roll the backrest trim cover down, attaching the hook-and-loop strips and install hog rings attaching the backrest trim cover to the backrest foam pad in front and the backrest frame wire in the rear.
   - Feed the side air bag and heated seat (if equipped) wire harnesses through the side of the backrest trim cover.
9. Attach the hook-and-loop strips at the bottom of the backrest trim cover.
10. Attach the inner and outer backrest trim cover lower J-clips.
11. Position the recliners to the backrest frame and install the 4 recliner-to-backrest frame bolts.
    - Tighten to 55 Nm (41 lb-ft).
12. Install the head restraint.

WARNING: **If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the**

seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

WARNING: **Inspect the seat side air bag module and mounting surfaces for any damage or foreign material before installing the seat side air bag module. If any damage is found, install new components. If any foreign material is found, remove it. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increase the risk of serious personal injury or death in a crash.**

13. Connect the side air bag module electrical connector, then slide and engage the side air bag electrical connector locking clip.
14. Install the side air bag module to the mounting bracket on the backrest frame.
    - Position the side air bag module locator hook in the side air bag bracket.
15. Align the bolt hole and install the side air bag bolt.
    - Tighten to 10 Nm (89 lb-in).
16. Install the side air bag bolt cover.
17. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front, With Fold Flat**.
18. Install the front seat and repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.
19. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT CUSHION - FRONT

Special Tools

Illustration	Tool Name	Tool Number

27	W520113	Nut, safety belt buckle bracket (2 required)
28	-	Safety belt buckle bracket
29	61202	Safety belt buckle
30	-	Bolt, safety belt buckle (part of 61202)
31	14A698	Passenger seat wire harness
32	632A22	Cushion foam pad
33	19N550	Cushion manifold, climate controlled seat (if equipped)
34	-	Cushion insert (if equipped)
35	14D698	Cushion heater mat (if equipped)
36	62900	Cushion trim cover

DISASSEMBLY AND ASSEMBLY

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All seats

1. Remove the front seat. For additional information, refer to **Seat - Front**.
2. Remove the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat** or **Seat Backrest - Front, With Fold Flat**.
3. Remove the seat track. For additional information, refer to **Seat Track**.

CAUTION: Use care when separating the seat cushion trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the cushion foam pad.

4. Release the hook-and-loop strips, remove the hog rings, if equipped and separate the cushion trim cover from the cushion foam pad.

Heated seat

5. If necessary, remove the cushion heater mat and route out the wire harness through the cushion foam pad opening.
   - For installation, peel away the paper from the adhesive strips, align and apply the new heater mat to the cushion foam pad being sure to tuck the heater mat into the foam pad creases.
     - The heater mat must lay flat on the foam pad with no wrinkles.

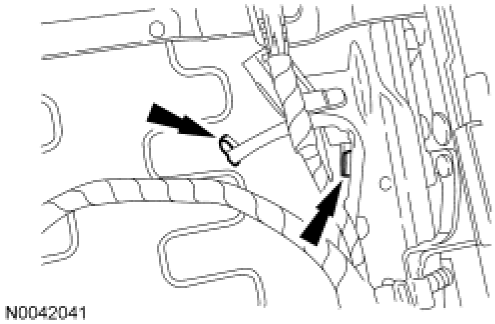

Fig. 358: Locating Wire Harness Routing
Courtesy of FORD MOTOR CO.

Climate controlled seat

CAUTION: Before assembly, inspect the climate controlled seat components for damage, crush, obstruction and foreign material and repair as needed.

6. If necessary, remove the cushion manifold from the foam pad.
   - For installation, align the cushion manifold and insert into the valleys of the foam pad.
     - Check for correct fit between the manifold, foam pad and thermo-electric device (TED) assembly, to make sure there is no airflow obstruction or cushion crush.

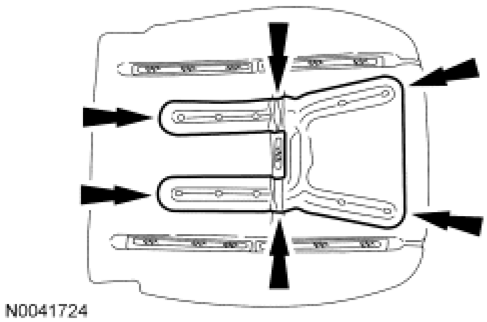

Fig. 359: Locating Backrest Manifold Position
Courtesy of FORD MOTOR CO.

NOTE:	**Covering the TED openings is recommended to prevent foreign material from entering the TED.**

7. Remove the 3 nuts and TED assembly from the cushion frame.
   - To install, tighten to 6 Nm (53 lb-in).
   - For installation, check for correct fit between the cushion manifold, foam pad and TED assembly, to make sure there is no air flow obstruction, cushion crush or foreign material.

Fold flat seats

8. Remove the recliner cable.

All seats

9. To assemble, reverse the disassembly procedure.
10. Install the seat track. For additional information, refer to **Seat Track**.
11. Install the front seat backrest. For additional information, refer to **Seat Backrest - Front, Without Fold Flat** or **Seat Backrest - Front, With Fold Flat**.
12. Install the front seat and repower the SRS. **If a passenger seat has been serviced, do not prove out the SRS at this time.** For additional information, refer to **Seat - Front**.

Passenger seat

13. Carry out the Occupant Classification Sensor (OCS) System Zero Seat Weight Test. For additional information, refer to the General Procedures portion of **SUPPLEMENTAL RESTRAINT SYSTEM** article.

SEAT BACKREST - REAR, 60 PERCENT

NOTE:	**Seat backrest with armrest shown, seat backrest without armrest similar.**

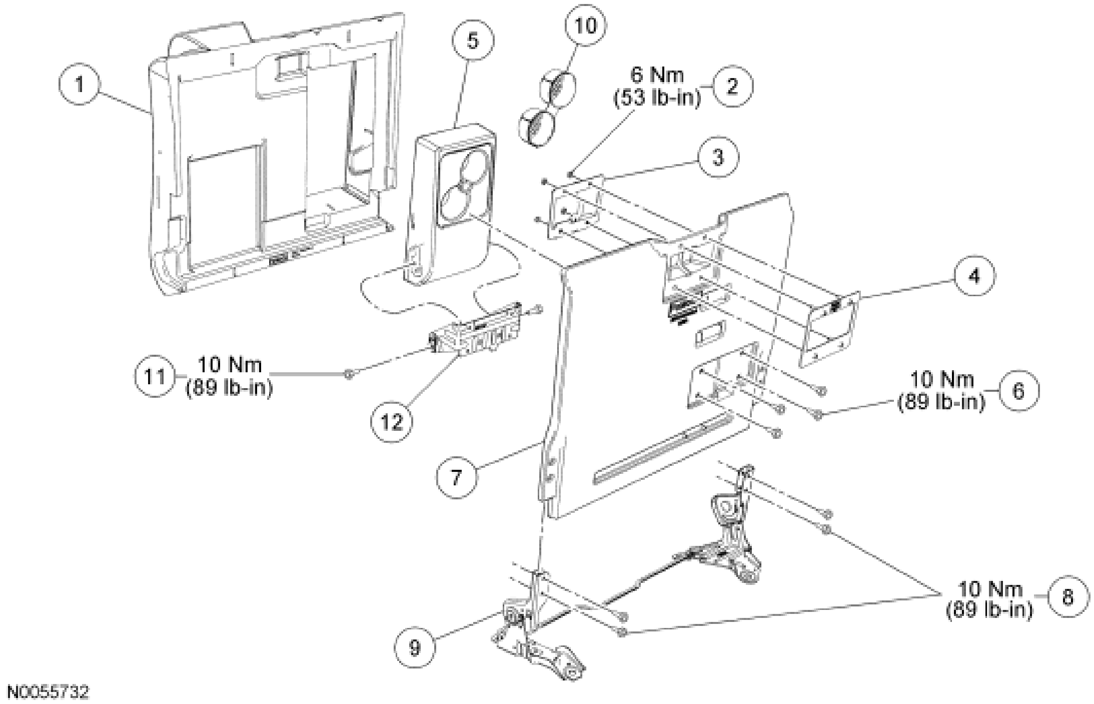

Fig. 360: Exploded View Of Rear Seat Backrest With Torque Specifications - 60 Percent
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	66801/66601	Backrest foam pad/trim cover
2	N620480	Striker-to-backrest frame nut (4 required)
3	-	Backrest latch striker (part of 613A39)
4	-	Striker support plate (part of 613A39)
5	67112	Armrest assembly (if equipped)
6	N605892	Armrest-to-backrest bolt (4 required, if equipped)
7	613A39	Backrest frame
8	N605892	Backrest-to-pivot bolts (4 required)
9	-	Backrest pivot assembly (part of 613A39)
10	67112	Rubber insert, armrest cup holder (if equipped)
11	W712494	Armrest pivot bolt (2 required) (if equipped)
12	67210	Armrest bracket (if equipped)

DISASSEMBLY AND ASSEMBLY

All seats

1. Remove the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.
2. Remove the 60 percent rear seat backrest. For additional information, refer to **Seat Backrest - Rear**.
3. Release the trim cover lower J-strip.

Seats equipped with armrest

4. Invert the trim cover enough to gain access to the armrest-to-backrest bolts.
5. Remove the 4 armrest-to-backrest bolts and support plate.
    - For installation, adjust the armrest horizontally as needed for good fit.
    - To install, tighten to 10 Nm (89 lb-in).
6. Separate the armrest assembly from the backrest and position aside.
    - For assembly, align the armrest bracket locator tab to the backrest frame.
7. Release the 4 pin-type retainers, separate the armrest trim cover panel from the backrest and remove the armrest assembly.
    - For a broken retainer, push the remaining end through and into the backrest frame and install a new pin-type retainer during assembly.

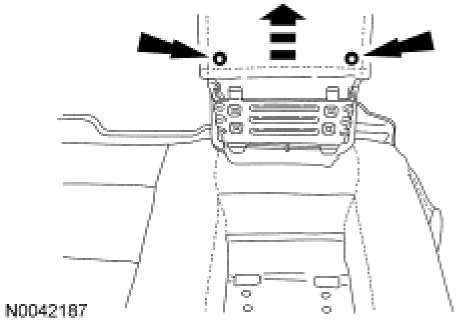

Fig. 361: Removing Armrest Assembly
Courtesy of FORD MOTOR CO.

8. Remove the pin-type retainer from the backrest trim cover armrest pocket.
9. To disassemble the armrest assembly, remove the cup holder rubber insert, 2 armrest pivot bolts and armrest bracket.
    - To install, tighten to 10 Nm (89 lb-in).

All seats

10. Release the 4 lower trim cover J-clips at both sides of the backrest and remove the staples.

CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

11. Invert the backrest trim cover separating the hook-and-loop strips and remove all rows of hog rings

working up the backrest.

12. Remove the backrest trim cover and foam pad from the backrest frame.
13. Remove the 4 backrest-to-pivot bolts.
    - To install, tighten to 10 Nm (89 lb-in).
14. Remove the 4 striker-to-backrest frame nuts, backrest latch striker and support plate.
    - To install, tighten to 6 Nm (53 lb-in).
15. To assemble, reverse the disassembly procedure.

SEAT BACKREST - REAR, 40 PERCENT

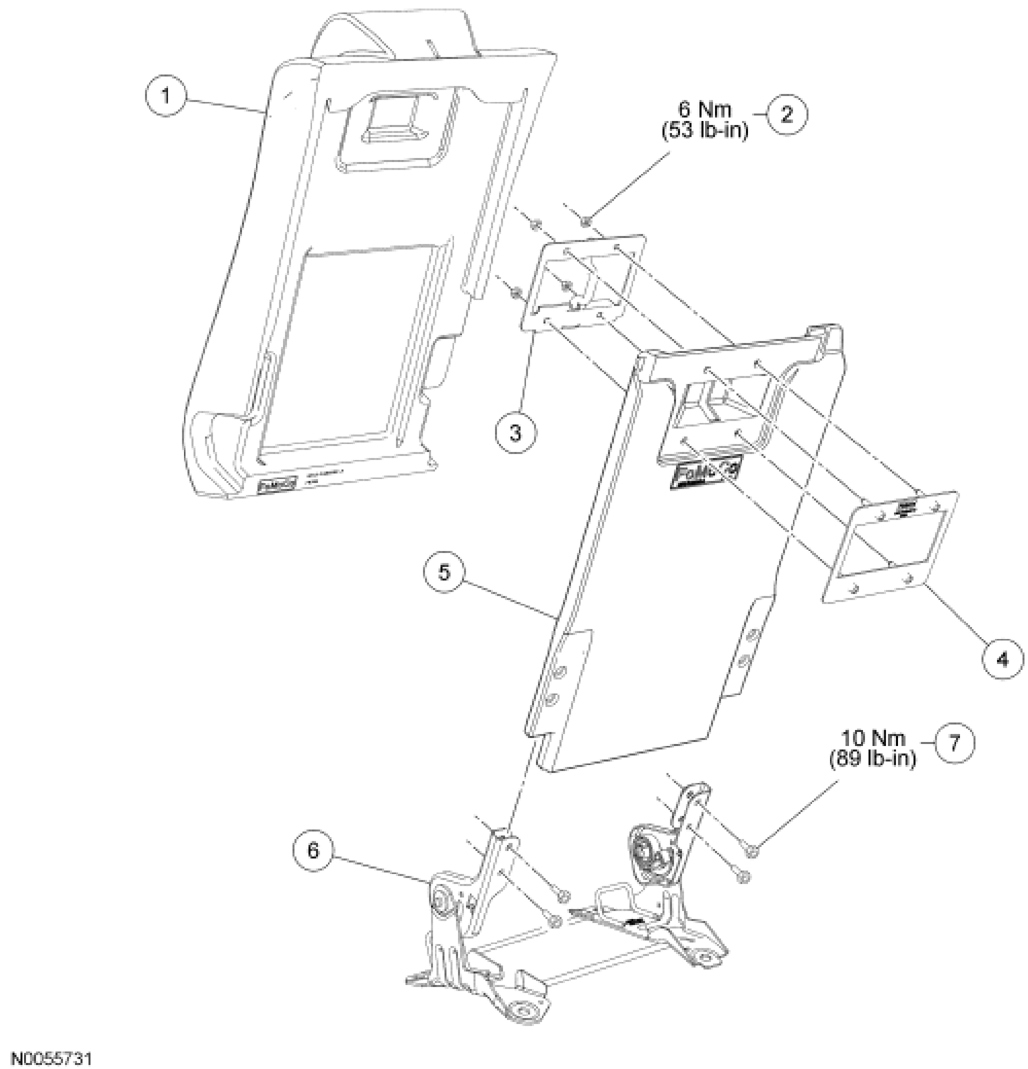

Fig. 362: Exploded View Of Rear Seat Backrest With Torque Specifications - 40 Percent
Courtesy of FORD MOTOR CO.

Item	Part Number	Description

1	66800/66600	Backrest foam pad/trim cover
2	N620480	Striker-to-backrest frame nut (4 required)
3	-	Backrest latch striker (part of 613A38)
4	-	Striker support plate (part of 613A38)
5	613A38	Backrest frame
6	-	Backrest pivot assembly (part of 613A38)
7	N605892	Backrest-to-pivot bolt (4 required)

DISASSEMBLY AND ASSEMBLY

1. Remove the rear seat cushion. For additional information, refer to **Seat Cushion - Rear**.
2. Remove the 40 percent rear seat backrest. For additional information, refer to **Seat Backrest - Rear**.
3. Release the lower J-strip, 4 J-clips and remove the staples from each side.

CAUTION: Use care when separating the backrest trim cover from the hook-and-loop strip, or the hook-and-loop strip can be torn from the backrest foam pad.

4. Partially invert the trim cover separating the hook-and-loop strips and remove the first row of hog rings.
5. Continue to invert the backrest trim cover separating the hook-and-loop strips and removing all rows of hog rings working up the backrest.
6. Remove the backrest trim cover.
7. Remove the foam pad from the backrest frame.
8. Remove the 4 backrest-to-pivot bolts.
   - To install, tighten to 10 Nm (89 lb-in).
9. Remove the 4 striker to backrest frame nuts and backrest latch striker and support plate.
   - To install, tighten to 6 Nm (53 lb-in).
10. To assemble, reverse the disassembly procedure.

2008 ACCESSORIES & BODY, CAB

Speed Control - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

SPEED CONTROL

The speed control system consists of the following components:

- Speed control switches
- Speed control deactivator switch (part of the stoplamp switch)
- Stoplamp switch
- Clutch pedal speed control deactivator switch (manual transaxle)
- Speed control indicator
- PCM

DIAGNOSTIC TESTS

SPEED CONTROL

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST2621-A	Restraint System Diagnostic Tool (2 required)	418-F395
	Flex Probe Kit	105-R025C or equivalent

 ST2574-A		

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The speed control system is controlled by the PCM. The speed control system is designed to maintain a selected vehicle speed above 48 km/h (30 mph) to the maximum limited vehicle speed. The speed control system is controlled by the steering wheel mounted switches (ON, OFF, SET+, SET- and RESUME), the stoplamp switch, the clutch pedal speed control deactivator switch (manual transaxle), and the speed control deactivator switch (part of the stoplamp switch). The steering wheel mounted switches are hardwired to the PCM through the clockspring.

The speed control functions include:

- Turning the speed control system on
- Setting and maintaining the desired vehicle speed
- Accelerating the vehicle speed
- Decelerating the vehicle speed
- Turning the vehicle speed control system off
- Canceling the speed control

Pressing and releasing the ON switch turns the speed control system on. Pressing and releasing the SET+ or SET- switch while the vehicle is traveling at the desired speed activates the speed control system.

Tapping the SET+ or the SET- switch while in the set mode respectively, increases or decreases the maintained vehicle speed by 1.6 km/h (1 mph) per tap. If the respective button is pressed and held, the vehicle speed continues to accelerate or decelerate until the button is released.

Pressing and releasing the OFF switch, or switching the ignition switch to the OFF position, turns the speed control system off. Applying the brake pedal puts the speed control system into the STANDBY mode. Pressing the RESUME button, when the speed control system is in the STANDBY mode causes the vehicle to accelerate to the last set speed. Resume does not function if the OFF button is pressed, the ignition switch is in the OFF position, or if the current vehicle speed is below the minimum operational speed.

The clockspring provides the electrical interface between the steering column wiring and the speed control switches in the steering wheel.

The clutch pedal speed control deactivator switch is incorporated on vehicles equipped with a manual transaxle. When the clutch pedal is applied with the vehicle speed control system engaged, the normally closed switch

opens and signals the PCM to deactivate the speed control.

The speed control deactivator switch (part of the stoplamp switch) is provided as an additional safety feature. When the brake pedal is applied, the speed control deactivator switch opens and removes the voltage signal from the PCM input circuit, deactivating the speed control system.

Whenever the speed control system is engaged and active, a speed control icon on the instrument cluster (IC) is illuminated.

The inputs to the PCM are:

- Output shaft speed (OSS) sensor
- Digital transmission range (TR) sensor (automatic transaxle)
- Speed control switch
- Clutch pedal speed control deactivator switch (manual transaxle)
- Speed control deactivator switch (part of the stoplamp switch)
- Accelerator pedal position sensor
- Smart junction box (SJB)
- Parking brake

The outputs of the PCM are:

- Speed control indicator lamp
- Throttle command

The speed control system throttle position is completely controlled by the PCM through the electronically controlled throttle body. Speed control electronics are contained entirely within the PCM.

When the speed control system is active, the PCM corrects for deviations in the actual vehicle speed by proportionally moving the throttle plate. The PCM modulates the throttle to minimize error between the actual vehicle speed and the desired speed.

The PCM strategy uses the throttle control for smooth accelerations.

The PCM sends a message over the controller area network (CAN) to the IC whenever the speed control telltale should be turned on or off.

In the event of an off command or a deactivation request from any source, the speed control system carries out a deactivation and immediately returns the throttle to the idle position.

The speed control system provides self-diagnostics. Speed control is disabled anytime an error is detected in the system. No cluster telltale or message center messages are displayed when faults occur. Fault codes are logged by the PCM.

An electronically controlled throttle system fault also causes the speed control system to be disabled and the

malfunction indicator lamp (MIL) illuminates, or a message center message is displayed.

Additionally, the following conditions cause the speed control system to deactivate:

- Transmission gear selector in a position other than D or OD (automatic transaxle)
- Vehicle clutch pedal is applied (manual transaxle)
- Speed control set speed is over-ridden with the accelerator pedal for a period longer than 5 minutes
- Vehicle speed loss from set speed of greater than 16 km/h (10 mph) occurs
- Vehicle speed falls below the minimum allowable limit of 48 km/h (30 mph)
- Parking brake is applied
- Speed control switch is pressed or stuck for longer than 2 minutes

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Throttle body	• Battery junction box (BJB) fuse 49 (15A) • Wiring, terminals or connectors • Speed control switch • Clutch pedal speed control deactivator switch (manual transaxle) • Digital transmission range (TR) sensor (automatic transaxle) • Speed control deactivator switch (part of the stoplamp switch) • Stoplamp switch • PCM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. Verify the speedometer operates correctly without speed control by test driving the vehicle. If the speedometer does not operate correctly, refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
5. Verify the stoplamp operate correctly with the ignition switch in the ON position. If the stoplamp do not

operate correctly, refer to **EXTERIOR LIGHTING** article.

6. Verify the parking brake warning indicator is operating correctly. If the parking brake warning indicator does not operate correctly, refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

NOTE: Make sure to use the latest scan tool software release.

7. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

8. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
9. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
10. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record the continuous memory DTCs.
11. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.
12. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
13. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

PCM DTC CHART

DTCs	Description	Action
P0579	Cruise Control Multifunction Input A Circuit Range/Performance	Go to **Pinpoint Test C**.
P0581	Cruise Control Multifunction Circuit High	Go to **Pinpoint Test C**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The speed control is inoperative	• PCM not configured for speed control • Stoplamp switch • Clutch pedal position (CPP) switch (manual transaxle) • Speed control switch • Digital transmission range (TR) sensor (automatic transaxle) • Vehicle speed signal • PCM	• Go to **Pinpoint Test A**.
• The speed control does not disengage when the clutch is applied	• Wiring, terminals or connectors • Clutch pedal speed control deactivator switch • PCM	• Go to **Pinpoint Test D**.
• The speed control indicator lamp is always on	• Wiring, terminals or connectors • Instrument cluster (IC) • PCM	• REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

Pinpoint Tests

Pinpoint Test A: The Speed Control Is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Speed Control for schematic and connector information.

Normal Operation

The PCM sends a signal through circuit VES10 (WH) to the speed control switches, which passes through the clockspring. The return signal is sent to the PCM through circuit RES08 (GN/BN) and the clockspring. When the brake pedal is applied, the smart junction box (SJB) sends a message to the PCM to deactivate the speed control if engaged.

The speed control deactivator switch (part of the stoplamp switch) interrupts circuit CES09 (VT/OG) removing the voltage signal to the PCM when the brake pedal is applied. This is a redundant signal to the PCM.

This pinpoint test is intended to diagnose the following:

- PCM not configured for speed control
- Stoplamp switch
- Clutch pedal position (CPP) switch
- Speed control switch
- Digital transmission range (TR) sensor
- Vehicle speed signal
- PCM

PINPOINT TEST A: THE SPEED CONTROL IS INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 VERIFY PCM CONFIGURATION

- Enter the following diagnostic mode on the diagnostic tool: Programmable Parameters
- Verify that the speed control is enabled in the PCM.
- **Is the speed control enabled?**

  YES : Go to A2.

  NO : Enable the speed control in the PCM using the scan tool programmable parameters menu. If no parameter exists, REFER to **MODULE CONFIGURATION** article to carry out PCM programmable module installation (PMI). TEST the system for normal operation.

A2 CHECK FOR DTCs

- Review the recorded DTCs from the PCM self-test.
- **Are any non-speed control DTCs recorded?**

  YES : REFER to the **Introduction - Gasoline Engines** article. REPAIR all PCM DTCs and RETEST the speed control.

  NO : Go to A3.

A3 CHECK THE SPEED CONTROL COMMAND SWITCH (SCCS) PID

- Start the engine.
- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- With the engine running, monitor the PCM SCCS PID while pressing the speed control switches as follows:

Speed Control Switch	PID Minimum Value	PID Maximum Value

OFF	0.00 volts	1.089 volts
SET -	2.192 volts	3.057 volts
SET +	3.057 volts	3.721 volts
RESUME	3.721 volts	4.209 volts
ON	4.209 volts	4.556 volts
No switch pressed	4.556 volts	4.839 volts

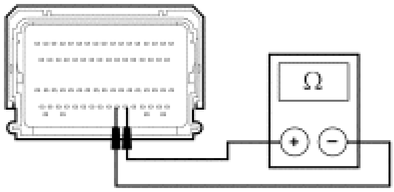
- **Are the PCM SCCS PID values OK?**

  YES : TURN the engine off. Go to A5.

  NO : TURN the engine off. Go to A4.

A4 CHECK THE SPEED CONTROL SWITCH

- Key in OFF position.
- Disconnect: PCM C175b



N0038826

Fig. 1: Checking Speed Control Switch
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and the PCM C175b-57, circuit RES08 (GN/BN), harness side while pressing the speed control switches as follows:

Speed Control Switch	Resistance Value
OFF	Less than 5 ohms
SET -	298 - 304 ohms
	596 - 608

SET +	ohms
RESUME	1,101 - 1,123 ohms
ON	2,091 - 2,133 ohms
No switch pressed	4,279 - 4,363 ohms

- **Are the speed control switch resistance values OK?**

  YES : Go to A9 .

  NO : INSTALL a new speed control switch. REFER to **Speed Control Switch**. TEST the system for normal operation.

A5 CHECK THE STOPLAMP SWITCH (BOO) PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- Monitor the PCM BOO PID.
- Apply and release the brake pedal.
- **Does the PID value agree with the brake pedal position?**

  YES : If equipped with an automatic transmission, go to A7.

  If equipped with a manual transmission, go to A6.

  NO : Go to **Pinpoint Test B**.

A6 CHECK THE CPP SWITCH (CPP_TT) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- Monitor the PCM CPP_TT PID while pressing and releasing the clutch pedal.
- **Does the PID value agree with the clutch pedal position?**

  YES : Go to A8.

  NO : Go to **Pinpoint Test D**.

A7 CHECK THE DIGITAL TR SENSOR (TR) PID

- Connect: PCM C175b
- Apply the parking brake.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- Monitor the PCM TR PID.
- Select DRIVE.
- **Does the PID value agree with the transmission range selector lever position?**

YES : Go to A8.

NO : REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article to diagnose the digital TR sensor.

A8 CHECK THE VEHICLE SPEED

NOTE: This step may require an assistant.

- Enter the following diagnostic mode on the diagnostic tool: ABS DataLogger
- Monitor and record the ABS LF_WSPD (left front wheel speed) PID while driving the vehicle at 48 km/h (30 mph) as indicated on the speedometer.
- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- Monitor and record the PCM VSS (vehicle speed signal) PID while driving the vehicle at 48 km/h (30 mph).
- **Does the speed indicated by the ABS LF_WSPD PID match the PCM VSS PID?**

  YES : Go to A9.

  NO : REFER to the **Introduction - Gasoline Engines** article to diagnose the output shaft speed (OSS) sensor signal.

A9 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article or **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTC P1572 or P1703 - Brake On/Off Circuit Failure

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Speed Control for schematic and connector information.

Normal Operation

When the brake pedal is applied, the smart junction box (SJB) sends a message to the PCM to deactivate the speed control if engaged.

The speed control deactivator switch (part of the stoplamp switch) interrupts circuit CES09 (VT/OG) removing the voltage signal to the PCM when the brake pedal is applied. This is a redundant signal to the PCM.

DTC P1572 sets when the PCM does not sense the proper sequence of the brake pedal input signal from both the speed control deactivator and stoplamp switches when the brake pedal is pressed and released.

DTC P1703 sets when there is an open or short in the deactivator switch circuits or when there is an open or short in the stoplamp circuits.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Speed control deactivator switch (integral to the stoplamp switch)
- ABS module
- PCM

PINPOINT TEST B: DTC P1572 OR DTC P1703 - BRAKE ON/OFF CIRCUIT FAILURE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

B1 CHECK THE OPERATION OF THE STOPLAMP

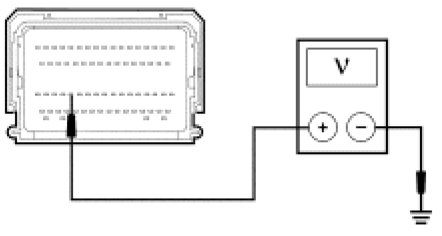
- Key in ON position.
- Operate the stoplamp.
- **Do the stoplamp operate correctly?**

  YES : Go to B2.

  NO : REFER to **EXTERIOR LIGHTING** article to continue diagnosis of the stoplamp.

B2 CHECK CIRCUIT CCB08 (VT/WH) FOR VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b
- Key in ON position.



N0038827

Fig. 2: Checking Circuit CCB08 (VT/WH) For Voltage

Courtesy of FORD MOTOR CO.

- While applying the brake pedal, measure the voltage between the PCM C175b-46, circuit CCB08 (VT/WH), harness side and ground.
- **Is the voltage greater than 10 volts with the brake pedal applied?**

  YES : Go to B3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B3 CHECK THE SPEED CONTROL DEACTIVATOR SWITCH FOR CORRECT OPERATION

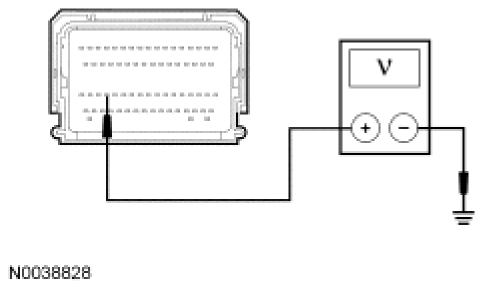


Fig. 3: Checking Speed Control Deactivator Switch For Correct Operation
Courtesy of FORD MOTOR CO.

- While firmly applying and releasing the brake pedal, measure the voltage between the PCM C175b-47, circuit CES09 (VT/OG), harness side and ground.
- **Is the voltage greater than 10 volts with the brake pedal released and 0 volts with the brake pedal firmly applied?**

  YES : Go to B9.

  NO : Go to B4.

B4 CHECK CIRCUIT CBP49 (VT/GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: Stoplamp Switch C278
- Key in ON position.

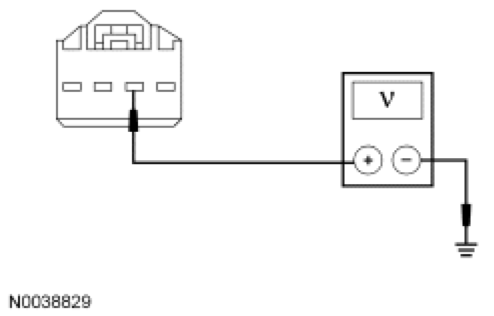

Fig. 4: Checking Circuit CBP49 (VT/GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between the stoplamp switch C278-2, circuit CBP49 (VT/GY), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to B5.

  NO : VERIFY the battery junction box (BJB) fuse 49 (15A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B5 CHECK CIRCUIT CES09 (VT/OG) FOR A SHORT TO VOLTAGE

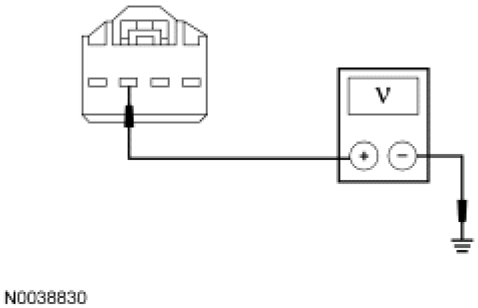

Fig. 5: Checking Circuit CES09 (VT/OG) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the stoplamp switch C278-3, circuit CES09 (VT/OG), harness side and ground.
- **Is any voltage present?**

  YES : Go to B6.

  NO : Go to B7.

B6 CHECK THE ABS MODULE FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: ABS Module C135
- Key in ON position.

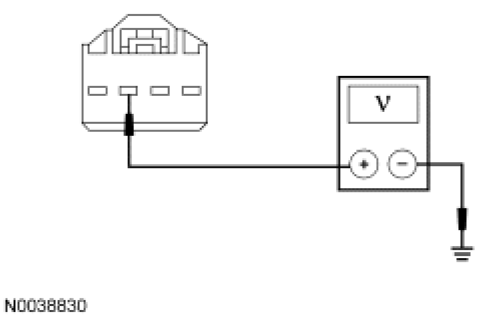

Fig. 6: Checking ABS Module For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the stoplamp switch C278-3, circuit CES09 (VT/OG), harness side

and ground.

- **Is any voltage present?**

  YES : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to B8.

B7 CHECK CIRCUIT CES09 (VT/OG) FOR AN OPEN

- Key in OFF position.

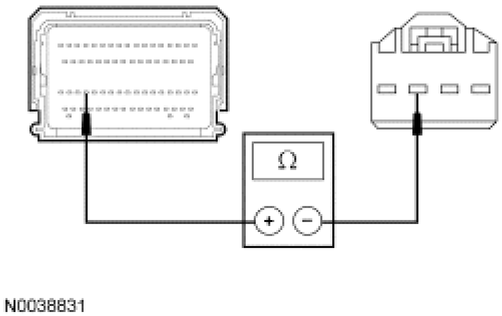

Fig. 7: Checking Circuit CES09 (VT/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the stoplamp switch C278-3, circuit CES09 (VT/OG), harness side and the PCM C175b-47, circuit CES09 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new stoplamp switch. REFER to **EXTERIOR LIGHTING** article. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to B9.

B8 CHECK FOR CORRECT ABS MODULE OPERATION

- Disconnect all the ABS module connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the ABS module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ABS module. REFER to **VEHICLE DYNAMIC SYSTEMS** article. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

B9 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:

    - corrosion
    - damaged pins
    - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article or **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: DTC P0579 or P0581 - Speed Control Switch Circuit Failure

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Speed Control for schematic and connector information.

Normal Operation

The PCM sends a signal through circuit VES10 (WH) to the speed control switches, which passes through the clockspring. The return signal is sent to the PCM through circuit RES08 (GN/BN) and the clockspring.

DTC P0579 may set when a speed control switch is stuck or the switch circuits are open, shorted to voltage or shorted to ground.

DTC P0581 sets when the speed control switch circuits are shorted to voltage or open.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Speed control switch
- PCM

PINPOINT TEST C: DTC P0579 OR DTC P0581 - SPEED CONTROL SWITCH CIRCUIT FAILURE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

C1 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b
- Key in ON position.

- Turn the parking lamps on.

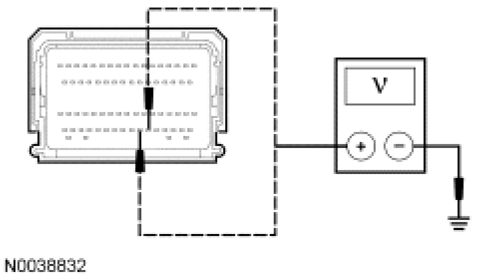

Fig. 8: Checking Speed Control Switch Circuitry For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Is any voltage present?**

  YES : TURN the parking lamps off. Go to C2 .

  NO : TURN the parking lamps off. Go to C4 .

C2 CHECK CIRCUITS VES10 (WH) AND RES08 (GN/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: Clockspring C218a
- Key in ON position.
- Turn the parking lamps on.

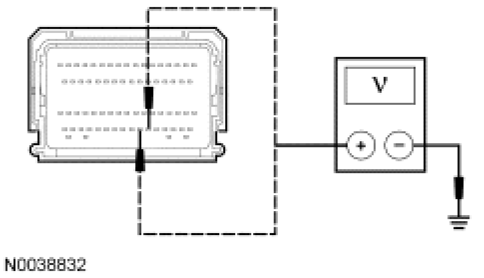

Fig. 9: Checking Circuits VES10 (WH) & RES08 (GN/BN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

  NO : TURN the parking lamps off. Go to C3 .

C3 CHECK THE CLOCKSPRING FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Connect: Clockspring C218a

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

- Remove the driver air bag module. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Upper Clockspring C218b
- Connect the restraint system diagnostic tools (418-F395) to the upper clockspring air bag connector.
- Connect the battery.
- Key in ON position.
- Turn the parking lamps on.

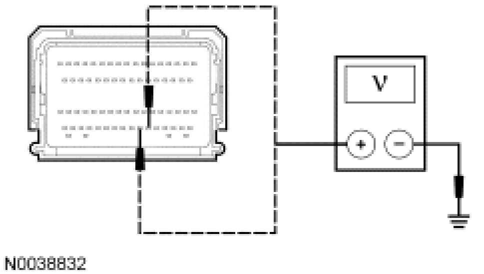

Fig. 10: Checking Clockspring For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Is any voltage present?**

  YES : INSTALL a new clockspring. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. DISCONNECT the battery. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new speed control switch. REFER to **Speed Control Switch**. DISCONNECT the battery. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

C4 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR A SHORT TO GROUND

- Key in OFF position.

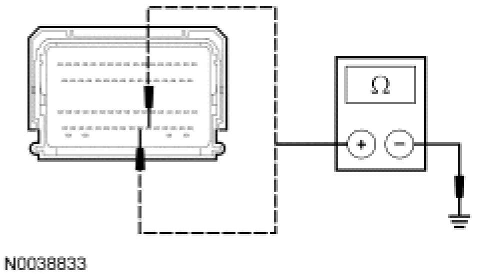

Fig. 11: Checking Speed Control Switch Circuitry For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to C7.

  NO : Go to C5.

C5 CHECK THE CLOCKSPRING FOR A SHORT TO GROUND

- Remove the driver air bag module. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
- Disconnect: Upper Clockspring C218b

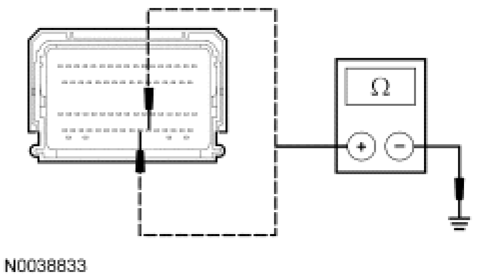

Fig. 12: Checking Clockspring For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new speed control switch. REFER to **Speed Control Switch**. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to C6.

C6 CHECK CIRCUITS VES10 (WH) AND RES08 (GN/BN) FOR A SHORT TO GROUND

- Disconnect: Clockspring C218a

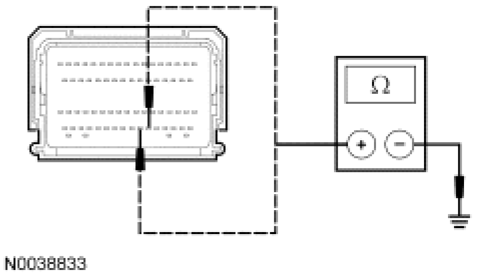

Fig. 13: Checking Circuits VES10 (WH) & RES08 (GN/BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and ground; and between the PCM C175b-57, circuit RES08 (GN/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new clockspring. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR the circuit in question. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

C7 CHECK THE SPEED CONTROL SWITCH CIRCUITRY FOR AN OPEN

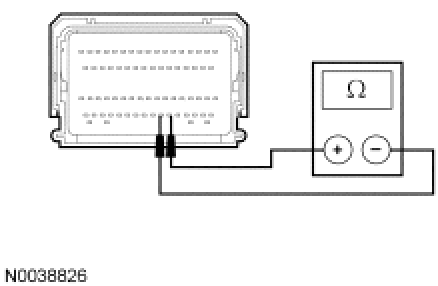

Fig. 14: Checking Speed Control Switch Circuitry For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and the PCM C175b-57, circuit RES08 (GN/BN), harness side.
- **Is the resistance between 4,279 and 4,363 ohms?**

  YES : Go to C10.

  NO : Go to C8.

C8 CHECK CIRCUITS VES10 (GN/BK) AND RES08 (GN/BN) FOR AN OPEN

- Disconnect: Clockspring C218a

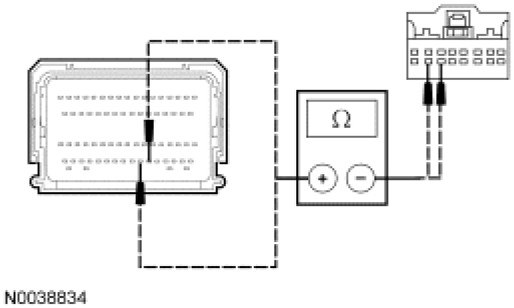

Fig. 15: Checking Circuits VES10 (GN/BK) & RES08 (GN/BN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PCM C175b-56, circuit VES10 (WH), harness side and the clockspring C218a-15, circuit VES10 (WH), harness side; and between the PCM C175b-57, RES08 (GN/BN), harness side and the clockspring C218a-14, circuit RES08 (GN/BN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to C9.

  NO : REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C9 CHECK THE CLOCKSPRING

- Remove the driver air bag module. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

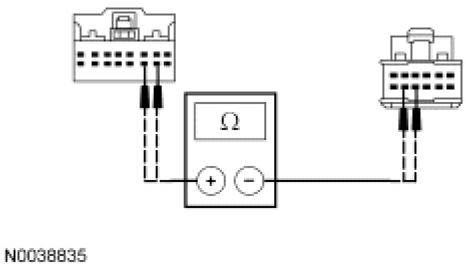

Fig. 16: Checking Clockspring
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clockspring C218a pin 15, component side and the upper clockspring C218b pin 8, component side; and between the clockspring C218a pin 14, component side and the upper clockspring C218b pin 9, component side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new speed control switch. REFER to **Speed Control Switch**. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

  NO : INSTALL a new clockspring. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

C10 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article or **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. INSTALL the driver air bag module. REFER to **SUPPLEMENTAL RESTRAINT SYSTEM** article. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTC P0833 - Clutch Pedal Switch B Circuit

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Speed Control for schematic and connector information.

Normal Operation

Vehicles equipped with a manual transaxle have an additional clutch pedal speed control deactivator switch. The PCM sends a signal through circuit CE904 (GN/VT) to the clutch pedal speed control deactivator switch. The return signal is sent to the PCM through circuit RE407 (YE/VT).

DTC P0833 sets when there is an open in the clutch pedal speed control deactivator switch circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clutch pedal speed control deactivator switch
- PCM

PINPOINT TEST D: DTC P0833 - CLUTCH PEDAL SWITCH B CIRCUIT

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

D1 CHECK THE CPP SWITCH (CPP_TT) PID

- Key in ON position.

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger
- Monitor the PCM CPP_TT PID while pressing and releasing the clutch pedal.
- **Does the PID value agree with the clutch pedal position?**

  YES : Go to D4.

  NO : Go to D2.

D2 CHECK THE CLUTCH PEDAL SPEED CONTROL DEACTIVATOR SWITCH

- Key in OFF position.
- Disconnect: Clutch Pedal Speed Control Deactivator Switch C2354

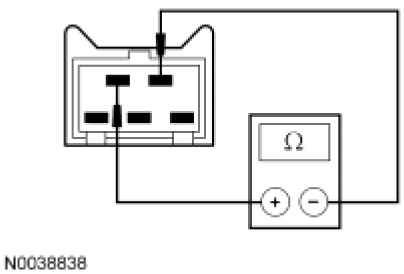

Fig. 17: Checking Clutch Pedal Speed Control Deactivator Switch
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clutch pedal speed control deactivator switch C2354 pin 4, component side and the clutch pedal speed control deactivator switch C2354 pin 5, component side.
- **Is the resistance less than 5 ohms with the clutch pedal released?**

  YES : Go to D3.

  NO : INSTALL a new clutch pedal speed control deactivator switch. CLEAR the DTCs. REPEAT the self-test.

D3 CHECK CIRCUIT CE904 (GN/VT) FOR AN OPEN

- Disconnect: PCM C175b

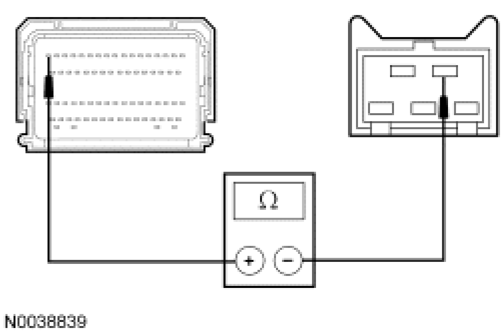

Fig. 18: Checking Circuit CE904 (GN/VT) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clutch pedal speed control deactivator switch C2354-4, circuit CE904 (GN/VT), harness side and the PCM C175b-17, circuit CE904 (GN/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to D4.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

D4 CHECK CIRCUIT RE407 (YE/VT) FOR AN OPEN

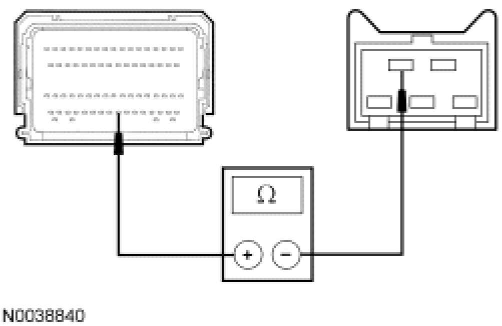

Fig. 19: Checking Circuit RE407 (YE/VT) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clutch pedal speed control deactivator switch C2354-5, circuit RE407 (YE/VT), harness side and the PCM C175b-58, circuit RE407 (YE/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to D5.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

D5 CHECK FOR CORRECT PCM OPERATION

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article or **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

REMOVAL AND INSTALLATION

SPEED CONTROL SWITCH

NOTE: **Fusion shown, Milan similar.**

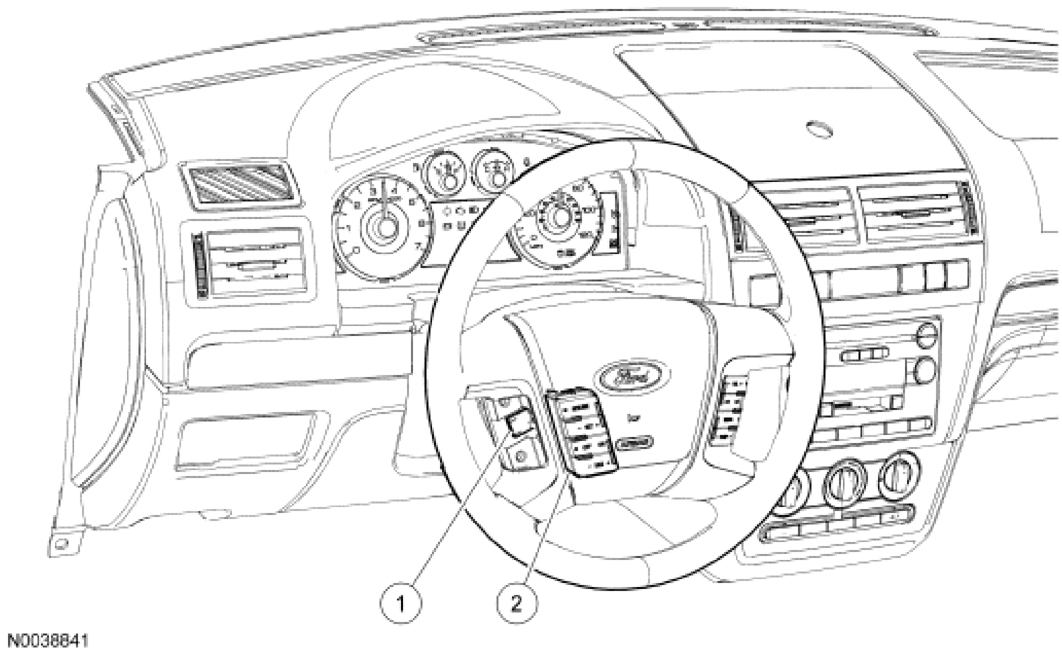

Fig. 20: Exploded View Of Speed Control Switch - Fusion, Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Speed control switch electrical connector (part of 14A411)
2	9C888	Speed control switch

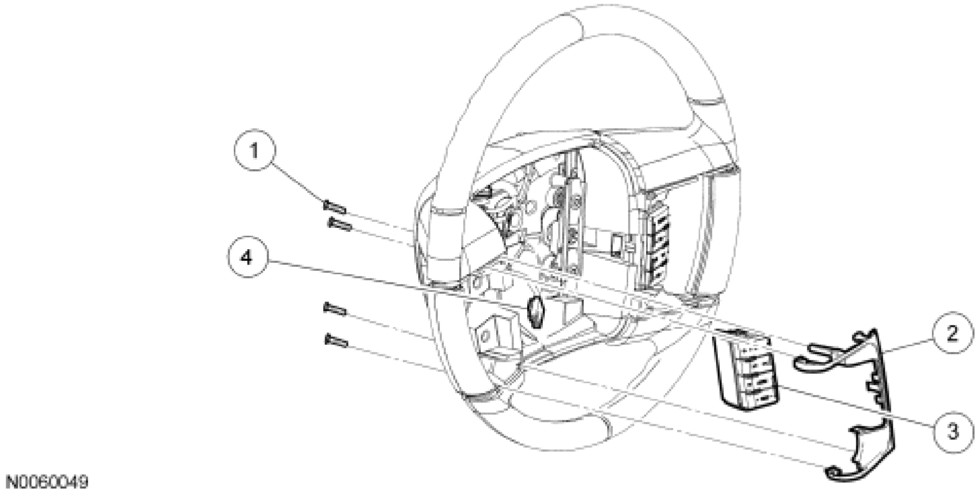

Fig. 21: Exploded View Of Speed Control Switch - MKZ
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Steering wheel controls bezel screws (4 required)
2	-	Steering wheel controls bezel
3	9C888	Speed control switch
4	-	Speed control switch electrical connector (part of 14A441)

REMOVAL AND INSTALLATION

MKZ

1. Remove the driver air bag module. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
2. Remove the 4 screws and the steering wheel control bezel.

   All vehicles

3. Remove the speed control switch by pulling the switch toward the rear of the vehicle.
   - Disconnect the electrical connector.
4. Remove the steering wheel controls bezel, if equipped.
5. To install, reverse the removal procedure.

2008 ENGINE

Starting System - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Starter motor bolt and stud bolt (2.3L)	25	18	-
Starter motor bolts (3.0L and 3.5L)	27	20	-
Starter motor solenoid battery cable nut	12	9	-
Starter motor solenoid wire nut	5	-	44

DESCRIPTION AND OPERATION

STARTING SYSTEM

The starting system consists of the following components:

- Starter motor
- Starter motor relay - part of smart junction box (SJB)
- Transmission range (TR) sensor - automatic transmission
- Clutch cutoff switch - manual transmission
- Battery
- Ignition switch
- PCM
- Start diode

When the key is placed in the START position, the starter solenoid is energized and a magnetic field is created in the starter solenoid windings. The iron plunger core is drawn into the starter solenoid coil, and a drive lever and pin connected to the starter drive engages the drive pinion gear to the flexplate/flywheel ring gear. When the plunger is pulled all the way in, its contact disc closes the circuit between the battery and the starter motor solenoid feed terminals. This sends current to the motor, and the drive pinion gear cranks the flexplate/flywheel to start the engine. When current flows to the starter motor, the starter solenoid pull-in coil is bypassed and the hold-in coil keeps the drive pinion gear engaged with the flywheel until the ignition switch is released from the START position.

An overrunning clutch in the starter drive protects the starter motor from excessive speeds during the brief period before the driver releases the ignition switch from the START position as the engine starts.

Vehicles equipped with a manual transaxle have a clutch cutoff switch mounted on the clutch pedal bracket. The clutch cutoff switch prevents operation of the starter motor unless the clutch is fully depressed.

Vehicles equipped with an automatic transmission have a TR sensor mounted on the transaxle. The TR sensor prevents operation of the starter motor unless NEUTRAL or PARK is selected. The vehicle has one-touch integrated start (OTIS), a computer-assisted cranking system. This feature assists in starting the engine. If the ignition key is turned to the START position and released when the engine begins cranking, the engine may continue cranking for up to 10 seconds or until the vehicle starts.

One-Touch Integrated Start (OTIS)

Once the ignition is turned to the START position and the vehicle is in NEUTRAL or PARK, the PCM reads starter motor request (SMR) from the ignition switch and gains control of the starter engagement. The customer is no longer in the loop after the initial crank request, the customer may release the key to the RUN/START position. The PCM will disengage the starter motor based on the following events:

- The engine is started (RPM threshold)
- A set time has been exceeded (calibrated)
- The ignition key has been turned to the OFF position

DIAGNOSTIC TESTS

STARTING SYSTEM

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2574-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

Starting System - Anti-Theft Intervention

The starting system is electronically controlled by the passive anti-theft system (PATS). PATS is controlled by the instrument cluster. PATS recognizes the correct electronically coded ignition key and the instrument cluster will send a message to the PCM to provide a ground for the starter relay. The energized relay provides voltage to the starter solenoid, thereby allowing the starter motor to activate.

Inspection and Verification

WARNING: **Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.**

NOTE: When working on the starter system, make sure the anti-theft system is operating correctly.

1. Verify the customer concern by operating the starting system to duplicate the conditions.
2. Inspect to determine if any of the following mechanical or electrical concerns apply.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Starter motor
• Starter motor bolts
• Flexplate
• Flywheel
	• Battery
	• Battery junction box (BJB) fuse(s):
	  ○ 2 (60A)
	  ○ 14 (15A)
	• Smart junction box (SJB) fuse(s):
	  ○ 10 (30A)
	  ○ 22 (7.5A) - 3.0L and 3.5L vehicles only
	• Wiring harness
	• Starter motor relay - non-serviceable (part of SJB)
	• Anti-theft system
	• Loose or corroded connections

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM.
9. If the DTCs retrieved are related to the concern, go to PCM DTC Chart or the Passive Anti-Theft System (PATS) DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

PCM DTC CHART

DTC	Description	Source	Action
P0512	Starter Request Circuit - Circuit has Power With the Ignition in the OFF Position	PCM	CARRY OUT the Ignition Switch Component Test. Refer to COMPONENT TESTING. If necessary, INSTALL a new ignition switch. If the ignition switch passed the component test, REPAIR circuit CDC35 (BU/WH) for a short to power.
P0706	TR Sensor Circuit Failure	PCM	Refer to the appropriate Automatic Transmission article for the procedure.
P0707	TR circuit low input	PCM	Refer to the appropriate Automatic Transmission article for the procedure.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The engine does not crank	• Battery • Battery junction box (BJB) fuse(s):	• Go to **Pinpoint Test A**.

	2 (60A) 14 (15A) - Smart junction box (SJB) fuse(s): 10 (30A) 22 (7.5A) - 3.0L and 3.5L vehicles - Starter motor - PCM - Circuitry - Starter motor relay - non-serviceable (part of SJB) - Ignition switch - Anti-theft system - Start diode - Transmission range (TR) sensor - automatic transmission - Clutch cutoff switch - manual transmission	
One-touch integrated start (OTIS) does not operate correctly	- Circuitry - PCM	Go to **Pinpoint Test B**.
The engine cranks slowly	- Battery - Starter motor - Circuitry	CARRY OUT the Starter Motor Component Test.
Unusual starter noise	- Starter motor mounting - Starter motor - Incorrect starter drive engagement	Go to **Pinpoint Test C**.
The starter spins but the engine does not crank	Starter motor	INSPECT the starter motor mounting and engagement. REPAIR as necessary.
	Damaged flywheel/flexplate ring gear teeth	INSPECT the flywheel/flexplate ring gear for damaged, missing or worn teeth. REPAIR as necessary.

Pinpoint Tests

Pinpoint Test A: The Engine Does Not Crank

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Starting System for schematic and connector information.

Normal Operation

Under normal operation, constant power is supplied to the starter relay on circuit SBB02 (YE/RD), the starter on circuit SDC02 (RD) and to the ignition switch on circuit SBB14 (BN/RD). When the key is placed in the START position, with the vehicle in PARK or NEUTRAL or with the clutch pedal depressed, power is supplied to the smart junction box (SJB) on circuit CDC36 (GN/WH) to the starter relay. Inputs from the transmission range (TR) sensor and clutch cutoff switch to the PCM provide a ground to the starter relay on circuit CDC12 (YE). When the coil of the relay is energized, it sends power to the starter motor on circuit CDC25 (BN/GN).

This pinpoint test is intended to diagnose the following:

- Battery
- Fuse(s)
- Ignition switch
- Starter motor relay - non-serviceable (part of SJB)
- PCM
- Anti-theft system
- Circuitry

PINPOINT TEST A: THE ENGINE DOES NOT CRANK

A1 CHECK THE BATTERY

- Check the battery condition and charge. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Is the battery OK?**

  YES : Go to A2.

  NO : CHARGE or INSTALL a new battery as necessary. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

A2 CHECK THE PATS AND PCM FOR DTCs

- Check for PATS and PCM DTCs.
- **Were any PATS and PCM DTCs retrieved?**

  YES : REFER to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article to diagnose the PATS DTCs. REFER to **Introduction - Gasoline Engines** article to diagnose the PCM DTCs.

  NO : For automatic transmission, go to A3. For manual transmission, go to A4.

A3 CHECK THE AUTOMATIC TRANSMISSION RANGE (TR) SENSOR

- Enter the following diagnostic mode on the scan tool: Transmission Control Module (TCM) DataLogger PID.
- While observing the TCM TR sensor PID, place the vehicle in PARK and NEUTRAL.

- **Does the PID match the gear selection?**

  YES : Go to A4.

  NO : Go to the appropriate automatic transmission section to diagnose the TR sensor.

A4 CHECK THE STARTER MOTOR RELAY ENABLE (STRT_RLY) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID STRT_RLY with the ignition switch in the START position.
- **Does the PID change from DISABLED to ENABLED?**

  YES : Go to A5.

  NO : Go to A12.

A5 CHECK THE STARTER MOTOR CONTROL OUTPUT DETECTED (SMC_MON) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID SMC_MON with the ignition switch in the START position.
- **Does the PID change from OFF to ON?**

  YES : Go to A6.

  NO : Go to A19.

A6 CHECK THE BATTERY GROUND CABLE

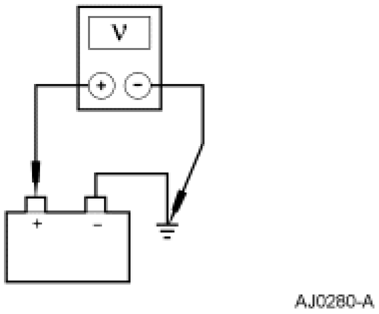

Fig. 1: Checking Battery Ground Cable
Courtesy of FORD MOTOR CO.

- Measure the voltage between the positive battery post and the battery ground cable connection at the engine.
- **Is the voltage greater than 10 volts?**

  YES : Go to A7.

  NO : INSTALL a new battery ground cable. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

A7 CHECK THE STARTER MOTOR GROUND

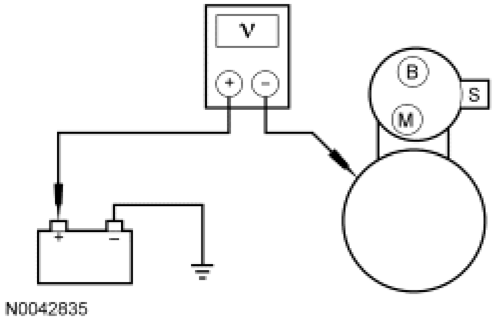

Fig. 2: Checking Starter Motor Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between the positive battery post and the starter motor case.
- **Is the voltage greater than 10 volts?**

  YES : Go to A8.

  NO : CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for normal operation.

A8 CHECK THE POWER SUPPLY TO THE STARTER MOTOR

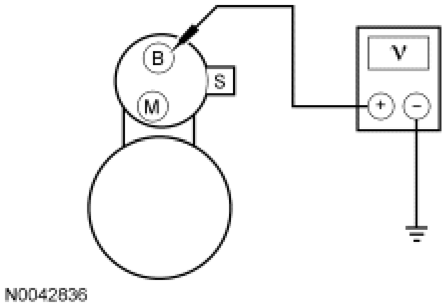

Fig. 3: Checking Power Supply To Starter Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between starter motor C197A, circuit SDC02 (RD) and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A9.

  NO : INSTALL a new positive battery cable. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

A9 CHECK THE STARTER MOTOR B-PIN

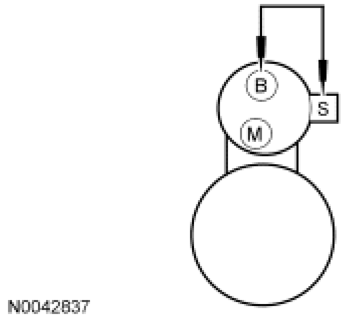

Fig. 4: Checking Starter Motor B-Pin
Courtesy of FORD MOTOR CO.

- Connect one end of a fused (30A) jumper wire to starter motor solenoid C197A, circuit SDC02 (RD). Momentarily connect the other end of the jumper to starter motor C197B, circuit CDC25 (BN/GN).
- **Did the starter motor engage and the engine crank?**

  YES : Go to A10.

  NO : INSTALL a new starter motor. REFER to **Starter Motor - 2.3L**, **Starter Motor - 3.0L** or **Starter Motor - 3.5L**. TEST the system for normal operation.

A10 CHECK THE CIRCUIT TO THE STARTER MOTOR

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

- Key in OFF position.
- Disconnect: Starter Motor Solenoid C197B
- Disconnect: SJB C2280A

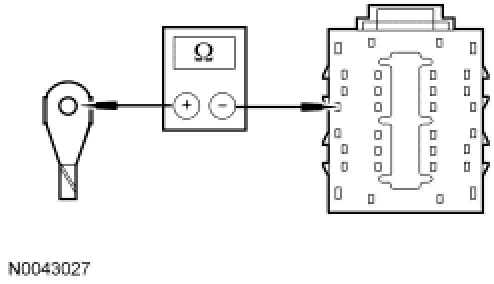

Fig. 5: Checking Circuit To Starter Motor
Courtesy of FORD MOTOR CO.

- Measure the resistance between starter solenoid S-terminal C197B, circuit CDC25 (BN/GN) harness side and the SJB C2280A-17, circuit CDC25 (BN/GN) harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to A11.

NO : REPAIR the circuit CDC25 (BN/GN). TEST the system for normal operation.

A11 CHECK THE STARTER MOTOR RELAY POWER

- Connect: Starter Motor Solenoid C197B
- Connect: SJB C2280A
- Disconnect: SJB C2280F

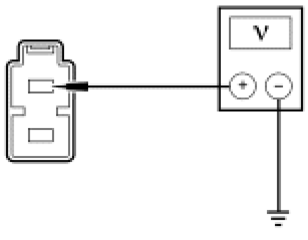

Fig. 6: Checking Starter Motor Relay Power
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280F-1, circuit SBB02 (YE/RD) and ground.
- **Is the voltage greater than 10 volts?**

YES : INSTALL a new SJB. TEST the system for normal operation.

NO : REPAIR circuit SBB02 (YE/RD). TEST the system for normal operation.

A12 CHECK THE STARTER DIODE

- Disconnect: Starter Diode

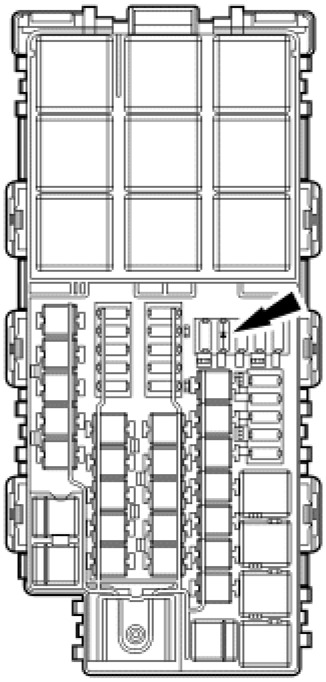

Fig. 7: Checking Starter Diode
Courtesy of FORD MOTOR CO.

- Carry out a Starter Diode Test.
- **Is the starter diode open or shorted?**

  YES : INSTALL a new starter diode. TEST the system for normal operation.

  NO : Go to A13.

A13 CHECK CIRCUIT CDC35 (BU/WH) FOR VOLTAGE

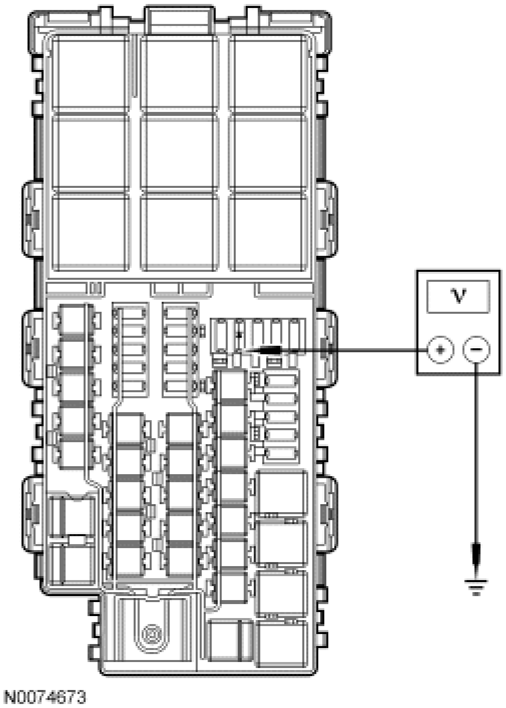

Fig. 8: Checking Circuit CDC35 (BU/WH) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between battery junction box (BJB) starter diode cell, circuit CDC35 (BU/WH) and ground with the ignition switch in the START position.
- **Is the voltage greater than 10 volts?**

  YES : Go to A16.

  NO : Go to A14.

A14 CHECK CIRCUIT SBB14 (BN/RD) FOR VOLTAGE

- Disconnect: Ignition Switch C250

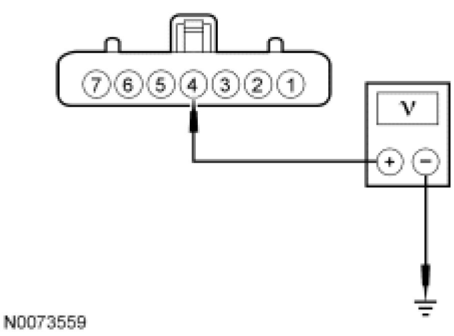

Fig. 9: Checking Circuit SBB14 (BN/RD) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ignition switch C250-4, circuit SBB14 (BN/RD), harness side and ground.

- **Is the voltage greater than 10 volts?**

  YES : Go to A15.

  NO : REPAIR circuit SBB14 (BN/RD). TEST the system for normal operation.

A15 CHECK THE IGNITION SWITCH

- Carry out the Ignition Switch Component Test. Refer to COMPONENT TESTING.
- **Did the ignition switch pass the component test?**

  YES : REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

  NO : INSTALL a new ignition switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

A16 CHECK CIRCUIT CDC36 (GN/WH) FOR AN OPEN

- Disconnect: Start Diode
- Disconnect: PCM C175B

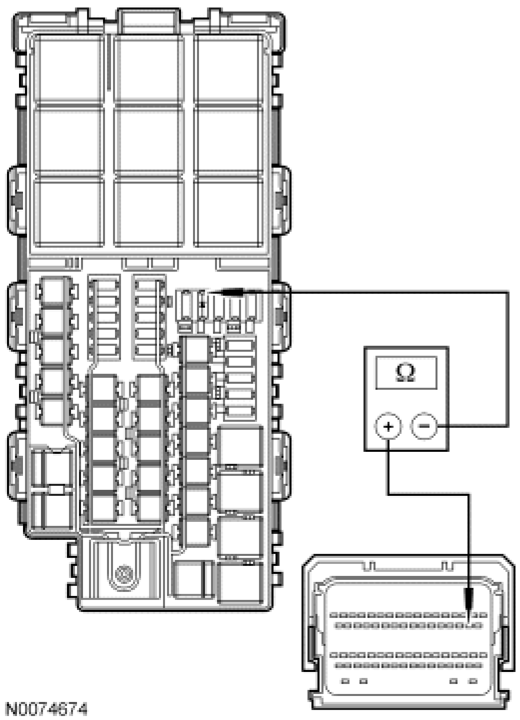

Fig. 10: Checking Circuit CDC36 (GN/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the BJB start diode cell, circuit CDC36 (BU/WH), harness side and PCM C175B-19, circuit CDC36 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A17.

  NO : REPAIR circuit CDC36 (BU/WH). TEST the system for normal operation.

A17 CHECK THE START SIGNAL TO THE STARTER MOTOR RELAY

- Connect: Start Diode

- Disconnect: SJB C2280B

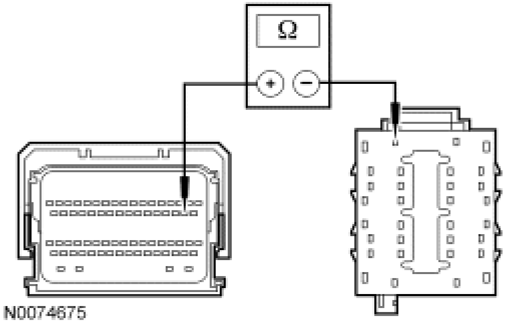

Fig. 11: Checking Start Signal To Starter Motor Relay
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280B-30, circuit CDC36 (GN/WH), harness side and C175B-19, circuit CDC36 (GN/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A18.

  NO : REPAIR circuit CDC36 (BU/WH). TEST the system for normal operation.

A18 CHECK CIRCUIT CDC35 (BU/WH) FOR AN OPEN

- Connect: SJB C2280B

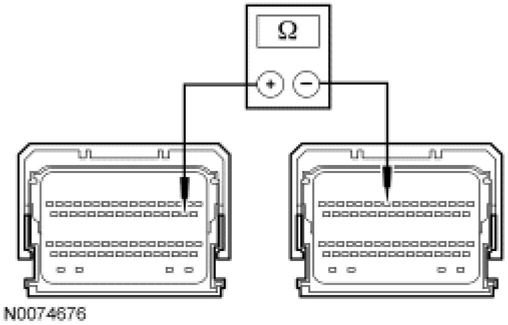

Fig. 12: Checking Circuit CDC35 (BU/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between PCM C175B-19, circuit CDC36 (GN/WH), harness side and PCM C175B-10, circuit CDC35 (BU/WH) harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

  NO : REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

A19 CHECK CIRCUIT CDC12 (YE) FOR AN OPEN

- Key in OFF position.

- Disconnect: PCM C175B
- Disconnect: SJB C2280A

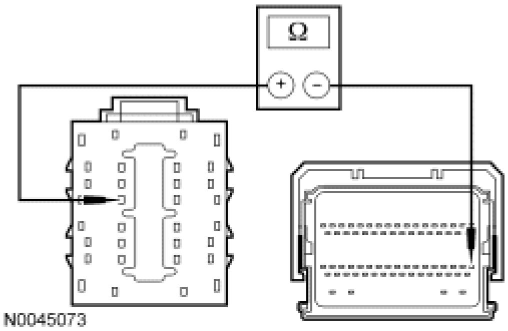

Fig. 13: Checking Circuit CDC12 (YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280A-18, circuit CDC12 (YE), harness side and PCM C175B-34, circuit CDC12 (YE), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A20.

  NO : REPAIR circuit CDC12 (YE). TEST the system for normal operation.

A20 CHECK STARTER MOTOR RELAY

- Key in OFF position.
- Disconnect: SJB C2280B
- Disconnect: SJB C2280A

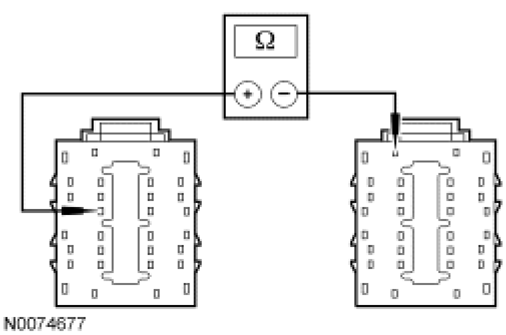

Fig. 14: Checking Starter Motor Relay
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280A-18, circuit CDC12 (YE), component side and SJB C2280B-30, circuit CE336 (GN/WH), component side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

NO : INSTALL a new SJB. TEST the system for normal operation.

Pinpoint Test B: One-Touch Integrated Start (OTIS) Does Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Starting System for schematic and connector information.

Normal Operation

When the ignition switch is turned in the START position and released, the PCM receives a starter motor request (SMR) signal through circuit CDC35 (BU/WH). With the vehicle in PARK or NEUTRAL, power flows from the PCM to the starter motor relay through circuit CDC36 (GN/WH). A ground is supplied through circuit CDC12 (YE) from the PCM causing the starter motor relay coil to energize and the relay contacts close. This allows power from starter motor relay through circuit CDC25 (BN/GN) to the starter solenoid. The solenoid is grounded at the starter motor. Energizing the starter solenoid will engage the starter drive into the ring gear and closes the solenoid contacts allowing power directly from the battery through circuit SDC02 (RD) to the starter motor to start the engine. The customer is no longer in the loop after the initial crank request, the customer may release the key to the RUN/START position. The PCM will disengage the starter motor based on engine running (RPM threshold), a set crank time has been exceeded or the ignition switch has been turned to the OFF position.

This pinpoint test is intended to diagnose the following:

- Circuitry
- PCM

PINPOINT TEST B: ONE-TOUCH INTEGRATED START (OTIS) DOES NOT OPERATE CORRECTLY

B1 CHECK THE STATUS OF ONE-TOUCH INTEGRATED START (OTIS) (OTS_STAT) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID OTS_STAT with the ignition switch in the RUN position.
- **Is the OTIS PID enabled?**

  YES : Go to B2.

  NO : ENABLE OTIS. TEST the system for normal operation. If OTIS will not enable, INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

B2 CHECK THE KEY POSITION FOR START INDICATED (START_KEY) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID START_KEY with the ignition switch in the START position.
- **Does the PID change from OFF to ON?**

  YES : Go to B4.

  NO : Go to B3.

B3 CHECK CIRCUIT CDC35 (BU/WH)

- Disconnect: Start Diode
- Disconnect: PCM C175B

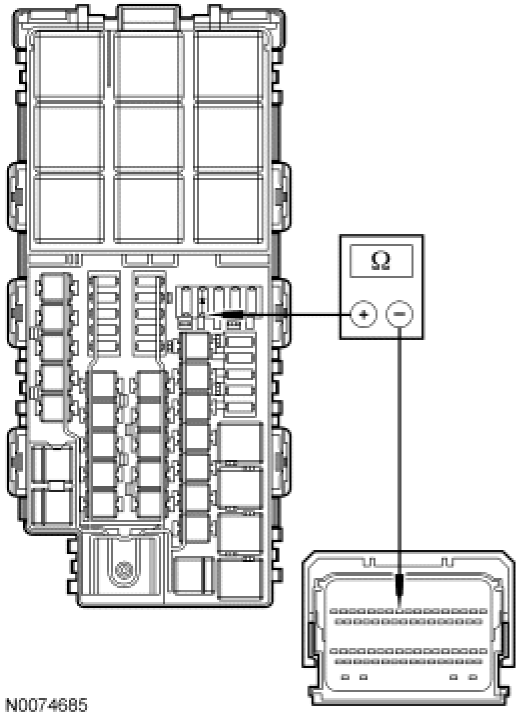

Fig. 15: Checking Circuit CDC35 (BU/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between the start diode cell, circuit CDC35 (BU/WH), harness side and PCM C175B-10, circuit CDC35 (BU/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

  NO : REPAIR circuit CDC35 (BU/WH). TEST the system for normal operation.

B4 CHECK THE STARTER MOTOR RELAY ENABLE (STRT_RLY) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID STRT_RLY with the ignition switch in the START position.
- **Does the PID change from DISABLED to ENABLED?**

  YES : Go to B6.

  NO : Go to B5.

B5 CHECK THE CIRCUIT CDC36 (GN/WH) BETWEEN THE BJB AND THE PCM

- Key in OFF position.
- Disconnect: PCM C175B

- Disconnect: SJB C2280B

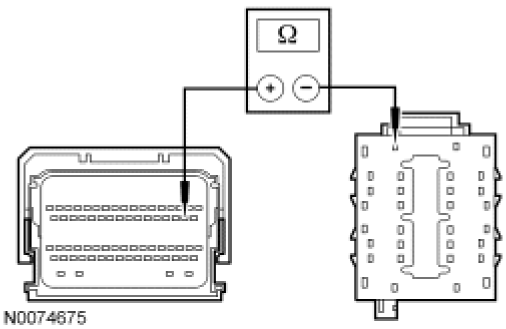

Fig. 16: Checking Circuit CDC36 (GN/WH) Between BJB & PCM
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280B-30, circuit CDC36 (GN/WH), harness side and C175B-19, circuit CDC36 (GN/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

  NO : REPAIR circuit CDC36 (GN/WH). TEST the system for normal operation.

B6 CHECK THE STARTER MOTOR CONTROL OUTPUT DETECTED (SMC_MON) PID

- Enter the following diagnostic mode on the diagnostic tool: PCM DataLogger/PID
- Monitor the PCM PID SMC_MON with the ignition switch in the START position.
- **Does the PID change from OFF to ON?**

  YES : REPAIR circuit CDC12 (YE). TEST the system for normal operation.

  NO : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article or **ELECTRONIC ENGINE CONTROLS - 3.5L** article. TEST the system for normal operation.

Pinpoint Test C: Unusual Starter Noise

This pinpoint test is intended to diagnose the following:

- Starter motor mounting
- Starter motor mounting bolts
- Starter motor drive
- Flywheel or flexplate ring gear
- Starter motor

PINPOINT TEST C: UNUSUAL STARTER NOISE

C1 CHECK THE STARTER MOUNTING

- Inspect the starter motor mounting bolts for looseness.
- **Is the starter motor mounted correctly?**

  YES : Go to C2.

  NO : INSTALL the starter motor correctly. REFER to **Starter Motor - 2.3L**, **Starter Motor - 3.0L** or **Starter Motor - 3.5L**. TEST the system for normal operation.

C2 CHECK FOR ENGINE NOISE

- Turn the ignition switch to the OFF position.
- Connect a fused jumper wire from the B-terminal to the S-terminal of the starter motor. Engage the starter motor and verify that the noise is due to the starter operation.
- **Is the noise due to the starter motor engagement?**

  YES : Go to C3.

  NO : REFER to **ENGINE SYSTEM - GENERAL INFORMATION** article to continue the diagnosis.

C3 CHECK FOR UNUSUAL WEAR

- Remove the starter motor. Refer to **Starter Motor - 2.3L**, **Starter Motor - 3.0L** or **Starter Motor - 3.5L**.
- Inspect the ring gear for damaged or worn teeth.
- **Is the noise due to flexplate/flywheel ring gear tooth damage?**

  YES : INSTALL a new flexplate/flywheel ring gear. EXAMINE the starter pinion teeth. If damaged, INSTALL a new starter motor. REFER to **Starter Motor - 2.3L**, **Starter Motor - 3.0L** or **Starter Motor - 3.5L**. TEST the system for normal operation.

  NO : INSTALL a new starter motor. REFER to **Starter Motor - 2.3L**, **Starter Motor - 3.0L** or **Starter Motor - 3.5L**. TEST the system for normal operation.

Component Tests

WARNING: **Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.**

Connect the 73III Automotive Meter at the component terminal rather than at the wiring end connector. Making a connection at the wiring end connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and the component.

Starter Motor - Motor Feed Circuit

1. Make sure the battery is fully charged. Carry out a battery load test. Refer to **BATTERY, MOUNTING AND CABLES** article.
2. Disconnect the inertia fuel shutoff (IFS) switch.
3. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) terminal.

4. Connect the 73III Automotive Meter positive lead to the battery positive (+) post. Connect the negative lead to the M-terminal.

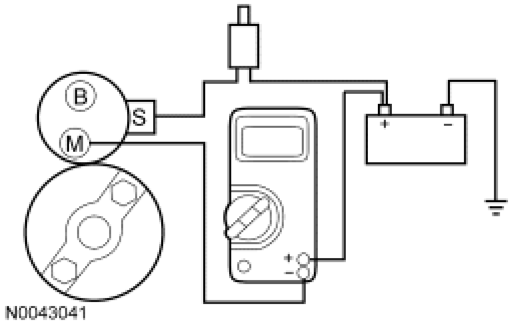

Fig. 17: Checking Voltage In Motor Feed Circuit
Courtesy of FORD MOTOR CO.

5. Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.8 volt or less.
6. If the voltage reading is 0.8 volt or less, go to the Starter Motor - Ground Circuit Component Test.
7. If the voltage reading is greater than 0.8 volt, this is an indication of excessive resistance in the connections, the positive battery cable or in the starter solenoid. Move the 73III Automotive Meter negative lead to the starter solenoid B-terminal and repeat the test. If the voltage reading at the B-terminal is lower than 0.8 volt, the concern is either in the connections at the starter solenoid or in the solenoid contacts.
8. Remove the cables from solenoid B-, S- and M-terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6. If the voltage drop reading is still greater than 0.8 volt when checked at the M-terminal and less than 0.8 volt when checked at the B-terminal, the concern is in the solenoid contacts. Install a new starter motor.
9. If the voltage reading taken at the solenoid B-terminal is still greater than 0.8 volt after cleaning the cables and the connections at the solenoid, the concern is either in the positive (+) battery cable connection or in the positive battery cable itself. Clean the positive (+) battery cable connection. If this does not solve the problem, install a new positive battery cable. Refer to **BATTERY, MOUNTING AND CABLES** article.

Starter Motor - Ground Circuit

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:

1. Connect the 73III Automotive Meter positive lead to the starter motor housing (the connection must be clean and free of rust or grease). Connect the negative lead to the negative (-) battery terminal.

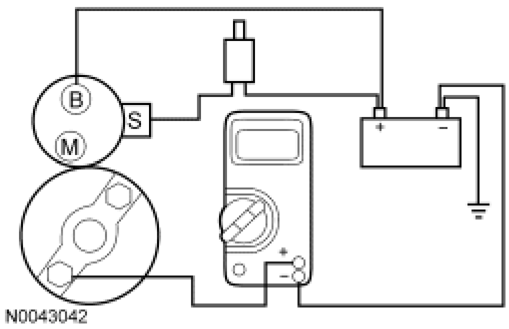

Fig. 18: Checking Voltage Drop In Ground Circuit
Courtesy of FORD MOTOR CO.

2. Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.5 volt or less.
3. If the voltage is more than 0.5 volt, clean the negative cable connections at the battery, the body ground connections and the starter ground connections. Retest.
4. If the voltage is more than 0.5 volt, install a new cable. If the voltage reading is less than 0.5 volt and the engine still cranks slowly, install a new starter motor.

REMOVAL AND INSTALLATION

STARTER MOTOR - 2.3L

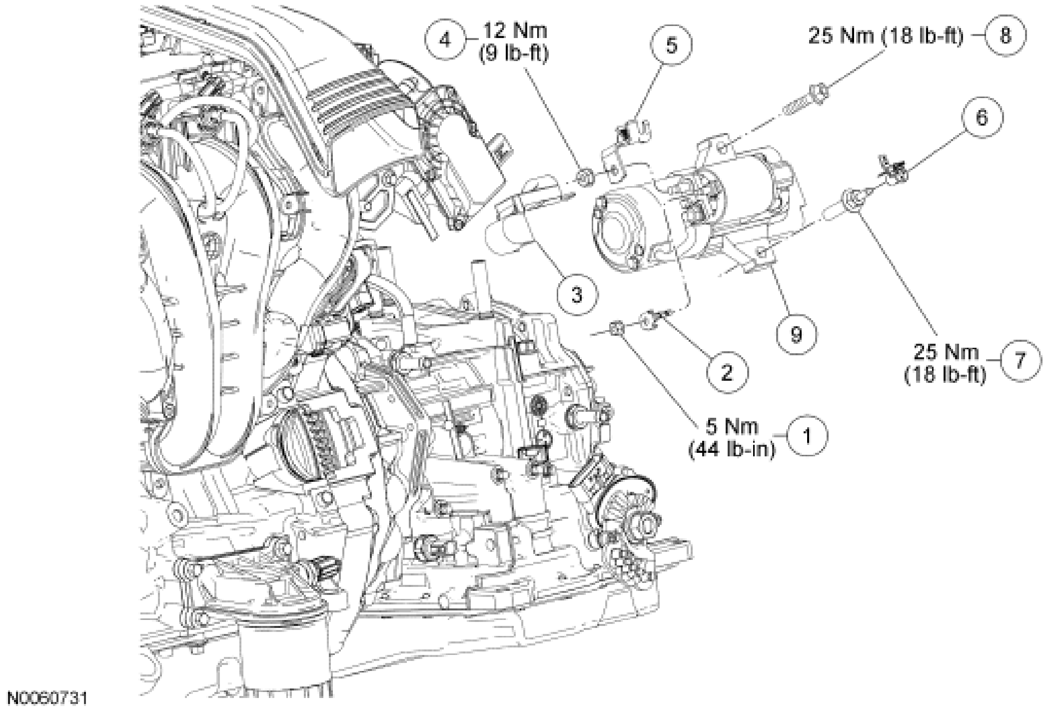

Fig. 19: Exploded View Of Starter Motor With Torque Specifications - 2.3L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	N805320	Starter motor solenoid wire nut
2	14463	Starter motor solenoid wire (part of 12B637)
3	14603	Starter motor solenoid battery cable terminal cover
4	W706414	Starter motor solenoid battery cable nut
5	14463	Starter motor solenoid battery cable (part of 14B060)
6	14A169	Wire harness retainer (part of 12B637)
7	W706194	Starter motor stud bolt
8	W705877	Starter motor bolt
9	11000	Starter motor

REMOVAL AND INSTALLATION

WARNING: **Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. If equipped, remove the 7 screws and the underbody cover.

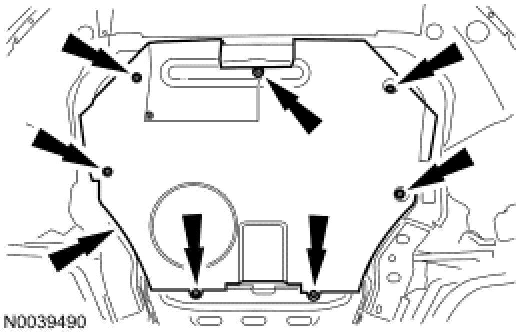

Fig. 20: Locating Splash Shield Bolts
Courtesy of FORD MOTOR CO.

4. Remove the starter motor solenoid wire nut and position the wire aside.
   - To install, tighten to 5 Nm (44 lb-in).
5. Position the starter motor solenoid battery cable terminal cover aside.
6. Remove the starter motor solenoid battery cable nut and position the cable aside.
   - To install, tighten to 12 Nm (9 lb-ft).

7. Disconnect the wiring harness retainer from the starter motor stud bolt and position the wiring harness aside.
8. Remove the starter motor bolt, stud bolt and the starter motor.
   - To install, tighten to 25 Nm (18 lb-ft).
9. To install, reverse the removal procedure.

STARTER MOTOR - 3.0L

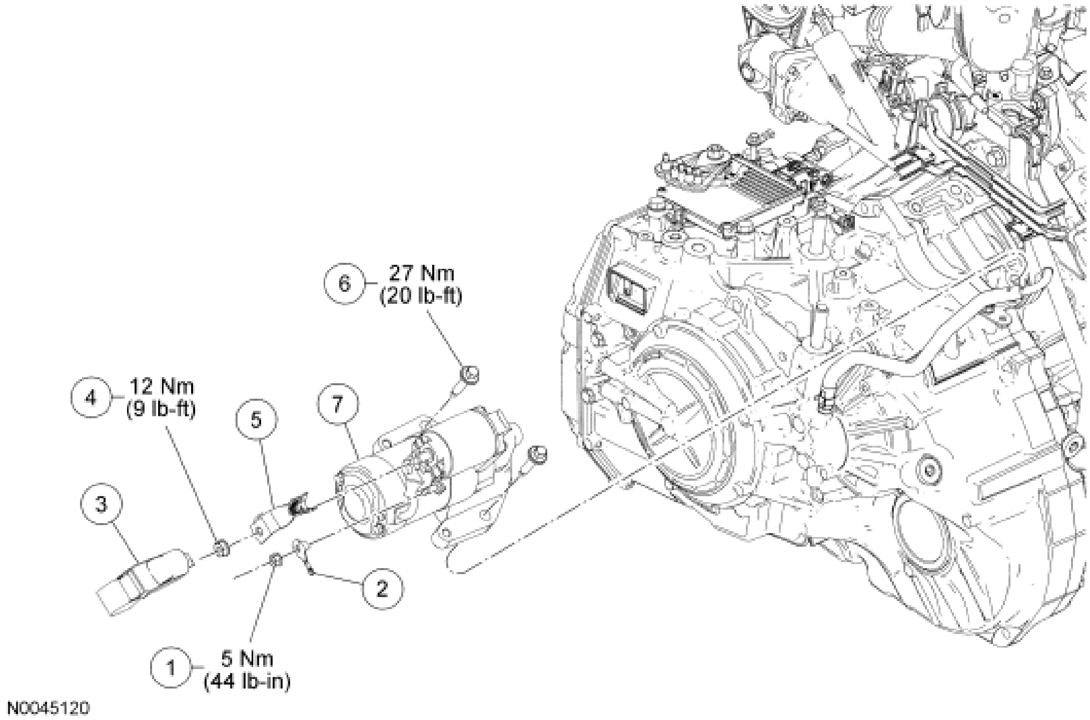

Fig. 21: Exploded View Of Starter Motor With Torque Specifications - 3.0L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	N805320	Starter motor solenoid wire nut
2	14463	Starter motor solenoid wire (part of 12B637)
3	14603	Starter motor solenoid battery cable terminal cover
4	W706414	Starter motor solenoid battery cable nut
5	14463	Starter motor solenoid battery cable (part of 14B060)
6	W503297	Starter motor bolt (2 required)
7	11000	Starter motor

WARNING: **Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to**

cause a skin burn. Failure to follow this instruction may result in serious personal injury.

1. Remove the battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
2. Remove the starter motor solenoid wire nut and position the wire aside.
   - To install, tighten to 5 Nm (44 lb-in).
3. Position the starter motor solenoid terminal battery cable cover aside.
4. Remove the starter motor solenoid battery cable nut and position aside the cable.
   - To install, tighten to 12 Nm (9 lb-ft).
5. Remove the 2 starter motor bolts and the starter motor.
   - To install, tighten to 27 Nm (20 lb-ft).
6. To install, reverse the removal procedure.

STARTER MOTOR - 3.5L

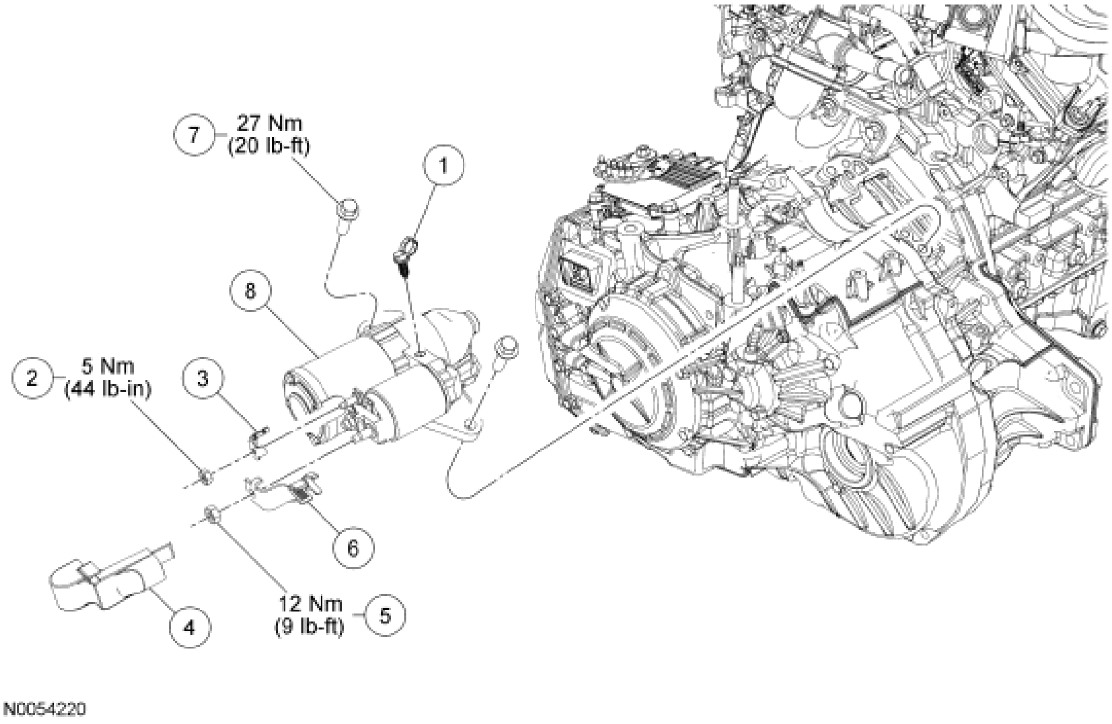

Fig. 22: Exploded View Of Starter Motor With Torque Specifications - 3.5L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14197	Starter motor wire harness pin-type retainer (part of 14B060)
2	N805320	Starter motor solenoid wire nut
3	14463	Starter motor solenoid wire (part of 14B060)

4	14603	Starter motor solenoid battery cable terminal cover
5	W706414	Starter motor solenoid battery cable nut
6	14463	Starter motor solenoid battery cable (part of 14B060)
7	W503297	Starter motor bolt (2 required)
8	11000	Starter motor

WARNING: **Always disconnect the battery ground cable at the battery before disconnecting the starter motor battery terminal lead. If a tool is shorted at the starter motor battery terminal, the tool can quickly heat enough to cause a skin burn. Failure to follow this instruction may result in serious personal injury.**

1. Remove the battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
2. Detach the starter motor wire harness pin-type retainer.
3. Remove the starter motor solenoid wire nut and position the wire aside.
   - To install, tighten to 5 Nm (44 lb-in).
4. Position the starter motor solenoid terminal battery cable cover aside.
5. Remove the starter motor solenoid battery cable nut and position aside the cable.
   - To install, tighten to 12 Nm (9 lb-ft).
6. Remove the 2 starter motor bolts and the starter motor.
   - To install, tighten to 27 Nm (20 lb-ft).
7. To install, reverse the removal procedure.

GENERAL INFORMATION

State Emission Standards - Gasoline

ALASKA

NOTE: Because of frequent revisions in state emission standards, the emission standards listed in this article should only be used as a guide.

NOTE: As of March 1, 2012, Alaska is not testing for tailpipe emissions.

ALASKA EMISSION STANDARDS - ANCHORAGE & FAIRBANKS (2-SPEED IDLE TEST)

Application	Idle HC ppm (CO %)	2500 RPM HC ppm (CO %)
Passenger Cars (1)		
1968-71	1000 (5.0)	1000 (4.0)
1972-74	1000 (4.0)	1000 (3.0)
1975-80	1000 (2.0)	1000 (2.0)
1981-83	1000 (1.0)	1000 (1.0)
1984-93	750 (1.0)	750 (1.0)
1994-	200 (0.5)	200 (0.5)
Light & Medium Duty Trucks (1)		
1968-72	1000 (5.0)	1000 (4.0)
1973-78	1000 (4.0)	1000 (3.0)
1979-83	1000 (2.0)	1000 (2.0)
1984-93	750 (1.0)	750 (1.0)
1994-	220 (0.5)	220 (0.5)
Heavy Duty Vehicles (2)		
1968-73	1000 (5.0)	1000 (5.0)
1974-93	1000 (4.0)	1000 (4.0)
1994-	220 (1.0)	220 (1.0)

(1) 8500 GVWR or less.

(2) 8500 GVWR or more.

ARIZONA

NOTE: Curb idle only test are for vehicles with full-time 4WD, non-defeatable traction control and motorcycles. Curb idle and loaded cruise tests are performed on 1967-80 light-duty gasoline powered vehicles and all heavy-duty gasoline powered vehicles.

ARIZONA EMISSION STANDARDS - PHOENIX AREA (CURB IDLE & LOADED CRUISE TESTS)

Application [1]	Idle HC ppm (CO %)	[2] Loaded/Cruise HC ppm (CO %)
Light Duty Vehicles (6000 GVWR Or Less)		
1967-71 4-Cyl. Or Less	500 (5.50)	500 (4.20)
1967-71 More Than 4-Cyl.	450 (5.00)	450 (3.75)
1972-74 4-Cyl. Or Less	400 (5.50)	400 (4.20)
1972-74 More Than 4-Cyl.	400 (5.00)	400 (3.75)
1975-78 4-Cyl. Or Less	250 (2.20)	250 (1.65)
1975-78 More Than 4-Cyl.	250 (2.00)	250 (1.50)
Light Duty Vehicles (8500 GVWR Or Less)		
1979 4-Cyl. Or Less	220 (2.20)	220 (1.65)
1979 More Than 4-Cyl.	220 (2.20)	220 (1.50)
1980	220 (1.20)	220 (1.20)
1981 & Newer	220 (1.20)	.....
Light Duty Trucks (6000 GVWR Or Less)		
1967-80	[3]	[3]
Light Duty Trucks (6001-8500 GVWR)		
1967-74	[3]	[3]
1975-78	350 (4.00)	350 (3.00)
1979 4-Cyl. Or Less	220 (2.20)	220 (1.65)
1979 More Than 4-Cyl.	220 (2.00)	220 (1.50)
1980	220 (1.20)	220 (1.20)
1981 & Newer	220 (1.20)	.....
Heavy Duty Trucks (Greater Than 8500 GVWR)		
1967-74	[3]	[3]
1975-78	350 (4.00)	350 (3.00)
1979 & Newer	300 (4.00)	300 (3.00)
Motorcycles		
1967 & Newer	1800 (5.50)	.....

(1) 4-stroke engines only.

(2) Except AWD, non-defeatable traction control and motorcycles.

(3) Same as light duty vehicles.

ARIZONA EMISSION STANDARDS - PHOENIX AREA (IM147 TEST)

Application	HC gpm (CO gpm)	NOx gpm
Light Duty Vehicles		
1981-82	3.0 (25.0)	3.5
1983-85	2.4 (20.0)	3.5
1986-89	1.6 (15.0)	2.5

1990-93	1.0 (12.0)	2.5
1994 & Newer	0.8 (12.0)	2.0
Light Trucks (6000 GVWR Or Less)		
1981-85	4.0 (40.0)	5.5
1986-89	3.0 (25.0)	4.5
1990-93	2.0 (20.0)	4.0
1994 & Newer	1.6 (20.0)	3.0
Light Duty Trucks (6000-8500 GVWR)		
1981-85	4.4 (48.0)	7.0
1986-87	4.0 (40.0)	5.5
1988-89	3.0 (25.0)	5.5
1990-93	3.0 (25.0)	5.0
1994 & Newer	2.4 (25.0)	4.0

NOTE: Curb idle test only for 1967-80 light-duty gasoline vehicles, all vehicles with full-time 4WD and/or non-defeatable traction control and motorcycles. Curb idle and loaded cruise tests are performed on all 1981 and later vehicles except those with full-time 4WD and/or non-defeatable traction control.

Fig. 2: California Emission Standards - Enhanced & Partially Enhanced Program Areas - Heavy Duty Vehicles (ASM Test)

LEGEND

ESC - Emission Standard Category

GVWR - Manufacture's Gross Vehicle Weight Rating

LVW - Loaded Vehicle Weight

PC - Passenger Car

LDT1 - Light-Duty Truck up through 3750 LVW and GVWR no greater than 6000 lbs.

LDT2 - Light-Duty Truck greater than 3750 LVW and GVWR no greater than 6000 lbs.

MDV - Medium-Duty Vehicle, GVWR from 6001 to 8500 lbs.

HC - Hydrocarbon, ppm

CO - Carbon Monoxide, %

NO - Nitric Oxide, ppm

PASS/FAIL EMISSION STANDARDS = A+B / VTW

PASS/FAIL STANDARDS - Emission standards used to determine if a vehicle passes the emission inspection. A vehicle passes if the emission levels are equal to or less than the standards for HC, CO and NO for ASM 5015 and ASM 2525.

GROSS POLLUTER STANDARDS - Emission standards used to designate a vehicle as a gross polluter. A vehicle is designated as a gross polluter if the emission levels at the time of the initial inspection, before repairs are greater than the gross polluter standards for HC, CO or NO for ASM 5015 or ASM 2525.

NOTE: If test data on emission pass/fail rates or gross polluter identification rates indicate adjustments are required, the emission standards may be increased or decreased by the bureau by 30% or by the following tolerances, or standards may be set for any specific vehicle and engine configuration which the bureau determines has excessive errors of commission of omission, whichever is necessary to comply with Section 44001.5 of the Health and Safety Code.

COLORADO

COLORADO EMISSION STANDARDS - ENHANCED PROGRAM (IM240)

ILLINOIS

ILLINOIS EMISSION STANDARDS - IM240 TEST

Application	HC gpm	CO gpm
Light Duty Vehicles (6000 GVWR Or Less)		
1981-82	2.00	60.0
1983-87	2.00	30.0
1988-95	0.80	15.0
1996 & Newer	0.60	10.0
Light Duty Trucks (6000 GVWR Or Less)		
1981-83	7.50	100.0
1984-87	3.20	80.0
1988-95	1.60	40.0
1996 & Newer (3750 LVW Or More) (1)	0.80	13.0
1996 & Newer (3750 LVW Or Less) (1)	0.60	10.0
Light Duty Trucks (6001-6500 GVWR)		
1981-83	7.50	100.0
1984-87	3.20	80.0
1988-95	1.60	40.0
1996 & Newer (5750 ALVW Or More)	0.80	15.0
1996 & Newer (5750 ALVW Or Less)	0.80	13.0
(1) Loaded Vehicle Weight (LVW) is vehicle curb weight plus 300 lbs.		

ILLINOIS EMISSION STANDARDS - IDLE TEST

Application	HC ppm (CO %)
Passenger Vehicles (6000 GVWR Or Less)	
1968-71	900 (9.0)
1972-74	800 (8.0)
1975-77	700 (7.0)

1978-79	600 (6.0)
1980	300 (3.0)
1981 & Newer	220 (1.2)
Light Duty Vehicles (8000 GVWR Or Less)	
1968-71	900 (9.0)
1972-74	800 (8.0)
1975-78	700 (7.0)
1979-80	600 (6.0)
1981-83	300 (3.0)
1984 & Newer	220 (1.2)
Heavy Duty Vehicles (8001 GVWR Or More)	
1968-71	1500 (9.5)
1972-78	900 (9.0)
1979-84	700 (7.0)
1985 & Newer	300 (3.0)

INDIANA

INDIANA EMISSION STANDARDS - IM93 TEST

Application	**HC gpm (CO gpm)**	**NOx (gpm)**
Passenger Cars		
1981-82	2.0 (60)	3.0
1983-86	2.0 (30)	3.0
1987-90	1.4 (20)	3.0
1991-95	0.8 (15)	2.5
1996 & Newer	0.6 (10)	2.5
Light Duty Trucks (6000 GVWR Or Less)		
1981-83	5.0 (80)	7.0
1984-86	3.2 (70)	7.0
1987-90	2.2 (55)	3.5
1991-95	1.6 (40)	3.0
1996 & Newer	0.8 (20)	3.0
Light Duty Trucks (6001-8500 GVWR)		
1981-83	5.0 (80)	7.0
1984-86	3.2 (70)	7.0
1987-90	2.2 (55)	5.0
1991-96	1.6 (40)	4.5
1997 & Newer	0.8 (20)	4.5
Heavy Duty Trucks (8501-9000 GVWR)		
1981-82	7.5 (100)	8.0
1983-84	6.0 (100)	8.0

1985-86	5.0 (75)	8.0
1987-90	3.0 (60)	8.0
1991-97	2.4 (40)	8.0
1998 & Newer	2.0 (30)	6.0

INDIANA EMISSION STANDARDS - IDLE TEST

Application	HC ppm (CO %)
Passenger Cars	
1976-79	350 (3.5)
1980	250 (2.0)
1981 & Newer	220 (1.2)
Light Duty Trucks (6000 GVWR Or Less)	
1976-78	500 (5.0)
1979-83	350 (3.5)
1984 & Newer	220 (1.2)
Medium Duty Trucks (6001-8500 GVWR)	
1976-78	500 (5.0)
1979-83	350 (3.5)
1984 & Newer	220 (1.2)

KENTUCKY

NOTE: Currently, there is no emission testing in Kentucky.

KENTUCKY EMISSION STANDARDS - BOONE, CAMPBELL & KENTON COUNTIES (IDLE TEST)

Application	HC ppm (CO)
Passenger Cars (Automobiles)	
1968	950 (8.5)
1969	900 (8.5)
1970	850 (8.1)
1972	800 (8.0)
1973	800 (7.8)
1974	800 (7.6)
1975	700 (7.5)
1976	700 (6.5)
1977	650 (6.3)
1978	600 (5.5)
1979	600 (4.5)
1980	250 (2.5)
1981 & Newer	220 (1.2)

Light Duty Trucks (6000 GVWR Or Less)	
1968	1300 (8.0)
1969	1200 (8.0)
1970-71	1100 (8.0)
1972-73	1000 (7.8)
1974	950 (7.8)
1975	900 (7.0)
1976-77	700 (7.0)
1978	700 (6.3)
1979	450 (5.5)
1980	450 (4.0)
1981	350 (1.7)
1982 & Newer	220 (1.2)
Light Duty Trucks (6001-10,000 GVWR)	
1969	1500 (9.0)
1970	1100 (8.0)
1971	1000 (8.0)
1972-75	950 (7.5)
1976	900 (7.5)
1977	850 (7.5)
1978	700 (6.0)
1979	650 (5.5)
1980	550 (5.0)
1981	450 (4.0)
1982	400 (2.5)
1983	350 (2.0)
1984	220 (1.5)
1985 & Newer	220 (1.2)
Heavy Duty Trucks (10,001-18,000 GVWR)	
1968	1500 (9.0)
1969-70	1300 (8.5)
1971	1200 (8.5)
1972-76	1000 (7.0)
1977-80	900 (6.5)
1982-83	400 (3.0)
1984 & Newer	250 (1.5)

MARYLAND

MARYLAND EMISSION STANDARDS - IM240 TEST

Application	HC gpm (CO gpm)	NOx gpm

Light Duty Vehicles (6000 GVWR Or Less)		
1984-87	1.80 (30.0)	2.8
1988-90	1.40 (30.0)	2.5
1991-93	1.00 (20.0)	2.2
1994-95	0.90 (20.0)	2.1
Light Duty Trucks (6000 GVWR Or Less)		
1984-87	2.80 (80.0)	5.8
1988-90	2.40 (80.0)	3.0
1991-93	2.00 (60.0)	2.7
1994-95	1.80 (60.0)	2.6
Light Duty Trucks (6001-8500 GVWR)		
1984-87	2.90 (80.0)	6.6
1988-90	2.40 (80.0)	4.2
1991-93	2.00 (60.0)	4.0
1994-95	1.80 (60.0)	3.7
Heavy Duty Trucks (8501-9999 GVWR)		
1984	5.80 (100.0)	7.7
1985-86	4.70 (80.0)	7.7
1987	3.00 (80.0)	7.7
1988-90	2.60 (80.0)	7.0
1991-97	2.50 (60.0)	5.5
1998 & Newer	2.20 (60.0)	4.0

MARYLAND EMISSION STANDARDS - IDLE TEST

Application	**HC ppm (CO %)**
Light Duty Vehicles (6000 GVWR Or Less)	
1977	500 (6.0)
1978	430 (5.5)
1979	400 (4.0)
1980	220 (1.7)
1981 & Newer	220 (1.2)
Light Duty Trucks (6001-9999 GVWR)	
1977	580 (7.0)
1978	550 (6.7)
1979	470 (5.0)
1980	350 (5.0)
1981	250 (3.0)
1982	220 (2.5)
1983	220 (1.5)
1984 & Newer	220 (1.2)
Heavy Duty Trucks (10,000-26,000 GVWR)	

1977-78	650 (7.0)
1979	650 (6.5)
1980-82	500 (6.0)
1983	500 (3.5)
1984-85	440 (3.0)
1986	280 (2.5)
1987 & Newer	220 (1.2)

MASSACHUSETTS

MASSACHUSETTS EMISSION STANDARDS - MA31 TEST

Application	HC gpm (CO gpm)	NOx gpm
Passenger Cars		
1984-90	2.0 (30)	3.0
1991-95	1.2 (20)	2.5
1996 & Newer	0.8 (13)	2.0
Light Duty Trucks (6000 GVWR Or Less)		
1984-87	3.2 (80)	7.0
1988-1990	3.2 (80)	3.5
1991-95	2.4 (60)	3.0
1996 & Newer (3750 LVW (1) Or Less)	0.8 (15)	2.0
1996 & Newer (3751 LVW (1) Or Greater)	1.0 (20)	2.5
Light Duty Trucks (6001-8500 GVWR)		
1984-87	3.2 (80)	7.0
1988-90	3.2 (80)	5.0
1991-95	2.4 (60)	4.5
1996 & Newer (5750 ALVW (2) Or Less)	1.0 (20)	2.5
1996 & Newer (5751 ALVW (2) Or Greater)	2.4 (60)	4.0
Heavy Duty Trucks (8501-10,000 Or Greater)		
1984-87	3.2 (80)	7.0
1988-90	3.2 (80)	5.0
1991-95	2.4 (60)	4.5
1996 & Newer	2.4 (60)	4.0

(1) Loaded Vehicle Weight (LVW).

(2) Adjusted Loaded Vehicle Weight (ALVW).

MASSACHUSETTS EMISSION STANDARDS - 2-SPEED IDLE TEST

Application	HC ppm (CO %)
All Vehicles	
1984-86	220 (0.80)

1987 & Newer	100 (0.60)

MISSOURI

MISSOURI EMISSION STANDARDS - JEFFERSON, ST. CHARLES & ST. LOUIS COUNTIES - IM240 TEST

Application	HC gpm (CO gpm)	NOx gpm
Light Duty Vehicles (6000 GVWR Or Less)		
1981-82	0.80 (30.0)	2.0
1983-95	0.80 (15.0)	2.0
1996 & Newer	0.60 (10.0)	1.5
Light Duty Trucks (6000 GVWR Or Less)		
1981-83	3.40 (70.0)	4.5
1984-87	1.60 (40.0)	4.5
1988-95	1.60 (40.0)	2.5
1996 & Newer (Less Than 3750 LVW)	0.80 (13.0)	1.8
1996 & Newer (3750 LVW Or Less)	0.60 (10.0)	1.5
Light Duty Trucks (6001-8500 GVWR)		
1981-83	3.4 (70.0)	4.5
1984-87	1.6 (40.0)	4.5
1988-95	1.60 (40.0)	3.5
1996 & Newer (5750 ALVW Or Less)	0.80 (13.0)	1.8
1996 & Newer (5750 ALVW Or More)	0.80 (15.0)	2.0

MISSOURI EMISSION STANDARDS - FRANKLIN, JEFFERSON, ST. CHARLES & ST. LOUIS COUNTIES - IDLE TEST

Application (1)	HC ppm (CO %)
1971-74	700 (7.0)
1975-79	600 (6.0)
1980	300 (3.0)
1981 & Newer	220 (1.2)
(1) 8500 GVWR or less.	

MISSOURI EMISSION STANDARDS - FRANKLIN, JEFFERSON, ST. CHARLES & ST. LOUIS COUNTIES - REMOTE SENSING CLEAN SCREEN TEST

Application (1)	HC ppm (CO %)	NOx ppm
All Vehicles (8500 GVWR Or Less)		
1971 & Newer	200 (0.5)	2000
(1) 8500 GVWR or less.		

NEVADA

NEVADA EMISSION STANDARDS - 2-SPEED IDLE TEST

Application	HC ppm (CO %)
Light Duty Vehicles (8500 GVWR Or Less)	
1968-69	800 (4.0)
1970-74	700 (3.5)
1975-78	500 (2.5)
1979-80	500 (2.0)
1981 & Newer	220 (1.2)
Heavy Duty Vehicles (8501 GVWR Or More)	
1968-69	1400 (7.0)
1970-78	1400 (6.0)
1979	1000 (5.0)
1980	1000 (4.0)
1981 & Newer	1000 (3.5)

NEW JERSEY

NOTE: **The New Jersey program incorporates original U.S. EPA recommended start-up ASM5015 standards for 1981 and newer model year vehicles. Refer to appropriate model year range in appropriate table. See U. S. EPA ASM2525 & ASM5015 START-UP EMISSION STANDARDS.**

NEW JERSEY EMISSION STANDARDS - 2-SPEED IDLE TEST

Application	Idle HC ppm (CO %)	2500 RPM HC ppm (CO %)
Light Duty Vehicles (8500 GVWR Or Less)

RHODE ISLAND EMISSION STANDARDS - 2-SPEED IDLE TEST

Application Idle [1]	**HC ppm (CO %)**
1967 & Earlier	800 (7.0)
1968-74	700 (6.0)
1975-78	300 (3.0)
1979-80	300 (2.5)
1981 & Newer	220 (1.2)
(1) 8500 GVWR or less.	

TENNESSEE

TENNESSEE EMISSION STANDARDS - MEMPHIS - IDLE TEST

Application	**HC ppm (CO %)**
Light Duty Vehicles (9000 GVWR Or Less)	
1971 & Older	900 (8.9)
1972-74	700 (8.2)
1975-79	600 (7.5)
1980	400 (4.7)
1981 & Newer	220 (1.2)
Heavy Duty Trucks (9001-25,999 GVWR)	
1971 & Older	1000 (8.9)
1972-74	1000 (8.2)
1975-79	1000 (8.0)
1980	800 (6.0)

1981 & Newer	400 (4.0)

TENNESSEE EMISSION STANDARDS - DAVIDSON & NASHVILLE COUNTIES - IDLE TEST

Application	HC ppm (CO %)
Light Duty Vehicles (6000 GVWR Or Less)	
1975-77	500 (5.0)
1978-79	400 (4.0)
1980	300 (3.0)
1981 & Newer	220 (1.2)
Medium Duty Trucks (6001-8500 GVWR)	
1975-77	750 (6.5)
1978-79	600 (6.0)
1980	400 (4.5)
1981 & Newer	400 (4.0)

TENNESSEE EMISSION STANDARDS - FOUR COUNTY AREA SURROUNDING NASHVILLE - IDLE TEST

Application	HC ppm (CO %)
Light Duty Vehicles (6000 GVWR Or Less)	
1975-77	500 (5.0)
1978-79	400 (4.0)
1980	300 (3.0)
1981 & Newer	220 (1.2)
Medium Duty Trucks (6001-8500 GVWR)	
1975-77	750 (6.5)
1978-79	600 (6.0)
1980	400 (4.5)
1981 & Newer	400 (4.0)

TEXAS

NOTE: **The Texas program incorporates original U.S. EPA recommended start-up ASM2525 and ASM5015 standards for 1995 and newer model year vehicles. Refer to appropriate model year range in appropriate table. See U. S. EPA ASM2525 & ASM5015 START-UP EMISSION STANDARDS.**

TEXAS EMISSION STANDARDS - 2-SPEED IDLE TEST

Application	HC ppm (CO %)
Light Duty Vehicles (8500 GVWR Or Less)	
1979	600 (6.0)
1980	400 (4.0)
1981 & Newer	220 (1.2)

Heavy Duty Vehicles (8501 GVWR Or More)	
1979-81	700 (7.0)
1982-84	500 (5.0)
1985 & Newer	300 (3.0)

UTAH

UTAH EMISSION STANDARDS - DAVIS COUNTY - DC98 TEST

Application	HC gpm (CO gpm)	NOx gpm
Light Duty Vehicles (6000 GVWR Or Less)		
1989-90	2.00 (30)	3.0
1991-95	1.2 (20)	2.5
Light Duty Trucks (6000 GVWR Or Less)		
1989-90	3.2 (80)	3.5
1991-95	2.4 (60)	3.0
Light Duty Trucks (6001-8500 GVWR)		
1989-90	3.2 (80)	5.0
1991-95	2.4 (60)	4.5

UTAH EMISSION STANDARDS - DAVIS COUNTY - 2-SPEED IDLE TEST

U. S. EPA REVISED FINAL ASM EMISSION STANDARDS (ASM5015 & ASM2525)

NOTE: **EPA has not published a revised final standards for High Altitude, Light Duty Trucks 2 (6000-8500 GVWR), or vehicles older than 1980 model year. EPA guidance as of February 2003 states that a program may choose to use combinations of the Original and the Revised Final Standards.**

U.S. EPA REVISED FINAL ASM EMISSION STANDARDS

Application	ASM5015		ASM2525	
	HC ppm (CO %)	NOx ppm	HC ppm (CO %)	NOx ppm
Passenger Cars				
1980	275 (1.3)	8500	500 (2.3)	4750
1981-82	275 (1.3)	3600	500 (2.3)	3500
1983-	275 (1.1)	3600	500 (1.6)	3500

89				
1990 & Newer	275 (1.1)	3600	300 (1.6)	3500
Light Duty Trucks (Less Than 6000 GVWR)				
1980-83	1140 (9.7)	14,145	340 (23.28)	32,200
1984-87	537 (5.4)	14,145	160 (12.96)	32,200
1988-95	537 (5.4)	7380	160 (12.96)	16,800
1996 & Newer	275 (1.1)	6150	82 (4.40)	14,000

U.S. EPA IM240 EMISSION STANDARDS

START-UP STANDARDS

Start-up standards should be used during the first 2 years of program operation. Tier 1 standards are recommended for all 1996 and newer vehicles and may be used for 1994 and newer vehicles certified to Tier 1 standards as well.

U.S. EPA IM240 HYDROCARBONS EMISSION START-UP STANDARDS

Application	**Hydrocarbons (Grams/Mile)**	
	Composite	**Phase 2**
Light Duty Vehicles

2008 ACCESSORIES & BODY, CAB

Steering Column Switches - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

STEERING COLUMN SWITCHES

The steering column switches consist of the following:

- Multifunction switch
- Ignition switch

The steering column switches receive driver inputs and send signals to various components. The multifunction switch controls the windshield wipers, hazard flasher, turn signal, headlamp low/high beam and headlamp dimmer/flash-to-pass. The ignition switch is used in conjunction with the lock cylinder key to start the vehicle. When the lock cylinder key is switched to different positions, it moves linkages which enable the ignition switch to send battery voltage to various components.

DIAGNOSTIC TESTS

STEERING COLUMN SWITCHES

Special Tools

Illustration	Tool Name	Tool Number

 ST2574-A	Flex Probe Kit	105-R025B or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also identified as the Generic Electronic

Module (GEM).

Steering Column Switches - The steering column switches include the ignition switch and the multifunction switch (high beam/low beam, flash-to-pass, turn signal and windshield wiper). The ignition switch is controlled by the ignition lock cylinder with a key. When the ignition lock cylinder is turned using the key, a mechanical connection positions the ignition switch to the selected position and allows the ignition switch to send voltage to specific components. The multifunction switch controls the various components electrically. The headlamp switch sends constant voltage to the headlamps when placed in the ON position, while the flash-to-pass is a momentary switch used to send voltage to the headlamp high beams only. The headlamp high beam/low beam switch sends voltage to the low or high beam headlamps while the headlamps are on. The turn signal switch portion of the multifunction switch operates the left and right turn signals. The windshield wiper switch function uses a ground signal to activate the various wiper modes and the wiper/washer.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Multifunction switch
• Ignition key
• Ignition switch
• Steering column shrouds
	• Battery Junction Box (BJB) fuse 14 (15A)
	• Wiring, terminals or connectors
	• Smart Junction Box (SJB) fuses:
	  ○ 22 (7.5A)
	  ○ 23 (7.5A)
	  ○ 24 (7.5A)
	  ○ 25 (7.5A)
	  ○ 26 (7.5A)
	  ○ 27 (7.5A)
	  ○ 28 (10A)

NOTE: For multifunction switch concerns, refer to one of the following sections:

- **For exterior lighting, refer to EXTERIOR LIGHTING article.**
- **For wipers and washers, refer to WIPERS AND WASHERS article.**

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

NOTE: The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the instrument cluster.
9. If the DTCs retrieved are related to the concern, go to Instrument Cluster DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Chart

INSTRUMENT CLUSTER DTC CHART

DTC	Description	Source	Action

Pinpoint Tests

Pinpoint Test A: No Power in All Ignition Switch Positions

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Distribution/SJB for schematic and connector information.

Normal Operation

The ignition switch receives fused battery voltage from Battery Junction Box (BJB) fuse 14 (15A) along circuit SBB14 (BN/RD). The ignition switch has 4 possible states:

- OFF
- ACC
- RUN

- START

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Ignition switch
- BJB

PINPOINT TEST A: NO POWER IN ALL IGNITION SWITCH POSITIONS

NOTE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

A1 CHECK FOR VOLTAGE AT THE IGNITION SWITCH

- Disconnect: Ignition Switch C250

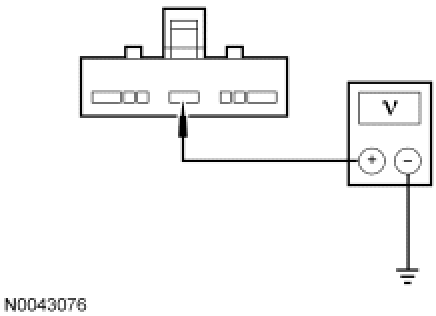

Fig. 1: Checking Circuit SBB14 (BN/RD) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ignition switch C250-4, circuit SBB14 (BN/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new ignition switch. REFER to **Ignition Switch**. TEST the system for normal operation.

  NO : VERIFY that BJB fuse 14 (15A) is OK. If OK, go to A2 .

  If the fuse is not OK, REPAIR the BJB or circuit SBB14 (BN/RD) as necessary. INSTALL a new fuse. TEST the system for normal operation.

A2 CHECK CIRCUIT SBB14 (BN/RD) FOR AN OPEN

- Disconnect: BJB Fuse 14 (15A)

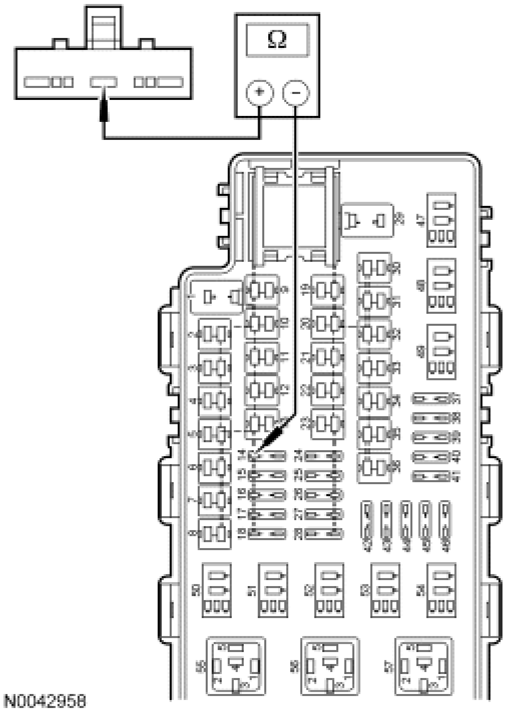

Fig. 2: Checking Circuit SBB14 (BN/RD) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between ignition switch C250-4, circuit SBB14 (BN/RD), harness side and BJB fuse 14 (15A), circuit SBB14 (BN/RD), output side.
- **Is the resistance less than 5 ohms?**

  YES : REPAIR or INSTALL a new BJB. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test B: No Power in ACC

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Distribution/SJB for schematic and connector information.

Normal Operation

The ignition switch ACC circuit provides fused ignition voltage, along circuit CDC33 (VT/GN) to the Smart Junction Box (SJB), when the key is in the ACC position.

This pinpoint test is intended to diagnose the following:

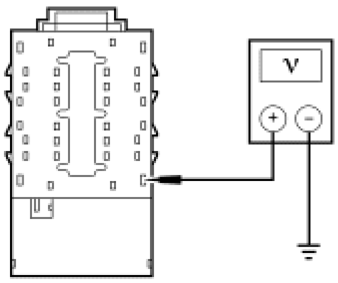
- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST B: NO POWER IN ACC

NOTE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

B1 CHECK CIRCUIT CDC33 (VT/GN) FOR VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280b
- Key in ACCESSORY position.



N0042959

Fig. 3: Checking Circuit CDC33 (VT/GN) For Voltage
Courtesy of FORD MOTOR CO.

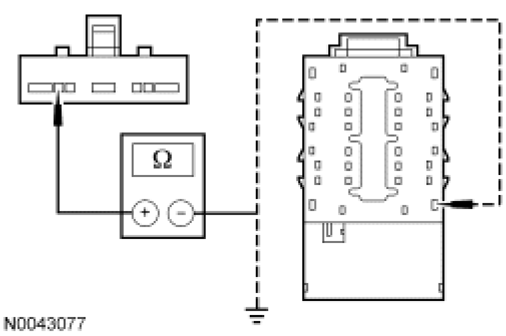
- Measure the voltage between SJB C2280b-4, circuit CDC33 (VT/GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to B3.

  NO : Go to B2.

B2 CHECK CIRCUIT CDC33 (VT/GN) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Disconnect: Ignition Switch C250



N0043077

Fig. 4: Checking Circuit CDC33 (VT/GN) For Open Or Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between:

    - ignition switch C250-6, circuit CDC33 (VT/GN), harness side and SJB C2280b-4, circuit CDC33 (VT/GN), harness side.
    - ignition switch C250-6, circuit CDC33 (VT/GN), harness side and ground.
- **Are the resistances less than 5 ohms between the components and greater than 10,000 ohms to ground?**

  YES : Go to B4.

  NO : REPAIR the circuit. TEST the system for normal operation.

B3 CHECK THE IGNITION SWITCH

- Carry out the Ignition Switch Component Test. Refer to **Ignition Switch - Mechanical**.
- **Is the ignition switch OK?**

  YES : Go to B4.

  NO : INSTALL a new ignition switch. REFER to **Ignition Switch**. CLEAR the DTCs. REPEAT the self-test.

B4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
    - corrosion.
    - pushed-out pins.
    - spread terminals.
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test C: No Power in RUN

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Distribution/SJB for schematic and connector information.

Normal Operation

The ignition switch RUN circuit provides fused ignition voltage, along circuit CDC34 (WH/OG) to the Smart Junction Box (SJB), when the key is in the RUN position.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ignition switch

- SJB

PINPOINT TEST C: NO POWER IN RUN

NOTE: **Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

C1 CHECK CIRCUIT CDC34 (WH/OG) FOR VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280b
- Key in ON position.

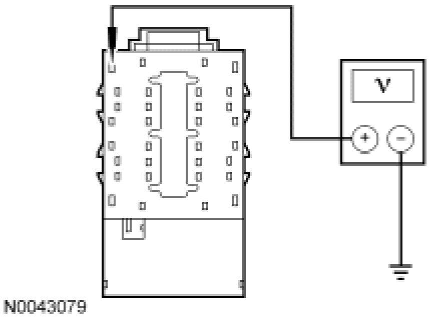


Fig. 5: Checking Circuit CDC34 (WH/OG) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280b-29, circuit CDC34 (WH/OG), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C3.

  NO : Go to C2.

C2 CHECK CIRCUIT CDC34 (WH/OG) FOR AN OPEN OR SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280b
- Disconnect: Ignition Switch C250

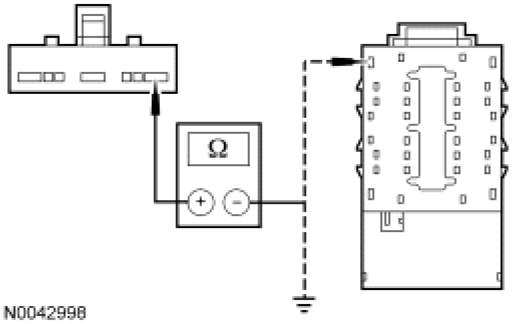

Fig. 6: Checking Circuit CDC34 (WH/OG) For Open Or Short To Ground

Courtesy of FORD MOTOR CO.

- Measure the resistance between:
  - ignition switch C250-1, circuit CDC34 (WH/OG), harness side and SJB C2280b-29, circuit CDC34 (WH/OG), harness side.
  - ignition switch C250-1, circuit CDC34 (WH/OG), harness side and ground.
- **Are the resistances less than 5 ohms between the ignition switch and the SJB, and greater than 10,000 ohms between the ignition switch and ground?**

  YES : Go to C3.

  NO : REPAIR the circuit. TEST the system for normal operation.

C3 CHECK THE IGNITION SWITCH

- Disconnect: Ignition Switch C250
- Carry out the Ignition Switch Component Test. Refer to **Ignition Switch - Mechanical**.
- **Is the ignition switch OK?**

  YES : Go to C4.

  NO : INSTALL a new ignition switch. REFER to **Ignition Switch**. CLEAR the DTCs. REPEAT the self-test.

C4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: No Power in START

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Power Distribution/SJB for schematic and connector information.

Normal Operation

The ignition switch START circuit provides fused ignition voltage, along circuit CDC35 (BU/WH) to the Smart Junction Box (SJB), when the key is in the START position.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ignition switch
- SJB

PINPOINT TEST D: NO POWER IN START

NOTE:	**Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.**

D1 CHECK CIRCUIT CDC35 (BU/WH) FOR VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280b
- Key in START position.

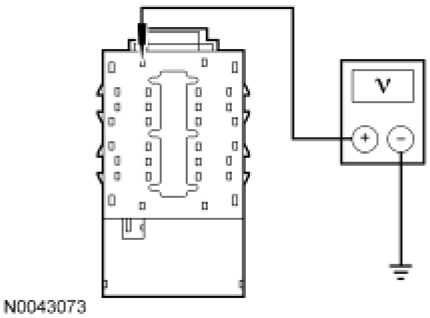

Fig. 7: Checking Circuit CDC35 (BU/WH) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280b-30, circuit CDC35 (BU/WH), harness side and ground while turning the key to the crank position.
- **Is the voltage greater than 10 volts?**

  YES : Go to D3.

  NO : Go to D2.

D2 CHECK CIRCUIT CDC35 (BU/WH) FOR AN OPEN OR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: Ignition Switch C250

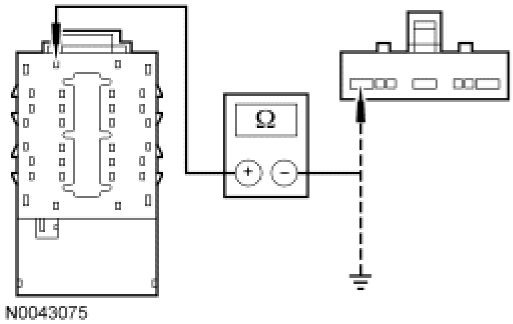

Fig. 8: Checking Circuit CDC35 (BU/WH) For Open Or Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between:
  - ignition switch C250-7, circuit CDC35 (BU/WH), harness side and SJB C2280b-30, circuit CDC35 (BU/WH), harness side.
  - SJB C2280b-30, circuit CDC35 (BU/WH), harness side and ground.
- **Are the resistances less than 5 ohms between the ignition switch and the SJB, and greater than 10,000 ohms between the SJB and ground?**

  YES : Go to D3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

D3 CHECK FOR CORRECT SJB OPERATION

- Inspect the SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Component Tests

Ignition Switch - Mechanical

The following conditions can cause difficulty in operating the ignition switch and lock cylinder:

- Burrs on the lock cylinder key
- Insufficient lube on the lock cylinder

- Binding lock cylinder
- Burrs or foreign material around the rack-and-pinion actuator in the lock cylinder housing
- Insufficient lube on the actuator (do not apply lubricant to the inside of the ignition switch)
- Binding ignition switch

If the steering wheel lock is engaged with the wheels loaded against a curb, high effort will be necessary to turn the key from lock. Turn the steering wheel to either side of the lock to unload the system.

Carry out the following test to determine if the ignition switch and lock cylinder are operating correctly.

1. Inspect the ignition key for any burrs, damage or incorrect cut. Have a new ignition key made as necessary.

NOTE: **The steering wheel may be locked full left or full right. If the steering wheel is locked, it will be necessary to apply turning effort to the steering wheel in the direction of the lock while turning the key.**

2. Turn the key to the ACC position and then the RUN position.
   - If the ignition key turns to the ACC and RUN position, continue with Step 3.
   - If the ignition key will not turn to the ACC and RUN position, continue with Step 4.

NOTE: **The ignition switch and lock cylinder should return from the START position back to the RUN position without assistance.**

3. Turn the ignition key to the START position and release the key.
   - If the ignition switch and lock cylinder return from the START position back to the RUN position without assistance, the ignition switch is operating correctly at this time.
   - If the ignition switch and lock cylinder do not return from the START position back to the RUN position without assistance, continue with Step 4.
4. Remove the ignition lock cylinder. Refer to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
5. Rotate the ignition lock cylinder through all of the switch positions.
   - If the lock cylinder operates correctly, continue with Step 6.
   - If the lock cylinder does not operate correctly, install a new ignition lock cylinder. Refer to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
6. Check for binding or sticking ignition switch actuating rod, burrs around the rack-and-pinion actuator in the ignition lock cylinder housing or insufficient lubrication.
   - If there is sufficient lubrication and there are no burrs, binding or sticking conditions; install a new ignition switch. Refer to **Ignition Switch**.
   - If there is insufficient lubrication, burrs, binding or sticking conditions; repair or lubricate as necessary.

Ignition Switch - Electrical

Refer to **Component Tests**.

Multifunction Switch - Electrical

Refer to **Component Tests**.

REMOVAL AND INSTALLATION

IGNITION SWITCH

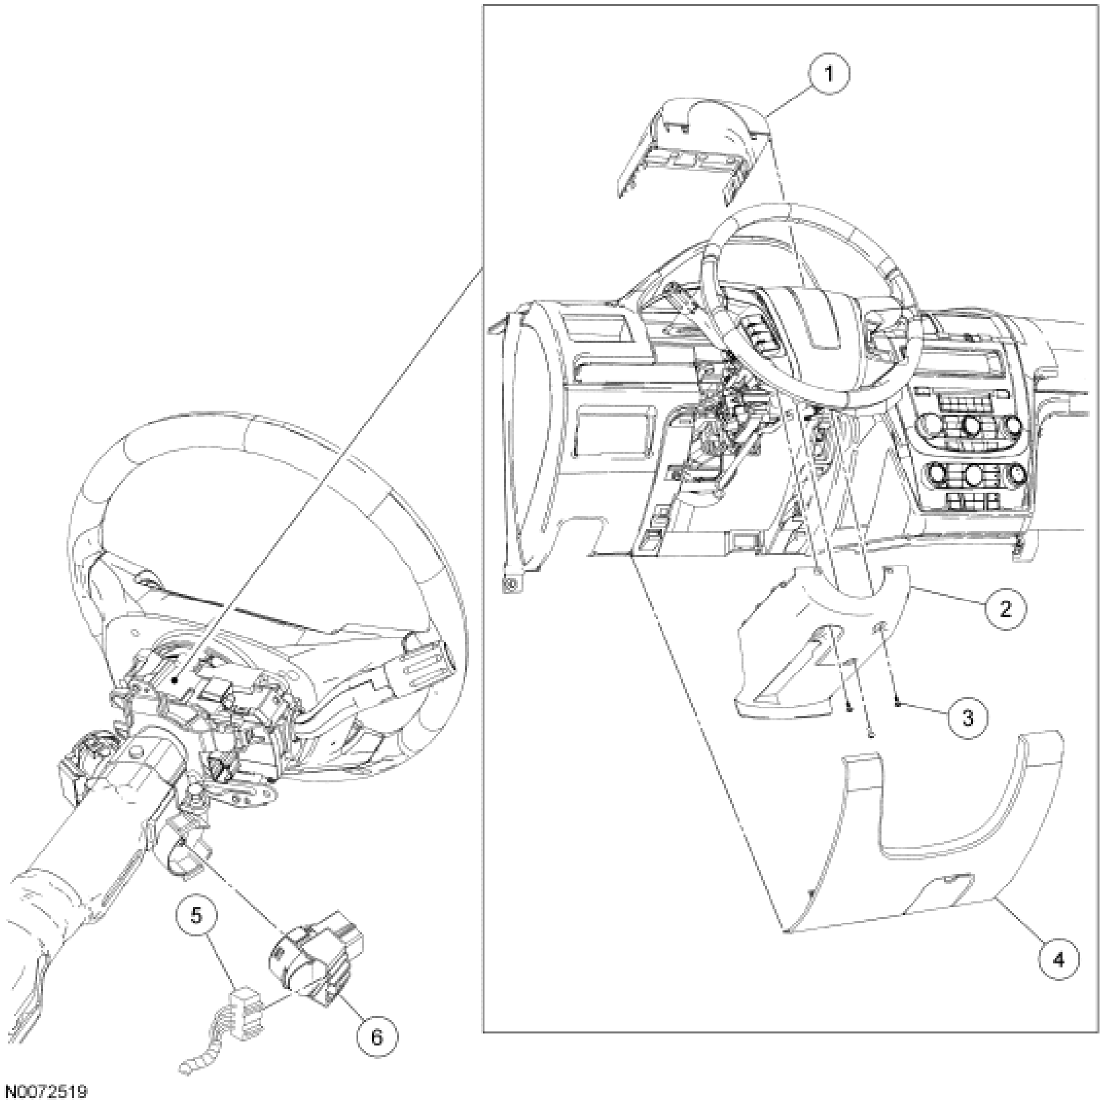

Fig. 9: Exploded View Of Ignition Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3530	Upper steering column shroud

2	3K512	Lower steering column shroud
3	W707658	Lower steering column shroud screw (3 required)
4	5404459	Steering column opening cover
5	-	Ignition switch electrical connector (part of 14401)
6	11572	Ignition switch

REMOVAL AND INSTALLATION

NOTE: Do not remove the ignition lock cylinder and the ignition switch at the same time or damage to the column may result.

1. Depower the Supplemental Restraint System (SRS). For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

   NOTE: The steering column opening cover is held in place by tabs that clip to the instrument panel.

2. Remove the steering column opening cover by pulling straight outward.

   NOTE: Release the upper steering column shroud, by pressing inward on the sides of the shroud and lifting upwards.

3. Remove the upper steering column shroud.
4. Release the tilt lever, remove the 3 lower steering column shroud screws and then the shroud.

   NOTE: Lower the steering column to the lowest tilt position.

5. Disconnect the ignition switch electrical connector.
6. Press the 2 tabs and remove the ignition switch.
7. To install, reverse the removal procedure.
8. Repower the SRS. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

STEERING COLUMN MULTIFUNCTION SWITCH

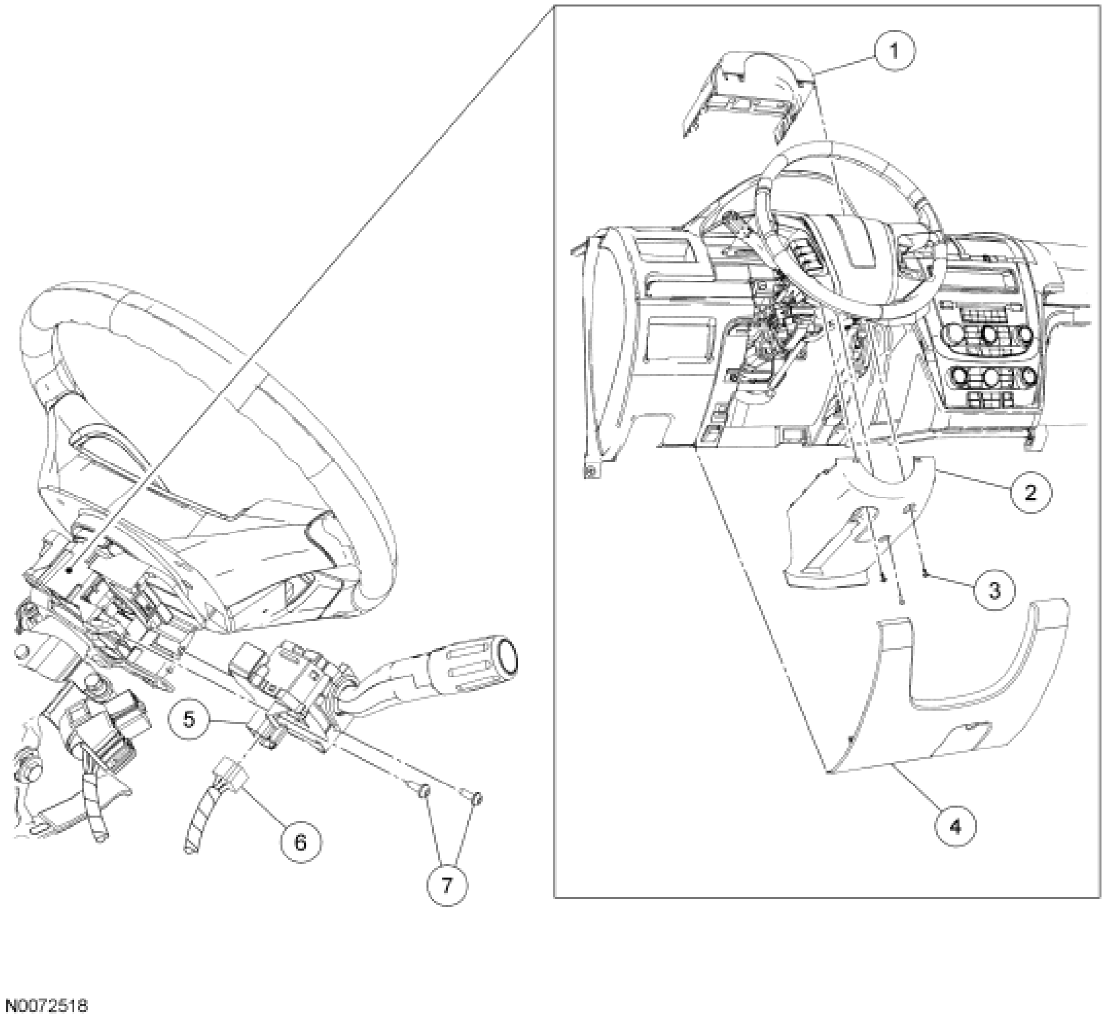

Fig. 10: Exploded View Of Steering Column Multifunction Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3530	Upper steering column shroud
2	3K512	Lower steering column shroud
3	W707658	Lower steering column shroud screw (3 required)
4	5404459	Steering column opening cover
5	14K147	Multifunction switch
6	-	Multifunction switch electrical connector (part of 14401)
7	W503521	Multifunction switch screws (2 required)

REMOVAL AND INSTALLATION

NOTE: The steering column opening cover is held in place by tabs that clip to the instrument panel.

1. Remove the steering column opening cover by pulling straight outward.

NOTE: Release the upper steering column shroud, by pressing inward on the sides of the shroud and lifting upwards.

2. Remove the upper steering column shroud.
3. Release the tilt lever, remove the 3 lower steering column shroud screws and then the shroud.
4. Disconnect the multifunction switch electrical connector.
5. Remove the 2 multifunction switch screws and the switch.
6. To install, reverse the removal procedure.

STEERING COLUMN LOCK MODULE

REMOVAL AND INSTALLATION

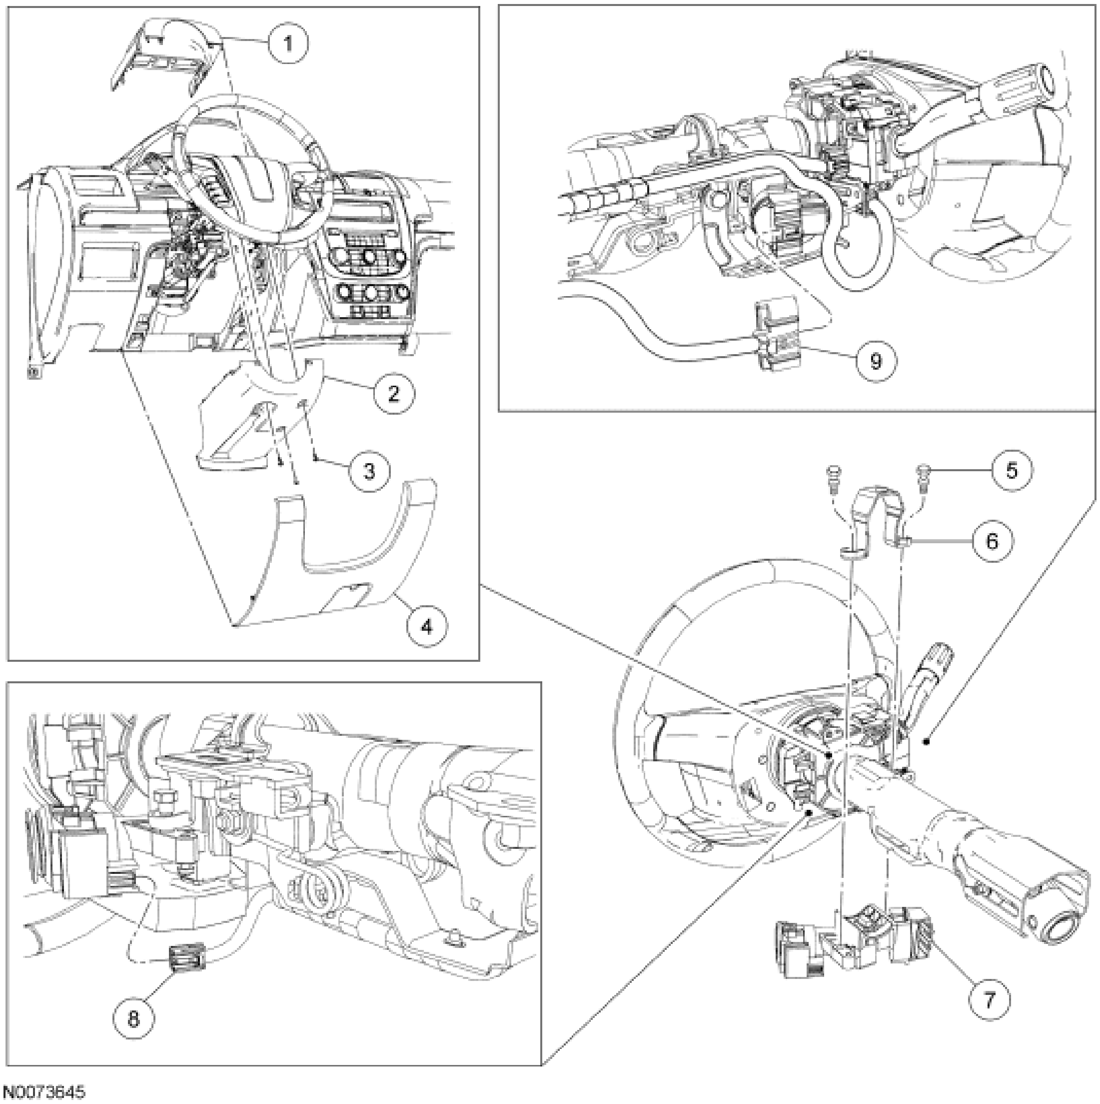

Fig. 11: Exploded View Of Steering Column Lock Module
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3530	Upper steering column shroud
2	3K512	Lower steering column shroud
3	W707658	Lower steering column shroud screw (3 required)
4	5404459	Steering column opening cover
5	-	Steering column lock module bolt (2 required)
6	-	Steering column lock module clamp
7	3K772	Steering column lock module assembly
8	-	Passive Anti-Theft System (PATS)

		electrical connector (part of 14401)
9	-	Ignition switch electrical connector (part of 14401)

NOTE: The steering column opening cover is held in place by tabs that clip to the instrument panel.

1. Remove the steering column opening cover by pulling straight outward.

NOTE: Release the upper steering column shroud, by pressing inward on the sides of the shroud and lifting upwards.

2. Remove the upper steering column shroud.
3. Release the tilt lever, remove the 3 lower steering column shroud screws and then the shroud.
4. Disconnect the Passive Anti-Theft System (PATS) and ignition switch electrical connectors.
5. Disconnect the multifunction switch electrical connector.

NOTE: After cutting slots in the lock module bolts, clean all metal shavings and foreign material from the steering column.

6. Using a suitable tool, cut slots into the heads of the 2 steering column lock module bolts.

NOTE: The lock module bolts are designed to sheer off when tightened.

7. Remove the 2 steering column lock module bolts using a screwdriver.
   - Discard the bolts.
   - To install, use new steering column lock module bolts and tighten until the heads of the bolts shear off.
8. Remove the steering column lock module clamp and the steering column lock module assembly.

NOTE: Align the locating tab on the steering column lock module with the window of the steering column tube. Verify that the lock module operates correctly.

9. To install, reverse the removal procedure.

2008 STEERING

Steering Column - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Steering column opening cover reinforcement bolts	3	-	27
Steering column shaft bolt	20	-	177
Steering column support bracket nut	21	15	-
Steering wheel nut	35	26	-

DESCRIPTION AND OPERATION

STEERING COLUMN

The steering column consists of the following:

- Steering wheel
- Steering column
- Upper and lower steering column shafts
- Steering column switches
- Ignition lock cylinder

The steering column is the mechanical linkage between the steering wheel and the steering gear. The steering wheel is mounted to a shaft which passes through the center of the steering column. The shaft is centered by roller ball bearings within the steering column. The steering column shaft then connects the steering column to the steering gear. The upper and lower steering column shaft connections utilize U-joint type couplings. The tilt and telescopic functions of the steering column are controlled by a mechanical lever on the underside of the steering column, which uses a cam to lock and unlock the steering column. When the tilt/telescopic column lever is unlocked, the steering column can then be adjusted to various positions. The steering column switches (multifunction and ignition) are mounted to the steering column. These switches are covered by the upper and lower steering column shrouds.

For steering column switch service information, refer to **STEERING COLUMN SWITCHES** article.

For ignition lock cylinder service information, refer to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.

DIAGNOSTIC TESTS

STEERING COLUMN

Refer to **STEERING SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

STEERING WHEEL

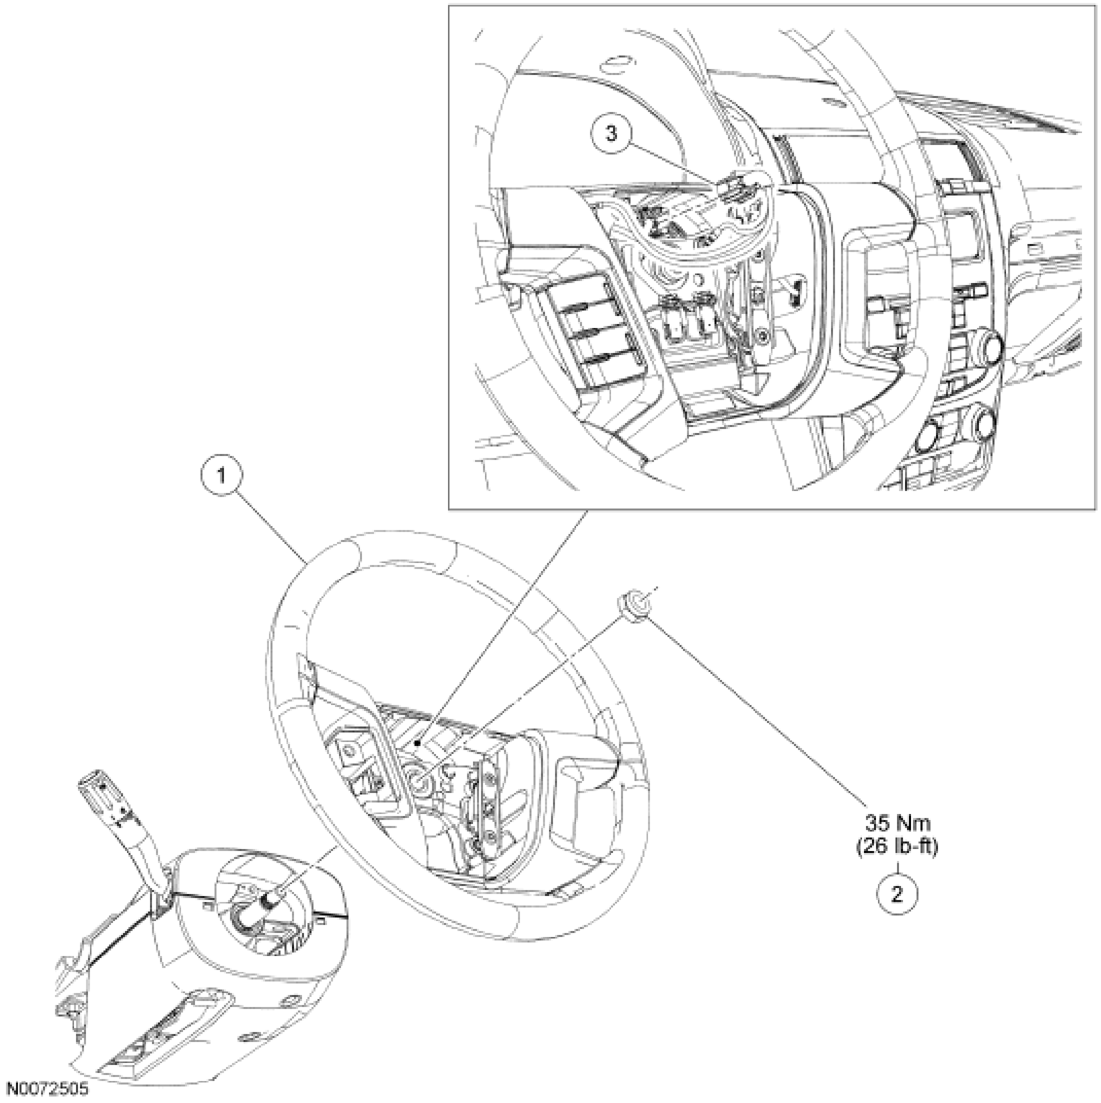

Fig. 1: Exploded View Of Steering Wheel With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3600/ 3F563	Steering wheel (urethane/leather)
2	W711835	Steering wheel nut
3	-	Steering wheel switches electrical connector (part of 3600/3F563)

REMOVAL AND INSTALLATION

1. Position the steering wheel in the straight-ahead position and turn the ignition switch to the OFF position.
    - Remove the key.
2. Remove the driver air bag module. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

NOTE: Mark the steering wheel and column shaft for reference during installation.

3. Remove the steering wheel nut.
    - To install, tighten to 35 Nm (26 lb-ft).
4. Disconnect the steering wheel switches electrical connector.

NOTE: Do not remove the steering wheel by hitting the shaft with a hammer. Damage to the column may occur.

5. Using a suitable puller, remove the steering wheel.
6. To install, reverse the removal procedure.
    - Align the steering wheel using the reference mark.

STEERING COLUMN

REMOVAL AND INSTALLATION

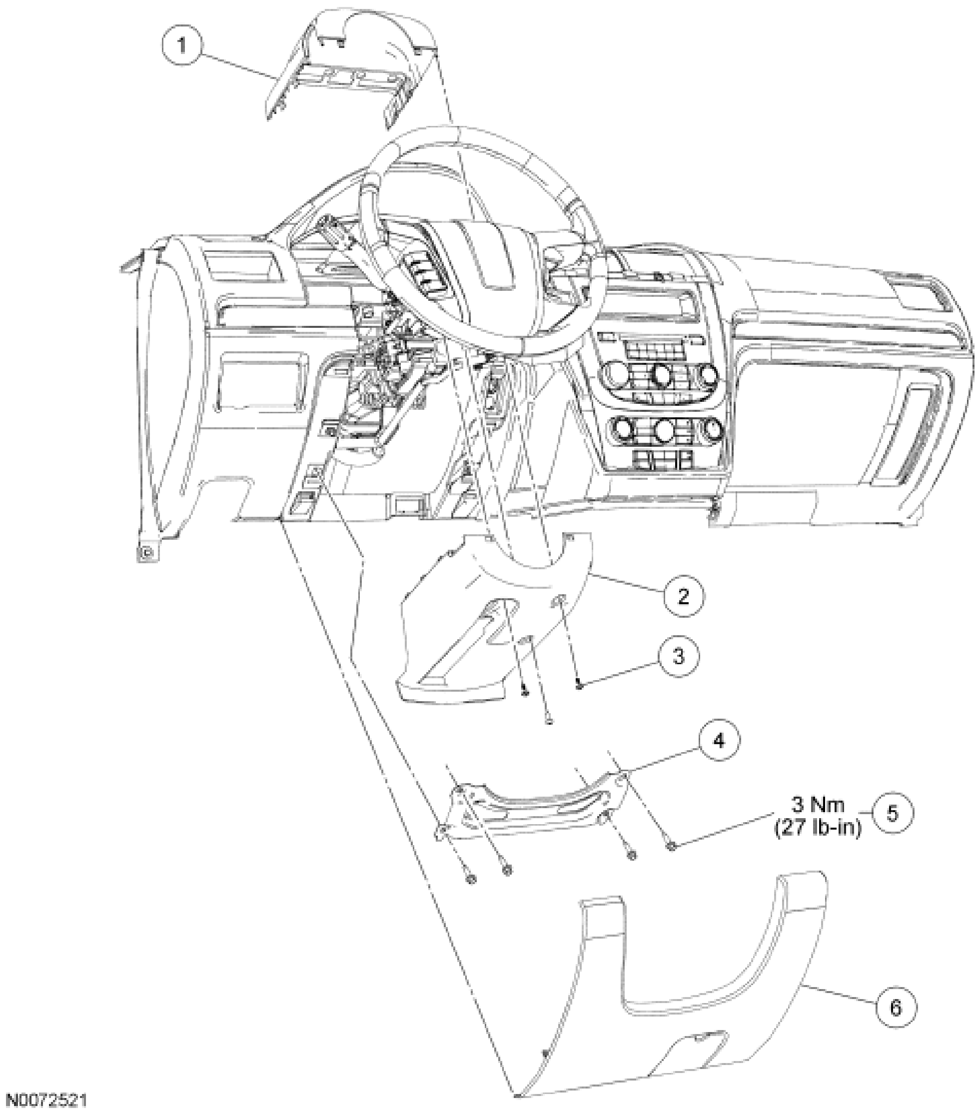

Fig. 2: Exploded View Of Steering Column With Torque Specification (1 Of 3)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3530	Upper steering column shroud

8	-	Ignition switch electrical connector (part of 14401)
9	-	Clockspring electrical connector (part of 14401)
10	-	Passive Anti-Theft System (PATS) electrical connector (part of 14401)
11	-	Wiring harness retainers (3 required) (part of 14401)

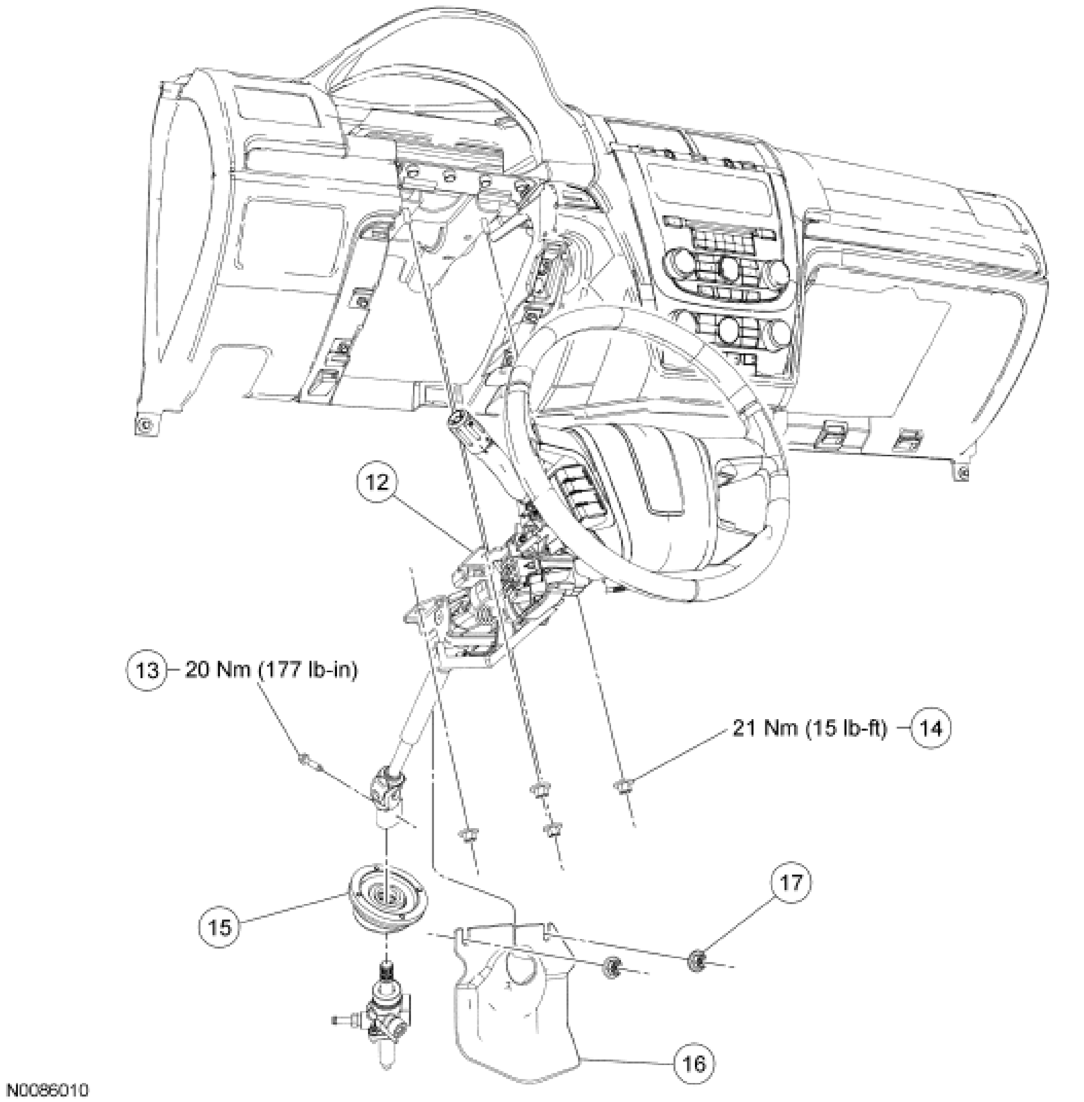

Fig. 4: Exploded View Of Steering Column With Torque Specifications (3 Of 3)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
12	3C529	Steering column
13	3R827	Steering column shaft bolt
14	N806423	Steering column support bracket nut (4 required)
15	3C611B	Steering gear/dash seal
16	3C611A	Lower steering column shaft joint cover
17	W704904	Lower steering column shaft joint cover nut

1. Turn the steering wheel to the straight-ahead position and turn the ignition switch to the OFF position.

- Remove the key.

2. Depower the Supplemental Restraint System (SRS). For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
3. Remove the steering column shrouds. Refer to **Steering Column Shroud**.
4. Disconnect the multifunction switch, ignition switch and clockspring electrical connectors.
5. Disconnect the Passive Anti-Theft System (PATS) electrical connector.
6. Detach the wiring harness retainers and position the wiring harness aside.
7. Remove the 2 lower steering column shaft joint cover bolts and cover.

NOTE: Do not allow the steering column to rotate while the steering column shaft is disconnected, or damage to the clockspring may result. If there is evidence that the steering column has rotated, the clockspring must be removed and recentered. For additional information, refer to SUPPLEMENTAL RESTRAINT SYSTEM article.

NOTE: Index-mark the steering column shaft position to the steering gear for reference during installation.

8. Remove the steering column shaft bolt and disconnect the shaft from the steering gear.
    - To install, tighten to 20 Nm (177 lb-in).

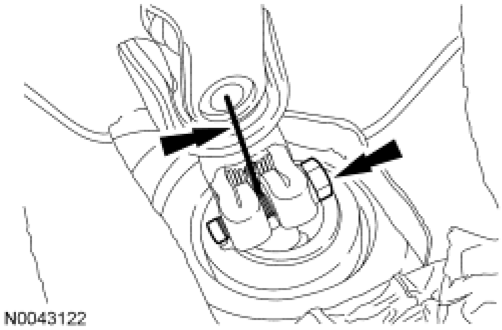

Fig. 5: Locating Steering Column Shaft Index Mark And Bolt
Courtesy of FORD MOTOR CO.

9. Remove the 4 steering column support bracket nuts and the steering column.
    - To install, tighten to 21 Nm (15 lb-ft).
10. To install, reverse the removal procedure.
11. Repower the SRS. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.

STEERING COLUMN SHROUD

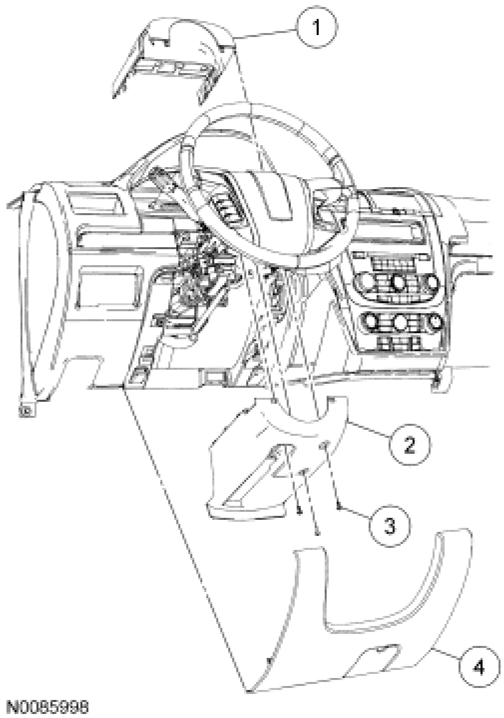

Fig. 6: Exploded View Of Steering Column Shroud
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3530	Upper steering column shroud
2	3K512	Lower steering column shroud
3	W707658	Lower steering column shroud screw
4	5404459	Steering column opening cover

REMOVAL AND INSTALLATION

NOTE: The steering column opening cover is held in place by tabs that clip to the instrument panel.

1. Remove the steering column opening cover by pulling straight outward.

NOTE: Release the upper steering column shroud by pressing inward on the sides of the shroud and lifting upwards.

2. Remove the upper steering column shroud.
3. Release the tilt lever, remove the 3 lower steering column shroud screws and then the shroud.
4. To install, reverse the removal procedure.

Flow (2.3L engine)	9.3-7.0L/min (2.47-1.84 gpm) Fluid @ 74°-80°C (165°-175°F) Engine @ 2,100 RPM
Flow (3.0L engine)	9.3-7.4L/min (2.47-1.95 gpm) Fluid @ 74°-80°C (165°-175°F) Engine @ 2,000 RPM
Minimum capacity (all engines)	3.4L/min (0.89 gpm) Fluid @ 74°-80°C (165°-175°F) Pressure 517 kPa (749 psi)
Pressure (2.3L engine)	648 kPa (94 psi) Fluid @ 74°-80°C (165°-175°F) Engine @ 2,000 RPM
Pressure (3.0L engine)	1069 kPa (155 psi) Fluid @ 74°-80°C (165°-175°F)

	Engine @ 2,000 RPM
Relief pressure (2.3L engine)	9,720-10.170 kPa (1,409-1,475 psi)
Relief pressure (3.0L engine)	9,090-9,540 kPa (1,318-1,284 psi)
Power Steering Purge Vacuum	
Air purge vacuum	68-85 kPa (20-25 in/Hg)

DESCRIPTION AND OPERATION

STEERING SYSTEM

The power steering system consists of the following components:

- Power steering pump
- Power steering fluid reservoir
- Steering gear
- Power steering fluid cooler
- Power steering lines
- Steering column
- Steering column shaft

The power steering system transfers driver inputs at the steering wheel to the front wheels of the vehicle. The steering column, hydraulic system and linkages that transfer these driver inputs make up the steering system. Gearing and hydraulic assist are used to significantly reduce steering efforts.

For information on the power steering fluid reservoir, power steering pump, power steering lines and steering gear, refer to **POWER STEERING** article.

For information on the steering wheel, steering column and steering column shaft, refer to **STEERING COLUMN** article.

DIAGNOSTIC TESTS

Material

Item	Specification
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	-
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

Principles of Operation

Power Steering - The power steering system uses a vane-type pump to move the fluid from the reservoir to the steering gear and through the rest of the steering hydraulic system. The power steering pump is mounted to the engine and driven by the engine accessory drive belt. Power steering fluid is pulled into the pump from the reservoir. The power steering fluid is then trapped between the pump vanes and moved to the high pressure side of the pump creating a flow of fluid. The restriction of this flow by the steering gear creates the pressure that provides the steering assist. A combined pressure relief/flow valve is built into the pump to control the maximum pressure and flow provided to the steering system. This action prevents damage to the system and provides the correct level of assist during all engine speeds. While under pressure, the power steering fluid flows through the high pressure power steering line to the steering gear. The fluid exits the gear and flows through the return line, cooler and finally to the reservoir. The reservoir slows the fluid, allows air to escape and filters the fluid before returning it to the pump.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

VISUAL INSPECTION CHART

Mechanical
• Fluid level • Tire pressure • Tires • Drive belt • Drive belt tensioner • Steering column alignment • Tie-rod ends • Suspension components • Steering column shaft U-joints • Intermediate shaft bolts • Power steering reservoir baffle • Power steering reservoir screen • Power steering pressure lines, fittings or O-rings • Power steering return hoses and clamps • Steering gear • Power steering pump • Power steering pressure switch

3. Inspect the power steering fluid for the following conditions:
   - Aeration or foam: Purge the power steering system. Refer to **Power Steering System Purging - 2.3L** or **Power Steering System Purging - 3.0L, 3.5L** .
   - Overheating or contamination: Flush the power steering system. Refer to **Power Steering System Flushing**.

NOTE: It may be necessary to add power steering fluid to achieve the correct level.

4. Check the fluid level and clean the power steering components.

   With the ignition OFF:

   - check the power steering fluid level and add fluid as necessary.
   - wipe off any visible signs of fluid or residue build up.

CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.

- Start the engine and turn the steering wheel from stop-to-stop several times.

5. Visually inspect the power steering hydraulic line/hose connections for leaks.
   - If a leak is detected at a threaded fitting or clamp plate joint, tighten to specification. If the leak is still evident, visually inspect the O-rings or Teflon® seals. Install new O-rings or Teflon® seals as necessary. Refer to **POWER STEERING** article.
   - If a leak is detected at a constant tension spring clamp, verify that the hose is not damaged and fully installed on the hose fitting. Make sure that the constant tension spring clamp is correctly positioned. If the leak remains, install a new constant tension spring clamp.
   - If a leak is detected at a screw clamp joint, verify that the hose is fully installed on the hose fitting before tightening the screw clamp. If the leak remains, install a new screw clamp. Refer to **POWER STEERING** article.
   - If a leak is detected at the power steering pressure switch, install a new switch. Refer to the appropriate Engine article for the procedure.
6. Visually inspect the power steering components for leaks.
   - If a leak is detected in the power steering pressure line or return hose, install a new hose. Refer to **POWER STEERING** article.
   - If a leak is detected in the power steering pump, install a new power steering pump. Refer to **POWER STEERING** article.

   NOTE: On vehicles with rack-and-pinion steering gear, it may be necessary to remove the bellows boot clamp from the steering gear bellows boot to inspect for internal steering gear leaks.

   - If a leak is detected in the steering gear, repair or install a new steering gear. Refer to **POWER STEERING** article.
   - If a leak is detected in the power steering reservoir, install a new reservoir. Refer to **POWER STEERING** article.
7. For information on power steering leak detection, refer to **Component Tests** in this article.
8. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding.
9. If the cause is not visually evident, verify the symptom and Go to **Symptom Chart - Steering System** or Go to **Symptom Chart - Noise, Vibration and Harshness (NVH)**.

Steering System Symptom Definitions

Drift/Pull

Pull is described as a tugging sensation felt by the hands on the steering wheel that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with the hands off the steering wheel.

- A vehicle-related drift/pull on a flat road can cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull can be induced by conditions external to the vehicle, such as wind or road camber.

Excessive Steering Wheel Play

Excessive steering wheel play is a condition in which there is too much steering wheel movement before the wheels move. A small amount of steering wheel free play is considered normal.

Lack of Assist or Inconsistent Assist

Lack of assist or inconsistent assist is experienced when the steering wheel effort is higher than normal. Hard steering can remain constant through the full turn or occur near the end of a turn. It is important to know the difference between hard steering/lack of assist and poor returnability/sticky steering.

Hard steering or lack of assist can result from either hydraulic or mechanical conditions. It is extremely important to know if this concern occurs during driving or during high-effort parking maneuvers.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or steering correction is completed.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Symptom Chart - Steering System

Symptom Chart - Steering System

Condition	Possible Sources	Action
• Steering has lack of assist or inconsistent assist	• Contaminated power steering fluid	• CHECK the power steering fluid for contamination. FLUSH the power steering system as necessary. REFER to **Power Steering System Flushing**.
	• Steering gear • Power steering pump • Restricted power steering lines/hoses	• Go to **Pinpoint Test A**.
• Excessive steering wheel play	• Steering gear	• REPAIR or INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article.

	• Steering column • Steering column shaft/coupling • Steering linkage • Ball joints • Strut bearing plate	• Go to **Pinpoint Test B**.
• Steering system drift/pull/wander	• Unevenly loaded vehicle	• CORRECT the vehicle loading as necessary.
	• Tire pressure • Wheel alignment • Steering column shaft/coupling • Frame alignment • Steering gear	• Go to **Pinpoint Test C**.
• Poor returnability/sticky steering	• Binding steering column shaft/coupling U-joints	• INSTALL a new steering column shaft. REFER to **STEERING COLUMN** article.
	• Loose, worn or damaged steering linkage	• Go to **Steering Linkage Test**.
	• Binding suspension components	• To continue the suspension diagnosis, REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.
	• Binding steering column bearing(s)	• INSTALL a new steering column. REFER to **STEERING COLUMN** article.
	• Binding dash boot seal	• INSTALL a new dash boot seal. REFER to **STEERING COLUMN** article.
	• Steering gear	• REPAIR or INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of

their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

Symptom Chart - Noise, Vibration and Harshness (NVH)

Condition	Possible Sources	Action
• Steering system cold start noise	• Blockage in the power steering fluid reservoir caused by power steering fluid contamination	**NOTE:** **Some noise during an extremely cold start (-12.2°C [-10°F]) is normal and should improve as the steering system warms up (usually within 60 seconds).** **NOTE:** **It may be necessary to remove the power steering fluid reservoir to flush contamination trapped in the reservoir screen.** • CHECK the power steering fluid reservoir for contamination. FLUSH the power steering system as necessary. REFER to **Power Steering System Flushing**.
	• Air in the steering hydraulic system (aerated fluid)	• CHECK for leaks in the system. REFER to Power Steering Leak Test Component Test. PURGE the air from the system. REFER to **Power Steering System Purging - 2.3L** or **Power Steering System Purging - 3.0L, 3.5L**.
• Steering grunt or shudder - occurs when turning into or out of a turn at low speeds (temperature sensitive)	• Air in the steering hydraulic system (aerated fluid)	• CHECK for leaks in the system. REFER to Power Steering Leak Test Component Test. PURGE the air from the system. REFER to **Power Steering System Purging - 2.3L** or **Power Steering System Purging - 3.0L, 3.5L**.
	• Steering gear or power steering hoses	• Go to **Steering Gear Grunt/Shudder Test**.
		NOTE: **Some amount of clonk noise is considered acceptable. If in**

		doubt of the acceptability, compare to another vehicle.
• Steering system clonk - hydraulic knocking sound	• Air in the steering hydraulic system (aerated fluid)	• CHECK for leaks in the system. REFER to Power Steering Leak Test Component Test. PURGE the air from the system. REFER to **Power Steering System Purging - 2.3L** or **Power Steering System Purging - 3.0L, 3.5L**.
• Power steering pump moan - loud humming noise occurs when the steering wheel is rotated to the stop position. Produces a 120-600 Hz frequency that changes with RPM	• Low fluid	• CHECK the fluid level. FILL as necessary. REFER to **Power Steering System Filling - 2.3L** or **Power Steering System Filling - 3.0L, 3.5L**.
	• Air in the steering hydraulic system (aerated fluid)	• CHECK for leaks in the system. REFER to Power Steering Leak Test Component Test. PURGE the air from the system. REFER to **Power Steering System Purging - 2.3L** or **Power Steering System Purging - 3.0L, 3.5L**. If a pump moan still exists, INSTALL a new power steering pump. REFER to **POWER STEERING** article.
	• Power steering fluid reservoir or screen is blocked or damaged	• INSPECT the reservoir. FLUSH or INSTALL a new reservoir as necessary.
	• Power steering line/hose grounded to chassis	• INSPECT the power steering lines/hoses. REPAIR as necessary.
	• Power steering pump brackets loose or misaligned	• CHECK bolts, brackets and bracket alignment. TIGHTEN bolts to specification. REPAIR or INSTALL new brackets as necessary. REFER to **POWER STEERING** article.
	• Steering gear isolators	• INSPECT the isolators for wear or damage. REPAIR as necessary.
• Steering gear clunk - occurs only while cornering over a bump (can be temperature	• Steering gear	• INSPECT the steering gear for loose mounting bolts. TIGHTEN to specification as necessary. REFER

sensitive)		to **POWER STEERING** article.
• Feedback (rattle, chuckle or knocking noise in the steering gear) - roughness is felt in the steering wheel when the vehicle is driven over rough surfaces	• Steering column shaft/coupling joints damaged or worn • Loose, damaged or worn tie-rod ends • Steering gear insulators or mounting bolts loose or damaged • Steering column shaft/coupling bolts are loose • Steering column damaged or worn	• INSTALL a new steering column shaft. REFER to **STEERING COLUMN** article. • INSPECT and INSTALL new tie-rod ends as necessary. Go to **Steering Linkage Test**. • TIGHTEN the bolts to specification or INSTALL new bolts as necessary. REFER to **POWER STEERING** article. • TIGHTEN the bolts to specification. REFER to **STEERING COLUMN** article. • REPAIR or INSTALL a new steering column as necessary. REFER to **STEERING COLUMN** article.
• Power steering hiss or whistle	• Steering column shaft/coupling-to-steering gear is binding or misaligned • Grounded or loose steering column boot at the dash panel • Damaged or worn steering gear input shaft and valve • Power steering pump low relief pressure • Restricted power steering lines/hoses	• REPAIR or INSTALL a new steering column shaft as necessary. REFER to **STEERING COLUMN** article. • REPAIR as necessary. • REPAIR or INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article. • Go to **Pinpoint Test A**. • Go to **Pinpoint Test A**.
• Steering column rattle	• Loose bolts or attaching brackets • Loose, worn or insufficiently lubricated column bearings	• TIGHTEN the bolts to specification. • LUBRICATE bearings or INSTALL new steering column bearings or steering column as necessary. REFER to **STEERING**

	• Steering shaft insulators damaged or worn • Steering column shaft/coupling compressed or extended	**COLUMN** article. • INSTALL new insulators. REFER to **STEERING COLUMN** article. • INSPECT the rubber spider coupling for damage. INSTALL a new intermediate/flexible shaft. REFER to **STEERING COLUMN** article.
• Steering gear squeak	• Incorrect power steering fluid in system	• If incorrect power steering fluid is suspected, FLUSH the power steering system. REFER to **Power Steering System Flushing**. If noise persists after system flush, INSTALL a new steering gear. REFER to **POWER STEERING** article.
	• Steering gear rotary seal	**NOTE:** **Use the chassis ears to verify that the steering gear is the source of the noise. It may be necessary to replicate the customer operating conditions (fluid temperature, turning rate of steering wheel) to get the squeak to reoccur.** • INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article.
	• Stone shield (if equipped)	• MAKE SURE that the stone shield is correctly installed and that it is not making contact with the steering shaft. REPOSITION stone shield or INSTALL a new stone shield as necessary.
• Steering column squeak, cracks or grinds	• Insufficiently lubricated steering shaft bushings	• LUBRICATE the steering shaft and shaft tube seals.
	• Loose or misaligned steering column shrouds	• TIGHTEN or ALIGN the steering column shrouds.
	• Steering wheel rubbing against steering column shrouds	• REPOSITION the steering column shrouds.
	• Upper or lower bearing sleeves out of position	• REPOSITION the bearing sleeves.

• Power steering pump noisy	• Power steering pump	• INSTALL a new power steering pump as necessary. REFER to **POWER STEERING** article.
• Power steering pump relief noise	• Power steering fluid flow into the bypass valve of the pump valve housing, with fluid temperature below 54°C (130°F)	• Acceptable condition.
• Power steering pump whine noise	• Aerated fluid	• CHECK for a leak in the system. REFER to Power Steering Fluid Leak Test Component Test. PURGE the air from the system. REFER to **Power Steering System Purging - 2.3L** or **Power Steering System Purging - 3.0L, 3.5L**.
	• Damaged power steering pump	• INSTALL a new power steering pump as necessary. REFER to **POWER STEERING** article.
• High speed shake or shimmy - occurs at high speeds	• Worn or damaged steering linkage components	• Go to **Steering Linkage Test**.

Pinpoint Tests

Pinpoint Test A: Steering Has Lack of Assist or Inconsistent Assist

NOTE: **Hard steering or lack of assist is experienced when the steering wheel effort exceeds specifications. Hard steering can remain constant through the full turn, occur near the end of a turn or differ right to left. It is important to know the difference between hard steering/lack of assist and poor returnability/sticky steering.**

This pinpoint test is intended to diagnose the following:

- Steering gear
- Power steering pump
- Power steering hoses

PINPOINT TEST A: STEERING HAS LACK OF ASSIST OR INCONSISTENT ASSIST

A1 CHECK THE STEERING ASSIST WITH THE ENGINE RPM RAISED

CAUTION: **Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.**

- Set the engine at 2,100 RPM and turn the steering wheel fully to the left and right.
- **Is steering assist normal with the engine RPM raised?**

  YES : INSTALL a new power steering pump. REFER to **POWER STEERING** article.

  NO : Go to A2.

A2 CHECK FOR A CHANGE OF ASSIST ON LEFT AND RIGHT TURNS

- With the engine at idle, turn the steering wheel fully to the left and to the right.
- **Does the steering assist change when turning from right to left?**

  YES : INSTALL a new steering gear. REFER to **POWER STEERING** article.

  NO : Go to A3.

A3 CHECK THE STEERING LINES AND HOSES FOR RESTRICTIONS

- Inspect the steering lines and hoses for damage, kinks or restrictions.
- **Are the steering lines or hoses damaged, kinked or restricted?**

  YES : INSTALL new lines or hoses as necessary.

  NO : Go to A4.

A4 MONITOR THE ENGINE RPM CHANGES

CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.

NOTE: Make sure that the vehicle is on a flat dry surface, all accessories are in the OFF position and that the steering system is at normal operating temperature.

- Connect the diagnostic tool.
- Start the engine.
- With the engine at idle, raise the power steering fluid temperature to 74-80°C (165-176°F) by rotating the steering wheel fully to the left and right several times.
- While monitoring the engine RPM with the scan tool, turn the steering wheel quickly to the left stop position and then to the right stop position.
- Note the engine RPM during the turns.
- **Does the engine RPM change (even temporarily) more than 30 RPM when turning the steering wheel?**

  YES : INSTALL a new steering gear. REFER to **POWER STEERING** article.

  NO : INSTALL a new power steering pump. REFER to **POWER STEERING** article.

Pinpoint Test B: Excessive Steering Wheel Play

This pinpoint test is intended to diagnose the following:

- Steering column bearings
- Steering linkage

- Suspension components

PINPOINT TEST B: EXCESSIVE STEERING WHEEL PLAY

B1 CHECK THE STEERING COLUMN BEARINGS

- Inspect the steering column mounting fasteners and bearings for looseness.
- **Are the fasteners and bearings OK?**

  YES : Go to B2.

  NO : TIGHTEN the steering column mounting fasteners or INSTALL a new steering column. REFER to **STEERING COLUMN** article.

B2 CHECK THE STEERING LINKAGE FOR LOOSENESS

- Carry out the **Steering Linkage Test**.
- **Is the steering linkage OK?**

  YES : To diagnose suspension components, REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

  NO : INSTALL new steering linkage components as necessary. Refer to the appropriate Steering System article for the procedure.

Pinpoint Test C: Steering System Drift/Pull/Wander

This pinpoint test is intended to diagnose the following:

- Steering gear
- Intermediate shaft
- Intermediate shaft U-joints
- Steering gear mounts
- Suspension components

PINPOINT TEST C: STEERING SYSTEM DRIFT/PULL/WANDER

C1 CHECK FOR TIRE PULL

- Rotate the front wheel and tire assemblies side to side. Refer to the appropriate Suspension article for the procedure.
- Carry out a road test on a smooth, flat road.
- **Does the vehicle drift/pull?**

  YES : If vehicle pulls in the opposite direction, go to C2 .

  If vehicle pulls in the original direction, go to C3 .

  NO : The concern has been corrected.

C2 ROTATE THE WHEEL AND TIRE ASSEMBLIES FRONT TO REAR

- Rotate the wheel and tire assemblies front to rear. Refer to the appropriate Suspension article for the procedure.

- Carry out a road test on a smooth, flat road.
- **Does the vehicle drift/pull?**

  YES : Go to C3.

  NO : The concern has been corrected.

C3 CHECK THE STEERING COLUMN INTERMEDIATE SHAFT

NOTE: **Be sure to keep the clockspring centered when disconnecting the intermediate shaft. Refer to the appropriate Body article for the procedure.**

- Check the steering column and intermediate shaft for grounding.
- Disconnect the steering column intermediate shaft at the steering column.
- Inspect the steering column intermediate shaft U-joints for looseness or wear.
- **Are the steering column intermediate shaft universal joints OK?**

  YES : Go to C4.

  NO : INSTALL a new steering column intermediate shaft as necessary. REFER to **STEERING COLUMN** article.

C4 CHECK THE STEERING GEAR MOUNTING

- Check the steering gear mounts for looseness or wear.
- **Are the steering gear mounts OK?**

  YES : Go to C5.

  NO : INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article.

C5 CHECK THE STEERING GEAR

- Carry out the **Steering Gear Valve Test**.
- **Is the steering gear valve OK?**

  YES : Go to C6.

  NO : REPAIR or INSTALL a new steering gear as necessary. REFER to **POWER STEERING** article.

C6 CHECK THE SUSPENSION COMPONENTS

- Check for loose or worn suspension components.
- **Are the suspension components OK?**

  YES : Go to C7.

  NO : INSTALL new suspension components as necessary. Refer to the appropriate Suspension article for the procedure.

C7 CHECK THE WHEEL ALIGNMENT

NOTE: **The vehicle will tend to pull toward the side with the least positive caster and the most positive camber.**

- Using a suitable alignment system, measure the wheel alignment settings. Refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article

- **Are the alignment settings within specifications?**

  YES : CHECK for correct frame alignments. Refer to the appropriate Frame and Mounting article for the procedure.

  NO : ADJUST the alignment angles to specifications. DO NOT exceed the specifications. TEST the system for normal operation.

Component Tests

Power Steering Fluid Leak Test

NOTE: This test should only be carried out if a leak in the system has not been detected during a thorough visual inspection. Refer to Inspection and Verification.

1. Check the power steering fluid level. If necessary, add the specified power steering fluid.
2. Remove the power steering pump reservoir cap and tightly install the evacuation cap to the power steering pump reservoir.
3. Install the hose from the fill adapter manifold tee to the evacuation cap on the power steering pump reservoir.
4. Install the vacuum pump to the evacuation cap.
5. Using the vacuum pump, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.
6. Observe the vacuum gauge for 30 seconds. If the vacuum gauge reading drops more than 3 kPa (0.88 in-Hg) a leak is present.
7. Remove the vacuum pump.

   CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.

8. Start the engine. With the engine at idle, raise the power steering fluid temperature to 74-80°C (165-176°F) by rotating the steering wheel fully to the left and right several times.
9. Visually inspect the system for leaks. If a leak is evident, repair as necessary. If a leak is not evident, add the specified UV fluorescent tracer dye to the power steering fluid. Use 14.78 mL (1/2 oz) of dye solution for every 1.89L (2 qt) of power steering fluid.

   CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump may occur.

10. Start the engine. With the engine at idle, raise the power steering fluid temperature to 74-80°C (165-176°F) by rotating the steering wheel fully to the left and right several times.
11. Using the special tool (UV lamp), inspect the system for traces of UV dye. Repair as necessary.

Steering Gear Valve Test

1. With the vehicle in motion, place the transmission in NEUTRAL and turn the engine OFF.
   - If the vehicle does not pull with the engine OFF, repair or install a new steering gear. Refer to **POWER STEERING** article.
2. If the vehicle pulls with the engine OFF, switch the right side front wheel to the left side of the vehicle and the left side front wheel to the right side of the vehicle.
3. If the vehicle pulls to the opposite side, switch the front wheels with the rear wheels keeping them on the same side of the vehicle.
4. If the vehicle pull direction does not change, check the front suspension components, wheel alignment and frame alignment. Refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

Steering Gear Grunt/Shudder Test

1. Start and run the vehicle to operating temperature.
2. Set engine idle speed to 1,200 RPM.

CAUTION: Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.

3. Rotate the steering wheel to the RH stop, then turn the steering wheel 90 degrees back from that position. Slowly turn the steering wheel back and forth approximately 1/12 of a full turn.
4. Turn the steering wheel another 90 degrees. Slowly turn the steering wheel back and forth approximately 1/12 of a full turn.
5. Repeat the test with the power steering fluid at different temperatures.
6. If a light grunt is heard or a low (50-200 Hz) shudder is present, this is a normal steering system condition.
7. If a loud grunt is heard, or a strong shudder is felt, purge the power steering system. Refer to **Power Steering System Purging - 2.3L** or **Power Steering System Purging - 3.0L, 3.5L**. If a loud grunt or strong shudder still exists, check the power steering lines/hoses for restrictions or damage and repair as necessary. Refer to **POWER STEERING** article. If the lines/hoses are OK, install a new steering gear. Refer to **POWER STEERING** article.

Steering Linkage Test

NOTE: Excessive vertical motion of the studs relative to the sockets may indicate excessive wear.

1. With the vehicle on the ground and the parking brake applied, start the vehicle and carry out the following:
   - Have an assistant rotate the steering wheel back and forth 360 degrees and watch for relative motion of the studs in the steering linkage ball sockets.
   - Watch for loose steering gear mounting.
2. As an additional check, with the key ON/engine OFF (KOEO) and the front wheels raised off the ground, grasp the wheel at the front and rear and watch for excessive play or binding in the joints while trying to

steer the wheels.

3. Install new components if necessary. Tighten any worn, damaged or loose components. Refer to the appropriate Steering System article for the procedure.

GENERAL PROCEDURES

POWER STEERING SYSTEM FLUSHING

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

CAUTION: Do not mix oil types. Any mixture or any unapproved oil can lead to seal deterioration and leaks. A leak can ultimately cause loss of fluid, which may result in a loss of power steering assist.

1. Remove the power steering fluid reservoir cap.
2. Using a suitable suction device, remove the power steering fluid from the reservoir.
3. Disconnect the power steering fluid return hose from the reservoir.
    - Remove the clamp.
4. Plug the power steering fluid reservoir inlet port.
5. Attach an extension hose to the power steering return hose.

NOTE: Do not reuse the power steering fluid that has been flushed from the power steering system.

6. Place the open end of the extension hose into a suitable container.

NOTE: Do not overfill the reservoir.

7. Fill the power steering fluid reservoir with new fluid.

CAUTION: Do not allow the power steering pump to run completely dry of power steering fluid. Damage to the power steering pump may occur.

8. Start the engine while simultaneously turning the steering wheel to lock and then immediately turn the ignition switch to the OFF position.

NOTE: Avoid turning the steering wheel without the engine running as this may cause air to be pulled into the steering gear.

NOTE: Do not overfill the reservoir.

9. Fill the power steering fluid reservoir with the approved power steering fluid.
10. Repeat Steps 8 and 9, turning the steering wheel in the opposite direction each time, until the fluid exiting the power steering fluid return hose is clean and clear of foreign material.
11. Remove the extension hose from the power steering return hose.
12. Remove the plug from the power steering fluid reservoir inlet port.
13. Install the power steering return hose to the reservoir.
    - Install the clamp.

NOTE: It is necessary to properly fill the power steering system to remove any trapped air and completely fill the power steering system components.

If, after properly filling the power steering system, there is power steering noise accompanied by evidence of aerated fluid and there are no fluid leaks, it may be necessary to purge the power steering system. For additional information, refer to Power Steering System Purging - 2.3L or Power Steering System Purging - 3.0L, 3.5L.

14. Fill the power steering system. For additional information, refer to **Power Steering System Filling - 2.3L** or **Power Steering System Filling - 3.0L, 3.5L**.

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

CAUTION: If the air is not purged from the power steering system correctly, premature power steering pump failure can result. The condition can occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.

NOTE: A whine heard from the power steering pump can be caused by air in the system. The power steering purge procedure must be carried out prior to any component repair for which power steering noise complaints are accompanied by evidence of aerated fluid.

1. Remove the power steering pump reservoir cap. Check the fluid.
2. Raise the front of the vehicle and support it on safety stands. For additional information, refer to **JACKING AND LIFTING** article.
3. Tightly insert the stopper of the vacuum pump into the reservoir.
4. Start the engine.
5. Install the vacuum pump, apply vacuum and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).
6. If equipped with Hydro-Boost®, apply the brake pedal twice.

CAUTION: Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.

7. Cycle the steering wheel fully from stop-to-stop 10 times.
8. Stop the engine.
9. Release the vacuum and remove the vacuum pump.

NOTE: Do not overfill the reservoir.

10. Fill the reservoir.
    - Use approved transmission fluid.
11. Start the engine.
12. Install the vacuum pump. Apply and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).

CAUTION: Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.

13. Cycle the steering wheel fully from stop-to-stop 10 times.
14. Stop the engine, release the vacuum and remove the vacuum pump.

NOTE: Do not overfill the reservoir.

15. Fill the reservoir as needed and install the reservoir cap.

16. Visually inspect the power steering system for leaks.

NOTE: Do not overfill the reservoir.

17. Fill the reservoir as needed and visually inspect the power steering system for leaks.
18. Install the reservoir cap.

POWER STEERING SYSTEM PURGING - 2.3L

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

NOTE: Do not turn the steering wheel during the fluid level inspection, or the fluid level changes and cannot be inspected correctly.

1. Check the power steering fluid level and add fluid as necessary.
2. Raise the front of the vehicle and support it on safety stands. For additional information, refer to **JACKING AND LIFTING** article.
3. Slowly turn the steering wheel fully to the left and right several times with the engine not running (minimum 10 times in each direction).
4. Check the power steering fluid level and add fluid as necessary.
5. Repeat Steps 3 and 4 until the fluid level stabilizes.
6. Lower the vehicle.
7. Start the engine and let it idle.

CAUTION: Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.

8. Slowly turn the steering wheel fully to the left and right several times (minimum 10 times in each direction).
9. Verify that the power steering fluid is not foamy and that the fluid level has not dropped.
   - If the fluid level has dropped, add fluid as necessary and repeat Steps 8 and 9.

POWER STEERING SYSTEM FILLING - 3.0L, 3.5L

Special Tools

Illustration	Tool Name	Tool Number

MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

CAUTION: If the air is not purged from the power steering system correctly, premature power steering pump failure may result. The condition can occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.

1. Remove the power steering pump reservoir cap.
2. Tightly install the evacuation cap to the power steering pump reservoir.
3. Install the hose from the fill adapter manifold tee to the evacuation cap on the power steering pump reservoir.
4. Install the vacuum pump to the fill adapter manifold control valve.
5. Install the hose to the opposite fill adapter manifold control valve and submerge the open end of the hose into a container of new power steering fluid.

NOTE: The fill adapter manifold control valves are in the OPEN position when the point of the handles face the center of the fill adapter manifold.

6. Close the fill adapter manifold control valve connected to the power steering fluid container.
7. Open the fill adapter manifold control valve connected to the vacuum pump.
8. Using the vacuum pump, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.
9. Observe the vacuum gauge for 30 seconds.

10. If the vacuum gauge reading drops more than 3 kPa (0.88 in-Hg), correct any leaks in the power steering system or the filling tools before proceeding.

NOTE: The vacuum pump gauge reading will drop slightly during this step.

11. Slowly open the fill adapter manifold control valve connected to the power steering fluid container until power steering fluid completely fills the hose.
12. Close the fill adapter manifold control valve connected to the power steering fluid container.
13. Using the vacuum pump, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.
14. Close the fill adapter manifold control valve connected to the vacuum pump.
15. Slowly open the fill adapter manifold control valve connected to the power steering fluid container.
16. When the power steering fluid has drained from the hose connected to the power steering fluid container, close the fill adapter manifold control valve connected to the power steering fluid container.
17. Remove the tools from the vehicle.
18. Install the power steering reservoir cap.

CAUTION: Do not hold the steering wheel against the stops for an extended amount of time. Damage to the power steering pump may occur.

NOTE: There will be a slight drop in the power steering fluid level in the power steering fluid reservoir when the engine is started.

19. Start the engine and turn the steering wheel from stop-to-stop.
20. Turn the ignition switch to the OFF position.

NOTE: Do not overfill the reservoir.

21. Remove the power steering reservoir cap and fill the reservoir.
22. Install the power steering reservoir cap.

POWER STEERING SYSTEM FILLING - 2.3L

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM (or XT-5-QMC) (US); CXT-5-LM12 (Canada)	MERCON® V

1. Inspect the power steering fluid level and add fluid to the specified level as necessary.
2. Start the engine and inspect for fluid aeration. If fluid aeration is evident, carry out the power steering system purging procedure. For additional information, refer to **Power Steering System Purging - 2.3L**.

DESCRIPTION AND OPERATION

AIR BAG AND SAFETY BELT PRETENSIONER SUPPLEMENTAL RESTRAINT SYSTEM (SRS)

The air bag supplemental restraint system (SRS) is designed to provide increased collision protection for front seat and second row outboard occupants, in addition to that provided by the 3-point safety belt system. Safety belt use is necessary to obtain the best occupant protection and to receive the full advantage of the SRS.

This vehicle line contains dual stage deployment (advanced restraint system) driver and front passenger air bag modules. These vehicles are also equipped with driver and front passenger safety belt retractor pretensioners, side air curtains and seat side air bag modules in the front seats.

Side air curtains deploy from the headliner, protecting the first and second row outboard occupants during a side impact. Seat side air bag modules deploy from the outboard front seat backrest upon a side impact. In addition, a front impact severity sensor is mounted to the lower radiator support, a seat position sensor is mounted to the driver seat and a usage detection switch is added to the front driver and passenger outboard buckles.

Vehicles are also equipped with an occupant classification sensor (OCS) system as part of the front passenger seat. The OCS includes 2 OCS rails and an occupant classification system module (OCSM).

The serviceable air bag and safety belt pretensioner SRS components are shown in the following illustration.

DIAGNOSTIC TESTS

AIR BAG AND SAFETY BELT PRETENSIONER SUPPLEMENTAL RESTRAINT SYSTEM (SRS)

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ for schematic and connector information.

Special Tools

Illustration	Tool Name	Tool Number
 ST1436-A	Flex Probe Kit	105-R025C or equivalent
 ST1185-A	FLUKE 73III Automotive Meter	105-R0057 or equivalent
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

Principles of Operation

A supplemental restraint system (SRS) consists of a dual stage driver and passenger air bag module, safety belt retractor pretensioners, side air bag modules and side air curtains (containing an inflator/squib or gas generator and an air bag), impact sensors, a restraints control module (RCM), a clockspring, an air bag warning indicator, occupant classification sensor (OCS) system and a passenger air bag deactivation (PAD) indicator. These components are all interconnected by a wiring harness and powered by the vehicle's battery. The RCM includes

a backup power supply. This feature provides sufficient backup power to deploy the SRS components in the event that the ignition circuit is lost or damaged during impact. The backup power supply will deplete its stored energy approximately one minute after power and/or ground has been removed from the RCM. The RCM performs an internal, external circuitry and component "self-test" during each startup. If a SRS fault exists, the RCM sends a message to instrument cluster (IC) module to illuminate the air bag warning indicator. In addition to the self-test at start up, the RCM continuously monitors all of its external and internal circuitry for faults.

In a frontal collision, the impact sensors located in the front of the vehicle detect the sudden deceleration and send an electrical signal to the RCM. The RCM uses the information from the impact sensors and the OCS system in the deployment determination. If the RCM determines that SRS deployment is required, the RCM sends voltage and current to the squib(s) causing the solid chemical propellant to undergo a rapid chemical reaction. This controlled reaction produces harmless nitrogen gas that fills the air bag(s)/side air curtains and/or activates the safety belt pretensioners/adaptive load limiting retractor(s) to control the tension of the safety belt (s).

In certain side collisions, the air curtain and seat-mounted side air bag on the side affected by the collision will be inflated, except that the OCS system will deactivate the passenger seat-mounted side air bag if it detects an empty unbuckled passenger seat or an unbuckled child or small person in the passenger seat. The side air curtain was designed to inflate between the side window area and occupant to further enhance the head protection provided to occupants in side impact collisions. The seat-mounted side air bag was designed to inflate between the door panel and occupant to further enhance the protection provided occupants in side impact collisions.

The RCM communicates through the data link connector (DLC) the current and historical DTCs on the high-speed controller area network (HS-CAN). The RCM also communicates over the HS-CAN to the IC module, occupant classification system module (OCSM) and PCM.

Air Bag Warning Indicator

The air bag warning indicator:

- is located in the instrument cluster (IC) module.
- lamp and circuitry prove out is a function of the instrument cluster module. The instrument cluster will prove out the air bag warning indicator by lighting the air bag warning indicator for 6 seconds and then turn off.
- will flash and/or illuminate based on the message the instrument cluster module receives from the restraints control module (RCM).
- will illuminate if the instrument cluster module does not receive a message from the RCM.

Air Bag Module Second Stage Deployment Check

Because the driver and passenger front air bags each have 2 deployment stages, it is possible that Stage 1 has deployed and Stage 2 has not.

If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure.

- For information on driver air bag module and/or passenger air bag module remote deployment, refer to **Pyrotechnic Device Disposal**.

Clockspring

The clockspring:

- is mounted on the steering column, behind the steering wheel.
- allows for continuous electrical connections between the driver air bag module and the restraints control module (RCM) when the steering wheel is turned.

Driver Air Bag Module

The driver air bag module:

- is installed as an assembly.
- is a dual-stage air bag, deploying at 1 of 2 different rates depending upon impact severity.
- is mounted in the center of the steering wheel.

Electrical System

The electrical system that supports the supplemental restraint system (SRS):

- is powered from the battery through the ignition circuit.
- provides the electrical path from the restraints control module (RCM) to the SRS components.
- provides a communication path from the RCM to the air bag warning indicator, located in the instrument cluster (IC) module, via the high-speed control area network (HS-CAN).
- provides the electrical communication path from the RCM to the DLC and all other modules on the HS-CAN.

High-Speed Controller Area Network (HS-CAN)

This vehicle utilizes a communication system called a high-speed controller area network (HS-CAN). The HS-CAN consists of a twisted pair of wires connected to some of the following:

- ABS module
- Instrument cluster (IC) module
- PCM
- Transmission control module (TCM)
- Restraints control module (RCM)
- Occupant classification system module (OCSM)
- Data link connector (DLC)

The HS-CAN circuits use a bias voltage of approximately 2.5 volts. The HS-CAN also uses 2 terminating resistors, one contained within the PCM, the other in the instrument cluster (IC) module. The terminating

resistors are not serviced separately. The terminating resistors have a value of 120 ohms each, for a normal operating system total of 60 ohms. The HS-CAN may operate with only one terminating resistor and may communicate with only one circuit functioning. Refer to **MODULE COMMUNICATIONS NETWORK** article.

Impact Sensors

> WARNING: **If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.**

The impact sensors provide data to the restraints control module (RCM) for use in calculating impact severity. This is accomplished using various electrical sensors located throughout the vehicle.

For these vehicles, the supplemental restraint system (SRS) employs 6 impact sensors. One of the sensors is integral to the RCM and is not separately serviceable. The RCM is mounted on the center tunnel between the front seats. There is one front impact severity sensor located in the front-center of the vehicle, behind the grille and 4 side impact sensors. The first row side impact sensors are located in each of the front doors behind the trim panel, the second row side impact sensors are located on or near the base of the C-pillar. Mounting orientation is critical for correct operation of all impact sensors.

The side impact sensors are **not** interchangeable between the first and second row.

Loops/Squibs

All deployable devices contain an initiating device called a squib. The squib is part of the deployment loop. Air bag/safety canopies/side air curtain modules can contain more than one squib, some vehicles may have up to 4 squibs in one air bag module. Squibs are often referred to as loops during the diagnostic process.

Occupant Classification Sensor (OCS) System

The occupant classification sensor (OCS) system is found only on the front passenger seat. The front passenger OCS system is comprised of the following: 2 OCS rails (weight sensors) that are mounted to the underside of each side seat track; an occupant classification system module (OCSM) mounted to the electrical bracket underneath the seat cushion pan. The weight of any occupant or object on the front passenger seat is electronically communicated to the OCSM.

The OCS system is also used for operation of the passenger Belt-Minder®. For information on the passenger Belt-Minder® feature, refer to **SAFETY BELT SYSTEM** article. To deactivate or reactivate the passenger Belt-Minder® feature, refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article or the Owner's Literature.

When the front passenger seat is removed for service, the Zero Seat Weight Test must be carried out after the installation of the front passenger seat. When an OCS system component is installed new, the System Reset must be carried out after the installation of the front passenger seat. The Zero Seat Weight Test and/or System

Reset must be carried out only as instructed to do so in the Workshop article. For information on the Zero Seat Weight Test and/or System Reset, refer to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test** or **Occupant Classification Sensor (OCS) System Reset**.

Occupant Classification System Module (OCSM)

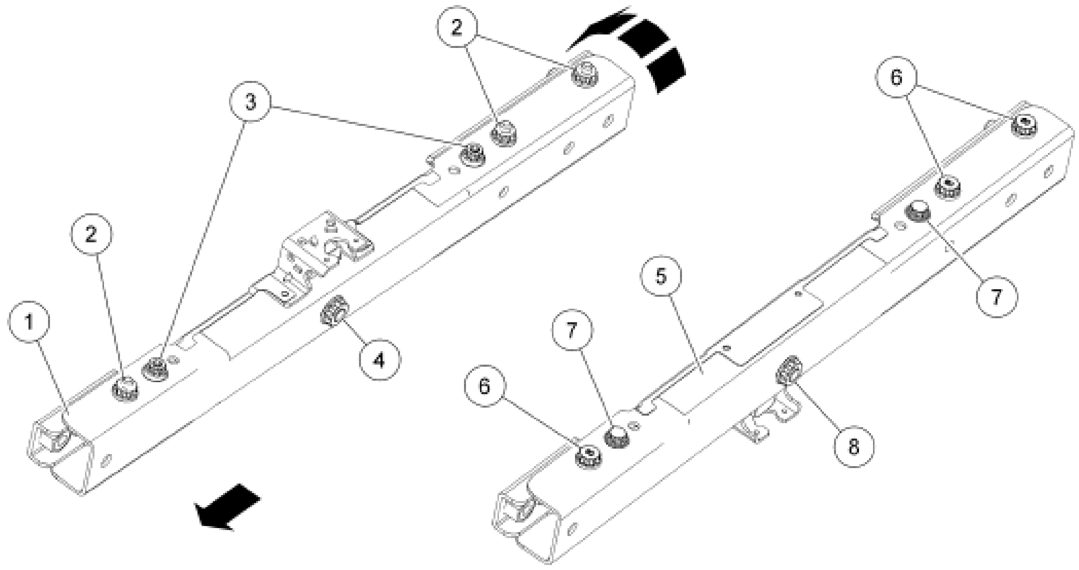
Based on programmed limits, the occupant classification system module (OCSM) will inform the restraints control module (RCM), via a high-speed controller area network (HS-CAN), of the weight of any occupant or object on the front passenger seat. The RCM uses this information in determining if the passenger air bag module or passenger seat side air bag module is to be deployed in the event of a deployable collision.

The OCSM monitors the occupant classification sensor (OCS) system for faults and communicates on-demand and continuous DTCs via the data link connector (DLC) with the use of a scan tool.

Occupant Classification Sensor (OCS) Rails (Weight Sensors)

WARNING: **Do not disassemble the occupant classification sensor (OCS) rail or tighten or loosen any of the nuts and bolts installed to the OCS rail body. Only the 8 bolts that attach the 2 OCS rails to the seat track may be removed and installed. Failure to follow these instructions may result in incorrect operation of the OCS system and increase the risk of serious personal injury or death in a crash.**

NOTE: The illustration below is indicating the fasteners of the occupant classification sensor (OCS) rails (weight sensors) that must not be tightened or loosened. The OCS rails are installed individually as an assembly and require no adjustment.



N0041796

Fig. 2: Fasteners Of OCS Rails (Weight Sensors) Must Not Be Tightened Or Loosened
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	61708	Occupant classification sensor (OCS) rail, outboard side
2	-	Stopper nut(s) and bolt(s) outboard side
3	-	Sensor pivot nut(s) and bolt(s) outboard side
4	-	Sensor nut (under assembly) outboard side
5	61708	OCS rail, inboard side
6	-	Stopper nut(s) and bolt(s), inboard side
7	-	Sensor pivot nut(s) and bolt(s), inboard side
8	-	Sensor nut (under assembly), inboard side

The components that make up the OCS system (occupant classification system module [OCSM], inboard OCS rail and outboard OCS rail) are serviced separately.

Passenger Air Bag Deactivation (PAD) Indicator

The passenger air bag deactivation (PAD) indicator is a visual indicator used to inform the front seat occupants of the passenger air bag deactivation state. The PAD indicator is located in the integrated control panel (ICP) in a position visible to each front seat occupant.

The restraints control module (RCM) controls the state of the PAD indicator through a direct hardwire connection, based on information provided by the occupant classification sensor (OCS) system. The PAD indicator is lit to indicate the passenger air bag module is deactivated (off). Some exceptions to this are made in certain scenarios such as when the front passenger seat is determined to be empty, and therefore indication of a deactivated passenger air bag module is not necessary. In all cases, the PAD indicator is unlit when the passenger air bag module is activated (on).

When the ignition switch is in the RUN position, the PAD indicator prove-out period is initiated by the RCM. The RCM briefly activates the PAD indicator to prove-out the indicator function and verify to the front seat occupants proper functional operation of the PAD indicator.

When an OCS fault is present, the supplemental restraint system (SRS) defaults the passenger air bag module to on (activated) regardless of the size of the occupant in the front passenger seat. The PAD indicator will be unlit. For information on the OCS, refer to **Occupant Classification Sensor**.

The following table indicates the passenger air bag status and the PAD indicator status based the size of the front passenger occupant.

PASSENGER AIR BAG AND PAD INDICATOR STATUS

Occu- pant Size	Passenger Safety Belt Buckle Status	Pass. Air Bag Status	PAD Ind. Status
None	Unbuckled	Disabled	Unlit
None	Buckled	Disabled	Lit

Infant or Small Child	Buckled/ Unbuckled	Disabled	Lit
Adult Sized	Buckled/ Unbuckled	Enabled	Unlit

Passenger Air Bag Module

NOTE: **References to the passenger air bag module must not be confused with the side (seat-mounted) air bag components of the supplemental restraint system (SRS).**

The passenger air bag module:

- is a dual-stage air bag, deploying at 1 of 2 different rates depending upon impact severity, safety belt usage and passenger seat occupant classification.
- will deploy upon receiving a flow of current from the restraints control module (RCM).
- is installed as an assembly.
- is mounted in the right side of the instrument panel.

Restraints Control Module (RCM)

WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

NOTE: **Prior to removal of the restraints control module (RCM) module, it is necessary to upload module configuration information to the scan tool. This information needs to be downloaded into the new RCM module once installed. Refer to MODULE CONFIGURATION article.**

NOTE: **When a new PCM is installed, the air bag warning indicator will illuminate when the ignition switch is ON. The warning indicator will remain on until PCM configuration is restored. Clear restraints control module (RCM) DTCs.**

NOTE: **When installing a new RCM, always make sure the correct RCM is being installed. If an incorrect RCM is installed, erroneous DTCs will result.**

The RCM carries out the following functions:

- deploys the air bag(s)/side air curtain(s) in the event of a deployable collision.
- activates the safety belt retractor pretensioner to control tension on the safety belt in the event of a deployable collision.
- monitors the supplemental restraint system (SRS) for faults.
- sends a message to the instrument cluster module to flash/illuminate the air bag warning indicator if a

fault is detected.
- communicates through the data link connector (DLC) the current or historical DTCs.

The RCM monitors the SRS for possible faults. If an SRS fault exists, the RCM sends a message to instrument cluster (IC) module to illuminate the air bag warning indicator.

When the ignition is cycled (turned OFF and then ON), the instrument cluster will prove out the air bag warning indicator by lighting for 6 seconds and then turn off. If a current SRS fault exists, the RCM requests illumination of the air bag warning indicator and will remain illuminated for the rest of the key cycle. The RCM will also communicate the on-demand (current) and continuous (historical) DTCs through the DLC, to the scan tool. If the RCM requests illumination of the air bag warning indicator and the air bag warning indicator does not function, the IC module will automatically activate an audible chime. The chime is a series of 5 sets of 5 tone bursts. If the chime is heard, the SRS and the air bag warning indicator require repair.

The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the air bags in the event that the ignition circuit is lost or damaged during impact. The backup power supply will deplete its stored energy approximately one minute after power and/or ground has been removed from the RCM.

Safety Belt Pretensioners

As part of the supplemental restraint system (SRS), the driver and front passenger safety belt retractors are equipped with pretensioners. The safety belt retractor pretensioners remove excess slack from the safety belt webbing. The pretensioners are activated by the restraints control module (RCM) when the module detects a collision event force exceeding a programmed limit.

Safety Belt Buckle Switches

As part of the supplemental restraint system (SRS), the driver and front passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckle switches indicate to the restraints control module (RCM) whether the safety belts are buckled or unbuckled. The RCM uses this information in determining the deployment of the dual-stage driver and passenger air bag modules.

Safety Belt Tension Sensor

The safety belt tension sensor:

- is part of the front passenger safety belt retractor assembly.
- is located at the safety belt anchor point on the passenger seat.
- is used in conjunction with the occupant classification sensor (OCS) system.
- is a 3-wire Hall-effect sensor that is part of the front passenger safety belt and retractor assembly.

The safety belt tension sensor is used by the OCS system to identify the presence of a child safety seat on the front passenger seat. The safety belt tension sensor senses the tension on the safety belt assembly then provides an output to the occupant classification system module (OCSM), indicating that the safety belt assembly is cinched. After sensing the weight applied to the seat by the occupant and using the safety belt tension sensor input, the OCSM determines how the occupant should be classified and communicates this information to the restraints control module (RCM). If the occupant is classified as a child, the RCM will then automatically

deactivate the passenger air bag module and illuminate the passenger air bag deactivation (PAD) indicator.

Seat Track Position Sensors

The seat track position sensors are mounted to a bracket attached to the driver and passenger seat track. The seat track position sensor informs the restraints control module (RCM) of the driver/passenger seat position. The RCM uses this information in determining the deployment of the dual-stage driver/passenger air bag module.

Secondary Air Bag Warning (Chime)

The secondary air bag warning chime, is an audible chime controlled by the instrument cluster (IC) module. If the IC module has detected a fault with the air bag warning indicator, a DTC will be stored in the memory of the IC module. Upon receiving the message from the restraints control module (RCM) that a supplemental restraint system (SRS) fault has been detected, the IC module will sound the secondary air bag warning chime in a pattern of 5 sets of 5 beeps.

Side Air Bag Module

NOTE: References to side air bag modules refer to the seat-mounted, not to the steering wheel or instrument panel mounted air bag components of the supplemental restraint system (SRS).

A side air bag module provides protection of the thorax area (between the neck and abdomen) of the body, working in conjunction with the head protection provided by a side air curtain module.

The side air bag module:

- will deploy upon receiving a flow of current from the restraints control module (RCM), initiated by the side impact sensor and internal RCM circuitry.
- is installed as an assembly.
- is mounted in the driver or passenger seat backrest.
- is used in conjunction with a side air curtain module.

Side Air Curtain Module

WARNING: Anytime the safety canopy or side air curtain module has deployed, a new headliner and new A-, B- and C-pillar upper trim panels and attaching hardware must be installed. Remove any other damaged components and hardware and install new components and hardware as needed. Failure to follow these instructions may result in the safety canopy or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

The side air curtain module:

- will deploy upon receiving a flow of current from the restraints control module (RCM) initiated by the side impact sensors and internal RCM circuitry when a side impact is detected.

- is installed as an assembly.
- is mounted above the headliner.
- attaches from the A-pillar frame to the C-pillar frame.
- cannot be interchanged from side to side.

Diagnostic Instructions

The symptom chart can be used to help locate supplemental restraint system (SRS) concerns if no DTCs are retrieved and the listed symptoms are observed. Whether or not the listed symptoms are observed, always carry out the following:

1. Run the Self Test to determine what on-demand and continuous memory DTCs are being sensed by the restraints control module (RCM)/occupant classification system module (OCSM).
2. Retrieve all SRS DTCs and fault PIDs stored in the RCM and OCSM memory.
3. If on-demand DTCs are different than continuous memory DTCs, always repair the on-demand DTCs first.

   A DTC can indicate several concerns. The DTCs are to assist in system diagnosis and are not to be considered definitive. Always refer to the pinpoint test corresponding to the DTC to determine where the concern lies and to repair the concern correctly.

Diagnostic Test Options

Scan tool options:

- Retrieve/Clear Continuous Memory DTCs
- Self Test/On-Demand

Refer to the manufacturer's literature for the scan tool being used for correct scan tool test options.

Self Test/On-Demand

The on-demand Self Test option is used to verify that no electrical concerns exist with the air bag supplemental restraint system (SRS). Upon entering the self-test, the restraints control module (RCM)/occupant classification system module (OCSM) will make an electrical check of each electrical component in the system. If a concern is detected, a DTC is displayed on the scan tool with a brief description of the DTC. The self-test should always be carried out after any repair to verify that the repair was successful.

To run the on-demand Self Test, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Select Self Test.
5. Select RCM or OCSM (selecting Restraints retrieves DTC's from both modules).

6. The module will run the self-test and display on-demand (reflecting hard system concerns) and continuous memory (historic) DTCs on the scan tool.

Self Test/Continuous Memory and Clear DTCs

During vehicle operation, the restraints control module (RCM)/occupant classification system module (OCSM) will detect and store both intermittent and hard failure DTCs in non-volatile memory. The DTC strategy employed by the restraints control module (RCM)/occupant classification system module (OCSM) incorporates a time-out scheme for determining when a concern exists in the system. This requires a concern to exist for up to one minute in the system before the RCM/OCSM will detect it. For the RCM/OCSM to determine that a concern no longer exists, the concern must be absent for up to one minute. The actual detection time-outs vary with each DTC and module. DTCs can be retrieved with a scan tool using the Self Test option. All DTCs stored in the RCM and OCSM will be displayed on the scan tool along with a brief description of the DTC. If no DTCs are present, the scan tool will display a SYSTEM PASSED message. This option can also be used to clear DTCs from the RCM and OCSM memory, as long as the concern no longer exists.

Once 75 hours of operation have been recorded by the RCM and 128 key cycles have been recorded by the OCSM since the concern was last detected, all continuous memory DTCs will automatically be removed from memory.

To retrieve or clear DTCs, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Select Self Test.
5. Select RCM or OCSM. (selecting Restraints retrieves DTC's from both modules).

NOTE: Before proceeding with the clearing operation, make note of the DTCs displayed. Once cleared, DTCs cannot be retrieved.

6. All DTCs will be displayed on the screen.
7. Clear the DTCs. After clearing the DTCs, cycle the key OFF, then ON.
    - Continuous memory DTCs that have been cleared will **not** reoccur as "continuous memory" in the same key cycle. Only new DTCs which were **not** present before clearing can occur as "continuous memory" after clearing.

DataLogger PID/Data

The DataLogger PID/Data option allows the scan tool operator to read the state of PIDs to aid in diagnosing the system. PIDs are real time measurements of parameters, such as voltages and resistances, calculated by the restraints control module (RCM)/occupant classification system module (OCSM) sent to the scan tool for display. Many of the PIDs supported by the modules are calculated periodically and are, therefore, not true real time readings.

To retrieve PIDs, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Select DataLogger.
5. Select RCM or OCSM.

Active Commands

Occupant Classification Sensor (OCS)

System Reset active command sets the zero set point or rezeros the occupant classification sensor (OCS) system. Refer to **Occupant Classification Sensor**.

Instrument Cluster Module

These commands allow the technician to verify the operation of instrument cluster module components and subsystems.

Lamp Fault Codes (LFCs)

This vehicle line does not utilize LFCs.

Diagnosing Customer Concerns With On-Demand DTCs

If the air bag warning indicator is reported ON by the customer when the vehicle comes in for service, connect the scan tool and follow the **DIAGNOSTIC TESTS** to identify the concern.

Once the DTC is known, read the Normal Operation of the pinpoint test for the DTC involved.

Using the scan tool with the use of PIDs and active command(s) may be of assistance in diagnosing the concern.

- Follow the depowering procedure as directed.
- Determine the location of components involved in creating the DTC.
- Carry out a thorough visual inspection of:
  - components.
  - connectors.
  - splices and wiring harnesses.
  - insulation on conductors.

Diagnosing Customer Concerns With Continuous Memory DTCs

If an air bag warning indicator ON is reported by the customer but is not present when the vehicle comes in for service, follow the **DIAGNOSTIC TESTS** to identify the intermittent DTC.

Once the DTC is known, read the Normal Operation part of the pinpoint test for the DTC involved.

- Follow the depowering procedure as directed.
- Determine the location of components involved in creating the DTC.
- Carry out a thorough visual inspection of:
    - components.
    - connectors.
    - splices and wiring harnesses.
    - insulation on conductors.

Fault PIDs

There are 2 types of fault PIDs that can be reported by the restraints control module (RCM) and/or occupant classification system module (OCSM). The first type, considered conventional, has only one level of fault reporting and identifies a specific concern for a given component and points to a particular diagnostic path, example: DTC B1317 (Battery Voltage High).

The second type uses a process within the software of the controller that maps the byte and bit to name a specific device and fault condition. This process is called Bit-mapping and is referred to as fault PIDs in the diagnosis of the vehicle. This type does not identify the specific concern or component on the first level of fault reporting, Example: DTC B2293 (Restraint system - Airbag Fault). DTC B2293 can have up to 28 specific on-demand fault PIDs (areas of concern) associated with this DTC.

Those associated fault PIDs are an extension of the information provided by the DTC and are identified by the same DTC number. A scan tool must be used to view DTCs and their fault PIDs. Once a scan tool has retrieved a DTC, use the scan tool to view the fault PIDs. In the diagnostic path, other types of PIDs are sometimes used to determine the root cause (example: resistance or voltage PIDs).

When viewing of fault PIDs has been carried out, the scan tool can display the PIDs associated with that DTC, including the status or state that exists (on-demand [active] DTC) or existed (continuous memory [historic]) DTC. Refer to the manufacturer instructions for the scan tool being used on how to view fault PIDs.

Prove Out Procedure

Turn the ignition switch from the OFF to the ON position and visually monitor the air bag warning indicator with all supplemental restraint system (SRS) components connected. The instrument cluster (IC) module will illuminate the air bag warning indicator continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will:

- fail to light.
- remain lit continuously.
- flash.

The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the restraints control module (RCM) to complete the testing of the SRS. If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator will need to be repaired before diagnosis can continue.

Diagnostic Test Modes

Two menu options are available under the diagnostic test modes:

- Retrieve/Clear Continuous DTCs
- Self Test/On-Demand

Retrieve/Clear Continuous DTCs

During vehicle operation, the restraints control module (RCM) and occupant classification system module (OCSM) will detect and store both intermittent and hard failure DTCs in non-volatile memory. The DTC strategy employed by the RCM/OCSM incorporates a time-out scheme for determining when a concern exists in the system. This requires a concern to exist for up to one minute in the system before the RCM/OCSM will detect it. For the RCM/OCSM to determine that a concern no longer exists, the concern must be absent for up to one minute. The actual detection time-outs vary with each DTC. The DTCs can be retrieved with a scan tool using the retrieve/clear continuous DTCs option. Any DTCs stored in the RCM/OCSM will be displayed on the scan tool along with a brief description of the DTC. If no DTCs are present, the scan tool will display a SYSTEM PASSED message. This option can also be used to clear DTCs from the RCM/OCSM memory, as long as the concern no longer exists.

Once 128 key cycles have been recorded by the OCSM since the concern was last detected, the DTC will automatically be removed from memory.

Once 75 hours of operation have been recorded by the RCM since the concern was last detected, the DTC will automatically be removed from memory.

To retrieve or clear DTCs, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.

NOTE: **Before proceeding with the clearing operation, make note of the DTCs displayed. Once cleared, DTCs cannot be retrieved.**

4. All continuous DTCs will be displayed on the screen.
5. Clear the DTCs. After clearing the DTCs, cycle the key OFF, then ON.
    - Continuous DTCs that have been cleared will **not** reoccur as "continuous" in the same key cycle. Only new DTCs which were **not** present before clearing can occur as "continuous" after clearing.

Self Test/On-Demand

The on-demand Self Test option is used to verify that no electrical concerns exist with the air bag SRS. Upon entering the self-test, the RCM/OCSM will make an electrical check of each electrical component in the system. If a concern is detected, a DTC is displayed on the scan tool with a brief description of the DTC. The self-test should always be carried out after any repair to verify that the repair was successful.

To run the on-demand Self Test, follow these steps:

1. Connect the scan tool to the data link connector (DLC).
2. Turn the ignition switch to the ON position.
3. Follow the manufacturer's instructions for the scan tool being used.
4. Select Self Test.
5. Select RCM or OCSM (selecting Restraints retrieves DTC's from both modules).
6. The module will run the self-test and display on-demand (reflecting hard system concerns) and continuous memory (historic) DTCs on the scan tool.

Zero Seat Weight Test

The Zero Seat Weight Test verifies the occupant classification sensor (OCS) system measures zero weight for an empty seat. It is necessary to carry out the Zero Seat Weight Test any time the front passenger seat is removed from the vehicle or as directed in the workshop article procedure.

Active Commands

Occupant Classification Sensor (OCS) System Reset

The Occupant Classification Sensor (OCS) System Reset active command sets the zero set point and rezeros the OCS. Refer to **Occupant Classification Sensor**.

Air Bag Reconnect Checklist

The checklist below should be completed following diagnosis or repair of any air bag system concern:

- All in-seat harness connectors connected?
- Occupant classification sensor (OCS) system connected?
- All air bag modules connected?
- Side air curtain modules connected?
- Safety belt pretensioner connectors connected?
- Restraints control module (RCM) connected?
- All sensors (front impact severity sensor, side impact sensor, safety belt tension sensor) connected?
- RCM fuse installed?
- Battery connected?

Air Bag Module Second Stage Deployment Check

Because the driver and passenger front air bags each have 2 deployment stages, it is possible that Stage 1 has deployed and Stage 2 has not.

If a front air bag module has deployed, it is **mandatory** that the front air bag module be remotely deployed using the appropriate air bag disposal procedure to make sure the second stage has been deployed.

- For information on driver or passenger air bag module remote deployment, refer to **Pyrotechnic Device Disposal**.

Glossary

Disconnect the Component

Disconnect the component means to disconnect the component vehicle harness connector, not to remove the component. Do not reconnect a disconnected component unless instructed to do so.

Deactivate the Supplemental Restraint System (SRS)

Deactivate the supplemental restraint system (SRS) means to carry out a deactivation procedure. Refer to **Supplemental Restraint System (SRS) Deactivation and Reactivation**.

Depower the SRS

Depower the SRS means to disconnect the battery and remove the restraints control module (RCM) fuse. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

Deployment Loop

The deployment loop is made up of the RCM, deployable device, air bag(s), safety belt pretensioners (safety canopies/side air curtains, deployable steering columns, load limiting retractor, adaptive tether, adaptive vent, if equipped) and associated circuits.

Install a New Component

Install a new component means to remove the existing component and install a new authorized part obtained from Ford Customer Service Division.

Prove Out the SRS

Prove out the SRS means to turn the ignition switch from the OFF to the ON position and visually monitor the air bag warning indicator with all SRS components connected. The air bag warning indicator will light continuously for approximately 6 seconds and then turn off. If an SRS fault is present, the air bag warning indicator will either fail to light, flash or remain lit continuously. The air bag warning indicator may not illuminate until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator will need to be repaired before diagnosis can continue.

Reactivate the SRS

Reactivate the SRS means to carry out the reactivation procedure. Refer to **Supplemental Restraint System (SRS) Deactivation and Reactivation**.

Reconnect the SRS

Reconnect the SRS means to reconnect all system components. Refer to **Air Bag Reconnect Checklist**.

Repower the SRS

Repower the SRS means, turn the ignition ON, install the RCM fuse and connect the battery ground cable. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

Secondary Air Bag Warning

The secondary air bag warning is an audible fault format that consists of 5 sets of 5 tone bursts, with each set of 5 tone bursts separated by a 5-second quiet period. One tone burst cycle will consist of one-second on and one-second off. This series of 5 activations is repeated every 30 minutes.

Squib

A squib (igniter) is a device designed to convert electrical energy to the heat energy necessary to deploy a pyrotechnic restraints system device.

Verify the SRS

Verify the SRS means to prove out the system with restraint system components in place.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Damaged restraints control module (RCM) or loose mounting • Damaged occupant classification system module (OCSM)/component or loose mounting • Damaged front impact severity sensor(s) or loose mounting • Damaged side impact sensor(s) or loose mounting • Damaged or disconnected passenger air bag deactivation	• Open smart junction box (SJB) fuse 25 (7.5A) • Damaged wiring harness • Loose, damaged or corroded connectors • Circuitry open/shorted • Damaged shorting bars

(PAD) indicator	

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record on-demand and continuous memory DTCs from the restraints control module (RCM) and occupant classification system module (OCSM).
8. If the DTCs retrieved are related to the concern, go to the Supplemental Restraint System (SRS) DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
9. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

Supplemental Restraint System (SRS) DTC Chart

The DTCs can be retrieved from the restraints control module (RCM) and the occupant classification system module (OCSM) with a scan tool via the data link connector (DLC).

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DTC CHART

DTC[a]	Description	Retrieved From	Action To Take
Continuous	The Air Bag Warning Indicator	Restraints control	Go to **Pinpoint Test A**.

Lamp	is Illuminated Continuously	module (RCM)	
B1231	Event Threshold Exceeded (Crash Data Memory Full)	RCM	INSTALL a new RCM, CARRY OUT programmable module installation (PMI) and INSTALL new impact sensors. REFER to **Inspection and Repair After a Supplemental Restraint System (SRS) Deployment** and **Restraints Control Module (RCM)**.
B1231	Event Threshold Exceeded (Crash Data Memory Full)	Occupant classification system module (OCSM)	INSTALL new OCS rails and CLEAR all OCSM and RCM DTCs. REFER to **Occupant Classification Sensor** and **Inspection and Repair After a Supplemental Restraint System (SRS) Deployment**.
B1317	Battery Voltage High	RCM	CHECK battery voltage; to be below 18 volts. REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article.
B1317	Battery Voltage High	OCSM	**NOTE:** **If no on-demand or continuous DTC is present in the RCM and DTC B1317 is only present in the OCSM continuous, CLEAR all OCSM DTCs and PROVE OUT the SRS.** CHECK battery voltage; to be below 18 volts. REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article.
B1318	Battery Voltage Low	RCM	CHECK battery voltage; to be above 8 volts. REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article.
B1318	Battery Voltage Low	OCSM	**NOTE:** **If no on-demand or continuous DTC is present in the RCM and DTC B1318 is only present in the OCSM continuous, CLEAR all OCSM DTCs and PROVE OUT the SRS.** CHECK battery voltage; to be above 8 volts. REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article.
B1342	ECU (RCM) is Faulted	RCM	INSTALL a new RCM and CARRY OUT PMI. REFER to **Restraints**

			Control Module (RCM).
B1342	ECU (OCSM) is Faulted	OCSM	CARRY OUT Occupant Classification Sensor (OCS) System Reset. REFER to **Occupant Classification Sensor (OCS) System Reset**. DO NOT carry out the Zero Seat Weight Test at this time. CLEAR the DTCs and REPEAT the self-test. If the DTC is no longer present, CARRY OUT the Zero Weight Test to complete the repair. If the DTC is still present, INSTALL a new OCSM. REFER to **Occupant Classification System Module (OCSM)**.
B1884	PAD Warning Lamp Circuit Failure	RCM	Go to **Pinpoint Test B**.
B1890	PAD Warning Lamp Circuit Short to Battery	RCM	Go to **Pinpoint Test C**.
B2290	Occupant Classification System Fault	RCM	**NOTE:** **If no on-demand or continuous DTC is present in the OCSM and DTC B2290 is only present in the RCM as a continuous DTC, CLEAR all RCM DTCs and PROVE OUT the SRS.** The OCSM reported a fault message to the RCM. CARRY OUT on-demand self test of the OCSM and RETRIEVE continuous DTCs.
B2290 (Rail Type System)	Occupant Classification System Fault	OCSM	**NOTE:** **If no on-demand or continuous DTC is present in the RCM and DTC B2290 is only present in the OCSM continuous, CLEAR all OCSM DTCs and PROVE OUT the SRS.** Go to **Pinpoint Test D**.
B2292	Restraint System - Safety Belt Pretensioner Fault	RCM	Go to **Pinpoint Test E**.
B2293	Restraint System - Air Bag Fault	RCM	Go to **Pinpoint Test F**.
B2294	Restraint System - Curtain Fault	RCM	Go to **Pinpoint Test G**.

retrieved	fault and air bag warning indicator fault	System (SRS) DTC Chart.
• No communication with the RCM	• Open fuse • Circuitry • Scan tool • DLC • RCM	• REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication concern.
• No communication with the occupant classification system module (OCSM)	• Open fuse • Circuitry • Scan tool • DLC • OCSM	• REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication concern.

Pinpoint Tests

Pinpoint Test A: The Air Bag Warning Indicator is Illuminated Continuously

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

During normal operation, the instrument cluster (IC) module will illuminate the air bag warning indicator continuously for 6 seconds after the ignition switch is placed to the RUN or ON position. If the supplemental restraint system (SRS) is fault free, the air bag warning indicator will turn off and remain off. If a fault is detected in the SRS, the restraints control module (RCM) will communicate to the IC module via the high-speed controller area network (HS-CAN) to illuminate the air bag warning indicator and it will remain illuminated for the rest of the key cycle. The instrument cluster module will illuminate the air bag warning indicator based on messaging from the RCM or if there is no communication between the RCM and IC module.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- IC module
- RCM

PINPOINT TEST A: THE AIR BAG WARNING INDICATOR IS ILLUMINATED CONTINUOUSLY

WARNING: **Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

A1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Were any continuous memory or on-demand DTCs retrieved?**

  YES : If on-demand or continuous memory DTCs were retrieved, go to the **Supplemental Restraint System (SRS) DTC Chart** for diagnostic direction.

  Do not clear any DTCs until all DTCs have been resolved.

  NO : If the RCM **does** communicate with the scan tool, REFER to**INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnose the IC module concern.

  If the RCM **does not** communicate with the scan tool, REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication concern.

  Do not clear any DTCs until all DTCs have been resolved.

Pinpoint Test B: DTC B1884 - PAD Warning Lamp Circuit Failure

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

When the ignition is in the ON position, the passenger air bag deactivation (PAD) indicator prove-out period is initiated by the restraints control module (RCM). The RCM briefly activates the PAD indicator to verify to the occupants correct functional operation of the PAD indicator. Refer to **Passenger Air Bag Deactivation (PAD) Indicator**.

If the RCM detects an open or short to ground on the PAD indicator circuit, it will store DTC B1884 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B1884 PAD Warning Lamp Circuit Failure - If the RCM detects an open circuit or short to ground on the PAD indicator circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAD indicator
- RCM

PINPOINT TEST B: DTC B1884 - PAD WARNING LAMP CIRCUIT FAILURE

WARNING: **Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

B1 CHECK FOR CONTINUOUS OR ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B1884 retrieved?**

  YES : If the PAD indicator **does** illuminate, go to B2.

  If the PAD indicator **does not** illuminate, go to B4.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not

retrieved on demand). The fault condition is not present at this time. Go to B8.

B2 CHECK CIRCUIT CR116 (GN/WH) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: PAD Indicator C2355

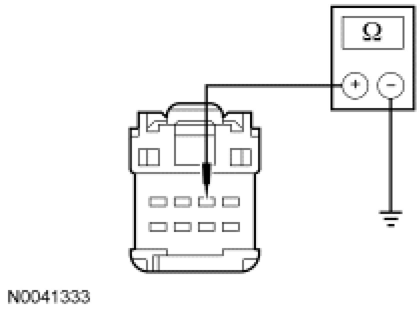

Fig. 3: Checking Circuit CR116 (GN/WH) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between PAD indicator C2355-2, circuit CR116 (GN/WH), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B7.

  NO : Go to B3.

B3 CHECK THE RCM FOR LOW RESISTANCE

- Disconnect: RCM C310a and C310b

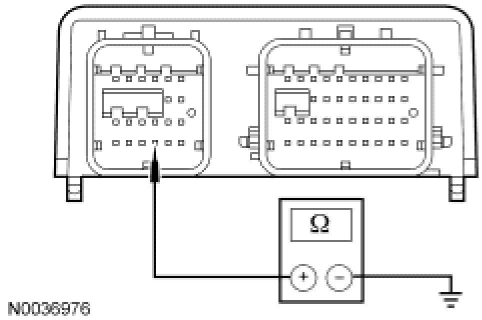

Fig. 4: Checking RCM For Low Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a pin 22, component side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuit CR116 (GN/WH). Go to B9.

  NO : Go to B7.

B4 CHECK CIRCUIT CR116 (GN/WH) FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Disconnect: PAD Indicator C2355

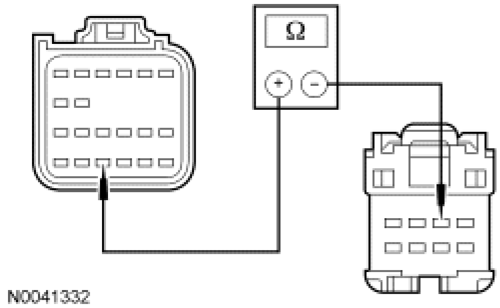

Fig. 5: Checking Circuit CR116 (GN/WH) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between PAD indicator C2355-2, circuit CR116 (GN/WH), harness side and RCM C310a-22, circuit CR116 (GN/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to B5.

  NO : REPAIR circuit CR116 (GN/WH). Go to B9.

B5 CHECK CIRCUIT CBP24 (VT/GN) FOR VOLTAGE

- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

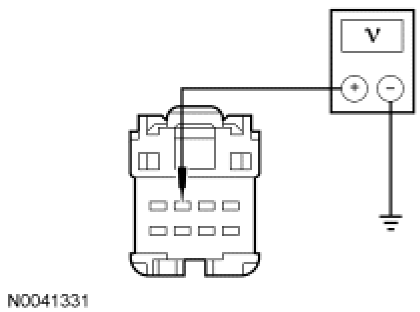

Fig. 6: Checking Circuit CBP24 (VT/GN) For Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between PAD indicator C2355-3, circuit CBP24 (VT/GN), harness side and ground.

- **Is the voltage greater than 10 volts?**

  YES : Go to B6.

  NO : VERIFY smart junction box (SJB) fuse 24 is OK. If OK, REPAIR circuit CBP24 (VT/GN). Go to B9.

B6 CHECK THE PAD INDICATOR LAMP

- Key in OFF position.
- Deactivate the SRS. Refer to **Supplemental Restraint System (SRS) Deactivation and Reactivation**.
- Connect: PAD Indicator C2355
- Key in ON position.

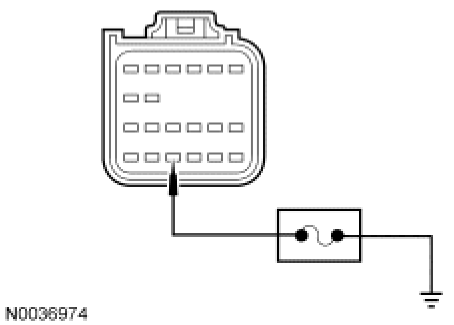

Fig. 7: Checking PAD Indicator Lamp
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between RCM C310a-22, circuit CR116 (GN/WH), harness side and ground.
- **Does the PAD indicator illuminate?**

  YES : Go to B7.

  NO : INSTALL a new PAD indicator. REFER to **Passenger Air Bag Deactivation (PAD) Indicator**. Go to B9.

B7 CONFIRM THE RCM FAULT

NOTE:	**Make sure all restraint system component electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: PAD Indicator C2355 (if disconnected in prior step)
- Connect: RCM C310a and C310b (if disconnected in prior step)
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B1884 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to B9.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to B9.

B8 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B1884 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to B2.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of intermittent open or short to ground on circuit CR116 (GN/WH). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to B9.

B9 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
  - If previously directed to deactivate the SRS, reactivate the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Deactivation and Reactivation**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN

the vehicle to the customer.

Pinpoint Test C: DTC B1890 - PAD Warning Lamp Circuit Short to Battery

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

When the ignition is in the ON position, the passenger air bag deactivation (PAD) indicator prove-out period is initiated by the restraints control module (RCM). The RCM briefly activates the PAD indicator to verify to the occupants correct functional operation of the PAD indicator. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

If the RCM detects a short to voltage on the PAD indicator circuit, it will store DTC B1890 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B1890 PAD Warning Lamp Circuit Short to Battery - If the RCM detects a short to voltage on the PAD indicator circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PAD indicator
- RCM

PINPOINT TEST C: DTC B1890 - PAD WARNING LAMP CIRCUIT SHORT TO BATTERY

WARNING: **Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

C1 CHECK FOR CONTINUOUS OR ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B1890 retrieved?**

  YES : Go to C2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to C4.

C2 CHECK CIRCUIT CR116 (GN/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: PAD Indicator C2355
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

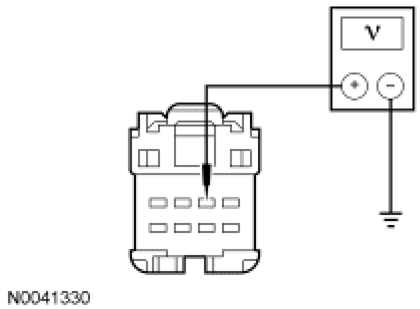

Fig. 8: Checking Circuit CR116 (GN/WH) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between PAD indicator C2355-2, circuit CR116 (GN/WH), harness side and ground.
- **Is any voltage present?**

  YES : Go to C3.

  NO : REPAIR circuit CR116 (GN/WH). Go to C5.

C3 CHECK THE RCM

- Key in OFF position.

- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM

NOTE: **DTC B1884 should be retrieved when carrying out the on-demand self test due to an open on circuit CR116 (GN/WH). DTC B1890 should not be retrieved at this time.**

- **Was RCM on-demand DTC B1890 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to C5.

  NO : INSTALL a new PAD indicator. Go to C5.

C4 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B1890 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to C2.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of intermittent short to voltage on circuit CR116 (GN/WH). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to C5.

C5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test D: DTC B2290 - Occupant Classification System Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

NOTE: DTC B2290, reported by the restraints control module (RCM), is informational only and indicates the presence of a fault in the occupant classification system module (OCSM). Refer to the Supplemental Restraints System (SRS) DTC Chart when DTC B2290 is reported by the RCM for diagnostic instructions.

NOTE: The following pinpoint test must only be used to diagnose DTC B2290 when reported by the OCSM.

Normal Operation

The occupant classification sensor (OCS) system is used to classify the front passenger seat occupant in the event of a deployable impact. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

The OCSM monitors the 2 OCS rails (weight sensors) and circuitry for faults. If the OCSM detects a fault with the sensor(s) or circuitry, it will store DTC B2290 in memory and send a message to the RCM which will store DTC B2290 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

Fault PIDs[a]	Description	Fault Trigger Condition
2290_8_OD and 2290_8_CM	Passenger Seat OCS Sensor No.2 Circuit Short to Battery	When the OCSM senses a short to voltage on either one of sensor 2 circuits, a fault will be indicated.
2290_9_OD and 2290_9_CM	Passenger Seat OCS Sensor No.2 Circuit Short to Ground	When the OCSM senses a short to ground on either one of sensor 1 circuits, a fault will be indicated.
2290_10_OD and 2290_10_CM	Passenger Seat OCS Sensor No.2 Comm. Fault / Open	When the OCSM is unable to communicate with sensor 2 or senses an open circuit, a fault will be indicated.
2290_11_OD and 2290_11_CM	Passenger Seat OCS Sensor No.2 Internal Fault	When the OCSM senses an internal failure with sensor 2, a fault will be indicated.
2290_12_OD and 2290_12_CM	Passenger Seat OCS Sensor	When the OCSM senses a short to voltage on either one of sensor 2

	No.1 Circuit Short to Battery	circuits, a fault will be indicated.
2290_13_OD and 2290_13_CM	Passenger Seat OCS Sensor No.1 Circuit Short to Ground	When the OCSM senses a short to ground on either one of sensor 2 circuits, a fault will be indicated.
2290_14_OD and 2290_14_CM	Passenger Seat OCS Sensor No.1 Comm. Fault/Open	When the OCSM is unable to communicate with sensor 1 or senses an open circuit, a fault will be indicated.
2290_15_OD and 2290_15_CM	Passenger Seat OCS Sensor No.1 Internal Fault	When the OCSM is unable to communicate with sensor 1 or senses an open circuit, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2290. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2290.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- OCS component

PINPOINT TEST D: DTC B2290 - OCCUPANT CLASSIFICATION SYSTEM FAULT

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

D1 CHECK FOR CONTINUOUS OR ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - OCSM - View and Record All B2290 Fault PIDs
  - Refer to PID list in Normal Operation to view B2290 fault PIDs.
- **Do any OCSM on-demand DTC B2290 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to D2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to D14.

D2 CHECK THE SEAT WIRING AND CONNECTORS

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Carry out a thorough visual inspection of the OCS system wiring, terminals and connectors and the related seat wiring harness and body wiring harness terminals and connectors.
- **Were any problems noted?**

  YES : REPAIR the seat connectors and wiring as needed. Go to D15.

  NO : Using the fault PIDs recorded in Step D1, go to the appropriate pinpoint test step.

  For 2290_15_CM (Passenger Seat OCS Sensor No.1 Internal Fault) or 2290_11_CM (Passenger Seat OCS Sensor No.2 Internal Fault), INSTALL a new OCS rail (weight sensor). REFER to **Occupant Classification Sensor**.

  For 2290_14_CM (Passenger Seat OCS Sensor No.1 Comm. Fault/Open), go to D3.

  For 2290_10_CM (Passenger Seat OCS Sensor No.2 Comm. Fault / Open), go to D6.

  For 2290_13_CM (Passenger Seat OCS Sensor No.1 Circuit Short to Ground), go to D9.

  For 2290_9_CM (Passenger Seat OCS Sensor No.2 Circuit Short to Ground), go to D10.

  For 2290_12_CM (Passenger Seat OCS Sensor No.1 Circuit Short to Battery), go to D11.

  For 2290_8_CM (Passenger Seat OCS Sensor No.2 Circuit Short to Battery), go to D12.

D3 CHECK CIRCUITS VR212 (YE/GN) AND RR140 (GN/OG) FOR AN OPEN

- Disconnect: OCSM C3159
- Disconnect: OCS Rail 1 C3294

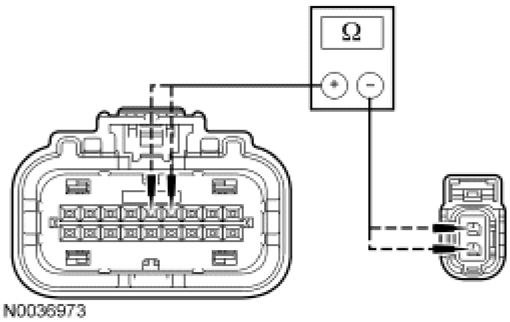

Fig. 9: Checking Circuits VR212 (YE/GN) & RR140 (GN/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCSM C3159-4, circuit VR212 (YE/GN), harness side and OCS rail 1 C3294-2, circuit VR212 (YE/GN), harness side; and between OCSM C3159-5, circuit RR140 (GN/OG), harness side and OCS rail 1 C3294-1, circuit RR140 (GN/OG), harness side.
- **Are the resistances less than 0.5 ohm?**

  YES : Go to D4.

  NO : REPAIR circuit VR212 (YE/GN) or circuit RR140 (GN/OG). Go to D15.

D4 CHECK FOR A SHORT BETWEEN CIRCUITS VR212 (YE/GN) AND RR140 (GN/OG)

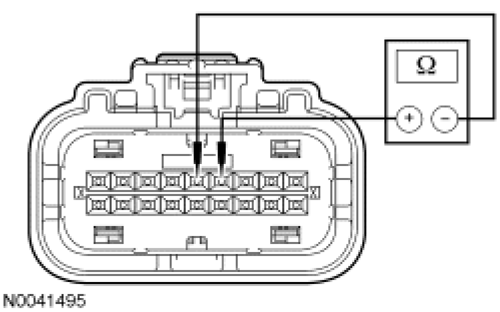

Fig. 10: Checking For A Short Between Circuits VR212 (YE/GN) & RR140 (GN/OG)
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCSM C3159-4, circuit VR212 (YE/GN), harness side and OCSM C3159-5, circuit RR140 (GN/OG), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to D5.

  NO : REPAIR circuits VR212 (YE/GN) and RR140 (GN/OG). Go to D15.

D5 CHECK THE OCS MODULE

- Install a known good OCS rail. Refer to **Occupant Classification Sensor**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Carry out System Reset. Refer to **Occupant Classification Sensor (OCS) System Reset**.
- Key in OFF position.

NOTE: The ignition switch must be cycled after the System Reset.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - OCSM - View and Record All B2290 Fault PIDs
    - Refer to PID list in Normal Operation to view B2290 fault PIDs.
- **Do any OCSM on-demand DTC B2290 fault PIDs indicate a fault?**

  YES : INSTALL a new OCSM. Refer to **Occupant Classification System Module (OCSM)**. Go to D15.

  NO : Fault corrected. Go to D15.

D6 CHECK CIRCUITS VR211 (WH/BN) AND RR141 (VT/BN) FOR AN OPEN

- Disconnect: OCSM C3159
- Disconnect: OCS Sensor 2 C3293

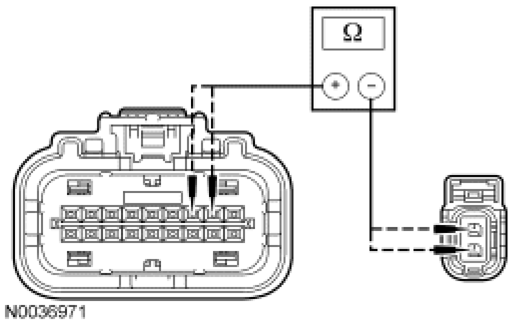

Fig. 11: Checking Circuits VR211 (WH/BN) & RR141 (VT/BN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCSM C3159-2, circuit VR211 (WH/BN), harness side and OCS sensor 2 C3293-2, circuit VR211 (WH/BN), harness side; and between OCSM C3159-3, circuit RR141 (VT/BN), harness side and OCS sensor 2 C3293-1, circuit RR141 (VT/BN), harness side.
- **Are the resistances less than 0.5 ohm?**

  YES : Go to D7.

  NO : REPAIR circuit VR211 (WH/BN) or circuit RR141 (VT/BN). Go to D15.

D7 CHECK FOR A SHORT BETWEEN CIRCUITS VR211 (WH/BN) AND RR141 (VT/BN)

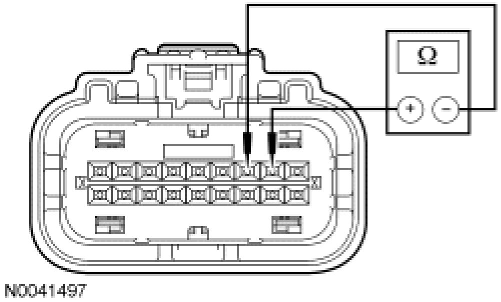

Fig. 12: Checking For A Short Between Circuits VR211 (WH/BN) & RR141 (VT/BN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCSM C3159-2, circuit VR211 (WH/BN), harness side and OCSM C3159-3, circuit RR141 (VT/BN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to D8.

  NO : REPAIR circuits VR211 (WH/BN) and RR141 (VT/BN). Go to D15.

D8 CHECK THE OCS MODULE

- Install a known good OCS rail. Refer to **Occupant Classification Sensor**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Carry out System Reset. Refer to **Occupant Classification Sensor (OCS) System Reset**.
- Key in OFF position.

NOTE: The ignition switch must be cycled after the System Reset.

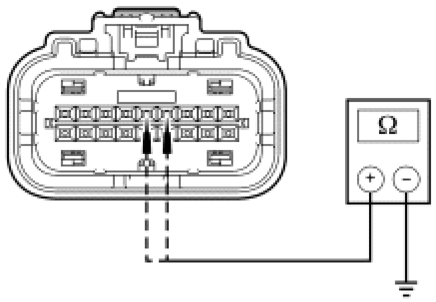
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - OCSM - View and Record All B2290 Fault PIDs
  - Refer to PID list in Normal Operation to view B2290 fault PIDs.
- **Do any OCSM on-demand DTC B2290 fault PIDs indicate a fault?**

  YES : INSTALL a new OCSM. Refer to **Occupant Classification System Module (OCSM)**. Go to D15.

  NO : Fault corrected. Go to D15.

D9 CHECK CIRCUITS VR212 (YE/GN) AND RR140 (GN/OG) FOR A SHORT TO GROUND

- Disconnect: OCSM C3159



N0036972

Fig. 13: Checking Circuits VR212 (YE/GN) & RR140 (GN/OG) For A Short To Ground
Courtesy of FORD MOTOR CO.

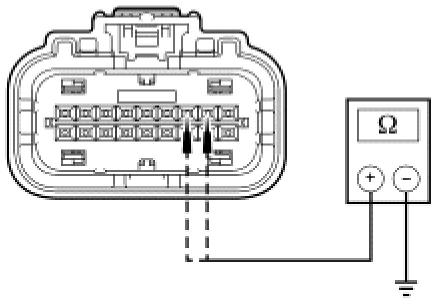
- Measure the resistance between OCSM C3159-4, circuit VR212 (YE/GN), harness side and ground; and between OCSM C3159-5, circuit RR140 (GN/OG), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to D13.

  NO : REPAIR circuit VR212 (YE/GN) or circuit RR140 (GN/OG). Go to D15.

D10 CHECK CIRCUITS VR211 (WH/BN) AND RR141 (VT/BN) FOR A SHORT TO GROUND

- Disconnect: OCSM C3159



N0036970

Fig. 14: Checking Circuits VR211 (WH/BN) & RR141 (VT/BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between OCSM C3159-2, circuit VR211 (WH/BN), harness side and ground; and between OCSM C3159-3, circuit RR141 (VT/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to D13.

  NO : REPAIR circuit VR211 (WH/BN) or circuit RR141 (VT/BN). Go to D15.

D11 CHECK CIRCUITS VR212 (YE/GN) AND RR140 (GN/OG) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Side Air Bag Module C313
- Disconnect: OCSM C3159
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Key in ON position.

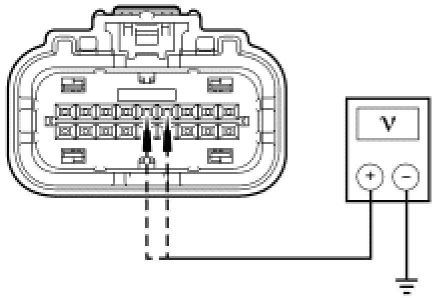


Fig. 15: Checking Circuits VR212 (YE/GN) & RR140 (GN/OG) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - OCSM C3159-4, circuit VR212 (YE/GN), harness side and ground.
  - OCSM C3159-5, circuit RR140 (GN/OG), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : REPAIR circuit VR212 (YE/GN) or circuit RR140 (GN/OG). Go to D15.

  NO : Go to D13.

D12 CHECK CIRCUITS VR211 (WH/BN) AND RR141 (VT/BN) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Side Air Bag Module C313
- Disconnect: OCSM C3159
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

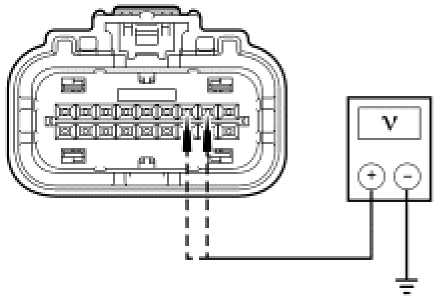

Fig. 16: Checking Circuits VR211 (WH/BN) & RR141 (VT/BN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - OCSM C3159-2, circuit VR211 (WH/BN), harness side and ground.
  - OCSM C3159-3, circuit RR141 (VT/BN), harness side and ground.

- **Is any voltage present on either circuit?**

  YES : REPAIR circuit VR211 (WH/BN) or circuit RR141 (VT/BN). Go to D15.

  NO : Go to D13.

D13 CHECK THE OCS

NOTE: Make sure all restraint system component electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Install a new OCS rail. Refer to **Occupant Classification Sensor**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Carry out System Reset. Refer to **Occupant Classification Sensor (OCS) System Reset**.
- Key in OFF position.

NOTE: The ignition switch must be cycled after the System Reset.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - OCSM - View and Record All B2290 Fault PIDs
  - Refer to PID list in Normal Operation to view B2290 fault PIDs.
- **Do any OCSM on-demand DTC B2290 fault PIDs indicate a fault?**

  YES : INSTALL a new OCSM. REFER to **Occupant Classification System Module (OCSM)**. Go to D15.

  NO : Fault corrected. Go to D15.

D14 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Seat Side Air Bag Module C313
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - OCSM - View and Record All B2290 Fault PIDs
  - Refer to PID list in Normal Operation to view B2290 fault PIDs.

- **Do any OCSM on-demand DTC B2290 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Go to D2.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to D15.

D15 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test E: DTC B2292 - Restraint System - Seatbelt Pretensioner Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) continuously monitors the safety belt retractor pretensioner circuits for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2292 in memory if any of these conditions are detected to be outside of their respectful range. If the RCM detects a fault, it will send a message to the instrument cluster (IC) module to illuminate the air bag

warning indicator.

As the RCM continuously monitors safety belt retractor pretensioner circuits for resistance, it expects a normal resistance between 1.31 and 4.29 ohms.

If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

Fault PIDs[a]	Description	Fault Trigger Condition
2292_24_OD and 2292_24_CM	Pretensioner Circuit Short to Ground, Front Passenger Side	When the RCM senses a short to ground on either of the passenger pretensioner circuits, a fault will be indicated.
2292_25_OD and 2292_25_CM	Pretensioner Circuit Short to Battery, Front Passenger Side	When the RCM senses a short to voltage on either of the passenger pretensioner circuits, a fault will be indicated.
2292_26_OD and 2292_26_CM	Pretensioner Circuit Open, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger pretensioner circuits, a fault will be indicated.
2292_27_OD and 2292_27_CM	Pretensioner Circuit Resistance Low, Front Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger pretensioner circuits, a fault will be indicated.
2292_28_OD and 2292_28_CM	Pretensioner Circuit Short to Ground, Front Driver Side	When the RCM senses a short to ground on either of the driver pretensioner circuits, a fault will be indicated.
2292_29_OD and 2292_29_CM	Pretensioner Circuit Short to Battery, Front Driver Side	When the RCM senses a short to voltage on either of the driver pretensioner circuits, a fault will be indicated.
2292_30_OD and 2292_30_CM	Pretensioner Circuit Open, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver pretensioner circuits, a fault will be indicated.
2292_31_OD and 2292_31_CM	Pretensioner Circuit Resistance Low, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver pretensioner

		circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2292. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous memory DTC B2292.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Safety belt retractor pretensioner
- RCM

PINPOINT TEST E: DTC B2292 - RESTRAINT SYSTEM - SEATBELT PRETENSIONER FAULT

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

E1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2292 Fault PIDs

  - Refer to PID list in Normal Operation to view B2292 fault PIDs.
- **Do any RCM on-demand DTC B2292 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2292_31_OD (Pretensioner Circuit Resistance Low, Front Driver Side), go to E2.

  For 2292_30_OD (Pretensioner Circuit Open, Front Driver Side), go to E2.

  For 2292_28_OD (Pretensioner Circuit Short to Ground, Front Driver Side), go to E9.

  For 2292_29_OD (Pretensioner Circuit Short to Battery, Front Driver Side), go to E11.

  For 2292_27_OD (Pretensioner Circuit Resistance Low, Front Passenger Side), go to E12.

  For 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side), go to E12.

  For 2292_24_OD (Pretensioner Circuit Short to Ground, Front Passenger Side), go to E19.

  For 2292_25_OD (Pretensioner Circuit Short to Battery, Front Passenger Side), go to E21.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2292_31_CM (Pretensioner Circuit Resistance Low, Front Driver Side), 2292_27_CM (Pretensioner Circuit Resistance Low, Front Passenger Side), 2292_30_CM (Pretensioner Circuit Open, Front Driver Side) and 2292_26_CM (Pretensioner Circuit Open, Front Passenger Side), go to E24.

  For 2292_28_CM (Pretensioner Circuit Short to Ground, Front Driver Side) and 2292_24_CM (Pretensioner Circuit Short to Ground, Front Passenger Side), go to E26.

  For 2292_29_CM (Pretensioner Circuit Short to Battery, Front Driver Side) and 2292_25_CM (Pretensioner Circuit Short to Battery, Front Passenger Side), go to E27.

E2 CHECK THE DRIVER SAFETY BELT PRETENSIONER RESISTANCE PID (DR_PTENS)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- Enter the following diagnostic mode on the diagnostic tool: DR_PTENS (Pretensioner Circuit Resistance, Driver side) Resistance PID
- **Does the resistance PID value read between 1.31 and 4.29 ohms?**

  YES : Go to E23.

NO : Go to E3.

E3 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER RESISTANCE PID (DR_PTENS) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the DR_PTENS (Pretensioner Circuit Resistance, Driver side) resistance PID while carrying out a harness test of the driver safety belt retractor pretensioner circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out a harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to E28.

  NO : If the driver safety belt retractor pretensioner resistance PID is less than 1.31 ohms, go to E4.

  If the driver safety belt retractor pretensioner resistance PID is greater than 4.29 ohms, go to E6.

E4 CHECK DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT FAULT PIDs (2292_31_OD) AND (2292_30_OD) FOR LOW RESISTANCE AND OPEN

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2292_30_OD (Pretensioner Circuit Open, Front Driver Side)
  - 2292_31_OD (Pretensioner Circuit Resistance Low, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner disconnected, an open circuit fault would normally be retrieved.
- **Did the driver safety belt retractor pretensioner on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to E22.

  NO : Go to E5.

E5 CHECK FOR A SHORT BETWEEN DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS CR120 (BU/OG) AND RR120 (BN/GN)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

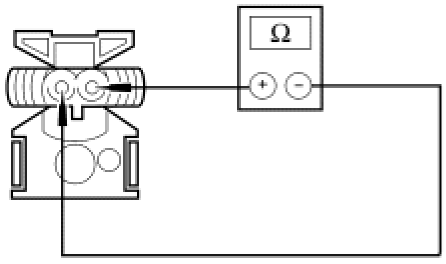

Fig. 17: Checking For A Short Between Driver Safety Belt Retractor Pretensioner Circuits CR120 (BU/OG) & RR120 (BN/GN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver safety belt retractor pretensioner C323-1, circuit CR120 (BU/OG), harness side and C323-2, circuit RR120 (BN/GN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to E23.

  NO : REPAIR circuits CR120 (BU/OG) and RR120 (BN/GN). Go to E28.

E6 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT FAULT PIDs (2292_30_OD) AND (2292_31_OD) FOR AN OPEN AND LOW RESISTANCE

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Connect a jumper wire between driver safety belt pretensioner C3201-1, circuit CR120 (BU/OG), harness side and C3201-2, circuit RR120 (BN/GN), harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2292_30_OD (Pretensioner Circuit Open, Front Driver Side)
  - 2292_31_OD (Pretensioner Circuit Resistance Low, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner circuits shorted together, a low resistance fault would normally be retrieved.
- **Did the driver safety belt retractor pretensioner on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to E22.

  NO : Go to E7.

E7 CHECK CIRCUIT CR120 (BU/OG) FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the jumper wire from the driver safety belt retractor pretensioner C323.
- Disconnect: RCM C310a and C310b

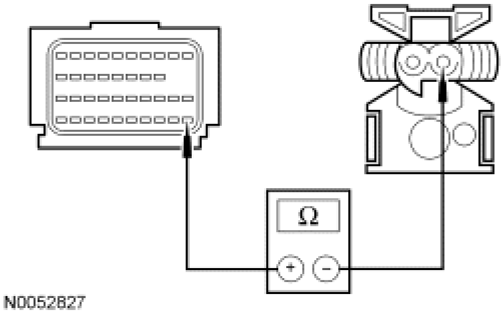

Fig. 18: Checking Circuit CR120 (BU/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-31, circuit CR120 (BU/OG), harness side and driver safety belt retractor pretensioner C323-1, circuit CR120 (BU/OG), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to E8.

  NO : REPAIR circuit CR120 (BU/OG). Go to E28.

E8 CHECK CIRCUIT RR120 (BN/GN) FOR AN OPEN

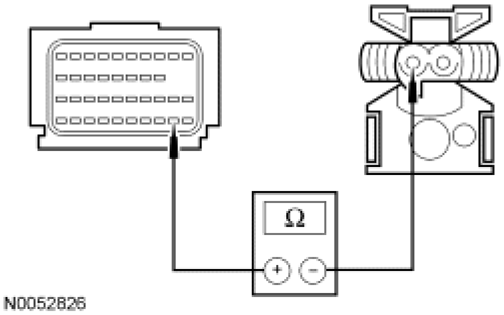

Fig. 19: Checking Circuit RR120 (BN/GN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-32, circuit RR120 (BN/GN), harness side and driver safety belt retractor pretensioner C323-2, circuit RR120 (BN/GN), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to E23.

  NO : REPAIR circuit RR120 (BN/GN). Go to E28.

E9 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT FAULT PIDs (2292_28_OD) AND (2292_30_OD) FOR A SHORT TO GROUND AND OPEN

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2292_28_OD (Pretensioner Circuit Short to Ground, Front Driver Side)
  - 2292_30_OD (Pretensioner Circuit Open, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the driver pretensioner disconnected, an open circuit fault would normally be retrieved.
- **Did the driver safety belt retractor pretensioner on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to E22.

NO : Go to E10.

E10 CHECK CIRCUITS CR120 (BU/OG) AND RR120 (BN/GN) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

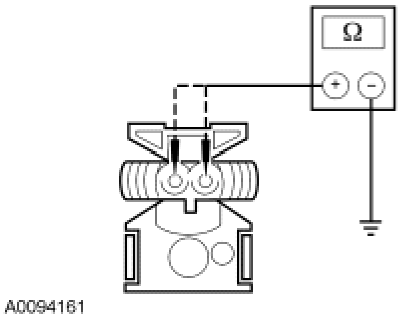

Fig. 20: Checking Circuits CR120 (BU/OG) & RR120 (BN/GN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver safety belt retractor pretensioner C323-1, circuit CR120 (BU/OG), harness side and ground; and between driver safety belt retractor pretensioner C323-2, circuit RR120 (BN/GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to E23.

  NO : REPAIR circuit CR120 (BU/OG) or circuit RR120 (BN/GN). Go to E28.

E11 CHECK CIRCUITS CR120 (BU/OG) AND RR120 (BN/GN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Side Air Bag Module C328
- Disconnect: Driver Safety Belt Retractor Pretensioner C323
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

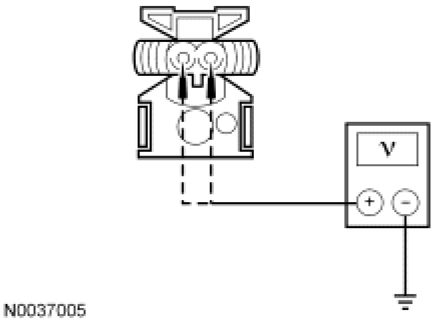

Fig. 21: Checking Circuits CR120 (BU/OG) & RR120 (BN/GN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - driver safety belt retractor pretensioner C323-1, circuit CR120 (BU/OG), harness side and ground.
  - driver safety belt retractor pretensioner C323-2, circuit RR120 (BN/GN), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : REPAIR circuit CR120 (BU/OG) or circuit RR120 (BN/GN). Go to E28.

  NO : Go to E23.

E12 CHECK THE PASSENGER SAFETY BELT PRETENSIONER RESISTANCE PID (PS_PTENS)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- Enter the following diagnostic mode on the diagnostic tool: PS_PTENS (Passenger Retractor Circuit Resistance) Resistance PID
- **Does the resistance PID value read between 1.31 and 4.29 ohms?**

  YES : Go to E23.

  NO : Go to E13.

E13 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER RESISTANCE PID (PS_PTENS) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the PS_PTENS (Passenger Retractor Circuit Resistance) resistance PID while carrying out a harness test of the passenger safety belt retractor pretensioner circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to E28.

  NO : If the passenger safety belt retractor pretensioner resistance PID is less than 1.31 ohms, go to E14.

  If the passenger safety belt retractor pretensioner resistance PID is greater than 4.29 ohms, go to

E16.

E14 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT FAULT PIDs (2292_26_OD) AND (2292_27_OD) FOR AN OPEN AND LOW RESISTANCE

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Retractor Pretensioner C3202
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side)
  - 2292_27_OD (Pretensioner Circuit Resistance Low, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger safety belt retractor pretensioner on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to E22.

  NO : Go to E15.

E15 CHECK FOR A SHORT BETWEEN THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER CIRCUITS RR121 (VT) AND CR121 (GY/VT)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

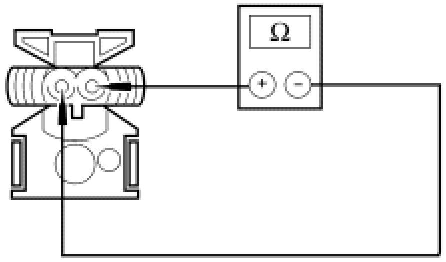

Fig. 22: Checking For A Short Between Passenger Safety Belt Retractor Pretensioner Circuits RR121 (VT) & CR121 (GY/VT)
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger safety belt retractor pretensioner C3202-1, circuit CR121 (GY/VT), harness side and C3202-2, circuit RR121 (VT), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to E23.

  NO : REPAIR circuits CR121 (GY/VT) and RR121 (VT). Go to E28.

E16 CHECK THE PASSENGER SAFETY BELT PRETENSIONER CIRCUIT FAULT PIDs (2292_26_OD) AND (2292_27_OD) FOR AN OPEN AND LOW RESISTANCE

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Retractor Pretensioner C3202
- Connect a jumper wire between passenger safety belt pretensioner C3202-1, circuit CR121 (GY/VT), harness side and C3202-2, circuit RR121 (VT), harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side)
  - 2292_27_OD (Pretensioner Circuit Resistance Low, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner circuits shorted together, a low resistance fault would normally be retrieved.

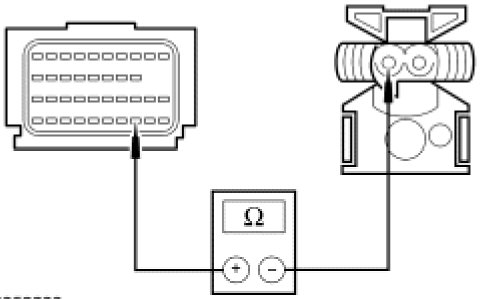
- **Did the passenger safety belt retractor pretensioner on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to E22.

  NO : Go to E17.

E17 CHECK CIRCUIT RR121 (VT) FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the jumper wire from passenger safety belt retractor pretensioner C3202.
- Disconnect: RCM C310a and C310b



N0052830

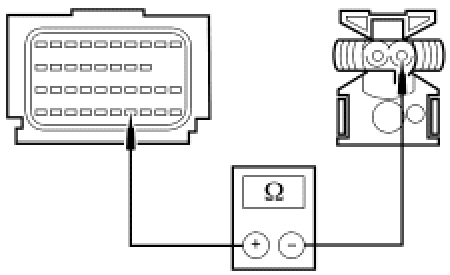
Fig. 23: Checking Circuit RR121 (VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-33, circuit RR121 (VT), harness side and passenger safety belt retractor pretensioner C3202-2, circuit RR121 (VT), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to E18.

  NO : REPAIR circuit RR121 (VT). Go to E28.

E18 CHECK CIRCUIT CR121 (GY/VT) FOR AN OPEN



A0090081

Fig. 24: Checking Circuit CR121 (GY/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-34, circuit CR121 (GY/VT), harness side and

passenger safety belt retractor pretensioner C3202-1, circuit CR121 (GY/VT), harness side.

- **Is the resistance less than 0.5 ohm?**

  YES : Go to E23.

  NO : REPAIR circuit CR121 (GY/VT). Go to E28.

E19 CHECK THE PASSENGER SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT FAULT PIDs (2292_24_OD) AND (2292_26_OD) FOR A SHORT TO GROUND AND OPEN

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Retractor Pretensioner C3202
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2292_24_OD (Pretensioner Circuit Short to Ground, Front Passenger Side)
  - 2292_26_OD (Pretensioner Circuit Open, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2292 on-demand fault PIDs with the passenger pretensioner disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger safety belt retractor pretensioner on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to E22.

  NO : Go to E20.

E20 CHECK CIRCUITS RR121 (VT) AND CR121 (GY/VT) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

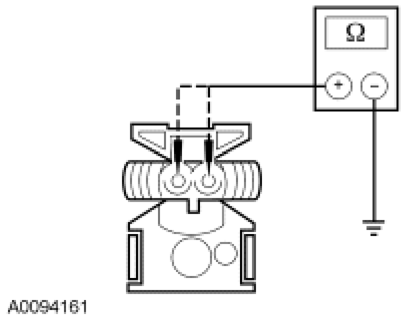


Fig. 25: Checking Circuits RR121 (VT) & CR121 (GY/VT) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger safety belt retractor pretensioner C3202-2, circuit RR121 (VT), harness side and ground; and between passenger safety belt retractor pretensioner C3202-1, circuit CR121 (GY/VT), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to E23.

  NO : REPAIR circuit RR121 (VT) or circuit CR121 (GY/VT). Go to E28.

E21 CHECK CIRCUITS RR121 (VT) AND CR121 (GY/VT) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Side Air Bag Module C314
- Disconnect: Passenger Safety Belt Retractor Pretensioner C3202
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

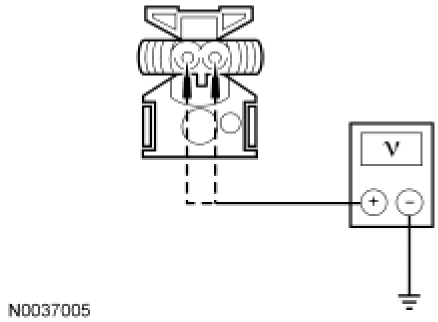

Fig. 26: Checking Circuits RR121 (VT) & CR121 (GY/VT) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - passenger safety belt retractor pretensioner C3202-2, circuit RR121 (VT), harness side and

ground.
- passenger safety belt retractor pretensioner C3202-1, circuit CR121 (GY/VT), harness side and ground.

- **Is any voltage present on either circuit?**

  YES : REPAIR circuit RR121 (VT) or circuit CR121 (GY/VT). Go to E28.

  NO : Go to E23.

E22 CONFIRM THE SAFETY BELT RETRACTOR PRETENSIONER FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Affected Safety Belt Retractor Pretensioner C323 (Driver) C3202 (Passenger)
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2292 Fault PIDs
  - Refer to PID list in Normal Operation to view B2292 fault PIDs.
- **Does the original RCM on-demand DTC B2292 fault PID indicate a fault?**

  YES : INSTALL a new driver or passenger safety belt retractor pretensioner. REFER to **SAFETY BELT SYSTEM** article. Go to E28.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected.

  For 2292_31_CM (Pretensioner Circuit Resistance Low, Front Driver Side), 2292_27_CM (Pretensioner Circuit Resistance Low, Front Passenger Side), 2292_30_CM (Pretensioner Circuit Open, Front Driver Side) and 2292_26_CM (Pretensioner Circuit Open, Front Passenger Side), go to E24.

  For 2292_28_CM (Pretensioner Circuit Short to Ground, Front Driver Side) and 2292_24_CM (Pretensioner Circuit Short to Ground, Front Passenger Side), go to E26.

  For 2292_29_CM (Pretensioner Circuit Short to Battery, Front Driver Side) and 2292_25_CM (Pretensioner Circuit Short to Battery, Front Passenger Side), go to E27.

E23 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: All Restraint System Components (if previously disconnected)
- Connect: RCM C310a and C310b (if previously disconnected)
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2292 Fault PIDs
  - Refer to PID list in Normal Operation to view B2292 fault PIDs.
- **Does the original RCM on-demand DTC B2292 fault PID indicate a fault?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to E28.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected.

  For 2292_31_CM (Pretensioner Circuit Resistance Low, Front Driver Side), 2292_27_CM (Pretensioner Circuit Resistance Low, Front Passenger Side), 2292_30_CM (Pretensioner Circuit Open, Front Driver Side) and 2292_26_CM (Pretensioner Circuit Open, Front Passenger Side), go to E24.

  For 2292_28_CM (Pretensioner Circuit Short to Ground, Front Driver Side) and 2292_24_CM (Pretensioner Circuit Short to Ground, Front Passenger Side), go to E26.

  For 2292_29_CM (Pretensioner Circuit Short to Battery, Front Driver Side) and 2292_25_CM (Pretensioner Circuit Short to Battery, Front Passenger Side), go to E27.

E24 CHECK SAFETY BELT RETRACTOR PRETENSIONER RESISTANCE PIDs FOR AN INTERMITTENT LOW RESISTANCE OR OPEN

- If the fault PID was reported for the driver safety belt retractor pretensioner, monitor the DR_PTENS (Pretensioner Circuit Resistance, Driver side) resistance PID.
- If the fault PID was reported for the passenger safety belt retractor pretensioner, monitor the PS_PTENS (Passenger Retractor Circuit Resistance) pretensioner resistance PID.

NOTE: A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5.0 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make

sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.

- Attempt to recreate the fault by wiggling the connectors (including any inline connectors) and flexing the wire harness.
- **Does any safety belt retractor pretensioner resistance PID indicate less than 1.31 ohms or greater than 4.29 ohms?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to E28.

  NO : Go to E25.

E25 CHECK THE HARNESS AND CONNECTORS

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect the affected safety belt retractor pretensioner C323 (driver) or C3202 (passenger):
  - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - inspect wire harness for any damage, pinched, cut or pierced wires.
- **Were any concerns found?**

  YES : REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to E28.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to E28.

E26 CHECK SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT FAULT PIDs FOR AN INTERMITTENT SHORT TO GROUND

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- If the fault PID was reported for the driver safety belt retractor pretensioner, monitor the 2292_28_OD (Pretensioner Circuit Short to Ground, Front Driver Side) on-demand fault PID on the scan tool.
- If the fault PID was reported for the passenger safety belt retractor pretensioner, monitor the 2292_24_OD (Pretensioner Circuit Short to Ground, Front Passenger Side) on-demand fault PID on the scan tool.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds

for the scan tool display to update.

- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any safety belt retractor pretensioner on-demand fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to E28.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to E28.

E27 CHECK SAFETY BELT PRETENSIONER CIRCUIT FAULT PIDs FOR AN INTERMITTENT SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect the side air bag module electrical connector C328 (driver) or C3252 (passenger) on the side with the affected pretensioner.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- If the fault PID was reported for the driver safety belt retractor pretensioner, monitor the 2292_29_OD (Pretensioner Circuit Short to Battery, Front Driver Side) on-demand fault PID.
- If the fault PID was reported for the passenger safety belt retractor pretensioner, monitor the 2292_25_OD (Pretensioner Circuit Short to Battery, Front Passenger Side) on-demand fault PID.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.
- Attempt to recreate the fault by wiggling the connectors (including any inline connectors) and flexing the wire harness.
- **Does the safety belt retractor pretensioner short to battery on-demand fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to E28.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire

harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to E28.

E28 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test F: DTC B2293 - Restraint System - Air Bag Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) continuously monitors all front air bag module circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2293 in memory if any of these conditions are detected to be outside of their respectful range. If the RCM detects a fault on any of the front air bag circuits, it will store DTC B2293 in memory and send a message to the instrument cluster module to illuminate the air bag warning indicator.

As the RCM continuously monitors all front air bag module circuits for resistance, it expects a normal resistance for the driver and passenger air bag modules loop 1 and 2, between 1.31 to 4.29 ohms.

If a loop resistance for the driver and/or passenger air bag loop 1 and/or 2 is between 0.9 and 1.31 or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

Fault PIDs[a]	Description	Fault Trigger Condition

2293_16_OD and 2293_16_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger air bag loop circuits, a fault will be indicated.
2293_17_OD and 2293_17_CM	Air Bag Circuit Open - Loop No. 2, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger air bag loop circuits, a fault will be indicated.
2293_18_OD and 2293_18_CM	Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side	When the RCM senses a short to voltage on either of the passenger air bag loop circuits, a fault will be indicated.
2293_19_OD and 2293_19_CM	Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side	When the RCM senses a short to ground on either of the passenger air bag loop circuits, a fault will be indicated.
2293_20_OD and 2293_20_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver air bag loop circuits, a fault will be indicated.
2293_21_OD and 2293_21_CM	Air Bag Circuit Open - Loop No. 2, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver air bag loop circuits, a fault will be indicated.
2293_22_OD and 2293_22_CM	Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side	When the RCM senses a short to voltage on either of the driver air bag loop circuits, a fault will be indicated.
2293_23_OD and 2293_23_CM	Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side	When the RCM senses a short to ground on either of the driver air bag loop circuits, a fault will be indicated.
2293_24_OD and 2293_24_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger air bag loop circuits, a fault will be indicated.
2293_25_OD and 2293_25_CM	Air Bag Circuit Open - Loop No. 1, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger air bag

		loop circuits, a fault will be indicated.
2293_26_OD and 2293_26_CM	Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side	When the RCM senses a short to voltage on either of the passenger air bag loop circuits, a fault will be indicated.
2293_27_OD and 2293_27_CM	Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side	When the RCM senses a short to ground on either of the passenger air bag loop circuits, a fault will be indicated.
2293_28_OD and 2293_28_CM	Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver air bag loop circuits, a fault will be indicated.
2293_29_OD and 2293_29_CM	Air Bag Circuit Open - Loop No. 1, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver air bag loop circuits, a fault will be indicated.
2293_30_OD and 2293_30_CM	Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side	When the RCM senses a short to voltage on either of the driver air bag loop circuits, a fault will be indicated.
2293_31_OD and 2293_31_CM	Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side	When the RCM senses a short to ground on either of the driver air bag loop circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2293. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2293.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Clockspring
- Driver air bag module
- RCM

PINPOINT TEST F: DTC B2293 - RESTRAINT SYSTEM - AIR BAG FAULT

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the**

accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

F1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2293 Fault PIDs
  - Refer to PID list in Normal Operation to view B2293 fault PIDs.
- **Do any RCM on-demand DTC B2293 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side), go to F2.

  For 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side), go to F2.

  For (2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side), go to F10.

  For driver air bag module loop 1 with a short to battery fault (2293_30_OD), go to F13.

  For 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), go to F15.

  For 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side), go to F15.

  For 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), go to F23.

For 2293_22_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side), go to F26.

For 2293_24_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side), go to F28.

For 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side), go to F28.

For 2293_27_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side), go to F34.

For 2293_26_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side), go to F36.

For 2293_16_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side), go to F37.

For 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side), go to F37.

For 2293_19_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side), go to F43.

For 2293_18_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side), go to F45.

NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time.

Using the fault PIDs recorded, go to the appropriate pinpoint test step.

For 2293_28_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) or 2293_20_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), go to F50.

For 2293_29_CM (Air Bag Circuit Open - Loop No. 1, Front Driver Side) or 2293_21_CM (Air Bag Circuit Open - Loop No. 2, Front Driver Side), go to F50.

For 2293_31_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) or 2293_23_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), go to F51.

For 2293_30_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) or 2293_22_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side), go to F53.

For 2293_24_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side) or 2293_16_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side), go to F50.

For 2293_25_CM (Air Bag Circuit Open - Loop No. 1, Front Passenger Side) or 2293_17_CM (Air Bag Circuit Open - Loop No. 2, Front Passenger Side), go to F50.

For 2293_27_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side) or 2293_19_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side), go to F52.

For 2293_26_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side) or 2293_18_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side), go to F54.

F2 CHECK THE DRIVER AIR BAG MODULE LOOP 1 RESISTANCE PID (D_ABAGR)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- Enter the following diagnostic mode on the diagnostic tool: D_ABAGR (Driver Air Bag) Resistance PID
- **Does the resistance PID value read between 1.31 and 4.29 ohms?**

  YES : Go to F49.

  NO : Go to F3.

F3 CHECK THE DRIVER AIR BAG MODULE LOOP 1 RESISTANCE PID (D_ABAGR) WHILE CARRYING OUT A HARNESS TEST

NOTE: Do not remove the driver air bag module from its mounted position at this time.

- With the driver air bag in its mounted position, continue monitoring the D_ABAGR (Driver Air Bag) resistance PID while carrying out a harness test of the driver air bag circuits and accessible connectors (including any inline connectors) by wiggling and flexing the wire harness, connectors, tilting and rotating the steering wheel frequently.
- **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. REFER to **Clockspring**. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to F56.

  NO : If the driver air bag module loop 1 resistance PID is less than 1.31 ohms, go to F4.

  If the driver air bag module loop 1 resistance PID is greater than 4.29 ohms, go to F7.

F4 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUIT FAULT PIDs (2293_28_OD) AND (2293_29_OD) LOW RESISTANCE AND OPEN

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint**

System (SRS) Depowering and Repowering.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side)
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to F46.

  NO : Go to F5.

F5 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUIT FAULT PIDS (2293_28_OD) AND (2293_29_OD) FOR LOW RESISTANCE AND OPEN (DRIVER AIR BAG REMOVED)

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Clockspring C218a
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side)
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to F48.

  NO : Go to F6.

F6 CHECK THE RCM FOR LOW RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

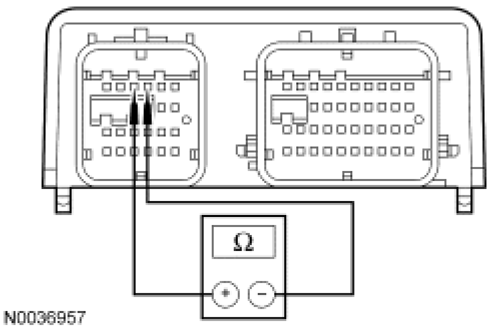

Fig. 27: Checking RCM For Low Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a pin 3 and C310a pin 4, component side.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR101 (VT/BN) and RR101 (YE/GN). Go to F56.

  NO : Go to F49.

F7 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUIT FAULT PIDs (2293_29_OD) AND (2293_28_OD) FOR AN OPEN AND LOW RESISTANCE

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Connect a jumper wire between driver air bag module loop 1 electrical connector pin-1, harness side and pin-2, harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side)

    - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved on loop 1. Loop 2 will show an open circuit fault due to the driver air bag being disconnected.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a open circuit to a low resistance fault?**

  YES : Go to F46.

  NO : Go to F8.

F8 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUIT FAULT PIDs (2293_29_OD) AND (2293_28_OD) FOR AN OPEN AND LOW RESISTANCE (CLOCKSPRING DISCONNECTED)

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the jumper wire from driver air bag module loop 1 electrical connector.
- Disconnect: Clockspring C218a
- Connect a jumper wire between clockspring C218a-1, circuit CR101 (VT/BN), harness side and clockspring C218a-9, circuit RR101 (YE/GN), harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
    - 2293_28_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side)
    - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved on loop 1. Loop 2 will show an open circuit fault due to the driver air bag being disconnected.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a open circuit to a low resistance fault?**

  YES : Go to F48.

  NO : Go to F9.

F9 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUITS CR101 (VT/BN) AND RR101 (YE/GN) FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM

- Key in OFF position.

- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the jumper wire from the clockspring connector.
- Disconnect: RCM C310a and C310b

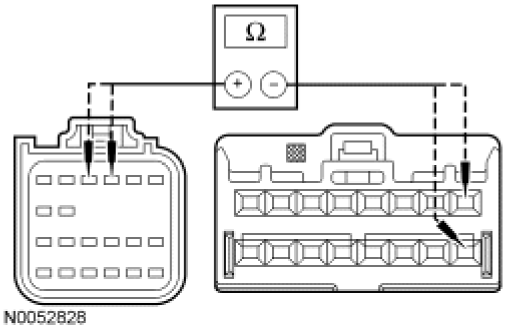

Fig. 28: Checking Driver Air Bag Module Loop 1 Circuits CR101 (VT/BN) & RR101 (YE/GN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a-4, circuit CR101 (VT/BN), harness side and clockspring C218a-1, circuit CR101 (VT/BN), harness side; and between RCM C310a-3, circuit RR101 (YE/GN), harness side and clockspring C218a-9, circuit RR101 (YE/GN), harness side.
- **Are the resistances less than 0.5 ohm?**

  YES : Go to F49.

  NO : REPAIR circuit CR101 (VT/BN) or circuit RR101 (YE/GN). Go to F56.

F10 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUIT FAULT PIDs (2293_31_OD) AND (2293_29_OD) FOR A SHORT TO GROUND AND OPEN

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)

  - 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to F46.

  NO : Go to F11.

F11 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUIT FAULT PIDs (2293_31_OD) AND (2293_29_OD) FOR A SHORT TO GROUND AND OPEN (CLOCKSPRING DISCONNECTED)

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Clockspring C218a
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)
  - 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to F48.

  NO : Go to F12.

F12 CHECK CIRCUITS CR101 (VT/BN) AND RR101 (YE/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND CLOCKSPRING

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

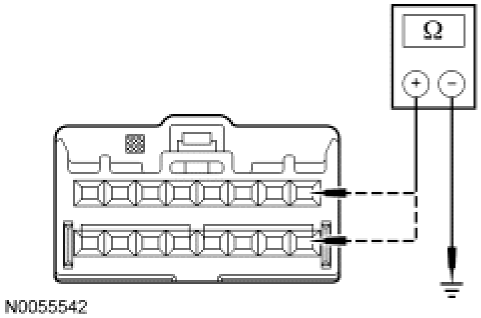

Fig. 29: Checking Circuits CR101 (VT/BN) & RR101 (YE/GN) For A Short To Ground Between RCM & Clockspring
Courtesy of FORD MOTOR CO.

- Measure the resistance between clockspring C218a-1, circuit CR101 (VT/BN), harness side and ground; and between clockspring C218a-9, circuit RR101 (YE/GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to F49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR101 (VT/BN) or circuit RR101 (YE/GN). Go to F56.

F13 CHECK THE DRIVER AIR BAG MODULE LOOP 1 CIRCUIT FAULT PIDs (2293_30_OD) AND (2293_29_OD) FOR A SHORT TO VOLTAGE AND OPEN (CLOCKSPRING DISCONNECTED)

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Disconnect: Clockspring C218a
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_29_OD (Air Bag Circuit Open - Loop No. 1, Front Driver Side)

    - 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 1 on-demand fault PIDs change from indicating a short to battery to an open circuit fault?**

  YES : Go to F48.

  NO : Go to F14.

F14 CHECK CIRCUITS CR101 (VT/BN) AND RR101 (YE/GN) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND CLOCKSPRING

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

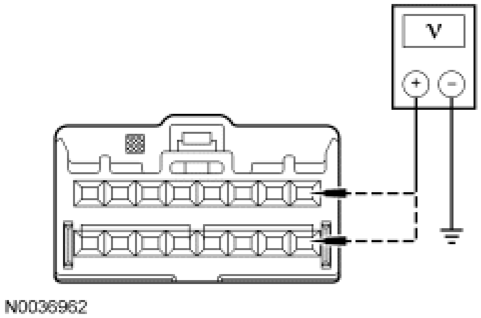

Fig. 30: Checking Circuits CR101 (VT/BN) & RR101 (YE/GN) For A Short To Voltage Between RCM & Clockspring
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
    - clockspring C218a-1, circuit CR101 (VT/BN), harness side and ground.
    - clockspring C218a-9, circuit RR101 (YE/GN), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR101 (VT/BN) or circuit RR101 (YE/GN). Go to F56.

  NO : Go to F49.

F15 CHECK THE DRIVER AIR BAG MODULE LOOP 2 RESISTANCE PID (D_ABAGR2)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- Enter the following diagnostic mode on the diagnostic tool: D_ABAGR2 (Driver Air Bag #2 Resistance) Resistance PID
- **Does the resistance PID value read between 1.31 and 4.29 ohms?**

  YES : Go to F49.

  NO : Go to F16.

F16 CHECK THE DRIVER AIR BAG MODULE LOOP 2 RESISTANCE PID (D_ABAGR2) WHILE CARRYING OUT A HARNESS TEST

NOTE: **Do not remove the driver air bag module from its mounted position at this time.**

- With the driver air bag in its mounted position, continue monitoring the D_ABAGR2 (Driver Air Bag #2 Resistance) resistance PID while carrying out a harness test of the driver air bag circuits and accessible connectors (including any inline connectors), by wiggling and flexing the wire harness, connectors, tilting and rotating the steering wheel frequently.
- **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness or INSTALL a new clockspring as needed. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to F56.

  NO : If the driver air bag module loop 2 resistance PID is less than 1.31 ohms, go to F17.

  If the driver air bag module loop 2 resistance PID is greater than 4.29 ohms, go to F20.

F17 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUIT FAULT PIDs (2293_20_OD) AND (2293_21_OD) FOR LOW RESISTANCE AND OPEN

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record

The Following Fault PIDs
  - 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side)
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to F46.

  NO : Go to F18.

F18 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUIT FAULT PIDs (2293_20_OD) AND (2293_21_OD) FOR LOW RESISTANCE AND OPEN (CLOCKSPRING DISCONNECTED)

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Disconnect: Clockspring C218a
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side)
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to F48.

  NO : Go to F19.

F19 CHECK THE RCM FOR LOW RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

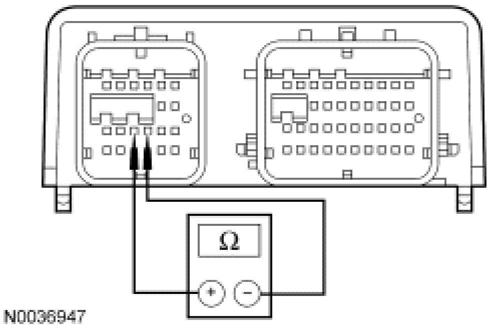

Fig. 31: Checking RCM For Low Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a pin 15 and C310a pin 16, component side.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR102 (BU) and RR102 (WH). Go to F56.

  NO : Go to F49.

F20 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUIT FAULT PIDs (2293_21_OD) AND (2293_20_OD) FOR AN OPEN AND LOW RESISTANCE

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Connect a jumper wire between driver air bag module loop 2 electrical connector, pin-1, harness side and pin-2, harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side)
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved on loop 2. Loop 1 will show an open circuit fault due to the driver air bag being disconnected.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating an open**

circuit to a low resistance fault?

YES : Go to F46.

NO : Go to F21.

F21 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUIT FAULT PIDs (2293_21_OD) AND (2293_20_OD) FOR AN OPEN AND LOW RESISTANCE (CLOCKSPRING DISCONNECTED)

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Remove the jumper wire from driver air bag module loop 2 electrical connector.
- Disconnect: Clockspring C218a
- Connect a jumper wire between clockspring C218a-2, circuit CR102 (BU), harness side and clockspring C218a-10, circuit RR102 (WH), harness side.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
    - 2293_20_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side)
    - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved on loop 2. Loop 1 will show an open circuit fault due to the driver air bag being disconnected.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to F48.

  NO : Go to F22.

F22 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUITS CR102 (BU) AND RR102 (WH) FOR AN OPEN BETWEEN THE CLOCKSPRING AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the jumper wire from the clockspring connector.
- Disconnect: RCM C310a and C310b

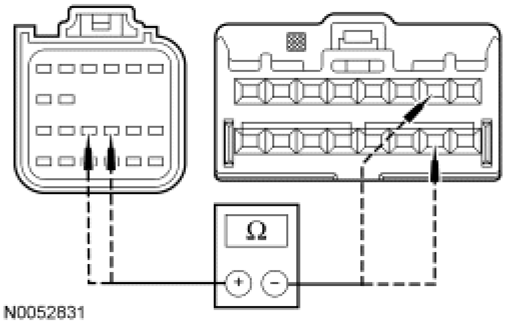

Fig. 32: Checking Driver Air Bag Module Loop 2 Circuits CR102 (BU) & RR102 (WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a-16, circuit CR102 (BU), harness side and clockspring C218a-2, circuit CR102 (BU), harness side; and between RCM C310a-15, circuit RR102 (WH), harness side and clockspring C218a-10, circuit RR102 (WH), harness side.
- **Are the resistances less than 0.5 ohm?**

  YES : Go to F49.

  NO : REPAIR circuit CR102 (BU) or circuit RR102 (WH). Go to F56.

F23 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUIT FAULT PIDs (2293_23_OD) AND (2293_21_OD) FOR A SHORT TO GROUND AND OPEN

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
  - 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

YES : Go to F46.

NO : Go to F24.

F24 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUIT FAULT PIDs (2293_23_OD) AND (2293_21_OD) FOR A SHORT TO GROUND AND OPEN (CLOCKSPRING DISCONNECTED)

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Disconnect: Clockspring C218a
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
  - 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to F48.

  NO : Go to F25.

F25 CHECK CIRCUITS CR102 (BU) AND RR102 (WH) FOR A SHORT TO GROUND BETWEEN THE RCM AND CLOCKSPRING

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

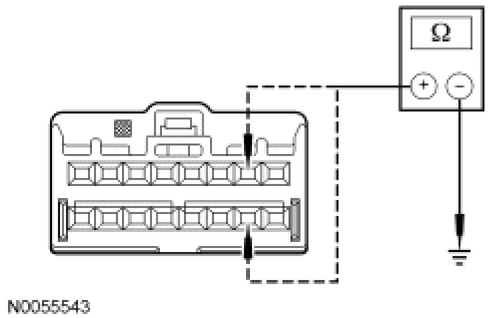

Fig. 33: Checking Circuits CR102 (BU) & RR102 (WH) For A Short To Ground Between

RCM & Clockspring
Courtesy of FORD MOTOR CO.

- Measure the resistance between clockspring C218a-2, circuit CR102 (BU), harness side and ground; and between clockspring C218a-10, circuit RR102 (WH), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to F49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR102 (BU) or circuit RR102 (WH). Go to F56.

F26 CHECK THE DRIVER AIR BAG MODULE LOOP 2 CIRCUIT FAULT PIDs (2293_22_OD) AND (2293_21_OD) FOR A SHORT TO VOLTAGE AND OPEN (CLOCKSPRING DISCONNECTED)

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Disconnect: Clockspring C218a
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_21_OD (Air Bag Circuit Open - Loop No. 2, Front Driver Side)
  - 2293_22_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the driver air bag module/clockspring disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the driver air bag module loop 2 on-demand fault PIDs change from indicating a short to battery to an open circuit fault?**

  YES : Go to F48.

  NO : Go to F27.

F27 CHECK CIRCUITS CR102 (BU) AND RR102 (WH) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND CLOCKSPRING

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

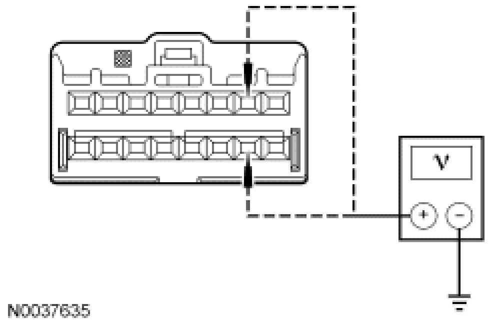

Fig. 34: Checking Circuits CR102 (BU) & RR102 (WH) For A Short To Voltage Between RCM & Clockspring
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - clockspring C218a-2, circuit CR102 (BU), harness side and ground.
  - clockspring C218a-10, circuit RR102 (WH), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR102 (BU) or circuit RR102 (WH). Go to F56.

  NO : Go to F49.

F28 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 RESISTANCE PID (P_ABAGR)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- Enter the following diagnostic mode on the diagnostic tool: P_ABAGR (Passenger Air Bag) Resistance PID
- **Does the resistance PID value read between 1.31 and 4.29 ohms?**

  YES : Go to F49.

  NO : Go to F29.

F29 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 RESISTANCE PID (P_ABAGR) WHILE CARRYING OUT A HARNESS TEST

NOTE: **Do not remove the passenger air bag module from its mounted**

position at this time.

- With the passenger air bag in its mounted position, continue monitoring the P_ABAGR (Passenger Air Bag) resistance PID while carrying out a harness test of the passenger air bag module circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to F56.

  NO : If the passenger air bag module loop 1 resistance PID is less than 1.31 ohms, go to F30.

  If the passenger air bag module loop 1 resistance PID is greater than 4.29 ohms, go to F32.

F30 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 CIRCUIT FAULT PIDs (2293_24_OD) AND (2293_25_OD) FOR LOW RESISTANCE AND OPEN

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_24_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side)
  - 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to F47.

  NO : Go to F31.

F31 CHECK THE RCM FOR LOW RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

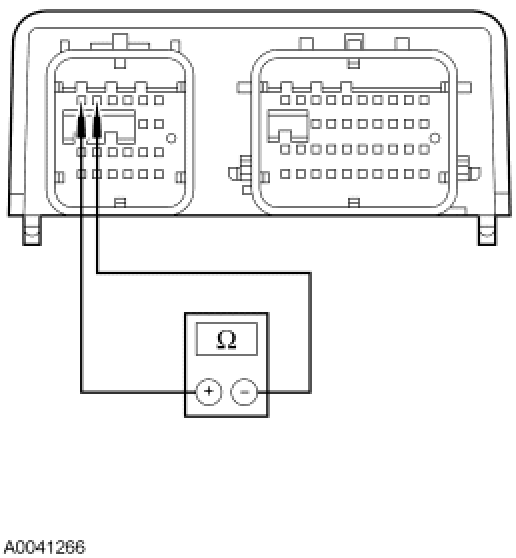

Fig. 35: Checking RCM For Low Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a pin 1 and C310a pin 2, component side.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR103 (GY/BU) and RR103 (VT/GN). Go to F56.

  NO : Go to F49.

F32 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 CIRCUIT FAULT PIDs (2293_25_OD) AND (2293_24_OD) FOR AN OPEN AND LOW RESISTANCE

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256a and C256b

- Connect a jumper wire between passenger air bag module C256a-1, circuit CR103 (GY/BU), harness side and C256a-2, circuit RR103 (VT/GN), harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_24_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side)
  - 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module loop 1 circuits shorted together, a low resistance fault would normally be retrieved on loop 1. Loop 2 will show an open circuit fault due to the passenger air bag being disconnected.
- **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to F47.

  NO : Go to F33.

F33 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 CIRCUITS FOR AN OPEN BETWEEN THE PASSENGER AIR BAG MODULE AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the jumper wire from passenger air bag module C256.
- Disconnect: RCM C310a and C310b

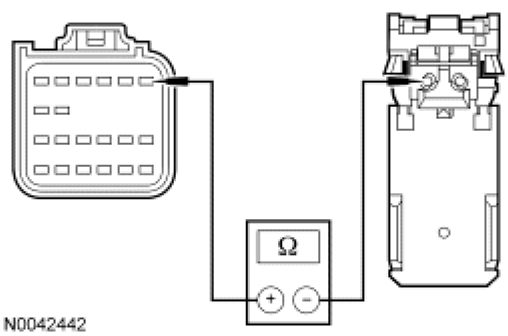

Fig. 36: Checking Circuit CR103 (GY/BU) For Open Between RCM And Passenger Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a-1, circuit CR103 (GY/BU), harness side and passenger air bag module C256a-1, circuit CR103 (GY/BU), harness side.

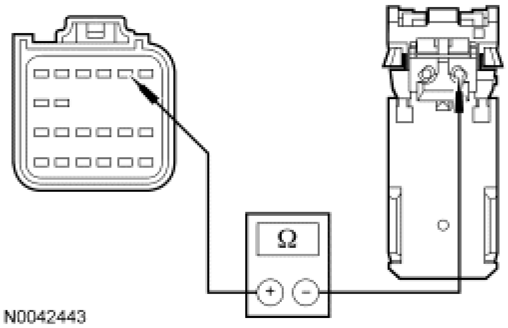

Fig. 37: Checking Circuit RR103 (VT/GN) For Open Between RCM And Passenger Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a-2, circuit RR103 (VT/GN), harness side and passenger air bag module C256a-2, circuit RR103 (VT/GN), harness side.
- **Are the resistances less than 0.5 ohm?**

  YES : Go to F49.

  NO : REPAIR circuit CR103 (GY/BU) or circuit RR103 (VT/GN). Go to F56.

F34 CHECK THE PASSENGER AIR BAG MODULE LOOP 1 CIRCUIT FAULT PIDs (2293_27_OD) AND (2293_25_OD) FOR SHORT TO GROUND AND OPEN

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256a
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_25_OD (Air Bag Circuit Open - Loop No. 1, Front Passenger Side)
  - 2293_27_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the passenger air bag module loop 1 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

YES : Go to F47.

NO : Go to F35.

F35 CHECK CIRCUITS CR103 (GY/BU) AND RR103 (VT/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

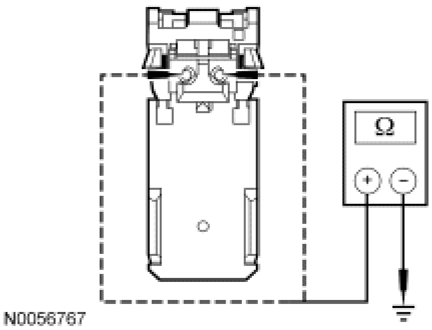

Fig. 38: Checking Circuits CR103 (GY/BU) & RR103 (VT/GN) For A Short To Ground Between RCM & Passenger Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger air bag module C256a-1, circuit CR103 (GY/BU), harness side and ground; and between passenger air bag module C256a-2, circuit RR103 (VT/GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to F49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR103 (GY/BU) or circuit RR103 (VT/GN). Go to F56.

F36 CHECK CIRCUITS CR103 (GY/BU) AND RR103 (VT/GN) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

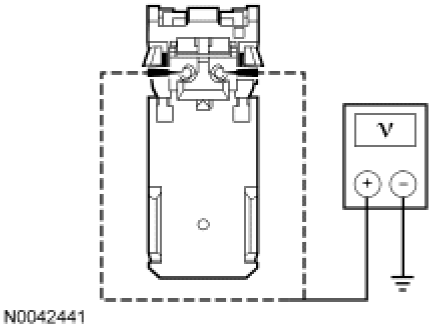

Fig. 39: Checking Circuits CR103 (GY/BU) & RR103 (VT/GN) For A Short To Voltage Between RCM & Passenger Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - passenger air bag module C256a-1, circuit CR103 (GY/BU), harness side and ground.
  - passenger air bag module C256a-2, circuit RR103 (VT/GN), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR103 (GY/BU) or circuit RR103 (VT/GN). Go to F56.

  NO : Go to F49.

F37 CHECK PASSENGER AIR BAG MODULE LOOP 2 RESISTANCE PID (P_ABAGR2)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- Enter the following diagnostic mode on the diagnostic tool: P_ABAGR2 (Passenger Side Air Bag #2 Resistance) Resistance PID
- **Does the resistance PID value read between 1.31 and 4.29 ohms?**

  YES : Go to F49.

  NO : Go to F38.

F38 CHECK PASSENGER AIR BAG MODULE LOOP 2 RESISTANCE PID (P_ABAGR2) WHILE CARRYING OUT A HARNESS TEST

NOTE: Do not remove the passenger air bag module from its mounted position at this time.

- With the passenger air bag in its mounted position, continue monitoring the P_ABAGR2 (Passenger Side Air Bag #2 Resistance) resistance PID while carrying out a harness test of the passenger air bag module circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer

to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to F56.

NO : If the passenger air bag module loop 2 resistance PID is less than 1.31 ohms, go to F39.

If the passenger air bag module loop 2 resistance PID is greater than 4.29 ohms, go to F41.

F39 CHECK PASSENGER AIR BAG MODULE LOOP 2 CIRCUIT FAULT PIDs (2293_16_OD) AND (2293_17_OD) FOR LOW RESISTANCE AND OPEN

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256a and C256b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_16_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side)
  - 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to F47.

  NO : Go to F40.

F40 CHECK THE RCM FOR LOW RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

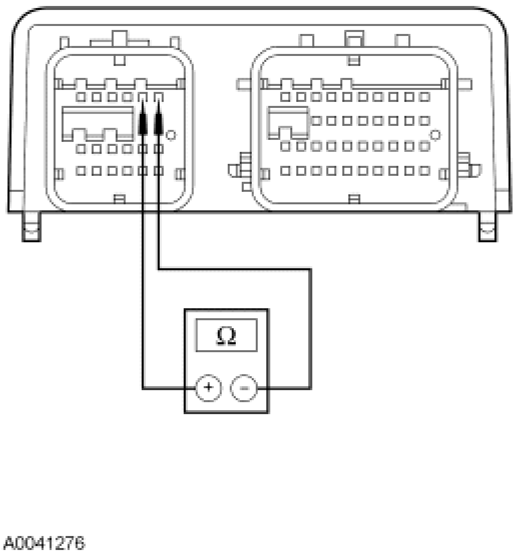

Fig. 40: Checking RCM For Low Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a pin 5 and C310a pin 6, component side.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR104 (YE/GY) and RR104 (WH/BU). Go to F56.

  NO : Go to F49.

F41 CHECK PASSENGER AIR BAG MODULE LOOP 2 CIRCUIT FAULT PIDs (2293_17_OD) AND (2293_16_OD) FOR AN OPEN AND LOW RESISTANCE

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256a and C256b
- Connect a jumper wire between passenger air bag module C256b-1, circuit CR104 (YE/GY), harness side and C256b-2, circuit RR104 (WH/BU), harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
    - 2293_16_OD (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side)
    - 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module loop 2 circuits shorted together, a low resistance fault would normally be retrieved on loop 2. Loop 1 will show an open circuit fault due to the passenger air bag module being disconnected.
- **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to F47.

  NO : Go to F42.

F42 CHECK PASSENGER AIR BAG MODULE LOOP 2 CIRCUITS FOR AN OPEN BETWEEN THE PASSENGER AIR BAG MODULE AND RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the jumper wire from passenger air bag module C256.
- Disconnect: RCM C310a and C310b

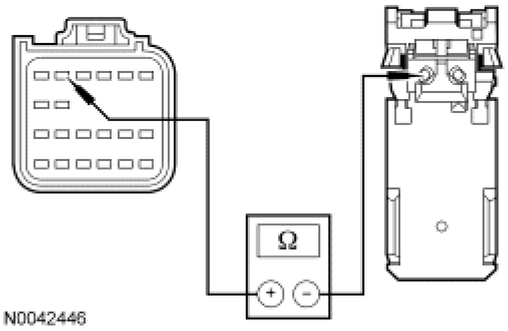

Fig. 41: Checking Circuit CR104 (YE/GY) For Open Between RCM And Passenger Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a-5, circuit CR104 (YE/GY), harness side and passenger air bag module C256b-1, circuit CR104 (YE/GY), harness side.

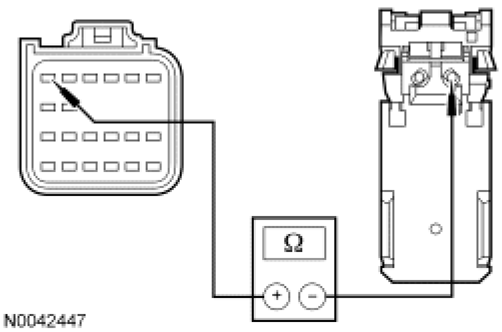

Fig. 42: Checking Circuit RR104 For Open Between RCM And Passenger Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310a-6, circuit RR104 (WH/BU), harness side and passenger air bag module C256b-2, circuit RR104 (WH/BU), harness side.
- **Are the resistances less than 0.5 ohm?**

  YES : Go to F49.

  NO : REPAIR circuit CR104 (YE/GY) or circuit RR104 (WH/BU). Go to F56.

F43 CHECK PASSENGER AIR BAG MODULE LOOP 2 CIRCUIT FAULT PIDs (2293_19_OD) AND (2293_17_OD) FOR A SHORT TO GROUND AND OPEN

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256a and C256b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2293_17_OD (Air Bag Circuit Open - Loop No. 2, Front Passenger Side)
  - 2293_19_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2293 on-demand fault PIDs with the passenger air bag module disconnected, open circuit faults would normally be retrieved on loop 1 and loop 2.
- **Did the passenger air bag module loop 2 on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to F47.

NO : Go to F44.

F44 CHECK CIRCUITS CR104 (YE/GY) AND RR104 (WH/BU) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

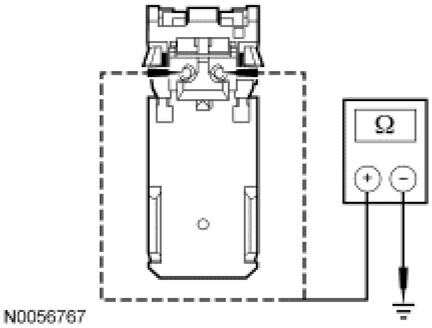

Fig. 43: Checking Circuits CR104 (YE/GY) & RR104 (WH/BU) For A Short To Ground Between RCM & Passenger Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger air bag module C256b-1, circuit CR104 (YE/GY), harness side and ground; and between passenger air bag module C256b-2, circuit RR104 (WH/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to F49.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR104 (YE/GY) or circuit RR104 (WH/BU). Go to F56.

F45 CHECK CIRCUITS CR104 (YE/GY) AND RR104 (WH/BU) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256a and C256b
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

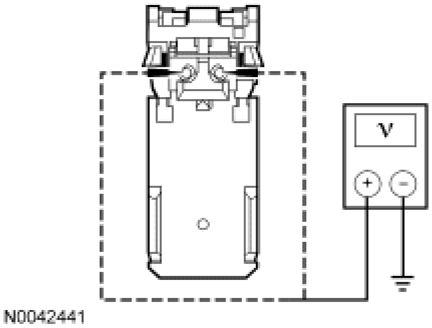

Fig. 44: Checking Circuits CR104 (YE/GY) & RR104 (WH/BU) For A Short To Voltage Between RCM & Passenger Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - passenger air bag module C256b-1, circuit CR104 (YE/GY), harness side and ground.
  - passenger air bag module C256b-2, circuit RR104 (WH/BU), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR104 (YE/GY) or circuit RR104 (WH/BU). Go to F56.

  NO : Go to F49.

F46 CONFIRM THE DRIVER AIR BAG MODULE FAULT

NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the on-demand self-test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Install the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2293 Fault PIDs
  - Refer to PID list in Normal Operation to view B2293 fault PIDs.
- **Does the original on-demand DTC B2293 fault PID indicate a fault?**

  YES : INSTALL a new driver air bag module. REFER to **Driver Air Bag Module**. Go to F56.

NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected.

For 2293_28_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) or 2293_20_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), go to F50.

For 2293_29_CM (Air Bag Circuit Open - Loop No. 1, Front Driver Side) or 2293_21_CM (Air Bag Circuit Open - Loop No. 2, Front Driver Side), go to F50.

For 2293_31_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) or 2293_23_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), go to F51.

For 2293_30_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) or 2293_22_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side), go to F53.

F47 CONFIRM THE PASSENGER AIR BAG MODULE FAULT

NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Passenger Air Bag Module C256a and C256b (if previously disconnected)
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2293 Fault PIDs
  - Refer to PID list in Normal Operation to view B2293 fault PIDs.
- **Does the original on-demand DTC B2293 fault PID indicate a fault?**

YES : INSTALL a new passenger air bag module. REFER to **Passenger Air Bag Module**. Go to F56.

NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected.

For 2293_24_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side) or

2293_16_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side), go to F50.

For 2293_25_CM (Air Bag Circuit Open - Loop No. 1, Front Passenger Side) or 2293_17_CM (Air Bag Circuit Open - Loop No. 2, Front Passenger Side), go to F50.

For 2293_27_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side) or 2293_19_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side), go to F52.

For 2293_26_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side) or 2293_18_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side), go to F54.

F48 CONFIRM THE CLOCKSPRING FAULT

NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Clockspring C218a
- Install the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2293 Fault PIDs
  - Refer to PID list in Normal Operation to view B2293 fault PIDs.
- **Does the original on-demand DTC B2293 fault PID indicate a fault?**

  YES : INSTALL a new clockspring. REFER to **Clockspring**. Go to F56.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected.

  For 2293_28_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) or 2293_20_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), go to F50.

  For 2293_29_CM (Air Bag Circuit Open - Loop No. 1, Front Driver Side) or 2293_21_CM (Air Bag Circuit Open - Loop No. 2, Front Driver Side), go to F50.

For 2293_31_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) or 2293_23_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), go to F51.

For 2293_30_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) or 2293_22_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side), go to F53.

F49 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- If previously removed, install the driver air bag module. Refer to **Driver Air Bag Module**.
- Connect: Clockspring C218a (if previously disconnected)
- Connect: Passenger Air Bag Module C256 (if previously disconnected)
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2293 Fault PIDs
  - Refer to PID list in Normal Operation to view B2293 fault PIDs.
- **Does the original on-demand DTC B2293 fault PID indicate a fault?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to F56.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected.

  For 2293_28_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Driver Side) or 2293_20_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Driver Side), go to F50.

  For 2293_29_CM (Air Bag Circuit Open - Loop No. 1, Front Driver Side) or 2293_21_CM (Air Bag Circuit Open - Loop No. 2, Front Driver Side), go to F50.

  For 2293_31_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) or 2293_23_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side), go to F51.

  For 2293_30_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) or

2293_22_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side), go to F53.

For 2293_24_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 1, Front Passenger Side) or 2293_16_CM (Air Bag Inflator Circuit Resistance Low - Loop No. 2, Front Passenger Side), go to F50.

For 2293_25_CM (Air Bag Circuit Open - Loop No. 1, Front Passenger Side) or 2293_17_CM (Air Bag Circuit Open - Loop No. 2, Front Passenger Side), go to F50.

For 2293_27_CM (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side) or 2293_19_CM (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side), go to F52.

For 2293_26_CM (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side) or 2293_18_CM (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side), go to F54.

F50 CHECK THE DRIVER OR PASSENGER AIR BAG MODULE CIRCUIT RESISTANCE PIDs FOR AN INTERMITTENT LOW RESISTANCE OR OPEN CIRCUIT

- If the fault PID was reported for the driver air bag module loop 1 or loop 2, monitor the following on the scan tool:
  - D_ABAGR (Driver air bag) resistance PID.
  - D_ABAGR2 (Driver Air Bag #2 Resistance) resistance PID.
- If the fault PID was reported for the passenger air bag module loop 1 or loop 2, monitor the following on the scan tool:
  - P_ABAGR (Passenger air bag) resistance PID.
  - P_ABAGR2 (Passenger Side Air Bag #2 Resistance) resistance PID.

NOTE: **A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5.0 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.**

NOTE: **Do not remove the driver or passenger air bag module from its mounted position at this time.**

- With the driver or passenger air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors), and flexing the wire harness, tilting and rotating the steering wheel frequently.
- **Does any driver or passenger air bag resistance PID indicate less than 1.31 ohms or greater than 4.29 ohms?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to F56.

  NO : Go to F55.

F51 CHECK THE DRIVER AIR BAG MODULE CIRCUIT FAULT PIDs FOR AN INTERMITTENT SHORT TO GROUND

- Monitor the 2293_31_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Driver Side) and 2293_23_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Driver Side) on-demand fault PIDs on the scan tool.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

NOTE: **Do not remove the driver air bag module from its mounted position at this time.**

- With the driver air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently.
- **Does any driver air bag module short to ground fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to F56.

  NO : Go to F55.

F52 CHECK THE PASSENGER AIR BAG MODULE CIRCUIT FAULT PIDs FOR AN INTERMITTENT SHORT TO GROUND

- Key in ON position.
- Monitor the 2293_27_OD (Air Bag Circuit Short to Ground - Loop No. 1, Front Passenger Side) and 2293_19_OD (Air Bag Circuit Short to Ground - Loop No. 2, Front Passenger Side) on-demand fault PIDs on the scan tool.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

NOTE: **Do not remove the passenger air bag module from its mounted position at this time.**

- With the passenger air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any passenger air bag module short to ground fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to F56.

  NO : Go to F55.

F53 CHECK THE DRIVER AIR BAG MODULE CIRCUIT FAULT PIDs FOR AN INTERMITTENT SHORT TO VOLTAGE

- Key in OFF position.

- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the driver air bag module. Refer to **Driver Air Bag Module**.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Monitor the 2293_30_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Driver Side) and 2293_22_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Driver Side) on-demand fault PIDs on the scan tool.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.
- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness, tilting and rotating the steering wheel frequently.
- **Does any driver air bag module short to battery fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to F56.

  NO : Go to F55.

F54 CHECK THE PASSENGER AIR BAG MODULE CIRCUIT FAULT PIDs FOR AN INTERMITTENT SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Air Bag Module C256a and C256b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Monitor the 2293_26_OD (Air Bag Circuit Short to Battery - Loop No. 1, Front Passenger Side) and 2293_18_OD (Air Bag Circuit Short to Battery - Loop No. 2, Front Passenger Side) on-demand fault PIDs on the scan tool.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

NOTE: **Do not remove the passenger air bag module from its mounted position at this time.**

- With the passenger air bag in its mounted position, attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any passenger air bag module short to battery fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING**

DIAGRAMS article for MKZ, Connector Repair Procedures for schematic and connector information. Go to F56.

NO : Go to F55.

F55 CHECK THE HARNESS AND CONNECTORS

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- If the fault PID was reported for the driver air bag:
  - remove the driver air bag module.
  - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - inspect wire harness for any damage, pinched, cut or pierced wires.
- If the fault PID was reported for the passenger air bag:
  - disconnect the passenger air bag module C256a and C256b.
  - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - inspect wire harness for any damage, pinched, cut or pierced wires.
- **Were any concerns found?**

  YES : REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to F56.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition key frequently and rotating the steering wheel (driver air bag module fault). **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to F56.

F56 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints

- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test G: DTC B2294 - Restraint System - Curtain Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) continuously monitors the driver and passenger safety canopy module circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2294 in memory if any of these conditions are detected to be outside of their respectful range. If the RCM detects a fault, it will send a message to the instrument cluster module to illuminate the air bag warning indicator.

As the RCM continuously monitors safety canopy module circuits for resistance, it expects a normal resistance between 1.31 to 4.29 ohms.

If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

Fault PIDs[a]	Description	Fault Trigger Condition
2294_24_OD and 2294_24_CM	A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side	When the RCM measures resistance less than 0.9 ohm between the passenger safety canopy circuits, a fault will be indicated.
2294_25_OD and 2294_25_CM	A - B or A - C Pillar Curtain Circuit Open, Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger safety canopy circuits, a fault will be indicated.
2294_26_OD and 2294_26_CM	A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side	When the RCM senses a short to ground on either of the passenger safety canopy circuits, a fault will be indicated.

2294_27_OD and 2294_27_CM	A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side	When the RCM senses a short to voltage on either of the passenger safety canopy circuits, a fault will be indicated.
2294_28_OD and 2294_28_CM	A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver safety canopy circuits, a fault will be indicated.
2294_29_OD and 2294_29_CM	A - B or A - C Pillar Curtain Circuit Open, Driver Side	When the RCM measures resistance greater than 5 ohms between the driver safety canopy circuits, a fault will be indicated.
2294_30_OD and 2294_30_CM	A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side	When the RCM senses a short to ground on either of the driver safety canopy circuits, a fault will be indicated.
2294_31_OD and 2294_31_CM	A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side	When the RCM senses a short to voltage on either of the driver safety canopy circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2294. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2294.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Safety canopy module
- RCM

PINPOINT TEST G: DTC B2294 - RESTRAINT SYSTEM - CURTAIN FAULT

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough**

inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

G1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2294 Fault PIDs
  - Refer to PID list in Normal Operation to view B2294 fault PIDs.
- **Do any RCM on-demand DTC B2294 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2294_28_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side), go to G2.

  For 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side), go to G2.

  For 2294_30_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side), go to G9.

  For 2294_31_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side), go to G11.

  For 2294_24_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side), go to G12.

  For 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), go to G12.

  For 2294_26_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), go to G19.

  For 2294_27_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), go to G21.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For (2294_28_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side),

2294_29_CM (A - B or A - C Pillar Curtain Circuit Open, Driver Side), 2294_24_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side) or 2294_25_CM (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), go to G24.

For 2294_30_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) or 2294_26_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), go to G26.

For 2294_31_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), go to G27.

G2 CHECK THE DRIVER SAFETY CANOPY MODULE RESISTANCE PID (DCURTL1)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- Enter the following diagnostic mode on the diagnostic tool: DCURTL1 (Curtain Airbag Driver Loop No.1 Resistance) Resistance PID
- **Does the resistance PID value read between 1.31 and 4.29 ohms?**

  YES : Go to G23.

  NO : Go to G3.

G3 CHECK THE DRIVER SAFETY CANOPY MODULE RESISTANCE PID (DCURTL1) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the DCURTL1 (Curtain Airbag Driver Loop No.1 Resistance) Resistance PID while carrying out a harness test of the driver safety canopy circuits and accessible connectors (including any inline connectors) by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to G28.

  NO : If the driver safety canopy resistance PID is less than 1.31 ohm, go to G4.

  If the driver safety canopy resistance PID is greater than 4.29 ohms, go to G7.

G4 CHECK THE DRIVER SAFETY CANOPY MODULE CIRCUIT FAULT PIDs (2294_28_OD) AND (2294_29_OD) FOR LOW RESISTANCE AND OPEN

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Canopy C3055

- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2294_28_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side)
  - 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy disconnected, an open circuit fault would normally be retrieved.
- **Did the driver safety canopy on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to G22.

  NO : Go to G5.

G5 CHECK FOR A SHORT BETWEEN DRIVER SAFETY CANOPY CIRCUITS CR109 (BN/BU) AND RR109 (BU/GN)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Measure the resistance between driver safety canopy C3055-1, circuit CR109 (BN/BU), harness side and C3055-2, circuit RR109 (BU/GN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to G23.

  NO : Go to G6.

G6 CHECK THE RCM FOR LOW RESISTANCE

- Disconnect: RCM C310a and C310b

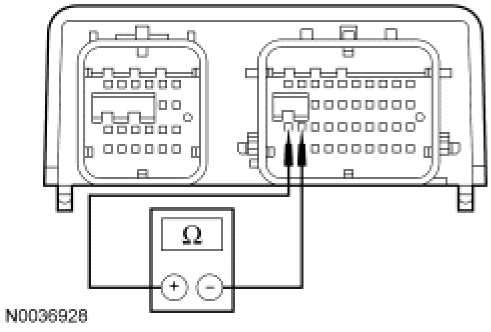

Fig. 45: Checking RCM For Low Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b pin 21, component side, and C310b pin 22, component side.

- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR109 (BN/BU) and RR109 (BU/GN). Go to G28.

  NO : Go to G23.

G7 CHECK THE DRIVER SAFETY CANOPY MODULE CIRCUIT FAULT PIDs (2294_29_OD) AND (2294_28_OD) FOR AN OPEN

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Canopy C3055
- Connect a fused jumper wire between driver safety canopy C3055-1, circuit CR109 (BN/BU), harness side and C3055-2, circuit RR109 (BU/GN), harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2294_28_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side)
  - 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy circuits shorted together, a low resistance fault would normally be retrieved.
- **Did the driver safety canopy on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to G22.

  NO : Go to G8.

G8 CHECK CIRCUITS CR109 (BN/BU) AND RR109 (BU/GN) FOR AN OPEN BETWEEN THE RCM AND DRIVER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from the driver safety canopy C3055.
- Disconnect: RCM C310a and C310b

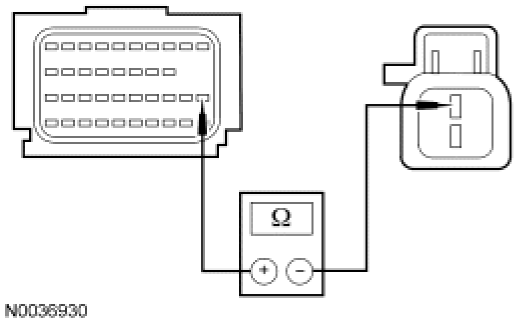

Fig. 46: Measuring Resistance Between RCM C310B-21, Circuit CR109 (BN/BU), Harness Side & Driver Safety Canopy C3055-1
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-21, circuit CR109 (BN/BU), harness side and driver safety canopy C3055-1, circuit CR109 (BN/BU), harness side.

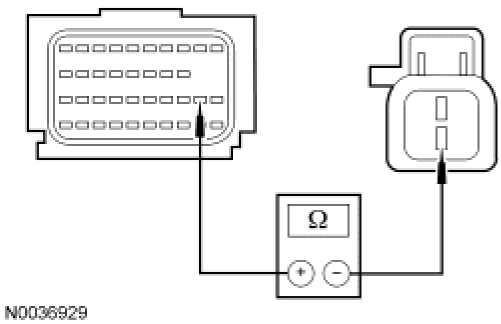

Fig. 47: Measuring Resistance Between RCM C310B-22, Circuit RR109 (BU/GN), Harness Side & Driver Safety Canopy C3055-2
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-22, circuit RR109 (BU/GN), harness side and driver safety canopy C3055-2, circuit RR109 (BU/GN), harness side.
- **Are the resistances less than 0.5 ohm?**

  YES : Go to G23.

  NO : REPAIR circuit CR109 (BN/BU) or circuit RR109 (BU/GN). Go to G28.

G9 CHECK THE DRIVER SAFETY CANOPY MODULE CIRCUIT FAULT PIDs (2294_30_OD) AND (2294_29_OD) FOR A SHORT TO GROUND AND OPEN

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and**

Repowering.

- Disconnect: Driver Safety Canopy C3055
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2294_29_OD (A - B or A - C Pillar Curtain Circuit Open, Driver Side)
  - 2294_30_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the driver safety canopy disconnected, an open circuit fault would normally be retrieved.
- **Did the driver safety canopy on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to G22.

  NO : Go to G10.

G10 CHECK CIRCUITS CR109 (BN/BU) AND RR109 (BU/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND DRIVER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

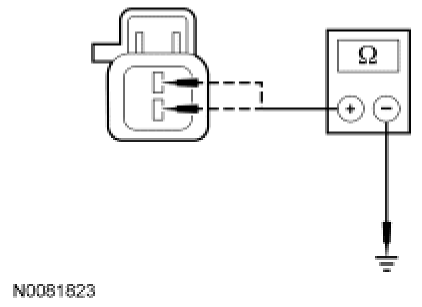

Fig. 48: Checking Circuits CR109 (BN/BU) & RR109 (BU/GN) For A Short To Ground Between RCM & Driver Safety Canopy Module
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver safety canopy C3055-1, circuit CR109 (BN/BU), harness side and ground; and between driver safety canopy C3055-2, circuit RR109 (BU/GN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to G23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either

circuit. Do not remove or defeat the shorting bar.

REPAIR circuit CR109 (BN/BU) or circuit RR109 (BU/GN). Go to G28.

G11 CHECK CIRCUITS CR109 (BN/BU) AND RR109 (BU/GN) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND DRIVER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Canopy C3055
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Measure the voltage between:
  - driver safety canopy C3055-1, circuit CR109 (BN/BU), harness side and ground.
  - driver safety canopy C3055-2, circuit RR109 (BU/GN), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR109 (BN/BU) or circuit RR109 (BU/GN). Go to G28.

  NO : Go to G23.

G12 CHECK THE PASSENGER SAFETY CANOPY MODULE RESISTANCE PID (PCURTL1)

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- Enter the following diagnostic mode on the diagnostic tool: PCURTL1 (Curtain Airbag Passenger Loop No.1 Resistance) Resistance PID
- **Does the resistance PID value read between 1.31 and 4.29 ohms?**

  YES : Go to G23.

  NO : Go to G13.

G13 CHECK THE PASSENGER SAFETY CANOPY MODULE RESISTANCE PID (PCURTL1) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the PCURTL1 (Curtain Airbag Passenger Loop No.1 Resistance) resistance PID while carrying out a harness test of the passenger safety canopy circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to G28.

NO : If the passenger safety canopy resistance PID is less than 1.31 ohm, go to G14.

If the passenger safety canopy resistance PID is greater than 4.29 ohms, go to G17.

G14 CHECK THE PASSENGER SAFETY CANOPY MODULE CIRCUIT FAULT PIDs (2294_24_OD) AND (2294_25_OD) FOR LOW RESISTANCE AND OPEN

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Canopy C3056
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2294_24_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side)
  - 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety canopy disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger safety canopy on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to G22.

  NO : Go to G15.

G15 CHECK FOR A SHORT BETWEEN PASSENGER SAFETY CANOPY CIRCUITS CR111 (BN/WH) AND RR111 (YE/VT)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Measure the resistance between passenger safety canopy module C3056-1, circuit CR111 (BN/WH), harness side and C3056-2, circuit RR111 (YE/VT), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to G23.

  NO : Go to G16.

G16 CHECK THE RCM FOR LOW RESISTANCE

- Disconnect: RCM C310a and C310b

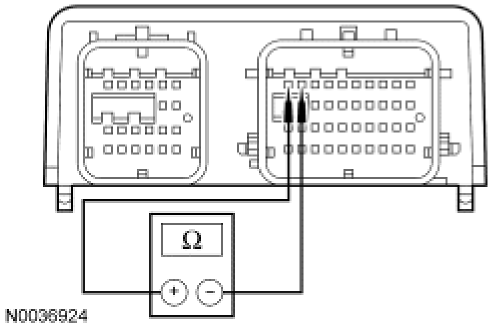

Fig. 49: Checking RCM For Low Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b pin 1, component side, and C310b pin 2, component side.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR111 (BN/WH) and RR111 (YE/VT). Go to G28.

  NO : Go to G23.

G17 CHECK THE PASSENGER SAFETY CANOPY MODULE CIRCUIT FAULT PIDs (2294_24_OD) AND (2294_24_OD) FOR AN FOR AN OPEN AND LOW RESISTANCE

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Canopy C3056
- Connect a fused jumper wire between passenger safety canopy C3056-1, circuit CR111 (BN/WH), harness side and C3056-2, circuit RR111 (YE/VT), harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2294_24_OD (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side)
  - 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety

canopy circuits shorted together, a low resistance fault would normally be retrieved.

- **Did the passenger safety canopy on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to G22.

  NO : Go to G18.

G18 CHECK CIRCUITS CR111 (BN/WH) AND RR111 (YE/VT) FOR AN OPEN BETWEEN THE RCM AND PASSENGER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the jumper wire from the passenger safety canopy C3056.
- Disconnect: RCM C310a and C310b

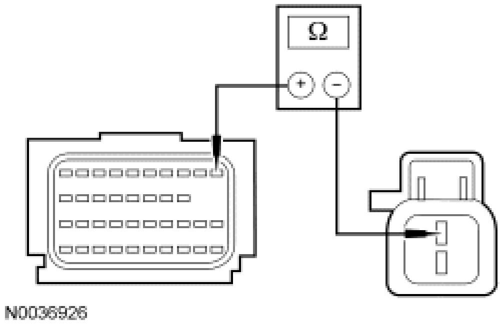

Fig. 50: Measuring Resistance Between RCM C310B-1, Circuit CR111 (BN/WH), Harness Side & Passenger Safety Canopy Module C3056-1
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-1, circuit CR111 (BN/WH), harness side and passenger safety canopy module C3056-1, circuit CR111 (BN/WH), harness side.

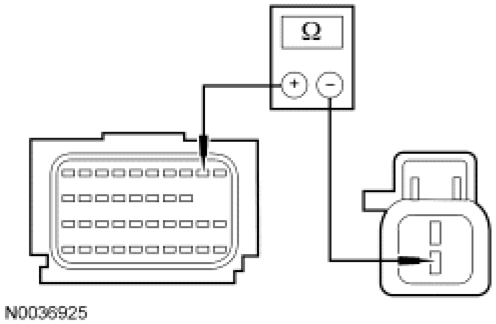

Fig. 51: Measuring Resistance Between RCM C310B-2, Circuit RR111 (YE/VT), Harness Side & Passenger Safety Canopy Module C3056-2
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-2, circuit RR111 (YE/VT), harness side and passenger safety canopy module C3056-2, circuit RR111 (YE/VT), harness side.

- **Are the resistances less than 0.5 ohm?**

  YES : Go to G23.

  NO : REPAIR circuit CR111 (BN/WH) or circuit RR111 (YE/VT). Go to G28.

G19 CHECK THE PASSENGER SAFETY CANOPY MODULE CIRCUIT FAULT PIDs (2294_26_OD) AND (2294_25_OD) FOR A SHORT TO GROUND AND OPEN

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Canopy C3056
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2294_25_OD (A - B or A - C Pillar Curtain Circuit Open, Passenger Side)
  - 2294_26_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2294 on-demand fault PIDs with the passenger safety canopy disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger safety canopy on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to G22.

  NO : Go to G20.

G20 CHECK CIRCUITS CR111 (BN/WH) AND RR111 (YE/VT) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

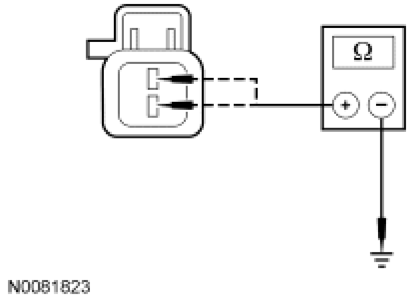

Fig. 52: Checking Circuits CR111 (BN/WH) & RR111 (YE/VT) For A Short To Ground Between RCM & Passenger Safety Canopy Module
Courtesy of FORD MOTOR CO.

- Measure the resistance between passenger safety canopy C3056-1, circuit CR111 (BN/WH), harness side and ground; and between passenger safety canopy C3056-2, circuit RR111 (YE/VT), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to G23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR111 (BN/WH) or circuit RR111 (YE/VT). Go to G28.

G21 CHECK CIRCUITS CR111 (BN/WH) AND RR111 (YE/VT) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER SAFETY CANOPY MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Canopy C3056
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Measure the voltage between:
  - passenger safety canopy C3056-1, circuit CR111 (BN/WH), harness side and ground
  - passenger safety canopy C3056-2, circuit RR111 (YE/VT), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR111 (BN/WH) or circuit RR111 (YE/VT). Go to G28.

  NO : Go to G23.

G22 CONFIRM THE SAFETY CANOPY MODULE FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Affected Safety Canopy C3055 (Driver) C3056 (Passenger)
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2294 Fault PIDs
  - Refer to PID list in Normal Operation to view B2294 fault PIDs.
- **Does the original RCM on-demand B2294 fault PID indicate a fault?**

  YES : INSTALL a new driver or passenger safety canopy. REFER to **Side Air Curtain Module**. Go to G28.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected.

  For (2294_28_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side), 2294_29_CM (A - B or A - C Pillar Curtain Circuit Open, Driver Side), 2294_24_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side) or 2294_25_CM (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), go to G24.

  For 2294_30_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) or 2294_26_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), go to G26.

  For 2294_31_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), go to G27.

G23 CONFIRM THE RCM FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.

- If previously directed to disconnect any SRS component(s):
  - depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
  - connect all previously disconnected restraint system component(s), including RCM C310a and C310b.
  - repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2294 Fault PIDs
  - Refer to PID list in Normal Operation to view B2294 fault PIDs.
- **Does the original RCM on-demand B2294 fault PID indicate a fault?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to G28.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected.

  For (2294_28_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Driver Side), 2294_29_CM (A - B or A - C Pillar Curtain Circuit Open, Driver Side), 2294_24_CM (A - B or A - C Pillar Curtain Circuit Resistance Low, Passenger Side) or 2294_25_CM (A - B or A - C Pillar Curtain Circuit Open, Passenger Side), go to G24.

  For 2294_30_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) or 2294_26_CM (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side), go to G26.

  For 2294_31_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_CM (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side), go to G27.

G24 CHECK SAFETY CANOPY MODULE CIRCUIT RESISTANCE PIDs FOR AN INTERMITTENT LOW RESISTANCE OR OPEN

- If the fault PID was reported for the driver safety canopy, monitor the DCURTL1 (Curtain Airbag Driver Loop No.1 Resistance) resistance PID on the scan tool.
- If the fault PID was reported for the passenger safety canopy, monitor the PCURTL1 (Curtain Airbag Passenger Loop No.1 Resistance) resistance PID on the scan tool.

NOTE: **A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5.0 ohms may or may not set an on-demand DTC yet indicates a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.**

- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing

the wire harness.

- **Does any safety canopy resistance PID indicate less than 1.31 ohms or greater than 4.29 ohms?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to G28.

  NO : Go to G25.

G25 CHECK THE HARNESS AND CONNECTORS

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect the affected safety canopy module C3055 (driver) or C3056 (passenger):
  - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - inspect wire harness for any damage, pinched, cut or pierced wires.
- **Were any concerns found?**

  YES : REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to G28.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to G28

G26 CHECK SAFETY CANOPY MODULE CIRCUIT FAULT PIDs FOR AN INTERMITTENT SHORT TO GROUND

- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- If the fault PID was reported for the driver safety canopy, monitor the 2294_30_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Driver Side) fault PID on the scan tool.
- If the fault PID was reported for the passenger safety canopy, monitor the 2294_26_OD (A - B or A - C Pillar Curtain Circuit Short to Ground, Passenger Side) fault PID on the scan tool.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2-second delay for the scan tool display to update.
- Attempt to recreate the fault by wiggling connectors (including any inline connectors), and flexing the wire harness.
- **Does any safety canopy on-demand fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to G28.

NO : The fault is not present and cannot be recreated at this time.

CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to G28

G27 CHECK SAFETY CANOPY MODULE CIRCUIT FAULT PIDs FOR AN INTERMITTENT SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- If the fault PID was reported for the driver safety canopy, disconnect the driver safety canopy module C3055.
- If the fault PID was reported for the passenger safety canopy, disconnect the passenger safety canopy module C3056.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2-second delay for the scan tool display to update.
- Monitor the 2294_31_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Driver Side) or 2294_27_OD (A - B or A - C Pillar Curtain Circuit Short to Battery, Passenger Side) fault PIDs on the scan tool.
- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any safety canopy on-demand fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to G28.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to G28

G28 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an**

accidental deployment.

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test H: DTC B2295 - Restraint System - Side Air Bag Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

A side air bag module provides protection of the thorax area (between the neck and abdomen) of the body, working in conjunction with the head protection provided by a safety canopy module. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

The restraints control module (RCM) continuously monitors the driver and passenger side air bag module circuits (loop) for an acceptable resistance range, unacceptable voltage and shorts to ground. The RCM will set on-demand and store DTC B2294 in memory if any of these conditions are detected to be outside of their respectful range. If the RCM detects a fault, it will send a message to the instrument cluster module to illuminate the air bag warning indicator.

As the RCM continuously monitors side air bag module circuits for resistance, it expects a normal resistance between 1.31 to 4.29 ohms.

If a loop resistance is between 0.9 and 1.31 or between 4.29 and 5 ohms, there exists a strong potential for an intermittent fault, a DTC may or may not set. The RCM will also set an on-demand DTC if the loop resistance is less than 0.9 ohm or greater than 5 ohms.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

Fault PIDs[a]	Description	Fault Trigger Condition
2295_24_OD and 2295_24_CM	Side Air Bag Circuit Resistance	When the RCM measures resistance less than 0.9 ohm between the passenger side air

	Low, Front Passenger Side	bag module circuits, a fault will be indicated.
2295_25_OD and 2295_25_CM	Side Air Bag Circuit Open, Front Passenger Side	When the RCM measures resistance greater than 5 ohms between the passenger side air bag module circuits, a fault will be indicated.
2295_26_OD and 2295_26_CM	Side Air Bag Circuit Short to Ground, Front Passenger Side	When the RCM senses a short to ground on either of the passenger side air bag module circuits, a fault will be indicated.
2295_27_OD and 2295_27_CM	Side Air Bag Circuit Short to Battery, Front Passenger Side	When the RCM senses a short to voltage on either of the passenger side air bag module circuits, a fault will be indicated.
2295_28_OD and 2295_28_CM	Side Air Bag Circuit Resistance Low, Front Driver Side	When the RCM measures resistance less than 0.9 ohm between the driver side air bag module circuits, a fault will be indicated.
2295_29_OD and 2295_29_CM	Side Air Bag Circuit Open, Front Driver Side	When the RCM measures resistance greater than 5 ohms between the driver side air bag module circuits, a fault will be indicated.
2295_30_OD and 2295_30_CM	Side Air Bag Circuit Short to Ground, Front Driver Side	When the RCM senses a short to ground on either of the driver side air bag module circuits, a fault will be indicated.
2295_31_OD and 2295_31_CM	Side Air Bag Circuit Short to Battery, Front Driver Side	When the RCM senses a short to voltage on either of the driver side air bag module circuits, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2295. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2295.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Side air bag module
- RCM

PINPOINT TEST H: DTC B2295 - RESTRAINT SYSTEM - SIDE AIR BAG FAULT

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

H1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2295 Fault PIDs
  - Refer to PID list in Normal Operation to view B2295 fault PIDs.
- **Do any RCM on-demand B2295 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2295_28_OD (Side Air Bag Circuit Resistance Low, Front Driver Side), go to H2.

  For (2295_29_OD (Side Air Bag Circuit Open, Front Driver Side), go to H2.

  For 2295_30_OD (Side Air Bag Circuit Short to Ground, Front Driver Side), go to H9.

  For 2295_31_OD (Side Air Bag Circuit Short to Battery, Front Driver Side), go to H11.

  For 2295_24_OD (Side Air Bag Circuit Resistance Low, Front Passenger Side), go to H12.

  For 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side), go to H12.

For 2295_26_OD (Side Air Bag Circuit Short to Ground, Front Passenger Side), go to H19.

For (2295_27_OD (Side Air Bag Circuit Short to Battery, Front Passenger Side), go to H21.

NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time.

Using the fault PIDs recorded, go to the appropriate pinpoint test step.

For 2295_28_CM (Side Air Bag Circuit Resistance Low, Front Driver Side), 2295_29_CM (Side Air Bag Circuit Open, Front Driver Side), 2295_24_CM (Side Air Bag Circuit Resistance Low, Front Passenger Side) or 2295_25_CM (Side Air Bag Circuit Open, Front Passenger Side), go to H24.

For (2295_30_CM (Side Air Bag Circuit Short to Ground, Front Driver Side) or 2295_26_CM (Side Air Bag Circuit Short to Ground, Front Passenger Side), go to H26.

For 2295_31_CM (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_CM (Side Air Bag Circuit Short to Battery, Front Passenger Side), go to H27.

H2 CHECK THE DRIVER SIDE AIR BAG MODULE RESISTANCE PID (DS_AB)

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- Enter the following diagnostic mode on the diagnostic tool: DS_AB (Driver Side Impact Air Bag Resistance) Resistance PID
- **Does the resistance PID value read between 1.31 and 4.29 ohms?**

  YES : Go to H23.

  NO : Go to H3.

H3 CHECK THE DRIVER SIDE AIR BAG RESISTANCE PID (DS_AB) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the DS_AB (Driver Side Impact Air Bag Resistance) resistance PID while carrying out a harness test of the driver side air bag circuits and accessible connectors (including any inline connectors) by wiggling connectors and flexing the wire harness.
- **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to H28.

  NO : If the driver side air bag resistance PID is less than 1.31 ohms, go to H4.

  If the driver safety canopy resistance PID is greater than 4.29 ohms, go to H7.

H4 CHECK THE DRIVER SIDE AIR BAG MODULE CIRCUIT FAULT PIDs (2295_28_OD) AND (2295_29_OD) FOR LOW RESISTANCE AND OPEN

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2295_28_OD (Side Air Bag Circuit Resistance Low, Front Driver Side)
  - 2295_29_OD (Side Air Bag Circuit Open, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag disconnected, an open circuit fault would normally be retrieved.
- **Did the driver side air bag on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to H22.

  NO : Go to H5.

H5 CHECK FOR A SHORT BETWEEN DRIVER SEAT SIDE AIR BAG CIRCUITS CR105 (GN/BU) AND RR105 (GY/YE)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Measure the resistance between driver side air bag C328-2, circuit CR105 (GN/BU), harness side and C328-1, circuit RR105 (GY/YE), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to H22.

  NO : Go to H6.

H6 CHECK THE RCM FOR LOW RESISTANCE

- Disconnect: RCM C310a and C310b

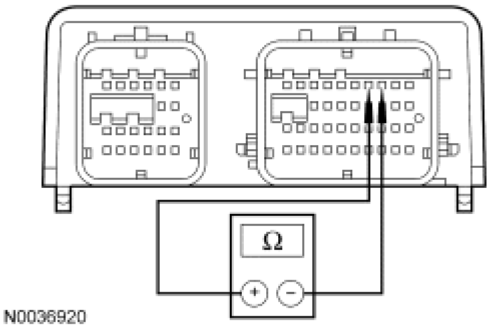

Fig. 53: Checking RCM For Low Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b pin 7, component side, and C310b pin 8, component side.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR105 (GN/BU) and RR105 (GY/YE). Go to H25.

  NO : Go to H23.

H7 CHECK THE DRIVER SIDE AIR BAG MODULE CIRCUIT FAULT PIDs (2295_29_OD) AND (2295_28_OD) FOR AN OPEN AND LOW RESISTANCE

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Side Air Bag Module C328
- Connect a jumper wire between driver side air bag C328-2, circuit CR105 (GN/BU), harness side and C328-1, circuit RR105 (GY/YE), harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2295_28_OD (Side Air Bag Circuit Resistance Low, Front Driver Side)
  - 2295_29_OD (Side Air Bag Circuit Open, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag module circuits shorted together, a low resistance fault would normally be retrieved.
- **Did the driver side air bag on-demand fault PIDs change from indicating an open circuit to a**

low resistance fault?

YES : Go to H22.

NO : Go to H8.

H8 CHECK CIRCUITS CR105 (GN/BU) AND RR105 (GY/YE) FOR AN OPEN BETWEEN THE RCM AND DRIVER SIDE AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the jumper wire from the driver side air bag C328.
- Disconnect: RCM C310a and C310b

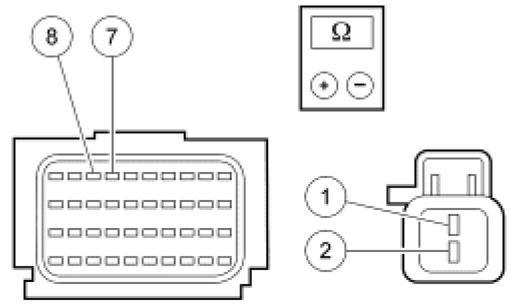

Fig. 54: Checking Circuits CR105 (GN/BU) & RR105 (GY/YE) For An Open Between RCM & Driver Side Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b, harness side and driver seat side air bag C328, harness side using the following chart.

RCM	Circuit	Driver Seat Side Air Bag Module
C310b-8	CR105 (GN/BU)	C328-2
C310b-7	RR105 (GY/YE)	C328-1

- **Are the resistances less than 0.5 ohm?**

YES : Go to H23.

NO : REPAIR circuit CR105 (GN/BU) or RR105 (GY/YE). Go to H28.

H9 CHECK THE DRIVER SIDE AIR BAG MODULE CIRCUIT FAULT PIDs (2295_30_OD) AND (2295_28_OD) FOR A SHORT TO GROUND AND OPEN

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2295_29_OD (Side Air Bag Circuit Open, Front Driver Side)
  - 2295_30_OD (Side Air Bag Circuit Short to Ground, Front Driver Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the driver side air bag module disconnected, an open circuit fault would normally be retrieved.
- **Did the driver side air bag on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to H22.

  NO : Go to H10.

H10 CHECK CIRCUITS CR109 (BN/BU) AND RR109 (BU/GN) FOR A SHORT TO GROUND BETWEEN THE RCM AND DRIVER SIDE AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Measure the resistance between driver side air bag C328-2, circuit CR105 (GN/BU), harness side and ground; and between driver side air bag C328-1, circuit RR105 (GY/YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to H23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR105 (GN/BU) or RR105 (GY/YE). Go to H28.

H11 CHECK CIRCUITS CR105 (GN/BU) AND RR105 (GY/YE) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND DRIVER SIDE AIR BAG MODULE

- Key in OFF position.

- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Side Air Bag Module C328
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

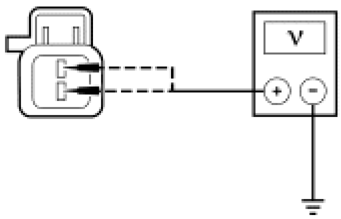

Fig. 55: Checking Circuits CR105 (GN/BU) & RR105 (GY/YE) For A Short To Voltage Between RCM & Driver Side Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - driver side air bag C328-2, circuit CR105 (GN/BU), harness side and ground.
  - driver side air bag C328-1, circuit RR105 (GY/YE), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR105 (GN/BU) or RR105 (GY/YE). Go to H28.

  NO : Go to H23.

H12 CHECK THE PASSENGER SIDE AIR BAG MODULE RESISTANCE PID (PS_AB)

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - PID
- Enter the following diagnostic mode on the diagnostic tool: PS_AB (Passenger Side Impact Air Bag Resistance) Resistance PID
- **Does the resistance PID value read between 1.31 and 4.29 ohms?**

  YES : Go to H23.

  NO : Go to H13.

H13 CHECK THE PASSENGER SIDE AIR BAG RESISTANCE PID (PS_AB) WHILE CARRYING OUT A HARNESS TEST

- Continue monitoring the PS_AB (Passenger Side Impact Air Bag Resistance) resistance PID while

carrying out a harness test of the passenger side air bag circuits and accessible connectors (including any inline connectors), by wiggling connectors and flexing the wire harness.

- **Does the resistance PID value read between 1.31 and 4.29 ohms while carrying out the harness test?**

  YES : DEPOWER the SRS and REPAIR the connector, terminals or wire harness as needed. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to H28.

  NO : If the passenger side air bag resistance PID is less than 1.31 ohms, go to H14.

  If the passenger side air bag resistance PID is greater than 4.29 ohms, go to H17.

H14 CHECK THE PASSENGER SIDE AIR BAG MODULE CIRCUIT FAULT PIDs (2295_24_OD) AND (2295_25_OD) FOR LOW RESISTANCE AND OPEN

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Side Air Bag Module C314
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2295_24_OD (Side Air Bag Circuit Resistance Low, Front Passenger Side)
  - 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag module disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger side air bag on-demand fault PIDs change from indicating a low resistance to an open circuit fault?**

  YES : Go to H22.

  NO : Go to H15.

H15 CHECK FOR A SHORT BETWEEN PASSENGER SEAT SIDE AIR BAG CIRCUITS CR106 (VT/GY) AND RR106 (YE/OG)

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Measure the resistance between passenger side air bag C314-2, circuit CR106 (VT/GY), harness side and C314-1, circuit RR106 (YE/OG), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to H23.

  NO : Go to H16.

H16 CHECK THE RCM FOR LOW RESISTANCE

- Disconnect: RCM C310a and C310b

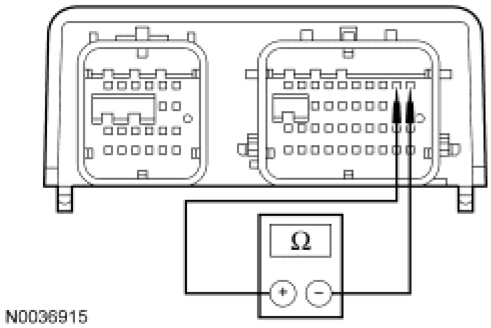

Fig. 56: Checking RCM For Low Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b pin 9, component side, and C310b pin 10, component side.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuits CR106 (VT/GY) and RR106 (YE/OG). Go to H28.

  NO : Go to H23.

H17 CHECK THE PASSENGER SIDE AIR BAG MODULE CIRCUIT FAULT PIDs (2295_25_OD) AND (2295_24_OD) FOR AN OPEN AND LOW RESISTANCE

NOTE:	This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Side Air Bag Module C314
- Connect a jumper wire between passenger side air bag C314-2, circuit CR106 (VT/GY), harness side and C314-1, circuit RR106 (YE/OG), harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2295_24_OD (Side Air Bag Circuit Resistance Low, Front Passenger Side)
  - 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag circuits shorted together, a low resistance fault would normally be retrieved.
- **Did the passenger side air bag on-demand fault PIDs change from indicating an open circuit to a low resistance fault?**

  YES : Go to H22.

  NO : Go to H18.

H18 CHECK CIRCUITS CR106 (VT/GY) AND RR111 (GN/OG) FOR AN OPEN BETWEEN THE RCM AND PASSENGER SIDE AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the jumper wire from the passenger side air bag C314.
- Disconnect: RCM C310a and C310b

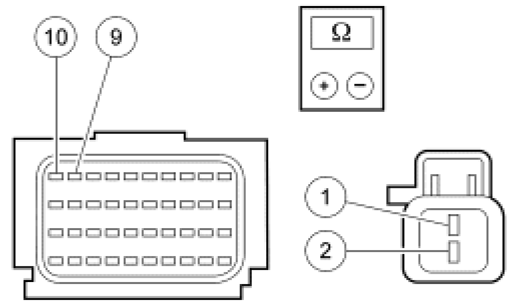

Fig. 57: Checking Circuits CR106 (VT/GY) & RR111 (GN/OG) For An Open Between RCM & Passenger Side Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b, harness side and passenger seat side air bag module C314, harness side using the following chart.

RCM	Circuit	Passenger Seat Side Air Bag Module
C310b-9	CR106 (VT/GY)	C314-2
C310b-10	RR106 (YE/OG)	C314-1

- **Are the resistances less than 0.5 ohm?**

  YES : Go to H23.

  NO : REPAIR circuit CR106 (VT/GY) or RR106 (YE/OG). Go to H28.

H19 CHECK THE PASSENGER SIDE AIR BAG MODULE CIRCUIT FAULT PIDs (2295_26_OD) AND (2295_25_OD) FOR A SHORT TO GROUND AND OPEN

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Side Air Bag Module C314
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record The Following Fault PIDs
  - 2295_25_OD (Side Air Bag Circuit Open, Front Passenger Side)
  - 2295_26_OD (Side Air Bag Circuit Short to Ground, Front Passenger Side)
- **DIAGNOSTIC TIP:** When viewing DTC B2295 on-demand fault PIDs with the passenger side air bag module disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger side air bag on-demand fault PIDs change from indicating a short to ground to an open circuit fault?**

  YES : Go to H22.

  NO : Go to H20.

H20 CHECK CIRCUITS CR106 (VT/GY) AND RR106 (YE/OG) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER SIDE AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

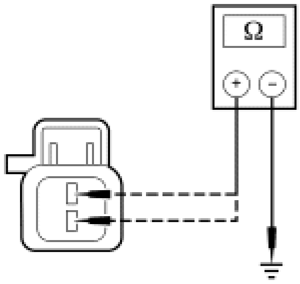

Fig. 58: Checking Circuits CR106 (VT/GY) & RR106 (YE/OG) For A Short To Ground Between RCM & Passenger Side Air Bag Module
Courtesy of FORD MOTOR CO.

- Measure the resistance between:
  - passenger side air bag C314-2, circuit CR106 (VT/GY), harness side and ground.
  - passenger side air bag C314-1, circuit RR106 (YE/OG), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to H23.

  NO : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR106 (VT/GY) or circuit RR106 (YE/OG). Go to H28.

H21 CHECK CIRCUITS CR106 (VT/GY) AND RR106 (YE/OG) FOR A SHORT TO VOLTAGE BETWEEN THE RCM AND PASSENGER SIDE AIR BAG MODULE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Side Air Bag Module C314
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Measure the voltage between:
  - passenger side air bag C314-2, circuit CR106 (VT/GY), harness side and ground.
  - passenger side air bag C314-1, circuit RR106 (YE/OG), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : Due to the shorting bar feature in the RCM electrical connector, the fault can exist in either circuit. Do not remove or defeat the shorting bar.

  REPAIR circuit CR106 (VT/GY) or RR106 (YE/OG). Go to H28.

NO : Go to H23.

H22 CONFIRM THE SIDE AIR BAG MODULE FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Affected Side Air Bag C328 (Driver) C314 (Passenger)
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2295 Fault PIDs
  - Refer to PID list in Normal Operation to view B2295 fault PIDs.
- **Does the original RCM on-demand DTC B2295 fault PID indicate a fault?**

  YES : REMOVE and INSPECT the seat side air bag module jumper harness, connector terminals for damage. REFER to **Side Air Bag Module**. If a concern is found, REPAIR or INSTALL a new seat jumper harness. Go to H28.

  If a concern was not found, INSTALL a new driver or passenger side air bag module. Go to H28.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected.

  For 2295_28_CM (Side Air Bag Circuit Resistance Low, Front Driver Side), 2295_29_CM (Side Air Bag Circuit Open, Front Driver Side), 2295_24_CM (Side Air Bag Circuit Resistance Low, Front Passenger Side) or 2295_25_CM (Side Air Bag Circuit Open, Front Passenger Side), go to H24.

  For (2295_30_CM (Side Air Bag Circuit Short to Ground, Front Driver Side) or 2295_26_CM (Side Air Bag Circuit Short to Ground, Front Passenger Side), go to H26.

  For 2295_31_CM (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_CM (Side Air Bag Circuit Short to Battery, Front Passenger Side), go to H27.

H23 CONFIRM THE RCM FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- If previously directed to disconnect any SRS component(s):
  - depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
  - connect all previously disconnected restraint system component(s), including RCM C310a and C310b.
  - repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2295 Fault PIDs
  - Refer to PID list in Normal Operation to view B2295 fault PIDs.
- **Does the original RCM on-demand DTC B2295 fault PID indicate a fault?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to H28.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. Using the fault PIDs recorded, go to the appropriate pinpoint test step and CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected.

  For 2295_28_CM (Side Air Bag Circuit Resistance Low, Front Driver Side), 2295_29_CM (Side Air Bag Circuit Open, Front Driver Side), 2295_24_CM (Side Air Bag Circuit Resistance Low, Front Passenger Side) or 2295_25_CM (Side Air Bag Circuit Open, Front Passenger Side), go to H24.

  For (2295_30_CM (Side Air Bag Circuit Short to Ground, Front Driver Side) or 2295_26_CM (Side Air Bag Circuit Short to Ground, Front Passenger Side), go to H26.

  For 2295_31_CM (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_CM (Side Air Bag Circuit Short to Battery, Front Passenger Side), go to H27.

H24 CHECK SIDE AIR BAG MODULE CIRCUIT RESISTANCE PIDs FOR AN INTERMITTENT LOW RESISTANCE OR OPEN

- If the fault PID was reported for the driver side air bag module, monitor the DS_AB (Driver Side Impact Air Bag Resistance) resistance PID on the scan tool.
- If the fault PID was reported for the passenger side air bag, monitor the PS_AB (Passenger Side Impact Air Bag Resistance) resistance PID on the scan tool.

NOTE: **A resistance PID that reads between 0.9 and 1.31 ohms or between 4.29 and 5 ohms may or may not set an on-demand DTC yet indicates**

a strong potential of an intermittent fault condition. Make sure to thoroughly check wire harness(es), connectors and terminals as they are the likely source of the fault condition.

- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any side air bag on-demand fault PID indicate a fault is present or is the side air bag resistance PID less than 1.31 ohms or greater than 4.29 ohms?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to H28.

  NO : Go to H25.

H25 CHECK THE HARNESS AND CONNECTORS

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect the affected side air bag module C328 (driver) C314 (passenger):
  - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
  - inspect wire harness for any damage, pinched, cut or pierced wires.
- **Were any concerns found?**

  YES : REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to H28.

  NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to H28.

H26 CHECK SIDE AIR BAG MODULE CIRCUIT FAULT PIDs FOR AN INTERMITTENT SHORT TO GROUND

- If the fault PID was reported for the driver side air bag module, monitor the 2295_30_OD (Side Air Bag Circuit Short to Ground, Front Driver Side) fault PID on the scan tool.
- If the fault PID was reported for the passenger side air bag, monitor the 2295_26_OD (Side Air Bag Circuit Short to Ground, Front Passenger Side) fault PID on the scan tool.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2-second delay for the scan tool display to update.
- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any side air bag on-demand fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING**

DIAGRAMS article for MKZ, Connector Repair Procedures for schematic and connector information. Go to H28.

NO : The fault is not present and cannot be recreated at this time. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to H28.

H27 CHECK SIDE AIR BAG MODULE CIRCUIT FAULT PIDs FOR AN INTERMITTENT SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect the affected side air bag module C328 (driver) C314 (passenger).
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- **DIAGNOSTIC TIP:** When monitoring fault PIDs with the scan tool, it may take up to a 2-second delay for the scan tool display to update.
- Monitor the 2295_31_OD (Side Air Bag Circuit Short to Battery, Front Driver Side) or 2295_27_OD (Side Air Bag Circuit Short to Battery, Front Passenger Side) on-demand fault PIDs on the scan tool.
- Attempt to recreate the fault by wiggling connectors (including any inline connectors) and flexing the wire harness.
- **Does any side air bag on-demand fault PID indicate a fault is present?**

  YES : DEPOWER the SRS and REPAIR as necessary. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information. Go to H28.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to H28.

H28 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

  WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).

- If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test I: DTC B2296 - Restraint System - Impact Sensor Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) continuously communicates with all impact sensors for external and internal sensor data. The RCM also continuously monitors all of the impact sensor circuits for a short to voltage, short to ground and open circuits. If the RCM detects any communication or circuit faults with any of the impact sensors, it will store DTC B2296 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

Fault PIDs[a]	Description	Fault Trigger Condition
2296_18_OD and 2296_18_CM	Driver/Center Front Crash Sensor Internal Fault	When the RCM senses an internal failure with the driver/center front impact sensor, a fault will be indicated.
2296_19_OD and 2296_19_OD	Driver/Center Front Crash Sensor Mount/Communication Fault	When the RCM is unable to communicate with the driver/center front impact sensor, a fault will be indicated.
2296_24_OD and 2296_24_CM	Side Crash Sensor 2 Internal Fault, Passenger side	When the RCM senses an internal failure with the passenger side second row impact sensor, a fault will be indicated.
2296_25_OD and 2296_25_CM	Side Crash Sensor Mount or Communication Fault, Row No.2 Passenger Side	When the RCM is unable to communicate with the passenger side second row impact sensor, a fault will be indicated.

2296_26_OD and 2296_26_CM	Side Crash Sensor 2 Internal Fault, Driver side	When the RCM senses an internal failure with the driver side second row impact sensor, a fault will be indicated.
2296_27_OD and 2296_27_CM	Side Crash Sensor Mount or Communication Fault, Row No.2 Driver Side	When the RCM is unable to communicate with the driver side second row impact sensor, a fault will be indicated.
2296_28_OD and 2296_28_CM	Side Crash Sensor Internal Fault, Front Passenger Side	When the RCM senses an internal failure with the passenger side first row impact sensor, a fault will be indicated.
2296_29_OD and 2296_29_CM	Side Crash Sensor Mount or Communication Fault, Front Passenger Side	When the RCM is unable to communicate with the passenger side first row impact sensor, a fault will be indicated.
2296_30_OD and 2296_30_CM	Side Crash Sensor Internal Fault, Front Driver Side	When the RCM senses an internal failure with the driver/center front impact sensor, a fault will be indicated.
2296_31_OD and 2296_31_CM	Side Crash Sensor Mount or Communication Fault, Front Driver Side	When the RCM is unable to communicate with the driver side first row impact sensor, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2296. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2296.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Impact sensor
- Incorrect sensor mounting
- RCM

PINPOINT TEST I: DTC B2296 - RESTRAINT SYSTEM - IMPACT SENSOR FAULT

WARNING: **Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of**

personal injury or death in a crash.

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Do not probe any impact sensor. The impact sensor can not be tested using a multi-meter.

I1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Do any RCM on-demand DTC B2296 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2296_31_OD (Side Crash Sensor Mount or Communication Fault, Front Driver Side), go to I2.

  For 2296_30_OD (Side Crash Sensor Internal Fault, Front Driver Side), INSTALL a new first row driver side impact sensor. REFER to **Side Impact Sensor - B-Pillar**. Go to I54.

  For 2296_29_OD (Side Crash Sensor Mount or Communication Fault, Front Passenger Side), go to I12.

  For 2296_28_OD (Side Crash Sensor Internal Fault, Front Passenger Side), INSTALL a new first

row passenger side impact sensor. REFER to **Side Impact Sensor - B-Pillar**. Go to I54.

For 2296_27_OD (Side Crash Sensor Mount or Communication Fault, Row No.2 Driver Side), go to I22.

For 2296_26_OD (Side Crash Sensor 2 Internal Fault, Driver side), INSTALL a new second row driver side impact sensor. REFER to **Side Impact Sensor - C-Pillar**. Go to I54.

For 2296_25_OD (Side Crash Sensor Mount or Communication Fault, Row No.2 Passenger Side), go to I32.

For 2296_24_OD (Side Crash Sensor 2 Internal Fault, Passenger side), INSTALL a new second row passenger side impact sensor. REFER to **Side Impact Sensor - C-Pillar**. Go to I54.

For 2296_19_OD (Driver/Center Front Crash Sensor Mount/Communication Fault), go to I42.

For 2296_18_OD (Driver/Center Front Crash Sensor Internal Fault), INSTALL a new front impact severity sensor. REFER to **Front Impact Severity Sensor**. Go to I54.

NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand. The fault condition is not present at this time. Go to I53.

I2 INSPECT THE FIRST ROW DRIVER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Access the first row driver side impact sensor. Refer to **Side Impact Sensor - B-Pillar**.
- Inspect the first row driver side impact sensor for:
  - loose electrical connector.
  - improper mounting.
  - loose sensor mounting bolt.
- Remove the first row driver side impact sensor.
- Visually inspect the first row driver side impact sensor, electrical connector and mounting surface for damage, corrosion or dirt.
- **Was a significant amount of corrosion or dirt found, the first row driver side impact sensor attached to the mounting surface incorrectly or was the impact sensor bolt not fully seated and tightened correctly?**

  YES : CLEAN, TIGHTEN the bolt or REPAIR the mounting surface as necessary. REINSTALL the first row driver side impact sensor. Go to I54.

  NO : Go to I3.

I3 INSTALL THE FIRST ROW DRIVER SIDE IMPACT SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST

- Clean and repair the mounting surface as necessary.

- Clean the first row driver side impact sensor mounting bolt.
- Install the first row driver side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Do any RCM on-demand DTC B2296 fault PIDs indicate a fault?**

  YES : Go to I4.

  NO : Fault corrected. Go to I54.

I4 CHECK THE FIRST ROW DRIVER SIDE IMPACT SENSOR GROUND CIRCUIT RR131 (VT/GY) FOR HIGH RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: First Row Driver Side Impact Sensor C3057
- Measure the resistance between first row driver side impact sensor C3057-2, circuit RR131 (VT/GY), harness side and the first row driver side impact sensor case ground.
- **Is the resistance less than 10 ohms?**

  YES : Go to I6.

  NO : Go to I5.

I5 CLEAN THE FIRST ROW DRIVER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF TEST

- Remove the first row driver side impact sensor.
- Clean and repair the mounting surface as necessary.
- Clean the first row driver side impact sensor mounting bolt.
- Install the first row driver side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Do any RCM on-demand DTC B2296 fault PIDs indicate a fault?**

  YES : Go to I6.

  NO : Fault corrected. Go to I54.

I6 CHECK FIRST ROW DRIVER SIDE IMPACT SENSOR CIRCUITS VR217 (GY/YE) AND RR131 (VT/GY) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: First Row Driver Side Impact Sensor C3057
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

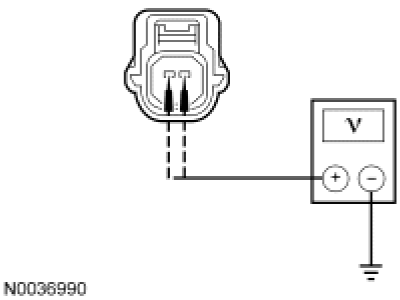

Fig. 59: Checking First Row Driver Side Impact Sensor Circuits VR217 (GY/YE) & RR131 (VT/GY) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - first row driver side impact sensor C3057-2, circuit RR131 (VT/GY), harness side and ground.
  - first row driver side impact sensor C3057-1, circuit VR217 (GY/YE), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : REPAIR circuit VR217 (GY/YE) or circuit RR131 (VT/GY). Go to I54.

  NO : Go to I7.

I7 CHECK FIRST ROW DRIVER SIDE IMPACT SENSOR CIRCUITS VR217 (GY/YE) AND CIRCUIT RR131 (VT/GY) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

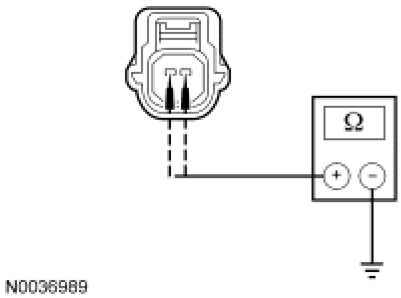

Fig. 60: Checking First Row Driver Side Impact Sensor Circuits VR217 (GY/YE) & RR131 (VT/GY) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between first row driver side impact sensor C3057-2, circuit RR131 (VT/GY), harness side and ground; and between C3057-1, circuit VR217 (GY/YE), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to I8.

  NO : REPAIR short to ground in circuit VR217 (GY/YE) or circuit RR131 (VT/GY). Go to I54.

I8 CHECK CIRCUIT VR217 (GY/YE) FOR AN OPEN BETWEEN THE RCM AND FIRST ROW DRIVER SIDE IMPACT SENSOR

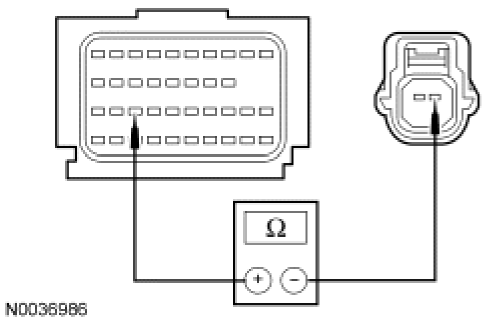

Fig. 61: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-28, circuit VR217 (GY/YE), harness side and first row driver side impact sensor C3057-1, circuit VR217 (GY/YE), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to I9.

  NO : REPAIR circuit VR217 (GY/YE). Go to I54.

I9 CHECK CIRCUIT RR131 (VT/GY) FOR AN OPEN BETWEEN THE RCM AND FIRST ROW DRIVER SIDE IMPACT SENSOR

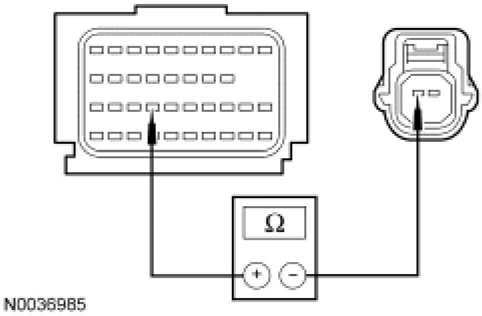

Fig. 62: Checking Circuit RR131 (VT/GY) For An Open Between RCM & First Row Driver Side Impact Sensor
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-27, circuit RR131 (VT/GY), harness side and first row driver side impact sensor C3057-2, circuit RR131 (VT/GY), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to I10.

  NO : REPAIR circuit RR131 (VT/GY). Go to I54.

I10 CHECK FOR A SHORT BETWEEN FIRST ROW DRIVER SIDE IMPACT SENSOR CIRCUITS VR217 (GY/YE) AND RR131 (VT/GY)

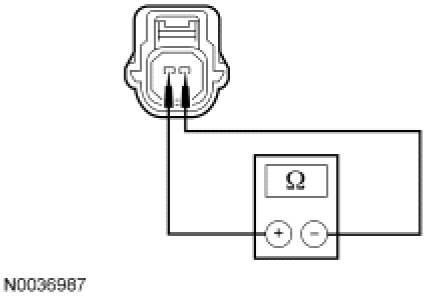

Fig. 63: Checking For A Short Between First Row Driver Side Impact Sensor Circuits VR217 (GY/YE) & RR131 (VT/GY)
Courtesy of FORD MOTOR CO.

- Measure the resistance between first row driver side impact sensor C3057-1, circuit VR217 (GY/YE), harness side and C3057-2, circuit RR131 (VT/GY), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to I11.

  NO : REPAIR circuit VR217 (GY/YE) and circuit RR131 (VT/GY). Go to I54.

I11 CHECK THE FIRST ROW DRIVER SIDE IMPACT SENSOR

- Connect: RCM C310a and C310b
- Install a known good first row driver side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint**

System (SRS) Depowering and Repowering.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Do any RCM fault PIDs for the first row driver side impact sensor indicate a fault?**

  YES : Go to I52.

  NO : Fault corrected. Go to I54.

I12 INSPECT THE FIRST ROW PASSENGER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Access the first row passenger side impact sensor. Refer to **Side Impact Sensor - B-Pillar**.
- Inspect the first row passenger side impact sensor for:
  - loose electrical connector.
  - incorrect mounting.
  - loose sensor mounting bolt.
- Remove the first row passenger side impact sensor.
- Visually inspect the first row passenger side impact sensor, electrical connector and mounting surface for damage, corrosion or dirt.
- **Was a significant amount of corrosion or dirt found, the first row passenger side impact sensor attached to the mounting surface incorrectly or was the impact sensor bolt not fully seated and tightened correctly?**

  YES : CLEAN, TIGHTEN the bolt or REPAIR the mounting surface as necessary. REINSTALL the first row passenger side impact sensor. Go to I54.

  NO : Go to I13.

I13 INSTALL THE FIRST ROW PASSENGER SIDE IMPACT SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST

- Clean and repair the mounting surface as necessary.
- Clean the first row passenger side impact sensor mounting bolt.
- Install the first row passenger side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.

- **Do any RCM on-demand DTC B2296 fault PIDs indicate a fault?**

  YES : Go to I14.

  NO : Fault corrected. Go to I54.

I14 CHECK THE FIRST ROW PASSENGER SIDE IMPACT SENSOR GROUND CIRCUIT RR132 (BU/WH) FOR HIGH RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: First Row Passenger Side Impact Sensor C3058
- Measure the resistance between the first row passenger side impact sensor C3058-2, circuit RR132 (BU/WH), harness side and the first row passenger side impact sensor case ground.
- **Is the resistance less than 10 ohms?**

  YES : Go to I16.

  NO : Go to I15.

I15 CLEAN THE FIRST ROW PASSENGER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF TEST

- Remove the first row passenger side impact sensor.
- Clean and repair the mounting surface as necessary.
- Clean the first row passenger side impact sensor mounting bolt and ground wire.
- Install the first row passenger side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Do any RCM on-demand DTC B2296 fault PIDs indicate a fault?**

  YES : Go to I16.

  NO : Fault corrected. Go to I54.

I16 CHECK FIRST ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS VR218 (YE/OG) AND RR132 (BU/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: First Row Passenger Side Impact Sensor C3058
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

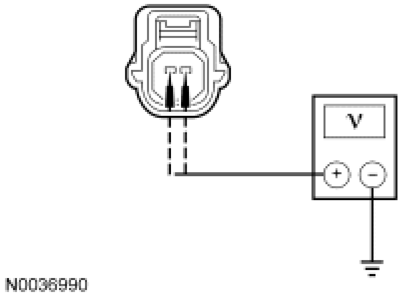

Fig. 64: Checking First Row Passenger Side Impact Sensor Circuits VR218 (YE/OG) & RR132 (BU/WH) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - first row passenger side impact sensor C3058-1, circuit VR218 (YE/OG), harness side and ground.
  - first row passenger side impact sensor C3058-2, circuit RR132 (BU/WH), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : REPAIR circuit VR218 (YE/OG) or circuit RR132 (BU/WH). Go to I54.

  NO : Go to I17.

I17 CHECK FIRST ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS VR218 (YE/OG) AND RR132 (BU/WH) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

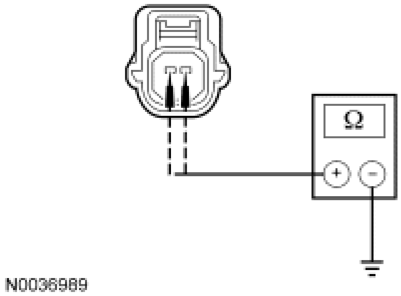

Fig. 65: Checking First Row Passenger Side Impact Sensor Circuits VR218 (YE/OG) & RR132 (BU/WH) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between first row passenger side impact sensor C3058-1, circuit VR218 (YE/OG), harness side and ground; and between C3058-2, circuit RR132 (BU/WH), harness side and ground.

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to I18.

  NO : REPAIR circuit VR218 (YE/OG) or circuit RR132 (BU/WH). Go to I54.

I18 CHECK CIRCUIT VR218 (YE/OG) FOR AN OPEN BETWEEN THE RCM AND FIRST ROW PASSENGER SIDE IMPACT SENSOR

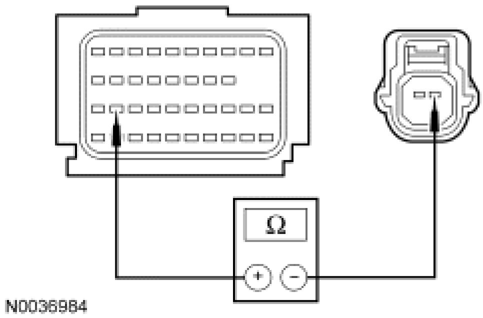

Fig. 66: Checking Circuit VR218 (YE/OG) For An Open Between RCM & First Row Passenger Side Impact Sensor
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-29, circuit VR218 (YE/OG), harness side and first row passenger side impact sensor C3058-1, circuit VR218 (YE/OG), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to I19.

  NO : REPAIR circuit VR218 (YE/OG). Go to I54.

I19 CHECK CIRCUIT RR132 (BU/WH) FOR AN OPEN BETWEEN THE RCM AND FIRST ROW PASSENGER SIDE IMPACT SENSOR

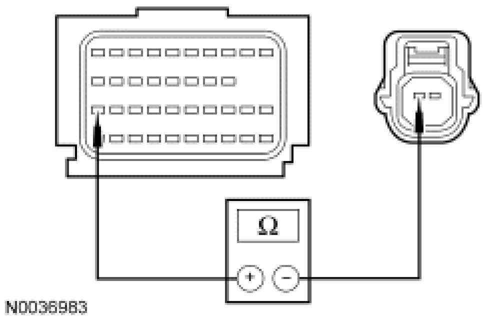

Fig. 67: Checking Circuit RR132 (BU/WH) For An Open Between RCM & First Row Passenger Side Impact Sensor
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-30, circuit RR132 (BU/WH), harness side and first row passenger side impact sensor C3058-2, circuit RR132 (BU/WH), harness side.
- **Is the resistance less than 0.5 ohm?**

YES : Go to I20.

NO : REPAIR circuit RR132 (BU/WH). Go to I54.

I20 CHECK FOR A SHORT BETWEEN FIRST ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS VR218 (YE/OG) AND RR132 (BU/WH)

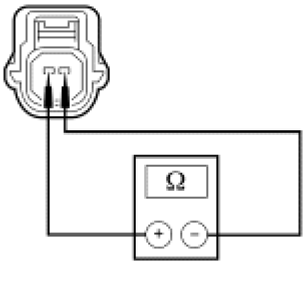

Fig. 68: Checking For A Short Between First Row Passenger Side Impact Sensor Circuits VR218 (YE/OG) & RR132 (BU/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between first row passenger side impact sensor C3058-1, circuit VR218 (YE/OG), harness side and C3058-2, circuit RR132 (BU/WH), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to I21.

  NO : REPAIR short between circuits VR218 (YE/OG) and RR132 (BU/WH). Go to I54.

I21 CHECK THE FIRST ROW PASSENGER SIDE IMPACT SENSOR

- Connect: RCM C310a and C310b
- Install a known good first row passenger side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any fault PIDs for the first row passenger side impact sensor indicating a fault?**

  YES : Go to I52.

  NO : Fault corrected. Go to I54.

I22 INSPECT THE SECOND ROW DRIVER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Access the second row driver side impact sensor. Refer to **Side Impact Sensor - C-Pillar**.
- Inspect the second row driver side impact sensor mounting and make sure that the retaining bolt is fully seated and tightened correctly.
- Remove the second row driver side impact sensor.
- Visually inspect the second row driver side impact sensor and mounting surface for damage, corrosion or dirt.
- **Was a significant amount of corrosion or dirt found, the second row driver side impact sensor attached to the mounting surface incorrectly or was the impact sensor bolt not fully seated and tightened correctly?**

  YES : CLEAN, TIGHTEN the bolt or REPAIR the mounting surface as necessary. REINSTALL the second row driver side impact sensor. Go to I54.

  NO : Go to I23.

I23 INSTALL THE SECOND ROW DRIVER SIDE IMPACT SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST

- Clean and repair the mounting surface as necessary.
- Clean the second row driver side impact sensor mounting bolt.
- Install the second row driver side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any fault PIDs for the second row driver side impact sensor indicating a fault?**

  YES : Go to I24.

  NO : Fault corrected. Go to I54.

I24 CHECK THE SECOND ROW DRIVER SIDE IMPACT SENSOR GROUND CIRCUIT RR133 (GY/BN) FOR HIGH RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Second Row Driver Side Impact Sensor C3059
- Measure the resistance between second row driver side impact sensor C3059-2, circuit RR133 (GY/BN), harness side and the second row driver side impact sensor case ground.
- **Is the resistance less than 10 ohms?**

  YES : Go to I26.

  NO : Go to I25.

I25 CLEAN THE SECOND ROW DRIVER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF TEST

- Remove the second row driver side impact sensor.
- Clean and repair the mounting surface as necessary.
- Clean the second row driver side impact sensor mounting bolt.
- Install the second row driver side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any fault PIDs for the second row driver side impact sensor indicating a fault?**

  YES : Go to I26.

  NO : Fault corrected. Go to I54.

I26 CHECK SECOND ROW DRIVER SIDE IMPACT SENSOR CIRCUITS VR219 (GN/WH) AND RR133 (GY/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Second Row Driver Side Impact Sensor C3059
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

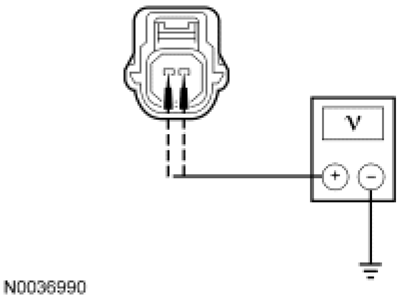

Fig. 69: Checking Second Row Driver Side Impact Sensor Circuits VR219 (GN/WH) & RR133 (GY/BN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - second row driver side impact sensor C3059-1, circuit VR219 (GN/WH), harness side and ground.

- second row driver side impact sensor C3059-2, circuit RR133 (GY/BN), harness side and ground.

- **Is any voltage present on either circuit?**

  YES : REPAIR circuit VR219 (GN/WH) or circuit RR133 (GY/BN). Go to I54.

  NO : Go to I27.

I27 CHECK SECOND ROW DRIVER SIDE IMPACT SENSOR CIRCUITS VR219 (GN/WH) AND RR133 (GY/BN) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

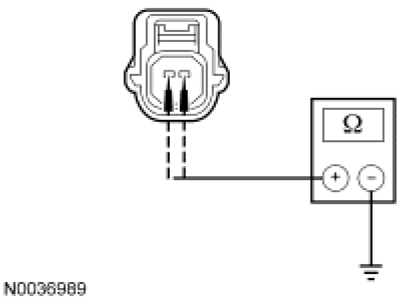

Fig. 70: Checking Second Row Driver Side Impact Sensor Circuits VR219 (GN/WH) & RR133 (GY/BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between second row driver side impact sensor C3059-1, circuit VR219 (GN/WH), harness side and ground; and between C3059-2, circuit RR133 (GY/BN), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to I28.

  NO : REPAIR circuit VR219 (GN/WH) or circuit RR133 (GY/BN). Go to I54.

I28 CHECK CIRCUIT VR219 (GN/WH) FOR AN OPEN BETWEEN THE RCM AND SECOND ROW DRIVER SIDE IMPACT SENSOR

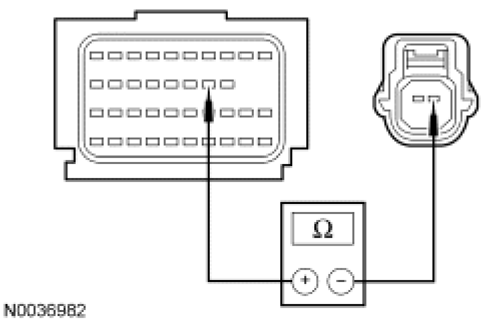

Fig. 71: Checking Circuit VR219 (GN/WH) For An Open Between RCM & Second Row

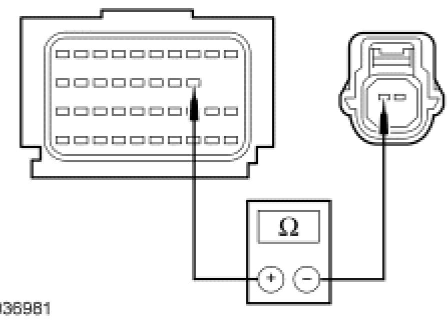
Driver Side Impact Sensor
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-14, circuit VR219 (GN/WH), harness side and second row driver side impact sensor C3059-1, circuit VR219 (GN/WH), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to I29.

  NO : REPAIR circuit VR219 (GN/WH). Go to I54.

I29 CHECK CIRCUIT RR133 (GY/BN) FOR AN OPEN BETWEEN THE RCM AND SECOND ROW DRIVER SIDE IMPACT SENSOR



N0036981

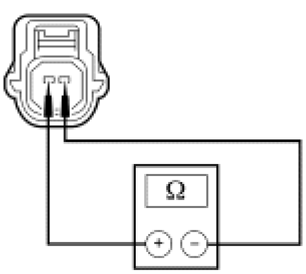
Fig. 72: Checking Circuit RR133 (GY/BN) For An Open Between RCM & Second Row Driver Side Impact Sensor
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-13, circuit RR133 (GY/BN), harness side and second row driver side impact sensor C3059-2, circuit RR133 (GY/BN), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to I30.

  NO : REPAIR circuit RR133 (GY/BN). Go to I54.

I30 CHECK FOR A SHORT BETWEEN SECOND ROW DRIVER SIDE IMPACT SENSOR CIRCUITS VR219 (GN/WH) AND RR133 (GY/BN)



N0036987

Fig. 73: Checking For A Short Between Second Row Driver Side Impact Sensor Circuits VR219 (GN/WH) & RR133 (GY/BN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between second row driver side impact sensor C3059-1, circuit VR219 (GN/WH), harness side and C3059-2, circuit RR133 (GY/BN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to I31.

  NO : REPAIR circuit VR219 (GN/WH) or circuit RR133 (GY/BN). Go to I54.

I31 CHECK THE SECOND ROW DRIVER SIDE IMPACT SENSOR

- Connect: RCM C310a and C310b
- Install a known good second row driver side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any fault PIDs for the second row driver side impact sensor indicating a fault?**

  YES : Go to I52.

  NO : Fault corrected. Go to I54.

I32 INSPECT THE SECOND ROW PASSENGER SIDE IMPACT SENSOR MOUNTING AND MOUNTING SURFACE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Access the second row passenger side impact sensor. Refer to **Side Impact Sensor - C-Pillar**.
- Inspect the second row passenger side impact sensor mounting and make sure that the retaining bolt is fully seated and tightened correctly.
- Remove the second row passenger side impact sensor.
- Visually inspect the second row passenger side impact sensor and mounting surface for damage, corrosion or dirt.
- **Was a significant amount of corrosion or dirt found, the second row passenger side impact sensor attached to the mounting surface incorrectly or was the impact sensor bolt not fully seated and tightened correctly?**

  YES : CLEAN, TIGHTEN the bolt or REPAIR the mounting surface as necessary. REINSTALL the second row passenger side impact sensor. Go to I54.

  NO : Go to I33.

I33 INSTALL THE SECOND ROW PASSENGER SIDE IMPACT SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST

- Clean and repair the mounting surface as necessary.
- Clean the second row passenger side impact sensor mounting bolt.
- Install the second row passenger side impact sensor.

- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
    - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any fault PIDs for the second row passenger side impact sensor indicating a fault?**

  YES : Go to I34.

  NO : Fault corrected. Go to I54.

I34 CHECK THE SECOND ROW PASSENGER SIDE IMPACT SENSOR GROUND CIRCUIT RR134 (BN/BU) FOR HIGH RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Second Row Passenger Side Impact Sensor C3060
- Measure the resistance between second row passenger side impact sensor C3060-2, circuit RR134 (BN/BU), harness side and the second row passenger side impact sensor case ground.
- **Is the resistance less than 10 ohms?**

  YES : Go to I36.

  NO : Go to I35.

I35 CLEAN THE SECOND ROW PASSENGER SIDE IMPACT SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF TEST

- Remove the second row passenger side impact sensor.
- Clean and repair the mounting surface as necessary.
- Clean the second row passenger side impact sensor mounting bolt.
- Install the second row passenger side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
    - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any fault PIDs for the second row passenger side impact sensor indicating a fault?**

  YES : Go to I36.

  NO : Fault corrected. Go to I54.

I36 CHECK SECOND ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS VR220 (VT/OG) AND RR134 (BN/BU) FOR A SHORT TO VOLTAGE

- Key in OFF position.

- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Second Row Passenger Side Impact Sensor C3060
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

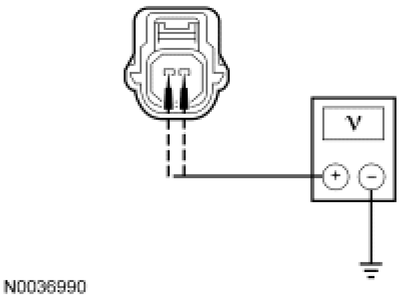


Fig. 74: Checking Second Row Passenger Side Impact Sensor Circuits VR220 (VT/OG) & RR134 (BN/BU) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - second row passenger side impact sensor C3060-1, circuit VR220 (VT/OG), harness side and ground.
  - second row passenger side impact sensor C3060-2, circuit RR134 (BN/BU), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : REPAIR circuit VR220 (VT/OG) or circuit RR134 (BN/BU). Go to I54.

  NO : Go to I37.

I37 CHECK SECOND ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS VR220 (VT/OG) AND RR134 (BN/BU) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

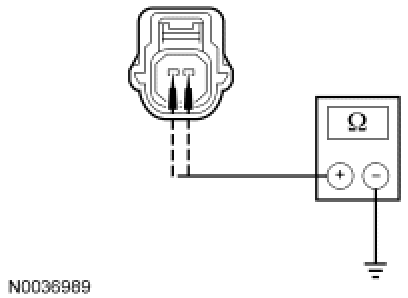

Fig. 75: Checking Second Row Passenger Side Impact Sensor Circuits VR220 (VT/OG) & RR134 (BN/BU) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between second row passenger side impact sensor C3060-1, circuit VR220 (VT/OG), harness side and ground; and between C3060-2, circuit RR134 (BN/BU), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to I38.

  NO : REPAIR circuit VR220 (VT/OG) or circuit RR134 (BN/BU). Go to I54.

I38 CHECK CIRCUIT VR220 (VT/OG) FOR AN OPEN BETWEEN THE RCM AND SECOND ROW PASSENGER SIDE IMPACT SENSOR

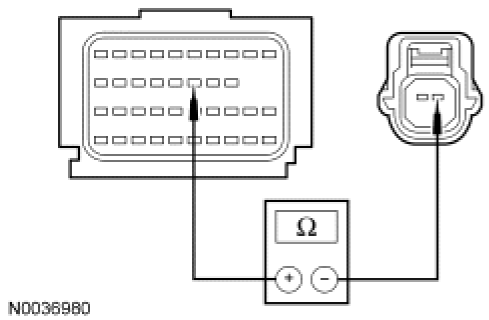

Fig. 76: Checking Circuit VR220 (VT/OG) For An Open Between RCM & Second Row Passenger Side Impact Sensor
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-15, circuit VR220 (VT/OG), harness side and second row passenger side impact sensor C3060-1, circuit VR220 (VT/OG), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to I39.

  NO : REPAIR circuit VR220 (VT/OG). Go to I54.

I39 CHECK CIRCUIT RR134 (BN/BU) FOR AN OPEN BETWEEN THE RCM AND SECOND ROW PASSENGER SIDE IMPACT SENSOR

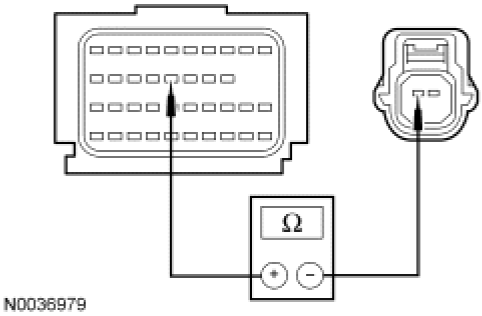

Fig. 77: Checking Circuit RR134 (BN/BU) For An Open Between RCM & Second Row Passenger Side Impact Sensor
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-16, circuit RR134 (BN/BU), harness side and second row passenger side impact sensor C3060-2, circuit RR134 (BN/BU), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to I40.

  NO : REPAIR circuit RR134 (BN/BU). Go to I54.

I40 CHECK FOR A SHORT BETWEEN SECOND ROW PASSENGER SIDE IMPACT SENSOR CIRCUITS VR220 (VT/OG) AND RR134 (BN/BU)

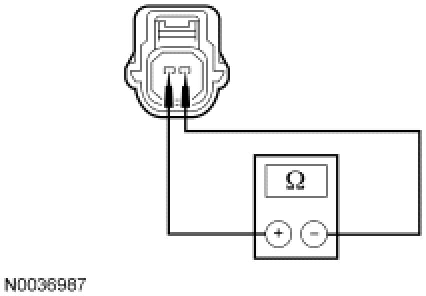

Fig. 78: Checking For A Short Between Second Row Passenger Side Impact Sensor Circuits VR220 (VT/OG) & RR134 (BN/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between second row passenger side impact sensor C3060-1, circuit VR220 (VT/OG), harness side and C3060-2, circuit RR134 (BN/BU), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to I41.

  NO : REPAIR circuits VR220 (VT/OG) and RR134 (BN/BU). Go to I54.

I41 CHECK THE SECOND ROW PASSENGER SIDE IMPACT SENSOR

- Connect: RCM C310a and C310b
- Install a known good second row passenger side impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint**

System (SRS) Depowering and Repowering.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any fault PIDs for the second row passenger side impact sensor indicating a fault?**

  YES : Go to I52.

  NO : Fault corrected. Go to I54.

I42 INSPECT THE FRONT IMPACT SEVERITY SENSOR MOUNTING AND MOUNTING SURFACE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Inspect the front impact severity sensor mounting and make sure that the retaining bolts are fully seated and tightened correctly.
- Remove the front impact severity sensor. Refer to **Front Impact Severity Sensor**.
- Visually inspect the front impact severity sensor and mounting surface for damage, corrosion or dirt.
- **Was a significant amount of corrosion or dirt found, the front impact severity sensor attached to the mounting surface incorrectly or were the front impact severity sensor bolts not fully seated and tightened correctly?**

  YES : CLEAN, TIGHTEN bolts or REPAIR the mounting surface as necessary. REINSTALL the front impact severity sensor. Go to I54.

  NO : Go to I43.

I43 INSTALL THE FRONT IMPACT SEVERITY SENSOR AND CARRY OUT THE ON-DEMAND SELF TEST

- Clean and repair the mounting surface as necessary.
- Clean the front impact severity sensor mounting bolt.
- Install the front impact severity sensor. Refer to **Front Impact Severity Sensor**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any fault PIDs for the front impact severity sensor indicating a fault?**

  YES : Go to I44.

  NO : Fault corrected. Go to I54.

I44 CHECK THE FRONT IMPACT SEVERITY SENSOR GROUND CIRCUIT RR129 (YE/GY) FOR HIGH RESISTANCE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Front Impact Severity Sensor C177
- Measure the resistance between front impact severity sensor C177-2, circuit RR129 (YE/GY), harness side and the front impact severity sensor case ground.
- **Is the resistance less than 10 ohms?**

  YES : Go to I46.

  NO : Go to I45.

I45 CLEAN THE FRONT IMPACT SEVERITY SENSOR MOUNTING SURFACE AND CARRY OUT THE ON-DEMAND SELF TEST

- Remove the front impact severity sensor. Refer to **Front Impact Severity Sensor**.
- Clean and repair the mounting surface as necessary.
- Clean the front impact severity sensor mounting bolts.
- Install the front impact severity sensor. Refer to **Front Impact Severity Sensor**.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any fault PIDs for the front impact severity sensor indicating a fault?**

  YES : Go to I46.

  NO : Fault corrected. Go to I54.

I46 CHECK FRONT IMPACT SEVERITY SENSOR CIRCUITS VR213 (VT/GN) AND RR129 (YE/GY) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Front Impact Severity Sensor C177
- Disconnect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

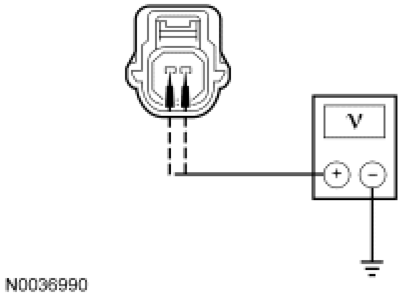

Fig. 79: Checking Front Impact Severity Sensor Circuits VR213 (VT/GN) & RR129 (YE/GY) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between:
  - front impact severity sensor C177-1, circuit VR213 (VT/GN), harness side and ground.
  - front impact severity sensor C177-2, circuit RR129 (YE/GY), harness side and ground.
- **Is any voltage present on either circuit?**

  YES : REPAIR circuit VR213 (VT/GN) or circuit RR129 (YE/GY). Go to I54.

  NO : Go to I47.

I47 CHECK FRONT IMPACT SEVERITY SENSOR CIRCUITS VR213 (VT/GN) AND RR129 (YE/GY) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

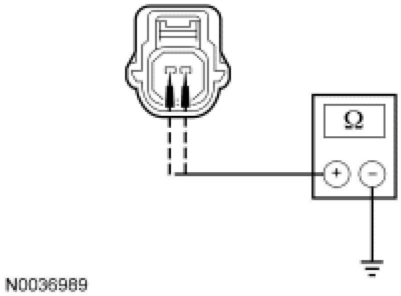

Fig. 80: Checking Front Impact Severity Sensor Circuits VR213 (VT/GN) & RR129 (YE/GY) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between front impact severity sensor C177-1, circuit VR213 (VT/GN), harness side and ground; and between front impact severity sensor C177-2, circuit RR129 (YE/GY), harness side and ground.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to I48.

NO : REPAIR circuit VR213 (VT/GN) or circuit RR129 (YE/GY). Go to I54.

I48 CHECK CIRCUIT VR213 (VT/GN) FOR AN OPEN BETWEEN THE RCM AND FRONT IMPACT SEVERITY SENSOR

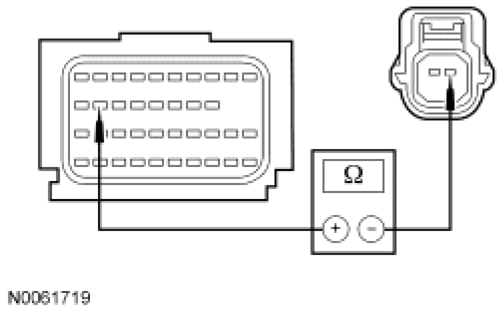

Fig. 81: Checking Circuit VR213 (VT/GN) For An Open Between RCM & Front Impact Severity Sensor
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-19, circuit VR213 (VT/GN), harness side and front impact severity sensor C177-1, circuit VR213 (VT/GN), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to I49.

  NO : REPAIR circuit VR213 (VT/GN). Go to I54.

I49 CHECK CIRCUIT RR129 (YE/GY) FOR AN OPEN BETWEEN THE RCM AND FRONT IMPACT SEVERITY SENSOR

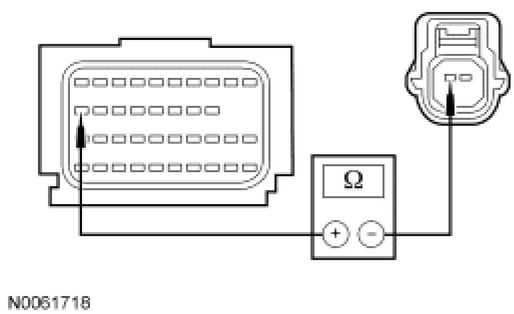

Fig. 82: Checking Circuit RR129 (YE/GY) For An Open Between RCM & Front Impact Severity Sensor
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-20, circuit RR129 (YE/GY), harness side and front impact severity sensor C177-2, circuit RR129 (YE/GY), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to I50.

  NO : REPAIR circuit RR129 (YE/GY). Go to I54.

I50 CHECK FOR A SHORT BETWEEN FRONT IMPACT SEVERITY SENSOR CIRCUITS VR213 (VT/GN) AND RR129 (YE/GY)

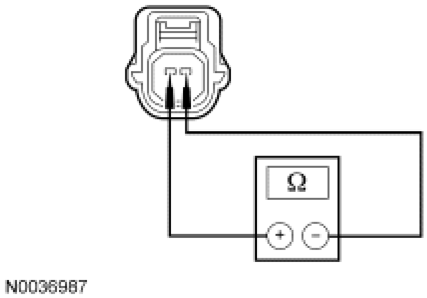

Fig. 83: Checking For A Short Between Front Impact Severity Sensor Circuits VR213 (VT/GN) & RR129 (YE/GY)
Courtesy of FORD MOTOR CO.

- Measure the resistance between front impact severity sensor C177-1, circuit VR213 (VT/GN), harness side and C177-2, circuit RR129 (YE/GY), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to I51.

  NO : REPAIR circuits VR213 (VT/GN) and RR129 (YE/GY). Go to I54.

I51 CHECK THE FRONT IMPACT SEVERITY SENSOR

- Connect: RCM C310a and C310b
- Install a known good front impact severity sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Were any fault PIDs for the front impact severity sensor indicating a fault?**

  YES : Go to I52.

  NO : Fault corrected. Go to I54.

I52 CONFIRM THE RCM FAULT

NOTE:	**Make sure all restraint system component electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and**

Repowering.

- Install the original impact sensor.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Does the original RCM on-demand DTC B2296 fault PID indicate a fault?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to I54.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to I54.

I53 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2296 Fault PIDs
  - Refer to PID list in Normal Operation to view B2296 fault PIDs.
- **Do any RCM on-demand DTC B2296 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is now present. The fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Using the fault PIDs recorded, go to the appropriate pinpoint test step.

  For 2296_31_OD (Side Crash Sensor Mount or Communication Fault, Front Driver Side), go to I2.

  For 2296_30_OD (Side Crash Sensor Internal Fault, Front Driver Side), INSTALL a new first row driver side impact sensor. REFER to **Side Impact Sensor - B-Pillar**. Go to I54.

  For 2296_29_OD (Side Crash Sensor Mount or Communication Fault, Front Passenger Side), go to I12.

  For 2296_28_OD (Side Crash Sensor Internal Fault, Front Passenger Side), INSTALL a new first row passenger side impact sensor. REFER to **Side Impact Sensor - B-Pillar**. Go to I54.

  For 2296_27_OD (Side Crash Sensor Mount or Communication Fault, Row No.2 Driver Side), go to I22.

  For 2296_26_OD (Side Crash Sensor 2 Internal Fault, Driver side), INSTALL a new second row

driver side impact sensor. REFER to **Side Impact Sensor - C-Pillar**. Go to I54.

For 2296_25_OD (Side Crash Sensor Mount or Communication Fault, Row No.2 Passenger Side), go to I32.

For 2296_24_OD (Side Crash Sensor 2 Internal Fault, Passenger side), INSTALL a new second row passenger side impact sensor. REFER to **Side Impact Sensor - C-Pillar**. Go to I54.

For 2296_19_OD (Driver/Center Front Crash Sensor Mount/Communication Fault), go to I42.

For 2296_18_OD (Driver/Center Front Crash Sensor Internal Fault), INSTALL a new front impact severity sensor. REFER to **Front Impact Severity Sensor**. Go to I54.

NO : The fault is not present and cannot be recreated at this time.

VISUALLY INSPECT the affected impact sensor, mounting surface for damage, corrosion or dirt. INSPECT the wiring, terminals and connectors for damage, corrosion or dirt. CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. ACTIVATE other systems in the same wire harness. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to I54.

I54 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

  WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test J: DTC B2434 - Drivers Seat Belt Buckle Switch Circuit Short to Ground

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and

connector information.

Normal Operation

As part of the supplemental restraint system (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the restraints control module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules. If the RCM detects current out of this range, it will store DTC B2434 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2434 Drivers Seat Belt Buckle Switch Circuit Short to Ground - If the RCM detects a short to ground on the driver safety belt buckle circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver safety belt buckle switch
- RCM

PINPOINT TEST J: DTC B2434 - DRIVERS SEAT BELT BUCKLE SWITCH CIRCUIT SHORT TO GROUND

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

J1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2434 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to J2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to J5.

J2 CHECK DRIVER SAFETY BELT BUCKLE SWITCH FOR A SHORT TO GROUND BETWEEN THE RCM

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Buckle Switch C3296
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch disconnected, an open circuit fault would normally be retrieved.
- **Did the driver safety belt buckle switch on-demand DTC change from indicating B2434 to B2691?**

  YES : INSTALL a new driver safety belt buckle assembly. REFER to **SAFETY BELT SYSTEM** article. Go to J6.

  NO : Go to J3.

J3 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

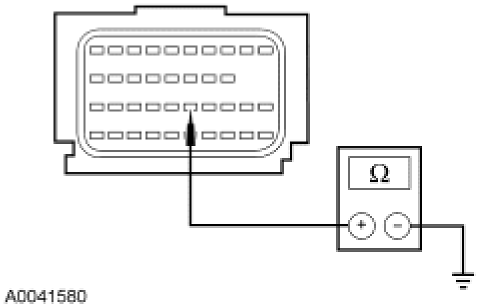

Fig. 84: Checking Driver Safety Belt Buckle Switch Circuit For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure resistance between RCM C310b-25, circuit CR201 (GN/BU), harness side and ground.
- **Is resistance greater than 10,000 ohms?**

  YES : Go to J4.

  NO : REPAIR circuit CR201 (GN/BU). Go to J6.

J4 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system component electrical connectors and the RCM electrical connectors are connected before carrying out the self test. If not, erroneous DTCs will be recorded.

- Connect: Driver Safety Belt Buckle Switch C3296
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2434 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to J6.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to J6.

J5 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2434 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to J2.

NO : The fault is not present and cannot be recreated at this time.

CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to J6.

J6 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

> WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test K: DTC B2435 - Drivers Seat Belt Buckle Switch Resistance Out of Range

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the supplemental restraint system (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the restraints control module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules. If the RCM detects current out of this range, it will store DTC B2435 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC B2435 Drivers Seat Belt Buckle Switch Resistance Out of Range - If the RCM detects a current out of range between buckled and unbuckled on the driver safety belt buckle switch, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver safety belt buckle and pretensioner assembly
- RCM

PINPOINT TEST K: DTC B2435 - DRIVERS SEAT BELT BUCKLE SWITCH RESISTANCE OUT OF RANGE

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

K1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2435 retrieved?**

YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to K2.

NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to K4.

K2 CHECK THE SAFETY BELT BUCKLE SWITCH

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Safety Belt Buckle Switch C3296
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch disconnected, an open circuit fault would normally be retrieved.
- **Did the driver safety belt buckle switch on-demand DTC change from indicating B2435 to B2691?**

  YES : INSTALL a new driver safety belt buckle assembly. REFER to **SAFETY BELT SYSTEM** article. Go to K5.

  NO : Go to K3.

K3 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Driver Safety Belt Buckle Switch C3296
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2435 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to K5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to K4.

K4 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect the driver safety belt buckle switch C3296:
  - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.

  - inspect wire harness for any damage, pinched, cut or pierced wires.
  - repair any concerns found. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information.
- Connect: All Previously Disconnected Component(s) - Connector(s)
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2435 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test.

  Go to K2.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to K5.

K5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test L: DTC B2438 - Passengers Seat Belt Buckle Switch Short to Ground

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and

connector information.

Normal Operation

As part of the supplemental restraint system (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the restraints control module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules. If the RCM detects current out of this range, it will store DTC B2438 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

- DTC B2438 Passenger's Seat Belt Buckle Switch Circuit Short to Ground - If the RCM detects a short to ground on the passenger safety belt buckle circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

PINPOINT TEST L: DTC B2438 - PASSENGERS SEAT BELT BUCKLE SWITCH SHORT TO GROUND

WARNING: Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

L1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2438 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to L2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to L5.

L2 CHECK CIRCUIT CR203 (GY/VT) FOR A SHORT TO GROUND BETWEEN THE RCM AND PASSENGER SAFETY BELT BUCKLE SWITCH

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Buckle Switch C3295/C3301
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2438 to B2692?**

  YES : INSTALL a new passenger safety belt buckle assembly. REFER to **SAFETY BELT SYSTEM** article. Go to L6.

  NO : Go to L3.

L3 CHECK THE SAFETY BELT BUCKLE SWITCH

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

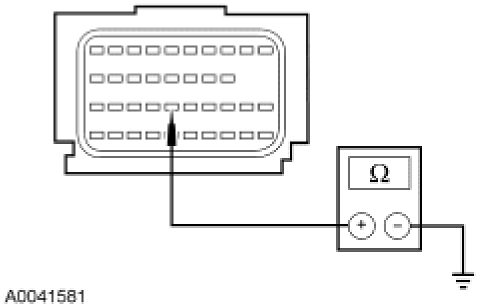

Fig. 85: Checking Safety Belt Buckle Switch
Courtesy of FORD MOTOR CO.

- Measure the resistance between RCM C310b-26, circuit CR203 (GY/VT), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to L4.

  NO : REPAIR circuit CR203 (GY/VT). Go to L6.

L4 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Connect: Passenger Safety Belt Buckle Switch C3295/C3301
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2438 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to L6.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to L5.

L5 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2438 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to L2.

  NO : The fault is not present and cannot be recreated at this time.

CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to L6.

L6 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

> WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test M: DTC B2439 - Passengers Seat Belt Buckle Switch Resistance Out of Range

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the supplemental restraint system (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the restraints control module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules. If the RCM detects current out of this range, it will store DTC B2439 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

- DTC B2439 Passengers Seat Belt Buckle Switch Resistance Out of Range - If the RCM detects a current out of range between buckled and unbuckled on the passenger safety belt buckle switch, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

PINPOINT TEST M: DTC B2439 - PASSENGERS SEAT BELT BUCKLE SWITCH RESISTANCE OUT OF RANGE

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

M1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2439 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to M2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to M4.

M2 CHECK THE SAFETY BELT BUCKLE SWITCH

NOTE: **This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the**

fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Safety Belt Buckle Switch C3295/C3301
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch disconnected, an open circuit fault would normally be retrieved.
- **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2439 to B2692?**

  YES : INSTALL a new passenger safety belt buckle assembly. REFER to **SAFETY BELT SYSTEM** article. Go to M5.

  NO : Go to M3.

M3 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Passenger Safety Belt Buckle Switch C3295/C3301
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2439 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to M5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to M4.

M4 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Disconnect the passenger safety belt buckle switch C3295/C3301:
    - inspect connector(s) (including any inline connectors) for corrosion, loose or spread terminals and loose or frayed wire connections at terminals.
    - inspect wire harness for any damage, pinched, cut or pierced wires.
    - repair any concerns found. Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Connector Repair Procedures for schematic and connector information.
- Connect: All Previously Disconnected Component(s)/Connector(s)
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2439 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to M2.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to M5.

M5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
    - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test N: DTC B2691 - Seat Belt Buckle Switch Circuit Fault, Front Driver's Side

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the supplemental restraint system (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the restraints control module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules.

If the RCM detects an open circuit or short to voltage fault, it will store DTC B2691 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

NOTE: **When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.**

- DTC B2691 Seat Belt Buckle Switch Circuit Fault, Front Driver's Side - If the RCM detects an open or short to voltage on the driver safety belt buckle switch circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver safety belt buckle switch
- RCM

PINPOINT TEST N: DTC B2691 - SEAT BELT BUCKLE SWITCH CIRCUIT FAULT, FRONT DRIVER'S SIDE

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected**

or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

N1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2691 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to N2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to N7.

N2 CHECK DRIVER SAFETY BELT BUCKLE SWITCH CIRCUIT FOR AN OPEN BETWEEN THE RCM

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Disconnect: Driver Safety Belt Buckle Switch C3296

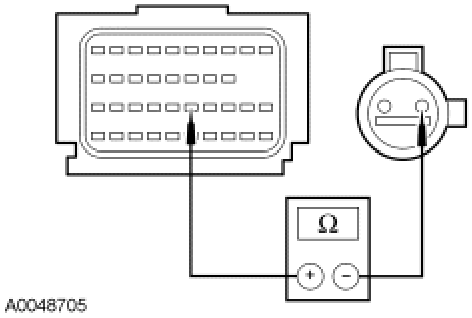

Fig. 86: Checking Driver Safety Belt Buckle Switch Circuit For An Open Between RCM
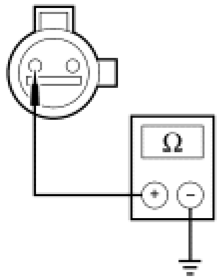
Courtesy of FORD MOTOR CO.

- Measure resistance between RCM C310b-25, circuit CR201 (GN/BU), harness side and driver safety belt buckle switch C3296-2, circuit CR201 (GN/BU), harness side.
- **Is resistance less than 0.5 ohm?**

  YES : Go to N3.

  NO : REPAIR circuit CR201 (GN/BU). Go to N8.

N3 CHECK CIRCUIT GD127 (BK/BU) FOR AN OPEN



A0048711

Fig. 87: Checking Circuit GD127 (BK/BU) For An Open
Courtesy of FORD MOTOR CO.

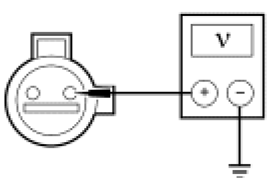
- Measure the resistance between driver safety belt buckle switch C3296-1, circuit GD127 (BK/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to N4.

  NO : REPAIR circuit GD127 (BK/BU). Go to N8.

N4 CHECK CIRCUIT CR201 (GN/BU) FOR A SHORT TO VOLTAGE

- Disconnect: Driver Seat Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.



A0048712

Fig. 88: Checking Circuit CR201 (GN/BU) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver safety belt buckle switch C3296-2, circuit CR201 (GN/BU), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit CR201 (GN/BU). Go to N8.

  NO : Go to N5.

N5 CHECK THE DRIVER SAFETY BELT BUCKLE SWITCH

NOTE: **This pinpoint test step will attempt to change the fault reported by the**

RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: RCM C310a and C310b
- Connect a fused jumper wire between driver safety belt buckle switch C3296-2, circuit CR201 (GN/BU), harness side and C3296-1, circuit GD127 (BK/BU), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver safety belt buckle switch circuits shorted together, a short to ground fault would normally be retrieved.
- **Did the driver safety belt buckle switch on-demand DTC change from indicating B2691 to B2434?**

  YES : INSTALL a new driver safety belt buckle assembly. REFER to **SAFETY BELT SYSTEM** article. Go to N8.

  NO : Go to N6.

N6 CONFIRM THE RCM FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from driver safety belt buckle switch C3296.
- Connect: Driver Safety Belt Buckle Switch C3296
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2691 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to N8.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to N7.

N7 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Seat Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2691 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to N2.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to N8.

N8 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test O: DTC B2692 - Front Passenger's Seat Belt Buckle Switch Circuit Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the supplemental restraint system (SRS), the driver and passenger safety belt buckles are equipped with safety belt buckle switches. The safety belt buckles are comprised of integrated circuits called Hall-effect switches. The safety belt buckle switches indicate to the restraints control module (RCM) whether the safety belt buckles are buckled or unbuckled.

The RCM supplies current to the safety belt buckle switch. Current flows through the switch, buckled or unbuckled to ground. The RCM will sense the difference in this current draw, 6 mA (unbuckled) or 15 mA (buckled), and use this information in determining the deployment rate of the dual-stage driver and passenger air bag modules.

If the RCM detects an open circuit or short to voltage fault, it will store DTC B2692 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

- DTC B2692 Front Passenger's Safety Belt Buckle Switch Circuit Fault - If the RCM detects an open or short to voltage on the passenger safety belt buckle switch circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Passenger safety belt buckle switch
- RCM

PINPOINT TEST O: DTC B2692 - FRONT PASSENGER'S SEAT BELT BUCKLE SWITCH CIRCUIT FAULT

WARNING: Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

O1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2692 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to O2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to O7.

O2 CHECK CIRCUIT CR203 (GY/VT) FOR AN OPEN BETWEEN THE RCM AND PASSENGER SAFETY BELT BUCKLE SWITCH

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Disconnect: Passenger Safety Belt Buckle Switch C3295/C3301

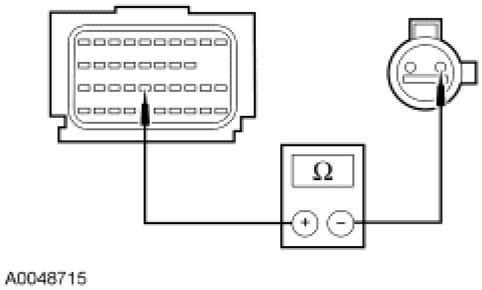


Fig. 89: Checking Circuit CR203 (GY/VT) For An Open Between RCM & Passenger Safety Belt Buckle Switch
Courtesy of FORD MOTOR CO.

NOTE: MKZ shown, Fusion/Milan similar.

- Measure the resistance between RCM C310b-26, circuit CR203 (GY/VT), harness side and the passenger safety belt buckle switch C3295-2 (Fusion/Milan), 3301-2 (MKZ), circuit CR203 (GY/VT), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to O3.

  NO : REPAIR circuit CR203 (GY/VT). Go to O8.

O3 CHECK CIRCUIT GD127 (BK/BU) FOR AN OPEN

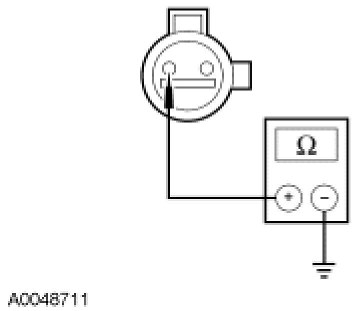

Fig. 90: Checking Circuit GD127 (BK/BU) For An Open
Courtesy of FORD MOTOR CO.

NOTE: MKZ shown, Fusion/Milan similar.

- Measure the resistance between passenger safety belt buckle switch C3295-1 (Fusion/Milan), 3301-1 (MKZ), circuit GD127 (BK/BU), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to O4.

  NO : REPAIR circuit GD127 (BK/BU). Go to O8.

O4 CHECK CIRCUIT CR203 (GY/VT) FOR A SHORT TO VOLTAGE

- Disconnect: Passenger Seat Side Air Bag Module C313
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

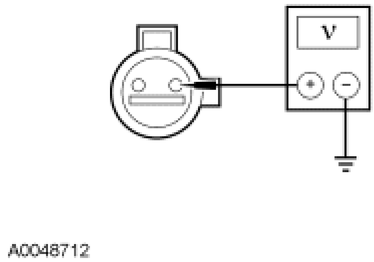

Fig. 91: Checking Circuit CR203 (GY/VT) For A Short To Voltage
Courtesy of FORD MOTOR CO.

NOTE: MKZ shown, Fusion/Milan similar.

- Measure the voltage between passenger safety belt buckle switch C3295-2 (Fusion/Milan), 3301-2 (MKZ), circuit CR203 (GY/VT), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit CR203 (GY/VT). Go to O8.

NO : Go to O5.

O5 CHECK THE SAFETY BELT BUCKLE SWITCH

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: RCM C310a and C310b
- Connect a fused jumper wire between passenger safety belt buckle switch C3295-2 (Fusion/Milan), 3301-2 (MKZ), circuit CR203 (GY/VT), harness side and C3295-1 (Fusion/Milan), 3301-1 (MKZ), circuit GD183 (BK/WH), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the passenger safety belt buckle switch circuits shorted together, a short to ground fault would normally be retrieved.
- **Did the passenger safety belt buckle switch on-demand DTC change from indicating B2692 to B2438?**

  YES : INSTALL a new passenger safety belt buckle assembly. REFER to **SAFETY BELT SYSTEM** article. Go to O8.

  NO : Go to O6.

O6 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from passenger safety belt buckle switch C3295/C3301.
- Connect: Passenger Safety Belt Buckle Switch C3295/C3301
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2692 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to O8.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK

for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to O7.

O7 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Passenger Seat Side Air Bag Module C314
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC B2692 retrieved?**

YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to O2.

NO : The fault is not present and cannot be recreated at this time.

CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to O8.

O8 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test P: DTC B2792 - Cross Link Between Firing Loops

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

The restraints control module (RCM) monitors all the deployable devices for a cross link between the circuits of another deployable device. If the RCM detects a short between the circuits of the deployable devices, it will store DTC B2792 and send a message to the instrument cluster (IC) module to illuminate the air bag indicator.

Fault PIDs[a]	Description	Fault Trigger Condition
2792_8_OD and 2792_8_CM	A-B or A-C pillar Curtain, Passenger Side	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_9_OD and 2792_9_CM	A-B or A-C pillar Curtain, Driver Side	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_12_OD and 2792_12_CM	Side Airbag Passenger	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_13_OD and 2792_13_CM	Side Airbag Driver	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_26_OD and 2792_26_CM	Pretensioner Passenger	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_27_OD and 2792_27_CM	Pretensioner Driver	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_28_OD and 2792_28_CM	Airbag Passenger Front Loop #2	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_29_OD and 2792_29_CM	Airbag Passenger Front Loop #1	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.
2792_30_OD and 2792_30_CM	Airbag Driver Front Loop #2	When the RCM detects a short between the circuits of 2 deployable devices, a fault

		will be indicated.
2792_31_OD and 2792_31_CM	Airbag Driver Front Loop #1	When the RCM detects a short between the circuits of 2 deployable devices, a fault will be indicated.

[a] Fault PIDs that end in OD indicate an on-demand status and are associated with on-demand DTC B2792. Fault PIDs that end in CM indicate continuous memory status and are associated with continuous DTC B2792.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RCM

PINPOINT TEST P: DTC B2792 - CROSS LINK BETWEEN FIRING LOOPS FAULT

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

P1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record

All B2792 Fault PIDs

- Refer to PID list in Normal Operation to view B2792 fault PIDs.

- **Do any RCM on-demand DTC B2792 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to P2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to P4.

P2 CHECK DEPLOYABLE CIRCUITS FOR A CROSS LINK FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Disconnect **ALL of the affected** deployable devices.
- Using the fault PIDs recorded and the following table, measure the resistance between the circuits of the affected deployable devices.

DEPLOYABLE DEVICES

Fault PID (loop/deployable device)	Connector - Pin	Circuit
2792_31_OD (Airbag Driver Front Loop #1)	• C310a-3 • C310a-4	• RR101 (YE/GN) • CR101 (VT/BN)
2792_30_OD (Airbag Driver Front Loop #2)	• C310a-15 • C310a-16	• RR102 (WH) • CR102 (BU)
2792_29_OD (Airbag Passenger Front Loop #1)	• C310a-1 • C310a-2	• CR103 (GY/BU) • RR103 (VT/GN)
2792_28_OD (Airbag Passenger Front Loop #2)	• C310a-5 • C310a-6	• CR104 (YE/GY) • RR104 (WH/BU)
2792_13_OD (Side Airbag Driver)	• C310b-7 • C310b-8	• RR105 (GY/YE) • CR105 (GN/BU)
	• C310b-	• CR106

2792_12_OD (Side Airbag Passenger)	9 • C310b-10	(VT/GY) • RR106 (YE/OG)
2792_9_OD (A-B or A-C pillar Curtain, Driver Side)	• C310b-21 • C310b-22	• CR109 (BN/BU) • RR109 (BU/GN)
2792_8_OD (A-B or A-C pillar Curtain, Passenger Side)	• C310b-1 • C310b-2	• CR111 (BN/WH) • RR111 (YE/VT)
2792_27_OD (Pretensioner Driver)	• C310b-31 • C310b-32	• CR120 (BU/OG) • RR120 (BN/GN)
2792_26_OD (Pretensioner Passenger)	• C310b-33 • C310b-34	• RR121 (VT) • CR121 (GY/VT)

- **Are the resistances greater than 10,000 ohms between the affected circuits?**

  YES : Go to P3.

  NO : REPAIR the affected circuits. Go to P5.

P3 CONFIRM THE RCM FAULT

NOTE: **Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Connect: RCM C310a and C310b
- Connect: All Previously Disconnected SRS Components
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2792 Fault PIDs
  - Refer to PID list in Normal Operation to view B2792 fault PIDs.
- **Does the original RCM on-demand DTC B2792 fault PID indicate a fault?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to P5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and

terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to P5.

P4 CHECK FOR AN INTERMITTENT FAULT

- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- If a cross link fault for driver air bag loop 1 or loop 2 is present continuous, remove the driver air bag module. Refer to **Driver Air Bag Module**.
- If a cross link fault for passenger air bag module loop 1 or loop 2 is present continuous, remove the passenger air bag module. Refer to **Passenger Air Bag Module**.
- If a cross link fault for driver seat side air bag is present continuous, disconnect the driver seat side air bag module C327.
- If a cross link fault for passenger seat side air bag is present continuous, disconnect the passenger seat side air bag module C313.
- If a cross link fault for driver side air curtain module is present continuous, disconnect the driver side air curtain module C3055.
- If a cross link fault for passenger side air curtain module is present continuous, disconnect the passenger side air curtain module C3056.
- If a cross link fault for driver safety belt retractor pretensioner is present continuous, disconnect the driver safety belt retractor pretensioner C323.
- If a cross link fault for passenger safety belt retractor pretensioner is present continuous, disconnect the passenger safety belt retractor pretensioner C3202.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- Enter the following diagnostic mode on the diagnostic tool: DataLogger - RCM - View and Record All B2792 Fault PIDs
  - Refer to PID list in Normal Operation to view B2792 fault PIDs.
- **Do any on-demand DTC B2792 fault PIDs indicate a fault?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to P2.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness, cycling the ignition key frequently and rotating the steering wheel (driver air bag module fault). **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to P5.

P5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test Q: DTC B229A - Occupant Classification System Contamination (Rail Type System)

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

The occupant classification sensor (OCS) system is used to classify the front passenger seat occupant in the event of a deployable impact. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

The occupant classification system module (OCSM) monitors the 2 OCS rails (weight sensors) and circuity for faults. If the OCSM detects an object within the OCS rails, it will store DTC B229A in memory and send a message to the restraints control module (RCM) which sends a message to the instrument cluster (IC) module to illuminates the air bag indicator.

- DTC B229A Occupant Classification System Contamination - If the OCSM detects foreign object (s)/substance in one or both OCS rails (weight sensors), it will set this DTC.

This pinpoint test is intended to diagnose the following:

- A foreign object within an occupant classification sensor rail
- OCS system component

PINPOINT TEST Q: DTC B229A - OCCUPANT CLASSIFICATION SYSTEM CONTAMINATION

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

Q1 CHECK FOR CONTINUOUS OR ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- **Was OCSM on-demand DTC B229A retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to Q2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to Q5.

Q2 INSPECT THE OCS RAILS

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the passenger seat. Refer to **SEATING** article.
- Remove the affected OCS rail and inspect for the presence of any foreign objects. Refer to **Occupant Classification Sensor**.
- **Were any problems noted?**

  YES : REPAIR as necessary. Go to Q6.

  NO : Go to Q3.

Q3 INSTALL A NEW OCS RAIL

- Install a new OCS rail. Refer to **Occupant Classification Sensor**.
- Install the passenger seat. Refer to **SEATING** article.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- **Was OCSM on-demand DTC B229A retrieved?**

  YES : Go to Q4.

  NO : Fault corrected. Go to Q6.

Q4 CONFIRM OCS MODULE FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the passenger seat. Refer to **SEATING** article.
- Install the original OCS rail. Refer to **Occupant Classification Sensor**.
- Install the passenger seat. Refer to **SEATING** article.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- **Was OCSM on-demand DTC B229A retrieved?**

  YES : INSTALL a new OCSM. REFER to **Occupant Classification System Module (OCSM)**. Go to Q6.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to Q6.

Q5 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- **Was OCSM on-demand DTC B229A retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to Q2.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to Q6.

Q6 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test R: DTC B229B - Occupant Classification System Obstruction

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

The occupant classification sensor (OCS) system is used to classify the front passenger seat occupant in the event of a deployable impact. Refer to **Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)**.

The occupant classification system module (OCSM) monitors the weight sensors and circuitry for faults. If the OCSM detects an obstruction on one or all OCS weight sensors, it will store DTC B229B in memory and send a message to the restraints control module (RCM) which sends a message to the instrument cluster (IC) module to illuminates the air bag indicator.

- DTC B229B Occupant Classification System Obstruction - If the OCSM detects a negative force on one or all OCS weight sensors, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- A foreign object placed under or contacting the passenger seat
- OCS system component(s)

PINPOINT TEST R: DTC B229B - OCCUPANT CLASSIFICATION SYSTEM OBSTRUCTION

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of**

serious personal injury or death.

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

R1 CHECK FOR CONTINUOUS OR ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- **Was OCSM on-demand DTC B229B retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to R2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to R5.

R2 INSPECT THE OCS SYSTEM

- Key in OFF position.
- Position the seat and inspect under the seat for the presence of any foreign objects contacting the under side of the seat.
- **Were any problems noted?**

  YES : REPAIR as necessary. Go to R6.

  NO : Go to R3.

R3 CHECK THE OCS

- Key in ON position.
- Carry out the Zero Seat Weight Test. **Do not carry out System Reset at this time.** Refer to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test**.
- **Was DTC C1941 retrieved during the Zero Seat Weight Test?**

  YES : INSTALL 2 new OCS rails. REFER to **Occupant Classification Sensor**. Go to R6.

  NO : Go to R4.

R4 CONFIRM OCS MODULE FAULT

- Key in OFF position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- **Was OCSM on-demand DTC B229B retrieved?**

YES : INSTALL a new OCSM. REFER to **Occupant Classification System Module (OCSM)**. Go to R6.

NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to R6.

R5 CHECK FOR AN INTERMITTENT FAULT

- Enter the following diagnostic mode on the diagnostic tool: Self Test - OCSM
- **Was OCSM on-demand DTC B229B retrieved?**

YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to R2.

NO : The fault is not present and cannot be recreated at this time.

CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by moving/positioning the passenger seat. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to R6.

R6 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test S: DTC C1946 - Front Driver's Seat Track Position Switch Circuit Open

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and

connector information.

Normal Operation

As part of the supplemental restraint system (SRS), the driver seat is equipped with a seat track position sensor. The seat track position sensor is comprised of integrated circuits called Hall-effect switch. The seat track position sensor indicates to the restraints control module (RCM) the position of the driver seat, forward or rearward.

The RCM supplies current to the seat track position sensor. Current flows through the switch, both in the forward or rearward seat position to ground. The RCM will sense the difference in this current draw, 6 mA (forward) or 15 mA (rearward), and use this information in determining the deployment rate of the dual-stage driver air bag module. If the RCM detects current out of range, it will store C1946 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

- DTC C1946 Front Driver's Seat Track Position Switch Circuit Open - If the RCM detects a open on the driver seat track position sensor circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

PINPOINT TEST S: DTC C1946 - FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT OPEN

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

S1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1946 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to S2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to S6.

S2 CHECK CIRCUIT RR137 (BU/GY) FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Seat Track Position Sensor C356
- Connect a fused jumper wire between driver seat track position sensor C356-2, circuit RR137 (BU/GY), harness side and C356-1, circuit GD127 (BK/BU), harness side.
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor circuits shorted together, a short to ground fault would normally be retrieved.
- **Did the driver seat track position switch on-demand DTC change from indicating C1946 to C1947?**

  YES : INSTALL a new seat track position sensor. REFER to **Seat Position Sensor**. Go to S7.

  NO : Go to S3.

S3 CHECK CIRCUIT RR137 (BU/GY) FOR AN OPEN

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Remover the jumper wire from the driver seat track position sensor C356.
- Measure the resistance between RCM C310b-23, circuit RR137 (BU/GY), harness side and driver seat track position sensor C356-2, circuit RR137 (BU/GY), harness side.
- **Is the resistance less than 0.5 ohm?**

  YES : Go to S4.

  NO : REPAIR circuit RR137 (BU/GY). Go to S7.

S4 CHECK CIRCUIT GD127 (BK/BU) FOR AN OPEN

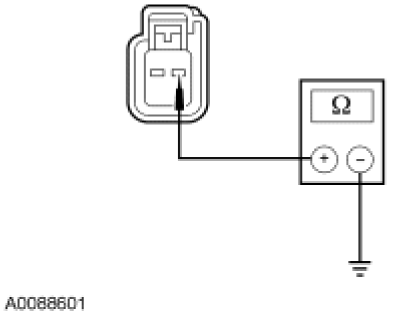

Fig. 92: Checking Circuit GD127 (BK/BU) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat track position sensor C356-1, circuit GD127 (BK/BU) and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to S5.

  NO : REPAIR GD127 (BK/BU). Go to S7.

S5 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Connect: Driver Seat Track Position Sensor C356
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1946 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to S7.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to S7.

S6 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

- Disconnect: Driver Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the system at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1946 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to S2.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to S7.

S7 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test T: DTC C1947 - Front Driver's Seat Track Position Switch Circuit Short to Ground

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the supplemental restraint system (SRS), the driver seat is equipped with a seat track position sensor. The seat track position sensor is comprised of integrated circuits called Hall-effect switch. The seat track

position sensor indicates to the restraints control module (RCM) the position of the driver seat, forward or rearward.

The RCM supplies current to the seat track position sensor. Current flows through the switch, both in the forward or rearward seat position to ground. The RCM will sense the difference in this current draw, 6 mA (forward) or 15 mA (rearward), and use this information in determining the deployment rate of the dual-stage driver air bag module. If the RCM detects current out of range, it will set a DTC.

If the RCM detects a short to ground, it will store DTC C1947 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

- DTC C1947 Front Driver's Seat Track Position Switch Circuit Short to Ground - If the RCM detects a short to ground on the driver seat track position sensor circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

PINPOINT TEST T: DTC C1947 - FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT SHORT TO GROUND

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle to the customer.**

T1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1947 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is

corrected and the DTC is no longer retrieved during the on-demand self test. Go to T2.

NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to T5.

T2 CHECK CIRCUIT RR137 (BU/GY) FOR A SHORT TO GROUND BETWEEN THE RCM AND SEAT TRACK POSITION SENSOR

NOTE:	**This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Seat Track Position Sensor C356
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor disconnected, an open circuit fault would normally be retrieved.
- **Did the driver seat track position switch on-demand DTC change from indicating C1947 to C1981?**

  YES : INSTALL a new driver seat track position sensor. REFER to **Seat Position Sensor**. Go to T6.

  NO : Go to T3.

T3 CHECK THE SEAT TRACK POSITION SENSOR CIRCUIT RR137 (BU/GY) FOR A SHORT TO GROUND

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b

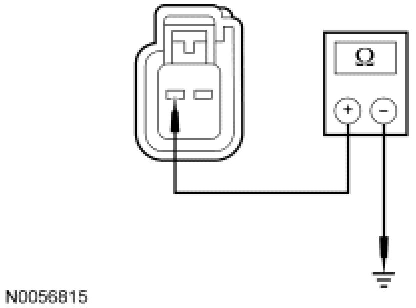

Fig. 93: Checking Seat Track Position Sensor Circuit RR137 (BU/GY) For A Short To Ground

Courtesy of FORD MOTOR CO.

- Measure the resistance between driver seat track position sensor C356-2, circuit RR137 (BU/GY) and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to T4.

  NO : REPAIR circuit RR137 (BU/GY). Go to T6.

T4 CONFIRM THE RCM FAULT

NOTE: Make sure all restraint system components, sensor electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: Seat Track Position Sensor C356
- Connect: RCM C310a and C310b
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1947 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to T6.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to T5.

T5 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Seat Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1947 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to T2.

  NO : The fault is not present and cannot be recreated at this time.

CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to T6.

T6 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
    - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test U: DTC C1948 - Front Driver's Seat Track Position Switch Circuit Resistance Out of Range

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

NOTE: **Due to the seat track position sensor being a Hall-effect type sensor, this pinpoint test will be diagnosing a current out of range fault instead of the current DTC definition for a resistance out of range fault.**

Normal Operation

As part of the supplemental restraint system (SRS), the driver seat is equipped with a seat track position sensor. The seat track position sensor is comprised of integrated circuits called Hall-effect switch. The seat track position sensor indicate to the restraints control module (RCM) the position of the driver seat, forward or rearward.

The RCM supplies current to the seat track position sensor. Current flows through the switch, both in the forward or rearward seat position to ground. The RCM will sense the difference in this current draw, 6 mA (forward) or 15 mA (rearward), and use this information in determining the deployment rate of the dual-stage driver air bag module. If the RCM detects current out of range, it will set a DTC.

If the RCM detects a current out of range condition, it will store DTC C1948 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

NOTE: When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.

- DTC C1948 Front Driver's Seat Track Position Switch Circuit Resistance out of Range - If the RCM detects a current out of range between forward and rearward on the driver seat track position switch, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver seat track position sensor
- RCM

PINPOINT TEST U: DTC C1948 - FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT RESISTANCE OUT OF RANGE

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

NOTE: Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.

NOTE: Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

U1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1948 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to U2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not

retrieved on demand). The fault condition is not present at this time. Go to U4.

U2 CHECK THE DRIVER SEAT TRACK POSITION SENSOR

NOTE: This pinpoint test step will attempt to change the fault reported by the RCM by inducing a different fault condition. If the fault reported changes, this indicates the RCM is functioning correctly and is not the source of the fault.

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Seat Track Position Sensor C356
- Connect a fused jumper wire between driver seat track position sensor C356-2, circuit RR137 (BU/GY), harness side and C356-1, circuit GD127 (BK/BU), harness side.
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **DIAGNOSTIC TIP:** When viewing on-demand DTCs with the driver seat track position sensor circuits shorted together, a short to ground fault would normally be retrieved.
- **Did the driver seat track position sensor on-demand DTC change from indicating C1948 to C1947?**

  YES : INSTALL a new driver seat track position sensor. REFER to **Seat Position Sensor**. Go to U5.

  NO : Go to U3.

U3 CONFIRM THE RCM FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Remove the fused jumper wire from the driver seat track position sensor.
- Connect: Driver Seat Track Position Sensor C356
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1948 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to U5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to U5.

U4 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Seat Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1948 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to U2.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to U5.

U5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

> WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

- Reconnect all SRS components (if previously disconnected).
  - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

Pinpoint Test V: DTC C1981 - Front Driver's Seat Track Position Switch Circuit Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Supplemental Restraint System for schematic and connector information.

Normal Operation

As part of the supplemental restraint system (SRS), the driver seat is equipped with a seat track position sensor. The seat track position sensor is comprised of integrated circuits called Hall-effect switch. The seat track position sensor indicate to the restraints control module (RCM) the position of the driver seat, forward or rearward.

The RCM supplies current to the seat track position sensor. Current flows through the switch, both in the forward or rearward seat position to ground. The RCM will sense the difference in this current draw, 6 mA (forward) or 15 mA (rearward), and use this information in determining the deployment rate of the dual-stage driver air bag module. If the RCM detects current out of range, it will set a DTC.

If the RCM detects an open circuit or a short to battery on the driver seat track position sensor, it will store DTC C1981 in memory and send a message to the instrument cluster (IC) module to illuminate the air bag warning indicator.

NOTE: **When monitoring fault and/or resistance PIDs with the scan tool, it may take up to 2 seconds for the scan tool display to update.**

- DTC C1981 Front Driver's Seat Track Position Switch Circuit Fault - If the RCM detects a short to voltage on the driver seat track position sensor circuit, it will set this DTC.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- RCM

PINPOINT TEST V: DTC C1981 - FRONT DRIVER'S SEAT TRACK POSITION SWITCH CIRCUIT FAULT

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **Use the correct probe adapter(s) from the Flex Probe Kit when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

NOTE: **Most faults are due to connector and/or wiring concerns. Carry out a thorough inspection and verification before proceeding with the pinpoint test.**

NOTE: **Supplemental restraint system (SRS) components should only be disconnected or reconnected when instructed to do so within a pinpoint test step. Failure to follow this instruction may result in incorrect diagnosis of the SRS.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle**

to the customer.

V1 CHECK FOR CONTINUOUS AND ON-DEMAND DTCs

- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1981 retrieved?**

  YES : This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to V2.

  NO : This is an intermittent fault when present as a continuous memory DTC only (DTC not retrieved on demand). The fault condition is not present at this time. Go to V4.

V2 CHECK CIRCUIT RR137 (BU/GY) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: RCM C310a and C310b
- Disconnect: Driver Seat Track Position Sensor C356
- Disconnect: Driver Seat Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.

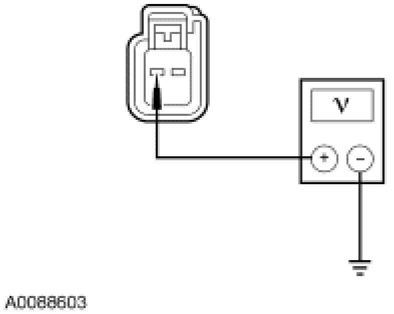

Fig. 94: Checking Circuit RR137 (BU/GY) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between driver seat track position sensor C356-2, circuit RR137 (BU/GY), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit RR137 (BU/GY). Go to V5.

  NO : Go to V3.

V3 CONFIRM THE RCM FAULT

NOTE:	**Make sure all restraint system component electrical connectors and the RCM electrical connectors are connected before carrying out the on-demand self test. If not, erroneous DTCs will be recorded.**

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Connect: RCM C310a and C310b
- Connect: Driver Seat Track Position Sensor C356
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1981 retrieved?**

  YES : INSTALL a new RCM. REFER to **Restraints Control Module (RCM)**. Go to V5.

  NO : In the process of diagnosing the fault, the fault condition has become intermittent. CHECK for causes of the intermittent fault in the areas previously worked in, particularly the pins and terminals of electrical connectors that were disconnected. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to V4.

V4 CHECK FOR AN INTERMITTENT FAULT

- Key in OFF position.
- Depower the SRS. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Disconnect: Driver Seat Side Air Bag Module C328
- Repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - RCM
- **Was RCM on-demand DTC C1981 retrieved?**

  YES : This is a hard fault. The fault condition is now present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. Go to V2.

  NO : The fault is not present and cannot be recreated at this time.

  CHECK for causes of the intermittent fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. **Do not install any new SRS components at this time. SRS components should only be installed when directed to do so in the pinpoint test.** REPAIR any intermittent wiring, terminal or connector concerns found. Go to V5.

V5 CHECK FOR ADDITIONAL SRS DTCs

- Key in OFF position.

WARNING: **Turn the ignition OFF and wait one minute to deplete the backup power supply. Failure to follow this instruction may**

result in serious personal injury or death in the event of an accidental deployment.

- Reconnect all SRS components (if previously disconnected).
    - If previously directed to depower the SRS, repower the SRS. **Do not** prove out the SRS at this time. Refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Self Test - Restraints
- **Are any RCM and/or OCSM DTCs retrieved indicating a fault?**

  YES : Do not clear any DTCs until all DTCs have been resolved. Go to the **Supplemental Restraint System (SRS) DTC Chart** for pinpoint test direction.

  NO : CLEAR all RCM and OCSM DTCs. PROVE OUT the SRS. REPAIR is complete. RETURN the vehicle to the customer.

GENERAL PROCEDURES

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPOWERING AND REPOWERING

Special Tools

Illustration	Tool Name	Tool Number
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

Depowering Procedure

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

WARNING: **To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.**

NOTE: **The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

1. Turn all vehicle accessories OFF.
2. Turn the ignition switch to OFF.
3. At the Smart Junction Box (SJB), located below the LH side of the instrument panel, remove the cover and the RCM fuse 25 (7.5A) from the SJB. For additional information, refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ.
4. Turn the ignition ON and visually monitor the air bag indicator for at least 30 seconds. The air bag warning indicator will remain lit continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.
5. Turn the ignition switch to OFF.

WARNING: **Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.**

See DESCRIPTION AND OPERATION for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

6. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

Repowering Procedure

1. Turn the ignition switch from OFF to ON.
2. Install RCM fuse 25 (7.5A) to the SJB and close the cover.

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

3. Connect the battery ground cable.
4. Prove out the SRS as follows:

   Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn OFF. If an air bag SRS fault is present, the air bag warning indicator will:

   - fail to light.

   - remain lit continuously.

   - flash at a 5 Hz rate (RCM not configured).

   The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

   Clear all continuous DTCs from the RCM and Occupant Classification System Module (OCSM) using a scan tool.

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEACTIVATION AND REACTIVATION

Special Tools

Illustration	Tool Name	Tool Number
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

Deactivation

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **To reduce the risk of accidental deployment, do not use any memory saver devices. Failure to follow this instruction may result in serious personal injury or death.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of**

serious personal injury or death.

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

NOTE: The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

1. Turn all vehicle accessories OFF.
2. Turn the ignition switch to OFF.
3. At the smart junction box (SJB), located below the LH side of the instrument panel, remove the cover and the RCM fuse 25 (7.5A) from the SJB. For additional information, refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ.
4. Turn the ignition ON and visually monitor the air bag warning indicator for at least 30 seconds. The air bag warning indicator will remain lit continuously (no flashing) if the correct RCM fuse has been removed. If the air bag warning indicator does not remain lit continuously, remove the correct RCM fuse before proceeding.
5. Turn the ignition OFF.

WARNING: **Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.**

See DESCRIPTION AND OPERATION for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

6. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

NOTE: There are 2 locking pins that retain the driver air bag module to the steering wheel.

7. Using a 3-mm Allen wrench or a suitable tool through the access hole on the backside of the steering wheel, position the tool against the spring clip and push in, disengaging the clip from the locking pin. With the spring clip disengaged from the locking pin, gently pull back on that side of the driver air bag module to release it from the steering wheel.

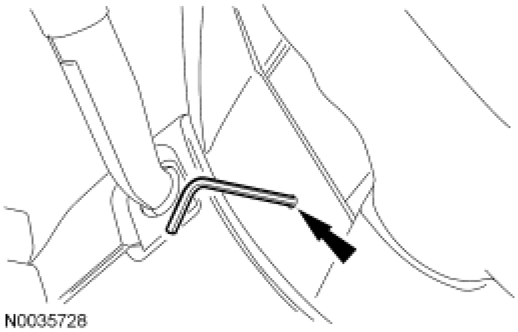

Fig. 95: Locating Allen Wrench
Courtesy of FORD MOTOR CO.

8. Repeat the previous step for the second locking pin.

CAUTION: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons can occur.

9. Using a small screwdriver as shown, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking buttons released, remove the electrical connectors and the driver air bag module.

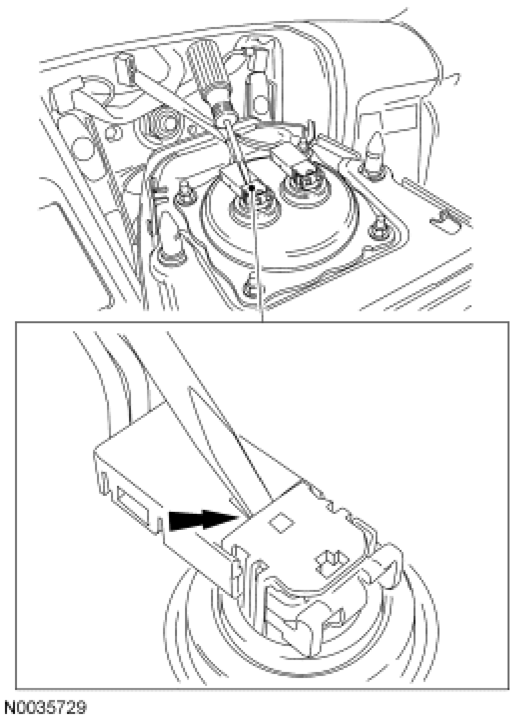

Fig. 96: Releasing Locking Buttons On Driver Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

10. Open the glove compartment door and release the door damper cable, then fully lower the glove compartment door.

NOTE: Fusion shown, Milan and MKZ similar.

24. Remove the LH C-pillar trim cover retainer caps.

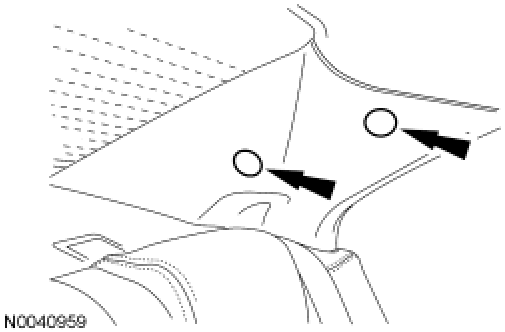

Fig. 110: Locating LH C-Pillar Trim Cover Retainer Caps
Courtesy of FORD MOTOR CO.

25. Remove the 2 retainers and the LH C-pillar trim cover.

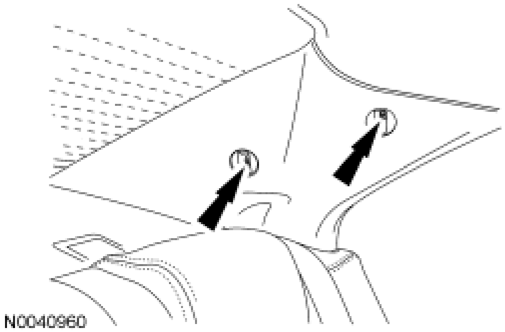

Fig. 111: Locating LH C-Pillar Trim Cover And Retainers
Courtesy of FORD MOTOR CO.

26. Disconnect the LH side air curtain module electrical connector.

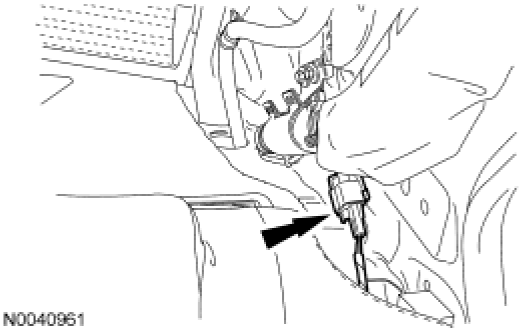

Fig. 112: Locating LH Side Air Curtain Module Electrical Connector
Courtesy of FORD MOTOR CO.

27. From under the rear of the driver seat, slide and disengage the driver seat side air bag module electrical connector locking clip, and then release the tab and disconnect the driver seat side air bag module electrical connector.

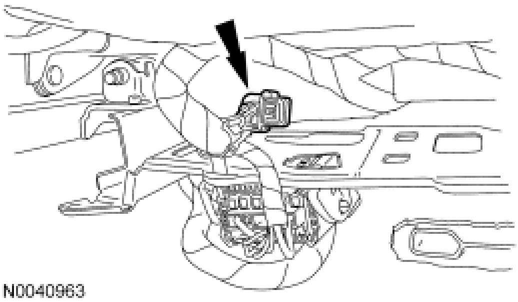

Fig. 113: Locating Driver Seat Side Air Bag Module Electrical Connector
Courtesy of FORD MOTOR CO.

28. Install RCM fuse 25 (7.5A) to the SJB.
29. Connect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

Reactivation

All vehicles

1. Remove restraints control module (RCM) fuse 25 (7.5A) from the SJB.
2. Disconnect the battery ground cable and wait at least one minute.
3. Connect the driver seat side air bag module electrical connector and then slide and engage the seat side air bag electrical connector locking clip.

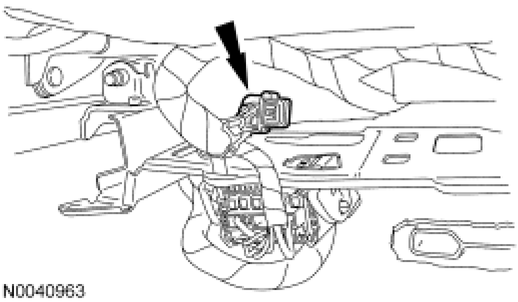

Fig. 114: Locating Driver Seat Side Air Bag Module Electrical Connector
Courtesy of FORD MOTOR CO.

4. Connect the LH side air curtain module electrical connector.

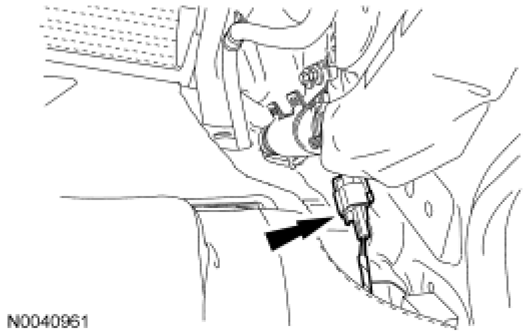

Fig. 115: Locating LH Side Air Curtain Module Electrical Connector
Courtesy of FORD MOTOR CO.

NOTE: Fusion shown, Milan and MKZ similar.

5. Install the LH C-pillar trim cover and the retainers.

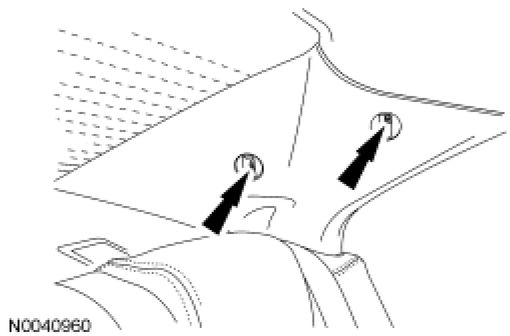

Fig. 116: Locating LH C-Pillar Trim Cover And Retainers
Courtesy of FORD MOTOR CO.

6. Install the LH C-pillar trim cover retainer caps.

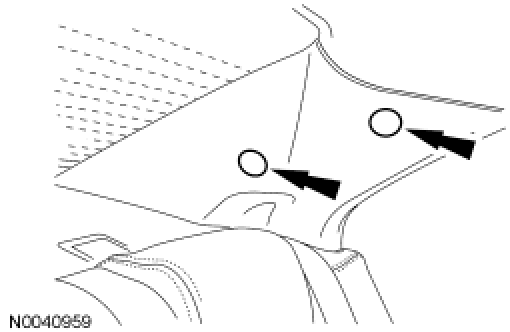

Fig. 117: Locating LH C-Pillar Trim Cover Retainer Caps
Courtesy of FORD MOTOR CO.

7. Connect the RH side air curtain module electrical connector.

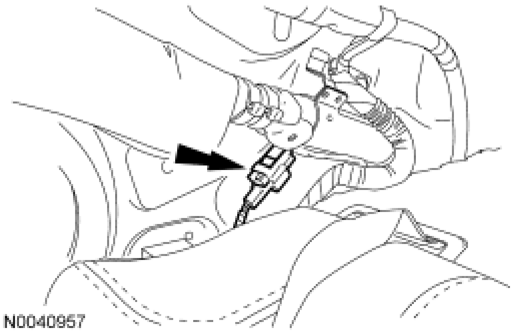

Fig. 118: Locating RH Side Air Curtain Module Electrical Connector
Courtesy of FORD MOTOR CO.

NOTE: **Fusion shown, Milan and MKZ similar.**

8. Install the RH C-pillar trim cover and the retainers.

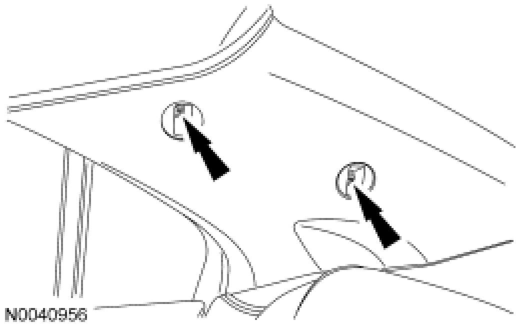

Fig. 119: Locating RH C-Pillar Trim Cover And Retainers
Courtesy of FORD MOTOR CO.

9. Install the RH C-pillar trim cover retainer caps.

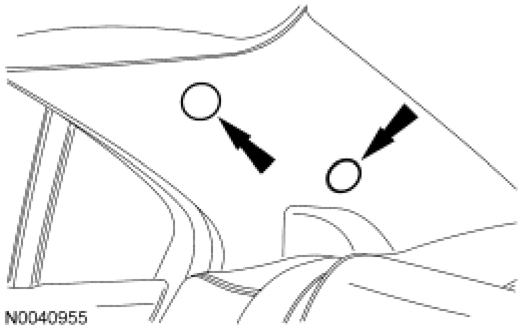

Fig. 120: Locating RH C-Pillar Trim Cover Retainer Caps
Courtesy of FORD MOTOR CO.

10. Connect the passenger seat side air bag module electrical connector and then slide and engage the seat side air bag electrical connector locking clip.

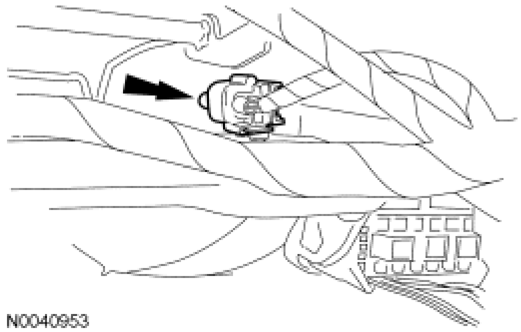

Fig. 121: Locating Passenger Seat Side Air Bag Module Electrical Connector
Courtesy of FORD MOTOR CO.

CAUTION: Do not install the passenger air bag module electrical connectors by the locking buttons. Damage to the locking buttons can occur.

CAUTION: The passenger air bag module electrical connector locking buttons must be in the released position when the connector is being installed, or connector damage may occur.

CAUTION: The passenger air bag module electrical connectors are unique and cannot be reversed when connected to the passenger air bag module. Match the electrical connector key to the keyway in the passenger air bag module. Do not force the electrical connectors into the passenger air bag module.

NOTE: RH shown, LH similar.

11. With the locking buttons released, install the passenger air bag module electrical connectors fully into the passenger air bag module and seat the locking buttons.

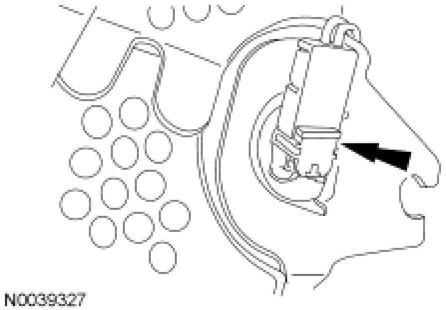

Fig. 122: Locating Passenger Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

MKZ

CAUTION: Do not handle the passenger air bag module by grabbing the edges of the deployment door. Damage to the passenger air bag module may occur.

NOTE: During air bag module installation, make sure all the deployment door clips are fully seated in the instrument panel.

12. Install the passenger air bag module into the instrument panel.
13. Through the glove compartment opening, install the 2 passenger air bag module bolts.
    - Tighten to 8 Nm (71 lb-in).

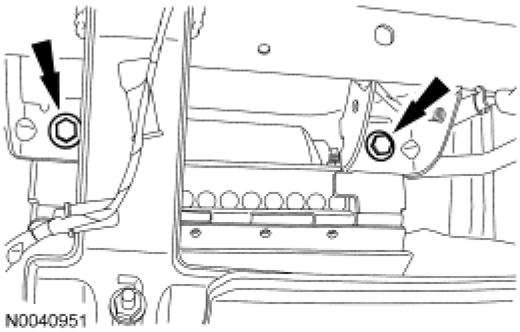

Fig. 123: Locating Passenger Air Bag Module Bolts
Courtesy of FORD MOTOR CO.

14. Align the 2 retaining clips and install the RH instrument panel trim panel.

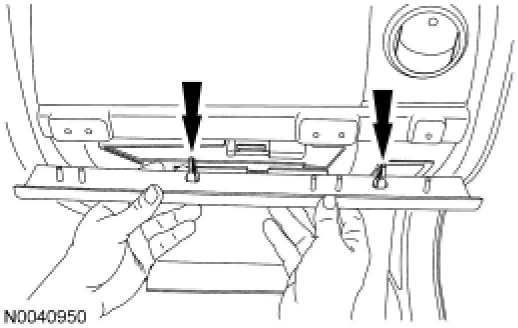

Fig. 124: Locating Retaining Clips
Courtesy of FORD MOTOR CO.

15. Through the glove compartment opening and the side of the instrument panel, install the 5 RH instrument panel trim panel nuts on the inside of the instrument panel.

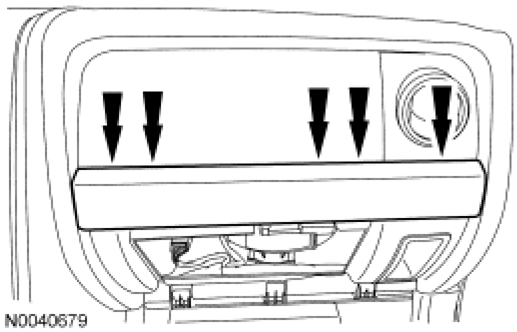

Fig. 125: Locating RH I/P Trim Panel Nuts
Courtesy of FORD MOTOR CO.

16. Install the instrument panel end panel.

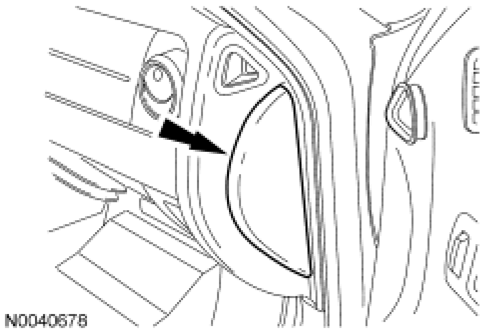

Fig. 126: Locating I/P End Panel
Courtesy of FORD MOTOR CO.

Fusion and Milan

CAUTION: Do not handle the passenger air bag module by grabbing the edges of the deployment doors. Damage to the passenger air bag module may occur.

NOTE: During air bag module installation, make sure all the deployment door clips are fully seated in the instrument panel.

17. Install the passenger air bag module into the instrument panel.

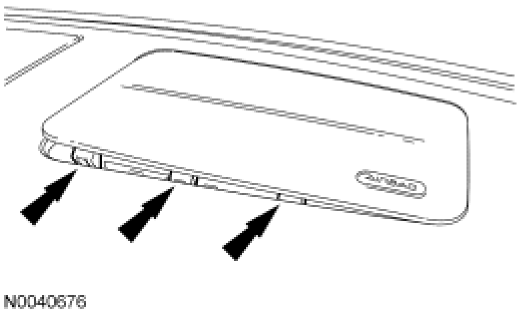

Fig. 127: Locating Deployment Door Clips
Courtesy of FORD MOTOR CO.

18. Install the 2 passenger air bag module bolts.
    - Tighten to 8 Nm (71 lb-in).

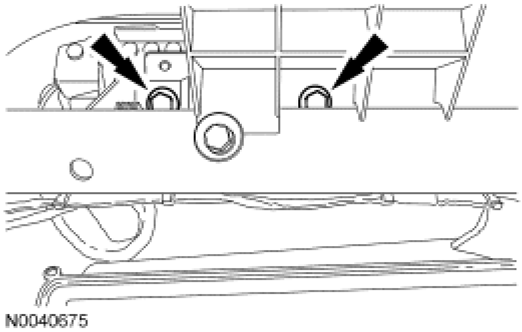

Fig. 128: Locating Passenger Air Bag Module Bolts
Courtesy of FORD MOTOR CO.

19. Attach the glove compartment door damper cable and close the glove compartment door.

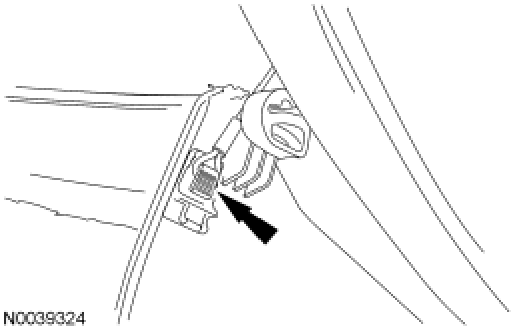

Fig. 129: Locating Door Damper Cable
Courtesy of FORD MOTOR CO.

All vehicles

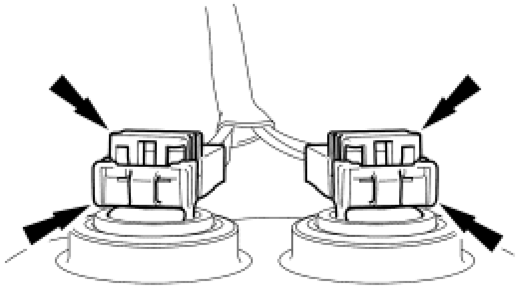
CAUTION: Do not install the driver air bag module electrical connectors by the

locking buttons. Damage to the locking buttons can occur.

CAUTION: The driver air bag module electrical connector locking buttons must be in the released position when the connector is being installed, or connector damage may occur.

CAUTION: The driver air bag module electrical connectors are unique and cannot be reversed when connected to the driver air bag module. Match the electrical connector key to the keyway in the driver air bag module. Do not force the electrical connectors into the driver air bag module.

20. With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

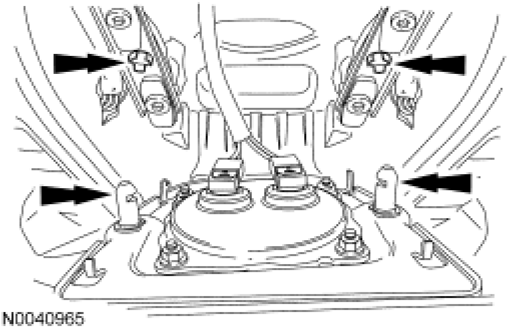


N0035730

Fig. 130: Locating Driver Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: Audible clicks will be heard when both wire clips are seated in the driver air bag module.

21. Align the driver air bag module locking pins to the steering wheel and, while pushing inward, seat the 2 driver air bag module locking pins in the steering wheel wire clips.
    - When the 2 locking pins are seated in place, there should be an even gap between the driver air bag module trim cover and the steering wheel.



N0040965

Fig. 131: Driver Air Bag Module Locking Pins In Steering Wheel Wire Clips
Courtesy of FORD MOTOR CO.

22. Turn the ignition switch from OFF to ON.
23. Install RCM fuse 25 (7.5A) to the SJB and close the cover.

WARNING: **Make sure no one is in the vehicle and there is nothing blocking or placed in front of any air bag module when the battery is connected. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

24. Connect the battery ground cable.
25. Prove out the SRS as follows:

    Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn OFF. If an air bag SRS fault is present, the air bag warning indicator will:

    - fail to light.

    - remain lit continuously.

    - flash at a 5 Hz rate (RCM not configured).

    The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

    Clear all continuous DTCs from the RCM and occupant classification system module (OCSM) using a scan tool.

INSPECTION AND REPAIR AFTER A SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DEPLOYMENT

WARNING: **Remove restraint system diagnostic tools from the vehicle prior to road testing. If tools are not removed, the supplemental restraint system (SRS) device may not deploy in a crash. Failure to follow this instruction may result in serious personal injury or death in a crash and possibly violate vehicle safety standards.**

NOTE: **After diagnosing or repairing a Supplemental Restraint System (SRS), the restraint system diagnostic tools (if required) must be removed before operating the vehicle over the road.**

NOTE: Deployable devices (such as air bag modules, pretensioners) may deploy alone or in various combinations depending on the impact event.

NOTE: Always refer to the appropriate workshop article procedures prior to carrying out vehicle repairs affecting the SRS and safety belt system.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

NOTE: Refer to the correct removal and installation procedure for all SRS components being installed.

1. When any deployable device or combination of devices are deployed and/or the Restraints Control Module (RCM) has the DTC B1231 (Event Threshold Exceeded) in memory, the repair of the vehicle SRS is to include the removal of all deployed devices and the installation of new deployable devices, the removal and installation of new impact sensors, and the removal and installation of a new RCM. DTCs must be cleared from all required modules after repairs are carried out.

   Vehicles with Occupant Classification Sensor (OCS) system

   NOTE: After installation of new Occupant Classification Sensor (OCS) system components, carry out the Occupant Classification Sensor (OCS) System Reset procedure as instructed in the workshop article. Refer to the appropriate workshop article for OCS system removal and installation procedure.

2. When a vehicle has been involved in a collision and the Occupant Classification System Module (OCSM) has DTC B1231 stored in memory, the repair of the OCS system is to include the following procedures for the specified system:
   - For rail-type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install new OCS system rails.
   - For weight sensor bolt-type OCS system, inspect the passenger side floorpan for damage and repair as necessary. Install a new seat track with OCS system weight sensor bolts. DTC must be cleared from the OCSM before carrying out Occupant Classification Sensor (OCS) System Reset. Do not install a new OCSM unless DTC B1231 cannot be cleared.

     NOTE: Most bladder-type OCSM do not store a DTC B1231 in memory after deployment. The DTC B1231 is stored only by the RCM.

   - For bladder-type OCS system, inspect for damage and repair as necessary. If installation of an OCS system component is required, an OCS system service kit must be installed.

   All vehicles

3. When any damage to the impact sensor mounting points or mounting hardware has occurred, repair or install new mounting points and mounting hardware as needed.
4. When the driver air bag module has deployed, a new clockspring must be installed.
5. New driver and/or front passenger safety belt systems (including retractors, buckles and height adjusters) must be installed if the vehicle is involved in a collision that results in deployment of the driver and/or front passenger safety belt pretensioners. For additional information, refer to **SAFETY BELT SYSTEM** article.
6. Inspect the entire vehicle for damage, including the following components:
    - Steering column (deployable column if equipped)
    - Instrument panel knee bolsters and mounting points
    - Instrument panel braces and brackets
    - Instrument panel and mounting points
    - Seats and seat mounting points
    - Safety belts, safety belt buckles and safety belt retractors. For additional information, refer to **SAFETY BELT SYSTEM** article
    - SRS wiring, wiring harnesses and connectors
7. After carrying out the review and inspection of the entire vehicle for damage, repair or install new components as needed.

OCCUPANT CLASSIFICATION SENSOR (OCS) SYSTEM RESET

Special Tools

Illustration	Tool Name	Tool Number
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

System Reset

WARNING: **Before carrying out the System Reset, make sure the occupant classification sensor (OCS) system is at a stable temperature in the range 5°C to 48°C (41°F to 118°F). Failure to follow this instruction may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.**

WARNING: **Make sure the front passenger seat repair is complete, the seat and all attached components (head restraint, seat side shield, etc.) are correctly assembled, and the seat is correctly installed to the vehicle before carrying out the System Reset. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a**

crash.

NOTE: **The System Reset active command should only be carried out as directed by the workshop article.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

WARNING: **The following precautions must be taken before carrying out the following procedure on the front passenger seat:**

- **Park the vehicle on level ground.**
- **Make sure the occupant classification sensor (OCS) system is stabilized at a temperature in the range of 5°C to 48°C (41°F to 118°F) and is not exposed to temperatures outside that range.**
- **Make sure the front passenger seat is empty and dry.**
- **Make sure the front passenger seat repair is complete and all attached components (head restraint, seat side shield) are correctly installed.**
- **Make sure the front passenger seat occupant classification sensor (OCS) rail shields are correctly installed.**
- **Make sure nothing is placed in the map pockets (if equipped) of the front passenger seat.**
- **Make sure nothing is underneath the front passenger seat.**
- **Make sure the under-seat body wiring harness and seat wiring harness are not twisted or pinched between the electrical bracket and the No. 2 crossmember, or are not twisted or pinched between the electrical bracket and the floor.**
- **Make sure no non-factory installed items (seat covers, DVD screens) are on or contacting the front passenger seat. If any non-factory items were installed to the seat, remove the item(s) and communicate to the customer that any alteration/modification to the front passenger seat may affect performance of the OCS system. Refer to the Owner's Literature.**
- **Make sure the seat is correctly installed in the vehicle.**

Failure to follow these instructions may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

1. Make sure the front passenger seat is empty, there is nothing underneath the seat, remove any items from the seat that were not factory installed, and make sure that the seat is correctly installed in the vehicle.

2. Position the front passenger seat.
   - Position the seat in the middle of seat track travel.
   - Position the seat backrest in the most forward position.
   - Position the seat height to its lowest position (power seat only).

WARNING: **Remove binding or resistance between all components of the front passenger seat as directed in the following procedure. Failure to follow this instruction may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.**

3. Remove hysteresis from the front passenger seat by firmly hitting the back of the seat head restraint 3 times.

WARNING: **Make sure nothing is placed on the front passenger seat during the following procedure. Do not press, touch or lay anything on the front passenger seat until the following procedure has been completed. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increase the risk of serious personal injury or death in a crash.**

NOTE: Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before carrying out the System Reset active command.

4. Turn the ignition switch ON, wait 8 seconds and carry out the System Reset active command using the scan tool.

NOTE: The ignition switch must be cycled after carrying out the System Reset active command.

5. Cycle the ignition switch ON to OFF.

WARNING: **Make sure nothing is placed on the front passenger seat during the Zero Seat Weight Test. Do not press, touch or lay anything on the front passenger seat until the Zero Seat Weight Test has been completed. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increase the risk of serious personal injury or death in a crash.**

NOTE: Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before carrying out the Zero Seat Weight Test.

6. Turn the ignition switch ON, wait 8 seconds and carry out the Zero Seat Weight Test using the scan tool.

NOTE: If the scan tool responds with system passed, do not carry out the System Reset active command.

1. If the system passed, the repair is complete.
2. If the system did not pass (DTC C1941 Zero Seat Weight Test Failure reported), carry out the following steps.
    - Cycle the ignition switch OFF then ON, wait 8 seconds and carry out the System Reset active command using the scan tool.
    - Cycle the ignition switch OFF then ON and wait 8 seconds.
    - Carry out the Zero Seat Weight Test using the scan tool.
        - If the system passed, the repair is complete.
        - If the system did not pass (DTC C1941 Zero Seat Weight Test Failure reported), install 2 new occupant classification sensor rails and carry out the System Reset procedure. For additional information, refer to **Occupant Classification Sensor** and **Occupant Classification Sensor (OCS) System Reset**.

7. Prove out the supplemental restraint system (SRS) as follows:

    Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag indicator with the air bag modules installed. The air bag indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag indicator will:

    - fail to light.

    - remain lit continuously.

    - flash at a 5 Hz rate (restraint control module [RCM] not configured).

    The air bag indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag indicator and any SRS fault discovered must be diagnosed and repaired.

    Clear all continuous DTCs from the restraints control module and occupant classification system module (OCSM) using a scan tool.

OCCUPANT CLASSIFICATION SENSOR (OCS) SYSTEM ZERO SEAT WEIGHT TEST

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

 ST1385-A		

Zero Seat Weight Test

WARNING: Make sure nothing is placed on the front passenger seat during the following procedure. Do not press, touch or lay anything on the front passenger seat until the following procedure has been completed. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increase the risk of serious personal injury or death in a crash.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

WARNING: The following precautions must be taken before carrying out the following procedure on the front passenger seat:

- **Park the vehicle on level ground.**
- **Make sure the occupant classification sensor (OCS) system is stabilized at a temperature in the range of 5°C to 48°C (41°F to 118°F) and is not exposed to temperatures outside that range.**
- **Make sure the front passenger seat is empty and dry.**
- **Make sure the front passenger seat repair is complete and all attached components (head restraint, seat side shield) are correctly installed.**
- **Make sure the front passenger seat occupant classification sensor (OCS) rail shields are correctly installed.**
- **Make sure nothing is placed in the map pockets (if equipped) of the front passenger seat.**
- **Make sure nothing is underneath the front passenger seat.**
- **Make sure the under-seat body wiring harness and seat wiring harness are not twisted or pinched between the electrical bracket and the No. 2 crossmember, or are not twisted or pinched between the electrical bracket and the floor.**
- **Make sure no non-factory installed items (seat covers, DVD screens) are on or contacting the front passenger seat. If any non-factory items were installed to the seat, remove the item(s) and communicate to the customer that any alteration/modification to the front passenger seat may affect performance of the OCS system. Refer to the Owner's**

Literature.

- **Make sure the seat is correctly installed in the vehicle.**

Failure to follow these instructions may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.

1. Make sure the front passenger seat is empty, there is nothing underneath the seat, remove any items from the seat that were not factory installed, and make sure that the seat is correctly installed in the vehicle.
2. Position the front passenger seat.
   - Position the seat in the middle of seat track travel.
   - Position the seat backrest in the most forward position.
   - Position the seat height to its lowest position (power seat only).

WARNING: **Remove binding or resistance between all components of the front passenger seat (as directed in the procedure) prior to carrying out the Zero Seat Weight Test. Failure to follow this instruction may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.**

3. Remove hysteresis from the front passenger seat by firmly hitting the back of the seat head restraint 3 times.

WARNING: **Make sure nothing is placed on the front passenger seat during the Zero Seat Weight Test. Do not press, touch or lay anything on the front passenger seat until the Zero Seat Weight Test has been completed. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increase the risk of serious personal injury or death in a crash.**

NOTE: Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before carrying out the Zero Seat Weight Test.

NOTE: If the scan tool responds with system passed, do not carry out the System Reset active command.

4. Cycle the ignition switch ON, wait 8 seconds and carry out the Zero Seat Weight Test using the scan tool.
   - If the system passed, the repair is complete. Proceed to Step 7.
   - If the system did not pass (DTC C1941 Zero Seat Weight Test Failure reported), repeat Steps 1-4. If the system did not pass the second Zero Seat Weight Test, proceed to the next step.

WARNING: **Make sure nothing is placed on the front passenger seat during the**

Zero Seat Weight Test. Do not press, touch or lay anything on the front passenger seat until the Zero Seat Weight Test has been completed. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increase the risk of serious personal injury or death in a crash.

NOTE: Make sure a minimum 8-second time period has passed after cycling the ignition switch ON before carrying out the Zero Seat Weight Test.

5. Cycle the ignition switch OFF then ON, wait 8 seconds and carry out the System Reset active command using the scan tool.
6. Cycle the ignition switch OFF then ON, wait 8 seconds and carry out the Zero Seat Weight Test using the scan tool.
   - If the system passed, the repair is complete. Proceed to Step 7.
   - If the system did not pass (DTC C1941 Zero Seat Weight Test Failure reported), install 2 new OCS rails and carry out the System Reset procedure. For additional information, refer to **Occupant Classification Sensor** and **Occupant Classification Sensor (OCS) System Reset**.
7. Prove out the supplemental restraint system (SRS) as follows:

   Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag indicator with the air bag modules installed. The air bag indicator will light continuously for approximately 6 seconds and then turn off. If an air bag SRS fault is present, the air bag indicator will:

   - fail to light.

   - remain lit continuously.

   - flash at a 5 Hz rate (restraints control module [RCM] not configured).

   The air bag indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag indicator and any SRS fault discovered must be diagnosed and repaired.

   Clear all continuous DTCs from the RCM and occupant classification system module (OCSM) using a scan tool.

PYROTECHNIC DEVICE DISPOSAL

Disposal of Deployable Devices and Pyrotechnic Devices That are Undeployed/Inoperative

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

NOTE: All inoperative air bag modules and safety belt pretensioners have been placed on the Mandatory Return List. All discolored or damaged air bag modules must be treated the same as any inoperative live air bag being returned.

1. Depower the Supplemental Restraint System (SRS). For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Remove the undeployed/inoperative device. For additional information, refer to the appropriate procedure or **SAFETY BELT SYSTEM** article.

   NOTE: When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the Vehicle Identification Number (VIN) must be recorded and sent to Ford Motor Company.

3. If installing a new air bag module, record the necessary information and return the inoperative air bag module to Ford Motor Company.

Disposal of Deployable Devices and Pyrotechnic Devices That Are Deployed

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Remove the deployed device. For additional information, refer to the appropriate procedure or **SAFETY BELT SYSTEM** article.

   NOTE: If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages have deployed before scrapping the vehicle or disposing of the air bag module. To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer to DESCRIPTION AND OPERATION.

3. Dispose of the deployed device in the same manner as any other part to be scrapped.

Disposal of Deployable Devices and Pyrotechnic Devices That Require Manual Deployment

1. Safety and environmental concerns require consideration and treatment of restraints system deployable and pyrotechnic devices when disposing of vehicles, deployable devices or pyrotechnic devices. Deploying deployable and pyrotechnic devices before scrapping a vehicle or the device eliminates the potential for hazardous exposures or reactions during processing. If special handling procedures are followed, deployable and pyrotechnic devices can be deployed safely and recycled with the vehicle, shipped separately to a recycling facility or disposed of safely.

   NOTE: To determine the deployable devices a vehicle is equipped with, refer to DESCRIPTION AND OPERATION.

A vehicle equipped with any of the following deployable devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.

- Driver air bag module
- Passenger air bag module
- Seat side air bag modules
- Safety canopy modules
- Side air curtain modules

NOTE: To determine the pyrotechnic devices a vehicle is equipped with, refer to DESCRIPTION AND OPERATION.

2. A vehicle equipped with any of the following pyrotechnic devices requires manual deployment of the devices before scrapping the vehicle or component. For additional information, refer to the appropriate portion of this procedure.
   - Safety belt buckle pretensioners
   - Safety belt retractor pretensioners
   - Adaptive load limiting retractors
   - Deployable steering column

NOTE: To determine if a vehicle is equipped with dual stage driver or passenger air bag modules, refer to DESCRIPTION AND OPERATION.

3. If a dual stage driver or passenger air bag module has deployed due to a crash event, the air bag module requires manual deployment to make sure both stages have deployed before scrapping the vehicle or disposing of the air bag module. For additional information, refer to Driver Air Bag Module, Passenger Air Bag Module and Seat Side Air Bag Modules - Remote Deployment in this procedure.

Driver Air Bag Module, Passenger Air Bag Module and Seat Side Air Bag Modules - Remote Deployment

WARNING: Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.

WARNING: Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.

WARNING: Always carry or place a live safety canopy, or side air curtain module, with the module and tear seam pointed away from your body. Failure to

follow this instruction may result in serious personal injury or death in the event of an accidental deployment.

WARNING: **Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.**

NOTE: For air bag modules with multiple loops, all the loops on the air bag module must be deployed.

NOTE: Some driver and passenger front air bags have 2 deployment stages. After a collision it is possible that Stage 1 has deployed and Stage 2 has not.

If a front air bag module has deployed, it is mandatory that the front air bag module be remotely deployed using the appropriate air bag disposal procedure.

NOTE: A typical air bag disposal is shown that is similar for all vehicles.

All driver, passenger and seat side air bag modules

1. Make a container to house the air bag module for deployment.

   NOTE: The tires must be of sufficient size to accommodate the air bag module.

   - Obtain a tire and wheel assembly and an additional 4 tires (without wheels) of the same size.
   - With the tire and wheel assembly on the bottom, stack the tires.
   - Securely tie all of the tires together.

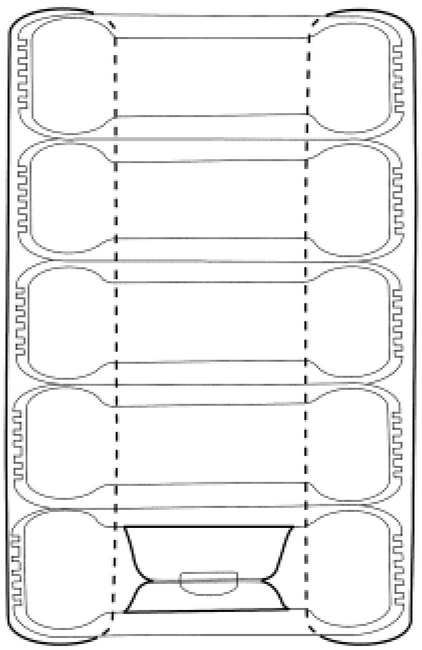


Fig. 132: Placing Air Bag Modules Inside Tire For Deployment
Courtesy of FORD MOTOR CO.

2. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
3. Remove the air bag module. For additional information, refer to the appropriate procedure.

NOTE: If the air bag module does not have a hardwired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the air bag module.

4. Cut each of the air bag module wires near the electrical connector that connects to the vehicle wire harness.
5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

NOTE: Typical driver air bag module with 2 loops shown, other air bag modules with multiple loops similar.

6. For air bag modules with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.

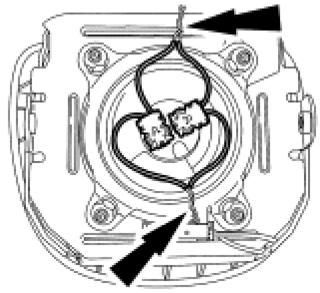

Fig. 133: Locating Air Bag Module Wire Squibs
Courtesy of FORD MOTOR CO.

7. Make a jumper harness to deploy the air bag module.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.
8. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the air bag module or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure that the leads do not make contact with each other.

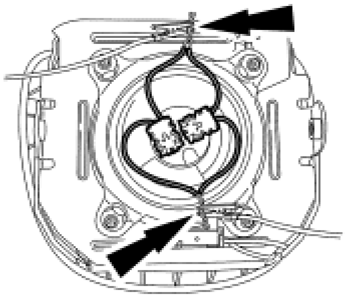

Fig. 134: Connecting Jumper Wires To Squibs
Courtesy of FORD MOTOR CO.

Driver air bag modules

NOTE: Make sure to maintain the connections to the air bag module.

9. With the stack of tires upright and the wheel on the bottom, carefully place the driver air bag module, with the trim cover facing up, on the wheel.

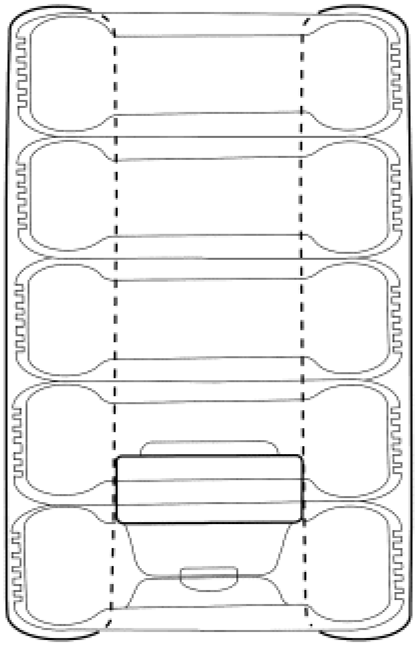

Fig. 135: Placing Driver Air Bag Modules Inside Tires For Deployment
Courtesy of FORD MOTOR CO.

Passenger and seat side air bag modules

NOTE: **Make sure to maintain the connections to the air bag module.**

10. Tip the stack of tires on its side and place the air bag module inside the center tire, making sure that there are 2 tires beneath the tire containing the air bag module and 2 tires (including the tire and wheel assembly) above the tire containing the air bag module.
11. Place the tire stack upright, with the wheel on top.

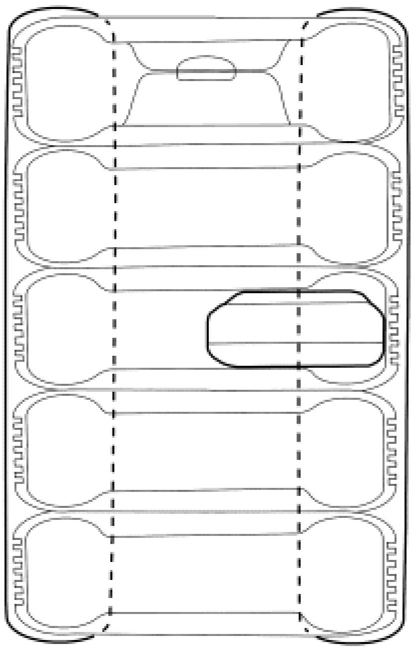

Fig. 136: Identifying Passenger Or Seat Side Air Bag Modules Inside Center Tire
Courtesy of FORD MOTOR CO.

All driver, passenger and seat side air bag modules

12. Remain at least 9.14 m (30 ft) away from the air bag module.
13. From the end of the jumper harness that is not connected to the air bag module, disconnect the 2 wires of the jumper harness from each other.
14. Deploy the air bag module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
15. To allow for cooling, wait at least 10 minutes before approaching the deployed air bag module.
16. Dispose of the deployed air bag module in the same manner as any other part to be scrapped.

Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners and Adaptive Load Limiting Safety Belt Retractors - Remote Deployment

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

WARNING: **Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud**

report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

NOTE: A typical safety belt buckle and retractor disposal is shown that is similar for all vehicles.

1. Make a container to house the safety belt buckle or retractor for deployment.

   NOTE: The tires must be of sufficient size to accommodate the safety belt buckle or retractor.

   - Obtain a tire and wheel assembly and an additional 4 tires (without wheels) of the same size.
   - With the tire and wheel assembly on the bottom, stack the tires.
   - Securely tie all of the tires together.

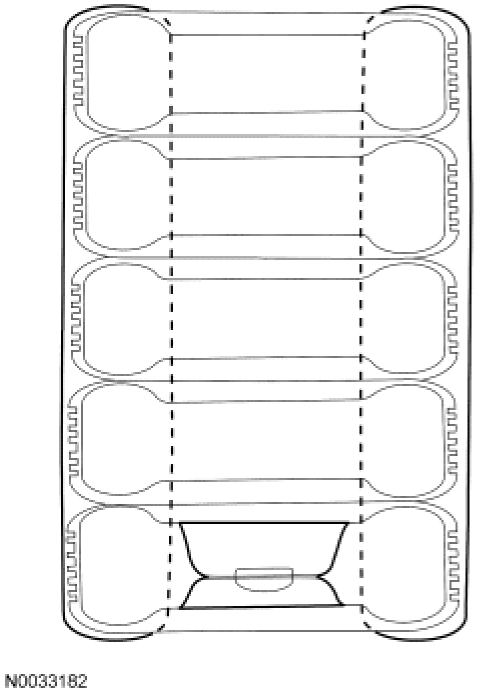

Fig. 137: Placing Air Bag Modules Inside Tire For Deployment
Courtesy of FORD MOTOR CO.

2. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
3. Remove the safety belt buckle or retractor. For additional information, refer to the appropriate procedure in **SAFETY BELT SYSTEM** article.
   - When deploying a safety belt buckle pretensioner, install a nut and bolt of sufficient length and of the same diameter as was used to retain it to the seat.

NOTE: If the safety belt buckle or retractor does not have a hardwired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the safety belt buckle or retractor.

4. Cut each of the safety belt buckle or retractor wires near the electrical connector that connects to the vehicle wire harness.
5. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.
6. Make a jumper harness to deploy the safety belt buckle or retractor.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

NOTE: Typical safety belt retractor pretensioner shown, other safety belt buckle pretensioners and load limiting retractors similar.

7. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt buckle or retractor. Use tape or other insulating material to make sure that the leads do not make contact with each other.

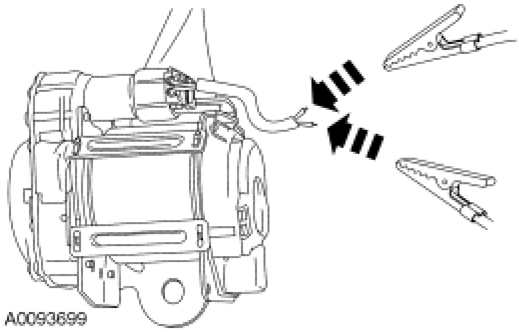

Fig. 138: Attaching Jumper Wires To Safety Belt Retractor Pretensioner
Courtesy of FORD MOTOR CO.

NOTE: Make sure to maintain the connections to the safety belt buckle or retractor.

8. Tip the stack of tires on its side and place the safety belt buckle or retractor inside the center tire, making sure that there are 2 tires beneath the tire containing the safety belt buckle or retractor and 2 tires (including the tire and wheel assembly) above the tire containing the safety belt buckle or retractor.
9. Place the tire stack upright, with the wheel on top.

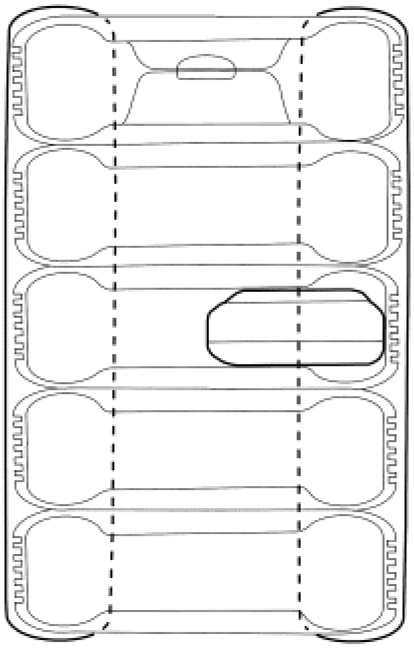

Fig. 139: Identifying Passenger Or Seat Side Air Bag Modules Inside Center Tire
Courtesy of FORD MOTOR CO.

10. Remain at least 9.14 m (30 ft) away from the safety belt buckle or retractor.
11. From the end of the jumper harness that is not connected to the safety belt buckle or retractor, disconnect the 2 wires of the jumper harness from each other.
12. Deploy the safety belt buckle or retractor by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
13. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt buckle or retractor.
14. Dispose of the deployed safety belt buckle or retractor in the same manner as any other part to be scrapped.

Safety Belt Buckle Pretensioners, Safety Belt Retractor Pretensioners and Load Limiting Safety Belt Retractors - In-Vehicle Deployment

WARNING: **Never probe the electrical connectors on safety belt buckle/retractor pretensioners or adaptive load limiting retractors. Failure to follow this instruction may result in the accidental deployment of the safety belt pretensioners or adaptive load limiting retractors, which increases the risk of serious personal injury or death.**

WARNING: **Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud**

report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.

NOTE: A typical safety belt buckle and retractor disposal is shown that is similar for all vehicles.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Access the safety belt buckle or retractor electrical connectors. For additional information, refer to **SAFETY BELT SYSTEM** article.
3. Cut each of the safety belt buckle or retractor wires, leaving at least 101.6 mm (4 in) to work with.
4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.
5. Make a jumper harness to deploy the safety belt buckle or retractor.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.

NOTE: Typical safety belt retractor pretensioner shown, other safety belt buckle pretensioners and load limiting retractors are similar.

6. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety belt buckle or retractor. Use tape or other insulating material to make sure that the leads do not make contact with each other.

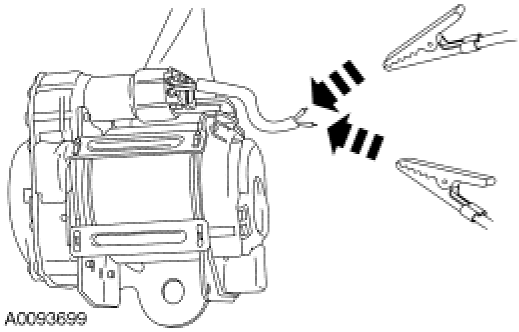

Fig. 140: Attaching Jumper Wires To Safety Belt Retractor Pretensioner
Courtesy of FORD MOTOR CO.

7. Remain at least 9.14 m (30 ft) away from the safety belt buckle or retractor.
8. From the end of the jumper harness that is not connected to the safety belt buckle or retractor, disconnect the 2 wires of the jumper harness from each other.
9. Deploy the safety belt buckle or retractor by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
10. To allow for cooling, wait at least 10 minutes before approaching the deployed safety belt buckle or retractor.

11. Dispose of the deployed safety belt buckle or retractor in the same manner as any other part to be scrapped.

Safety Canopy Modules and Side Air Curtain Modules - In-Vehicle Deployment

WARNING: **Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.**

NOTE: The safety canopy module deployment for a scrapped vehicle will occur in its installed position in the vehicle.

NOTE: A typical safety canopy module disposal is shown that is similar for all vehicles.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Access the safety canopy/side air curtain module electrical connectors. For additional information, refer to the appropriate procedure.
3. Cut each of the safety canopy/side air curtain module wires leaving at least 101.6 mm (4 in) to work with.
4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.

NOTE: Typical safety canopy/side air curtain module with 2 loops shown, other safety canopy/side air curtain modules with 2 loops are similar.

5. For safety canopy/side air curtain modules with multiple loops, twist together a wire from each loop then repeat for the remaining wires from each loop.

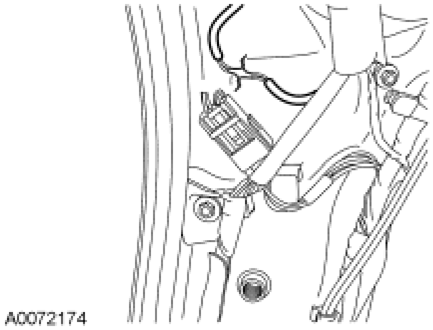

Fig. 141: Identifying Safety Canopy/Side Air Curtain Module Wire Squibs
Courtesy of FORD MOTOR CO.

6. Make a jumper harness to deploy the safety canopy/side air curtain module.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.

- At one end of the jumper harness, connect the wires together.

7. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the safety canopy/side air curtain module or to the twisted-together wires if multiple loops. Use tape or other insulating material to make sure that the leads do not make contact with each other.

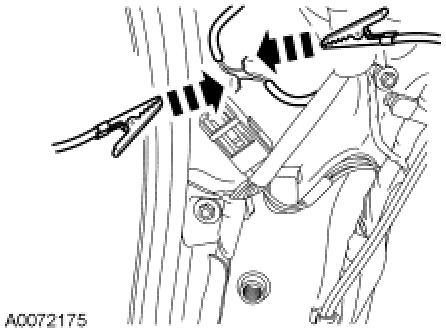

Fig. 142: Connecting Jumper Harness To Twisted Wires
Courtesy of FORD MOTOR CO.

8. From the end of the jumper harness that is not connected to the safety canopy/side air curtain module, disconnect the 2 wires of the jumper harness from each other.
9. Deploy the safety canopy/side air curtain module by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
10. To allow for cooling, wait at least 10 minutes before approaching the deployed safety canopy/side air curtain module.
11. Dispose of the deployed safety canopy/side air curtain module in the same manner as any other part to be scrapped.

Deployable Steering Column - In-Vehicle Deployment

WARNING: **Deploy all supplemental restraint system (SRS) devices (air bags, pretensioners, load limiters, etc.) outdoors with all personnel at least 9.14 meters (30 feet) away to make sure of personal safety. Due to the loud report which occurs when an SRS device is deployed, hearing protection is required. Failure to follow these instructions may result in serious personal injury.**

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

NOTE: **It may be necessary to lower or remove the deployable steering column from the instrument panel to access the deployable steering column electrical connector.**

2. Access the deployable steering column electrical connector.

NOTE: If the deployable steering column does not have a hardwired pigtail, it will be necessary to cut the wires and connector(s) from the vehicle wire harness and reconnect to the deployable steering column.

3. Cut each of the deployable steering column wires, leaving at least 101.6 mm (4 in) to work with.
4. Remove any sheathing (if present) and strip the insulation from the ends of the cut wires.
5. Make a jumper harness to deploy the deployable steering column.
   - Obtain 2 wires (20 gauge minimum) at least 9.14 m (30 ft) long and strip both ends of each wire.
   - At one end of the jumper harness, connect the wires together.
6. Using the end of the jumper harness that the wires are not connected together, attach each wire of the jumper harness to each wire of the deployable steering column. Use tape or other insulating material to make sure that the leads do not make contact with each other.

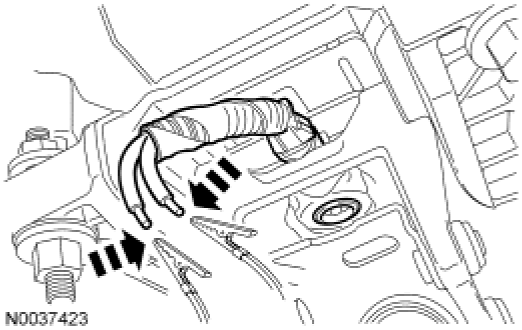

Fig. 143: Connecting Jumper Harness To Wires Of Deployable Steering Column
Courtesy of FORD MOTOR CO.

7. Remain at least 9.14 m (30 ft) away from the deployable steering column.
8. From the end of the jumper harness that is not connected to the deployable steering column, disconnect the 2 wires of the jumper harness from each other.
9. Deploy the deployable steering column by touching the ends of the 2 wires of the jumper harness to the terminals of a 12-volt battery.
10. To allow for cooling, wait at least 10 minutes before approaching the deployed steering column.
11. Dispose of the deployed steering column in the same manner as any other part to be scrapped.

RIVET NUT REPLACEMENT

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

NOTE: If the safety canopy/side air curtain module has deployed, the tether cord rivet nut must be inspected and replaced if damaged before installing a new safety canopy.

NOTE: A typical rivet nut replacement is shown that is similar for all vehicles.

NOTE: LH shown, RH similar.

1. Depower the Supplemental Restraint System (SRS). For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Remove the necessary trim panel(s). For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
3. Remove the bolt and bracket for the tether cord (if present).

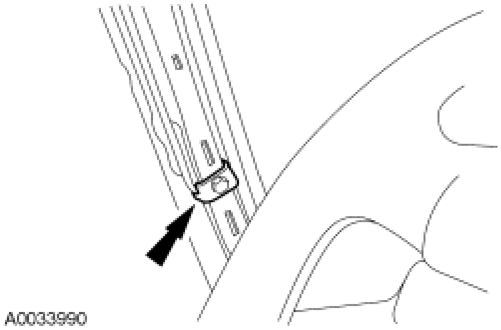

Fig. 144: Tether Cord Bracket & Bolt
Courtesy of FORD MOTOR CO.

4. If needed, position and secure the safety canopy/side air curtain tether cord and bracket assembly aside.
5. Using the appropriate service tool, sand the rivet nut shoulder until the shoulder surface is removed.

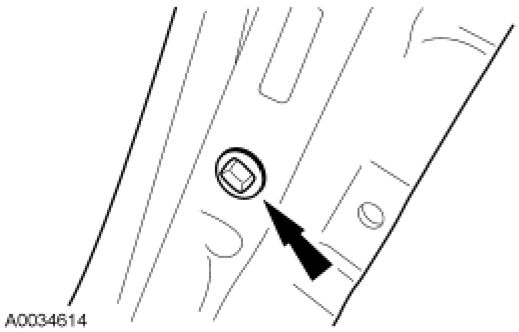

Fig. 145: Rivet Nut Shoulder
Courtesy of FORD MOTOR CO.

6. Punch the remaining portion of the rivet nut through the rivet nut hole.

NOTE: Use only Ford Motor Company factory-authorized replacement parts for rivet nut repair procedure.

7. Obtain the correct square shank rivet nut for the vehicle application from the Ford Master Parts Catalog, and insert it into the rivet nut hole.

8. Using a suitable rivet nut installing tool, install the rivet nut. For additional information, refer to the tool manufacturer's operating instructions.
9. If present, position the tether cord. Install the bolt. See the appropriate component removal and installation procedure or Specifications for the correct torque specification.

NOTE: The tether cord must be positioned correctly in place before installing the A-pillar trim panel.

10. Install the necessary trim panel(s). For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

REMOVAL AND INSTALLATION

AIR BAG TRIM COVER - PASSENGER

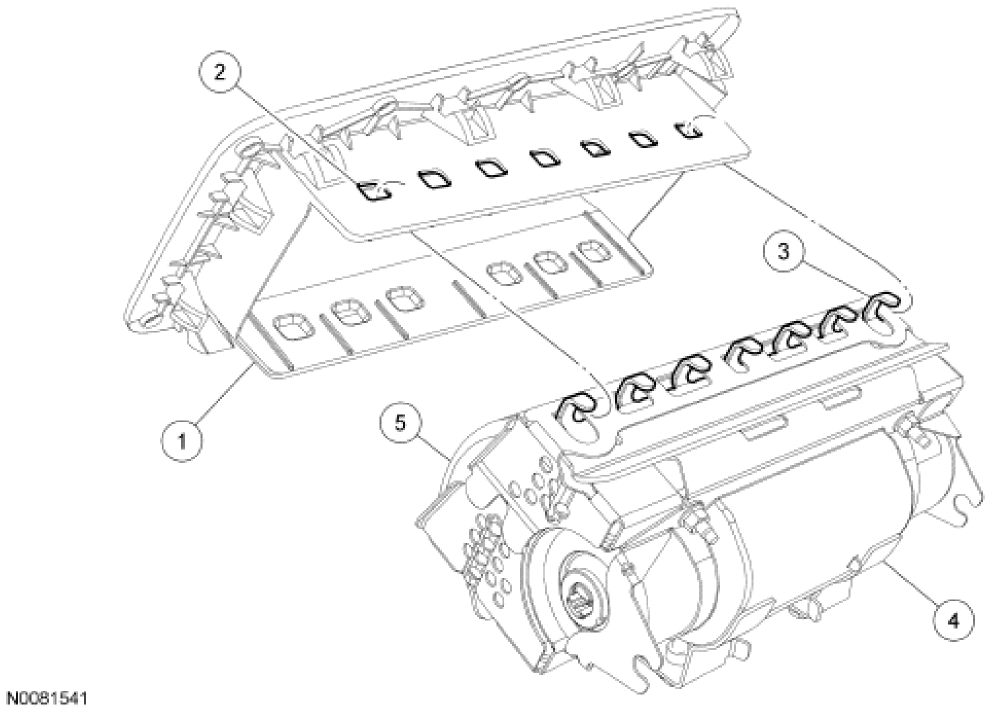

Fig. 146: Exploded View Of Passenger Air Bag Trim Cover - Fusion & Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	04338	Passenger air bag cover
2	-	Passenger air bag cover window (part of passenger air bag cover)
3	-	Passenger air bag canister hook (part of canister)
4	-	Passenger air bag canister (part of 044A74)
5	-	Passenger air bag soft pack (part of 044A74)

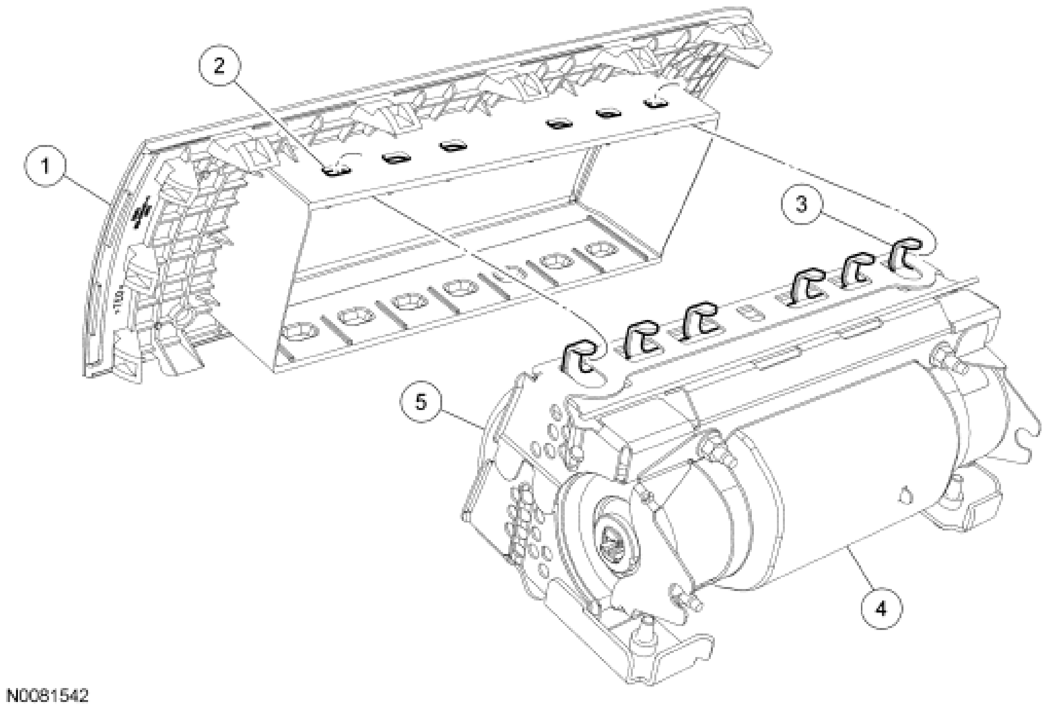

Fig. 147: Exploded View Of Passenger Air Bag Trim Cover - MKZ
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	04338	Passenger air bag cover
2	-	Passenger air bag cover windows (part of passenger air bag cover)
3	-	Passenger air bag canister hooks (part of canister)
4	-	Passenger air bag canister (part of 044A74)
5	-	Passenger air bag soft pack (part of 044A74)

REMOVAL

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Do not use any sharp tools to separate the passenger air bag module trim cover from the passenger air bag module canister. Sharp tools may damage the passenger air bag module. Failure to follow this instruction may result in the passenger air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

WARNING: **Do not unpack or unroll the passenger air bag module soft pack. If the**

soft pack becomes unpacked or unrolled, install a new passenger air bag module assembly. Failure to follow these instructions may result in the passenger air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.

WARNING: **Do not manipulate or compromise the passenger air bag module hooks during the removal or installation procedure. Failure to follow this instruction may result in the passenger air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

1. Remove the passenger air bag module. Refer to **Passenger Air Bag Module**.
2. Place a mark on top of the passenger air bag module canister for correct installation.
3. Carefully lift the passenger air bag module cover from the bottom of the air bag module canister, separating the windows from the canister hooks.

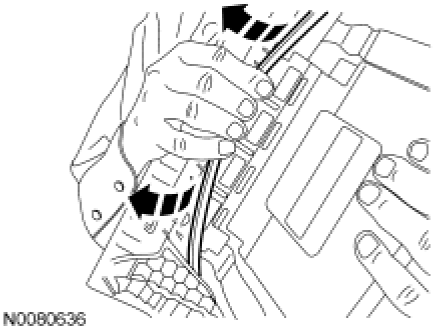

Fig. 148: Lifting Passenger Air Bag Module Cover From Bottom Of Air Bag Module Canister & Separating Windows From Canister Hooks
Courtesy of FORD MOTOR CO.

NOTE: **Place an X mark on the old air bag cover to avoid reinstalling.**

4. Remove the passenger air bag cover from the canister, separating the top windows from the canister hooks.

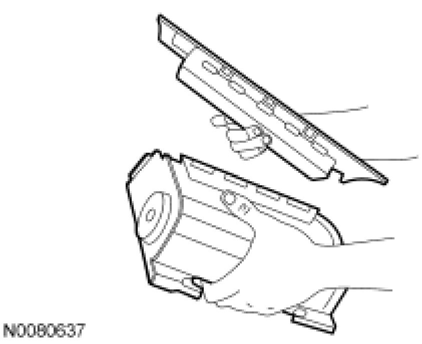

Fig. 149: Removing Passenger Air Bag Cover From Canister & Separating Top Windows From

Canister Hooks
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Place the passenger air bag cover on a clean work surface once it is removed from the shipping package.

   WARNING: **Carefully inspect the passenger air bag trim cover, canister and soft pack before assembly. If any foreign objects are found, remove them before attaching the passenger air bag trim cover to the canister. If the canister or soft pack is damaged, install a new passenger air bag module assembly. Failure to follow this instruction may result in the passenger air bag module deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

2. Match the number of cover windows to the number of canister hooks before attaching the passenger air bag cover to the canister.
3. Match the top of the passenger air bag cover with the canister mark from the removal procedure.
4. Position the canister onto the passenger air bag cover and engage the bottom hooks into the air bag cover windows.
5. Push the top of the passenger air bag cover to engage the top canister hooks.

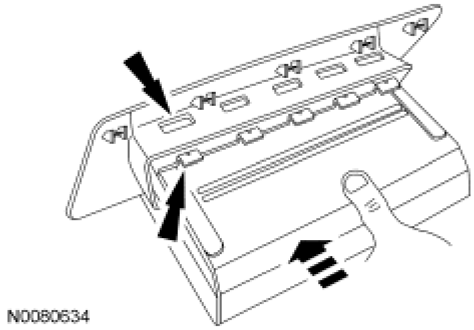

Fig. 150: Pushing Top Of Passenger Air Bag Cover To Engage Top Canister Hooks
Courtesy of FORD MOTOR CO.

6. Inspect the passenger air bag cover windows-to-canister hooks to verify that every window has a hook installed and the sides are not tucked or folded against the air bag canister.

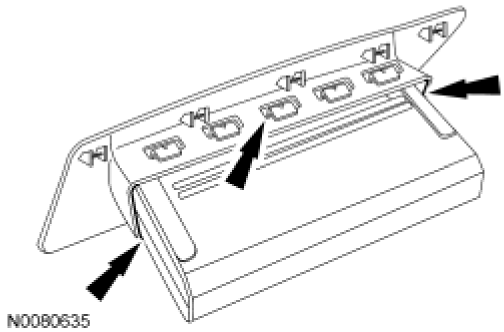

Fig. 151: Inspecting Passenger Air Bag Cover Windows-To-Canister Hooks To Verify Every Window Has A Hook Installed
Courtesy of FORD MOTOR CO.

7. Install the passenger air bag module. Refer to **Passenger Air Bag Module**.
8.

CLOCKSPRING

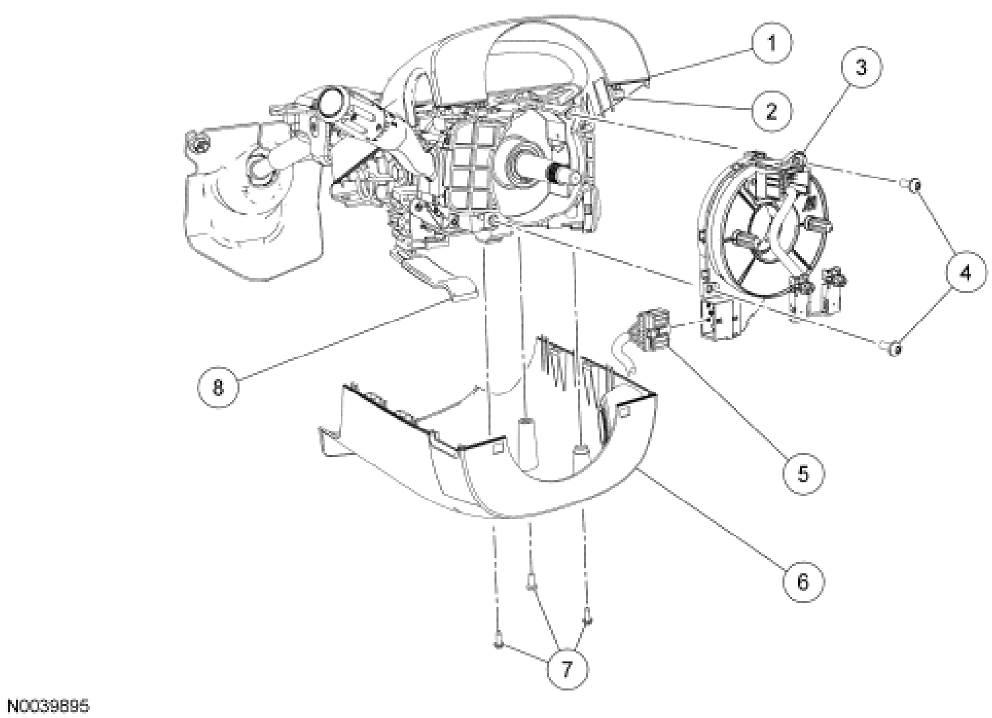

Fig. 152: Exploded View Of Clockspring
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	3530	Upper steering column shroud
2	-	Upper steering column shroud tab (2 required) (part of 3530)

3	14A644	Clockspring
4	W506942	Clockspring screws (2 required)
5	-	Clockspring electrical connector (part of 14401)
6	3K512	Lower steering column shroud
7	-	Lower steering column shroud screws (3 required) (part of 3K512)
8	-	Steering column tilt lock/unlock handle

REMOVAL

NOTE: The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and carry out the diagnostic procedure again.

1. Remove the driver air bag module. For additional information, refer to **Driver Air Bag Module**.

   NOTE: Make sure the road wheels are in the straight-ahead position. Damage to the clockspring may occur.

2. Remove the steering wheel. For additional information, refer to **STEERING COLUMN** article.
3. Release the 2 tabs and position the upper steering column shroud up.
4. Remove the 3 screws and lower steering column shroud.
5. Disconnect the clockspring electrical connector.
6. Remove the 2 clockspring screws and remove the clockspring.

INSTALLATION

All vehicles

1. Install the clockspring and 2 screws.
2. Connect the clockspring electrical connector.
3. Install the lower steering column shroud and 3 screws.
4. Attach the upper steering column shroud to the lower steering column shroud.

   Vehicles installing a new clockspring

5. Install the steering wheel. For additional information, refer to **STEERING SYSTEM - GENERAL**

INFORMATION article.

- After the steering wheel installation, remove the clockspring sealing key.

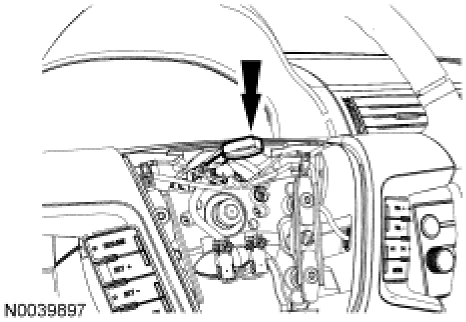

Fig. 153: Locating Clockspring Sealing Key
Courtesy of FORD MOTOR CO.

Vehicle repairs reusing the same clockspring

WARNING: **If the clockspring is not correctly centralized, it may fail prematurely. If in doubt, repeat the centralizing procedure. Failure to follow these instructions may increase the risk of serious personal injury or death in a crash.**

NOTE: Make sure the road wheels are in the straight-ahead position. Damage to the clockspring may occur.

6. If the vehicle's clockspring has rotated out of center, follow these steps to center the clockspring.
   1. Hold the clockspring outer housing stationary.

      NOTE: Overturning will destroy the clockspring. The internal ribbon wire acts as the stop and can be broken from its internal connection.

   2. While turning the rotor counterclockwise, carefully feel for the ribbon wire to run out of length and for a slight resistance. Stop turning at this point.
   3. Turn the clockspring clockwise (approximately 2.25 turns) until the clockspring rotor wiring and connector are in the 12 o'clock position. Clockspring is now centered.
      - Do not allow the rotor to turn from this position.

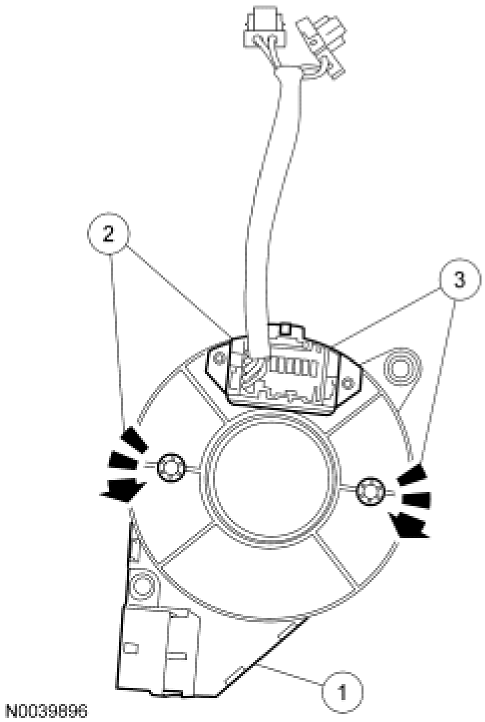

Fig. 154: Centering Clockspring
Courtesy of FORD MOTOR CO.

NOTE: If the vehicle is left unattended by the technician between centralizing the clockspring and installing the steering wheel, the centralizing procedure must be repeated. Damage to the clockspring may occur.

7. Install the steering wheel. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.

All vehicles

8. Install the driver air bag module. For additional information, refer to **Driver Air Bag Module**.

DRIVER AIR BAG MODULE

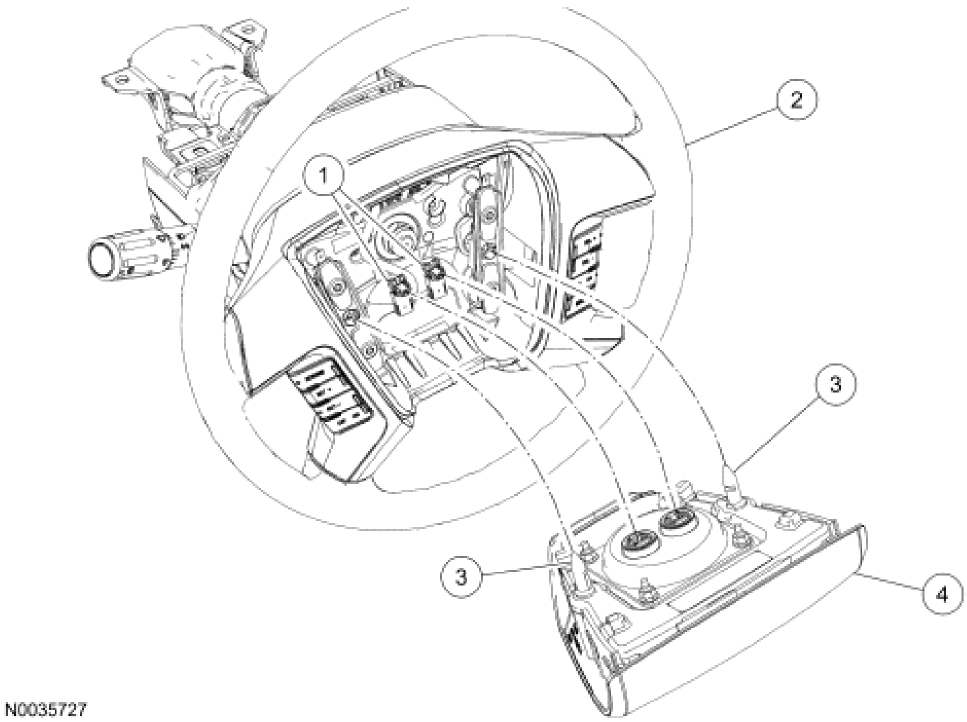

Fig. 155: Exploded View Of Driver Air Bag Module
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Driver air bag module electrical connectors (part of 14A664)
2	3600	Steering wheel
3	-	Driver air bag module locking pins (part of 43B13)
4	43B13	Driver air bag module

REMOVAL

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

NOTE: Repeat this step for both locking pins.

2. Using a 3-mm Allen wrench or a suitable tool through the access hole on the backside of the steering wheel, position the tool against the spring clip and push in, disengaging the clip from the locking pin. With the spring clip disengaged from the locking pin, gently pull back on that side of the driver air bag module to release it from the steering wheel.

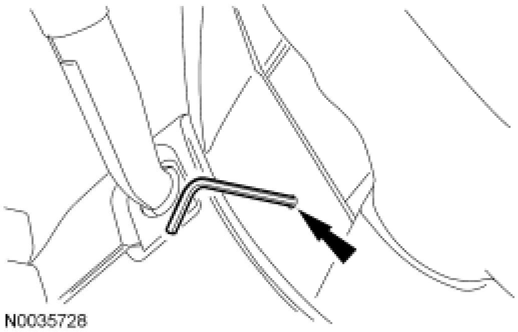

Fig. 156: Locating Allen Wrench
Courtesy of FORD MOTOR CO.

NOTE: Do not pull the driver air bag module electrical connectors out by the locking buttons. Damage to the locking buttons can occur.

3. Using a small screwdriver as shown, lift up and release the locking buttons on the driver air bag module electrical connectors. With the locking buttons released, remove the electrical connectors and the driver air bag module.

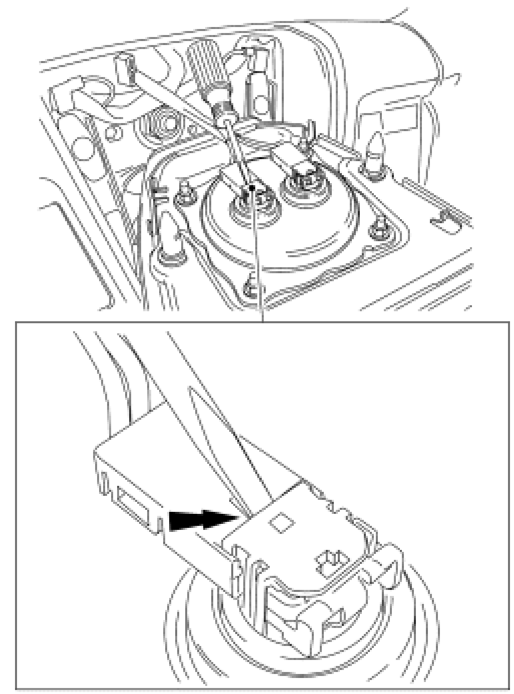

Fig. 157: Releasing Locking Buttons On Driver Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: **The driver air bag module electrical connector locking buttons must be in the released position when connected. Do not install the driver air bag module electrical connectors by the locking buttons. Failure to follow these instructions may cause connector damage.**

1. With the locking buttons released, install the driver air bag module electrical connectors fully into the driver air bag module and seat the locking buttons.

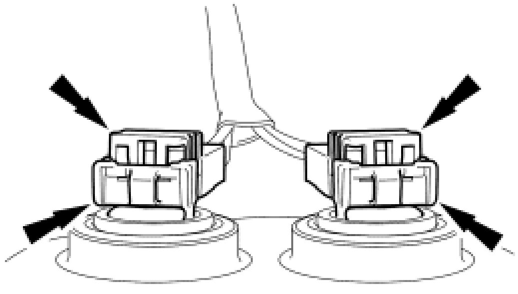

Fig. 158: Locating Driver Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

2. Align the driver air bag module locking pins to the steering wheel and, while pushing inward, seat the 2

driver air bag module locking pins to the steering wheel wire clips.

3. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

FRONT IMPACT SEVERITY SENSOR

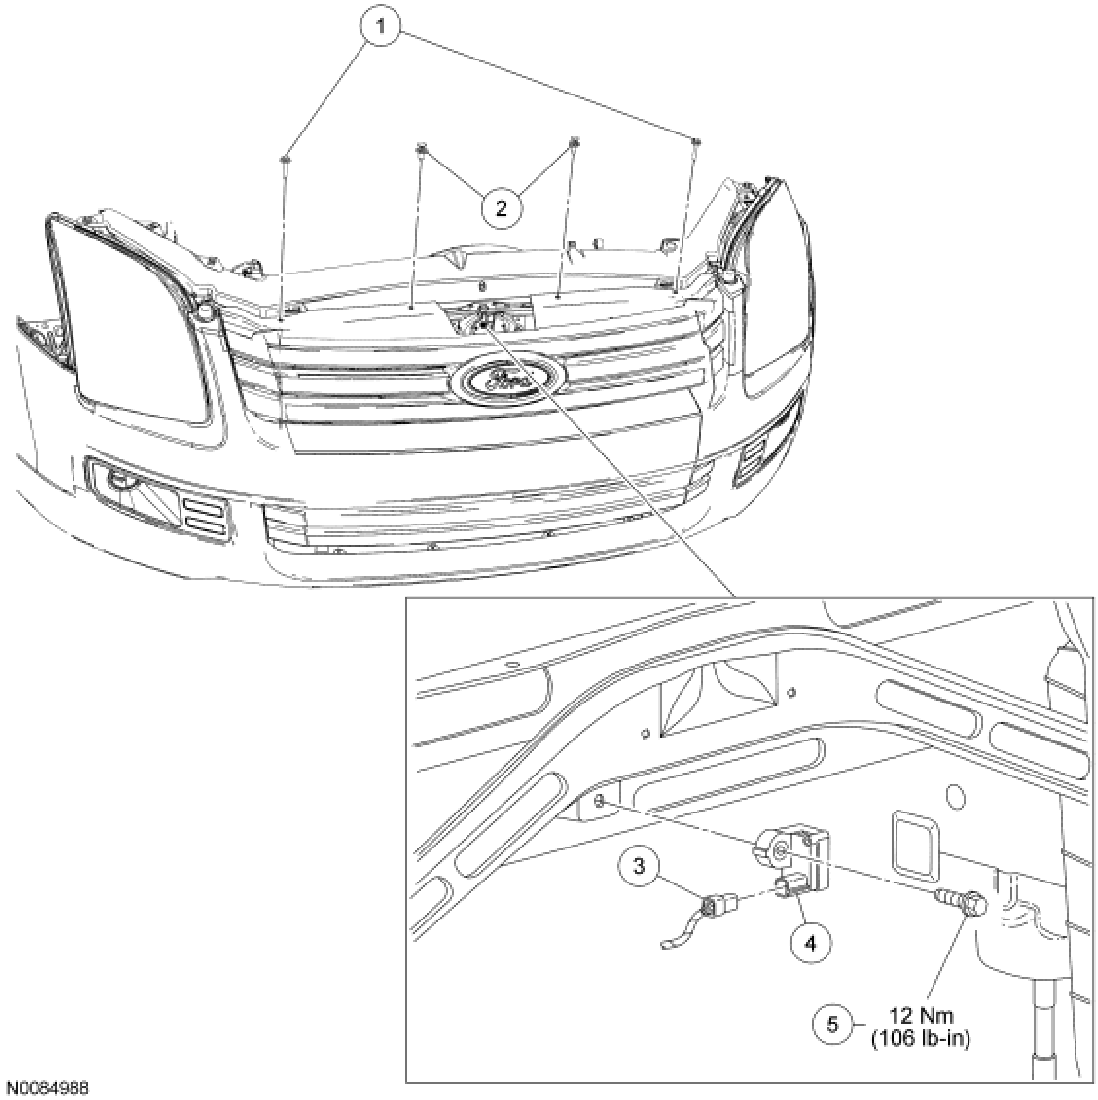

Fig. 159: Exploded View Of Front Impact Severity Sensor With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W505426	Upper grille bolts (2 required)
2	N807389	Upper grille pin-type retainers (2 required)
3	-	Front impact severity sensor electrical connector (part of 14290)
4	14B006	Front impact severity sensor assembly

5	W505256	Front impact severity sensor assembly bolt

REMOVAL AND INSTALLATION

WARNING: If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Remove the 2 bolts and the 2 pin-type retainers from the upper grille.
3. While gently positioning forward the upper grille, remove the bolt from the front impact severity sensor assembly.
   - To install, tighten to 12 Nm (106 lb-in).
4. Disconnect the electrical connector and remove the front impact severity sensor assembly.

   WARNING: Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

   NOTE: Make sure the radiator support and front impact severity sensor and bracket assembly mating surfaces are clean and free of foreign material.

5. To install, reverse the removal procedure.
6. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

OCCUPANT CLASSIFICATION SYSTEM MODULE (OCSM)

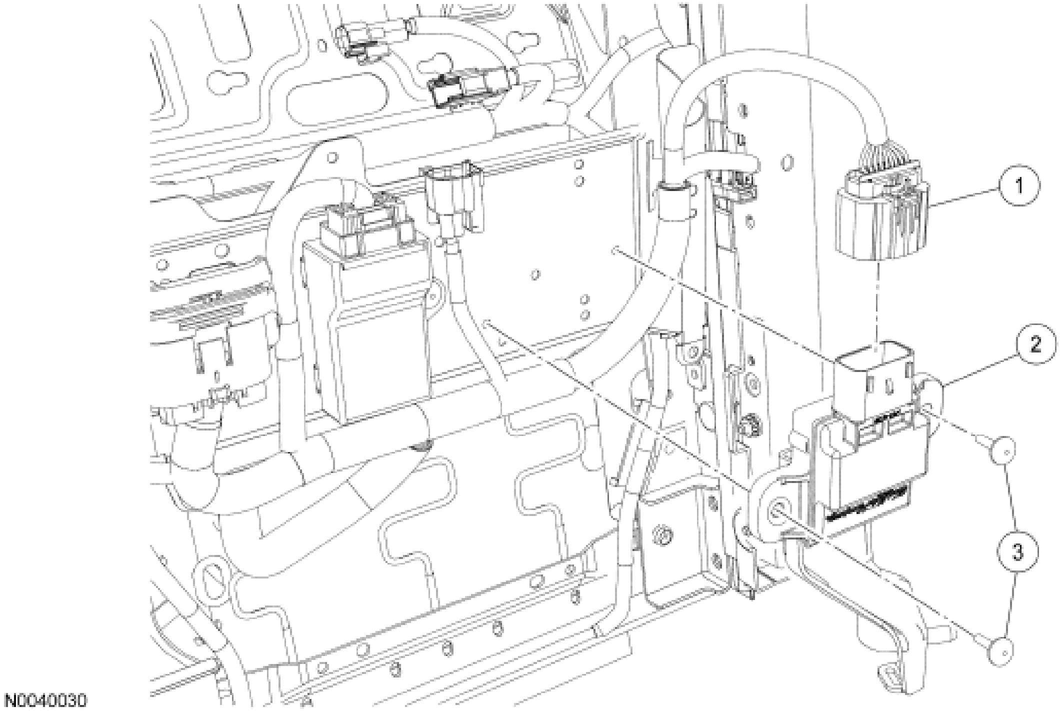

Fig. 160: Exploded View Of Occupant Classification System Module (OCSM)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Occupant classification system module (OCSM) electrical connector (part of 14A698)
2	14B422	OCSM
3	-	OCSM module rivets

REMOVAL

WARNING: **The occupant classification sensor (OCS) rails have a built-in strain gauge which may operate incorrectly if an OCS rail is dropped by itself, dropped after it is installed to the front passenger seat or dropped after it is installed to a front passenger seat track assembly. Use care when handling an OCS rail before or after it is installed to the front passenger seat or seat track assembly. Failure to follow these instructions may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.**

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation and does not indicate a supplemental restraint system (SRS) fault.**

NOTE: **The SRS must be fully operational and free of faults before releasing the vehicle**

to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

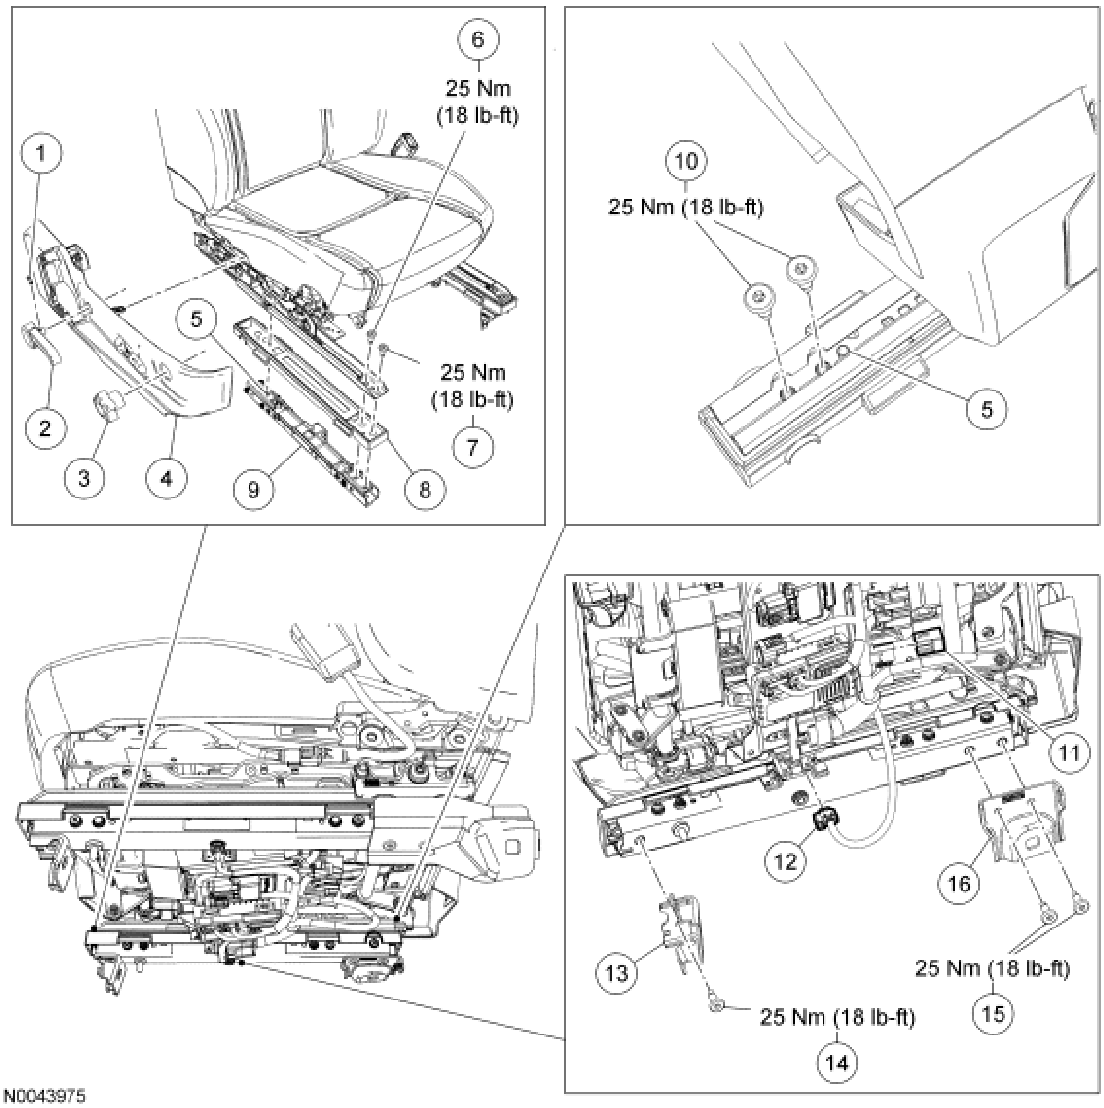
1. Remove the passenger seat. For additional information, refer to **SEATING** article.

   CAUTION: Make sure to remove all metal chips from the occupant classification system module (OCSM) and the surrounding areas after drilling out the rivets. Failure to follow this instruction may result in component damage and/or system failure.

2. Drill out the 2 occupant classification system module (OCSM) rivets.
3. Disconnect the electrical connector and remove the OCSM.
4. To install, reverse the removal procedure.
5. Install the passenger seat and repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **SEATING** article.
6. Carry out the appropriate procedure after installation of an occupant classification system module (OCSM) system component.
   - If installing the original OCSM, carry out the Occupant Classification System (OCS) Zero Seat Weight Test and prove out the SRS. For additional information, refer to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test**.
   - If installing a new OCSM, carry out the Occupant Classification Sensor (OCS) System Reset procedure and prove out the SRS. For additional information, refer to **Occupant Classification Sensor (OCS) System Reset**.

OCCUPANT CLASSIFICATION SENSOR

NOTE: Outboard shown, inboard similar.



N0043975

Fig. 161: Exploded View Of Occupant Classification Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Manual recliner handle spring clip (part of 61198)
2	61198	Manual recliner handle
3	62622	Manual lumbar control knob
4	62186	Seat cushion side shield
5	-	Occupant classification sensor (OCS) system rail locating pin (part of 61708)
6	-	OCS system rail front mounting position rear bolt (part of 61708)
7	-	OCS system rail front mounting position front bolt (part of 61708)

8	62126	OCS system rail shield
9	61708	OCS system rail
10	-	OCS system rail rear bolts (part of 61708)
11	-	Power seat track motor electrical connector (part of 14A698) (if equipped)
12	-	OCS system rail electrical connector (part of 14A698)
13	61913	Forward seat riser
14	-	Forward seat riser bolt
15	-	Rearward seat riser bolts
16	61913	Rearward seat riser

REMOVAL

WARNING: **The occupant classification sensor (OCS) rails have a built-in strain gauge which may operate incorrectly if an OCS rail is dropped by itself, dropped after it is installed to the front passenger seat or dropped after it is installed to a front passenger seat track assembly. Use care when handling an OCS rail before or after it is installed to the front passenger seat or seat track assembly. Failure to follow these instructions may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.**

WARNING: **Do not disassemble the occupant classification sensor (OCS) rail or tighten or loosen any of the nuts and bolts installed to the OCS rail body. Only the 8 bolts that attach the 2 OCS rails to the seat track may be removed and installed. Failure to follow these instructions may result in incorrect operation of the OCS system and increase the risk of serious personal injury or death in a crash.**

WARNING: **To prevent foreign material and contaminants from entering the occupant classification sensor (OCS) rail, make sure the OCS rail shield is present, is not damaged and is correctly installed to the OCS rail. Failure to follow these instructions may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.**

WARNING: **Use care when handling the front passenger seat and track assembly. Dropping the assembly, placing excessive weight on or sitting on a front passenger seat that is not secured in the vehicle may result in damaged seat components. Failure to follow these instructions may result in incorrect operation of the occupant classification sensor (OCS) system and increases the risk of serious personal injury or death in a crash.**

NOTE: **The air bag warning indicator illuminates when the restraints control module (RCM) fuse is removed and the ignition switch is ON. This is normal operation**

and does not indicate a supplemental restraint system (SRS) fault.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

All occupant classification sensor (OCS) system rails

1. Remove the passenger seat. For additional information, refer to **SEATING** article.

   Outboard OCS system rail

2. If equipped, remove the manual lumbar control knob.
3. If equipped, remove the spring clip and the manual recliner handle.
4. Detach and position aside the cushion side shield.
   - Pull the side shield away from the seat cushion at the front edge and release the forward and side retainers.
   - Pull the side shield rearward to release the rear retainer and detach the cushion side shield.

   Seat receiving a new OCS system rail

5. Remove the bolt and the forward seat riser from the affected side occupant classification sensor (OCS) system rail.
6. Remove the 2 bolts and the rearward seat riser from the affected side OCS system rail.

   All OCS system rails

   CAUTION: Push only on the tip of the occupant classification sensor (OCS) system electrical connector release tab to release the electrical connector. Do not insert the tool too deep into the OCS system electrical connector or damage to the electrical connector may occur.

   NOTE: Note the position and the routing of the OCS system rail electrical wiring and connector for installation.

7. On the affected side, using a suitable tool, release the tab and disconnect the OCS system rail electrical connector.

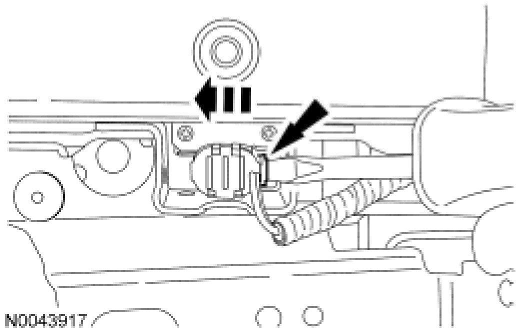


Fig. 162: Disconnecting OCS Rail Electrical Connector
Courtesy of FORD MOTOR CO.

8. If equipped, disconnect the power seat track motor electrical connector.
9. Move the seat to the forward most position.
   - If equipped with a power seat track, apply power and ground to the pins shown.

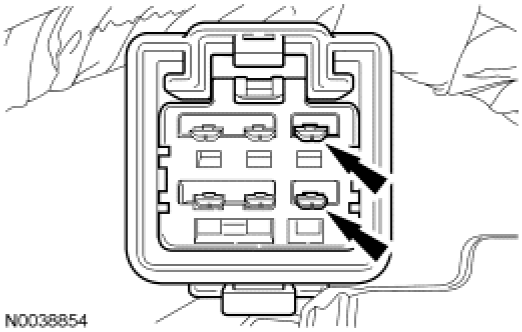

Fig. 163: Locating Power Seat Track Motor Electrical Connector Pins
Courtesy of FORD MOTOR CO.

10. Remove the 2 rear bolts from the affected OCS system rail.
11. Move the seat to the rearward most position.
    - If equipped with a power seat track, apply power and ground to the pins shown.

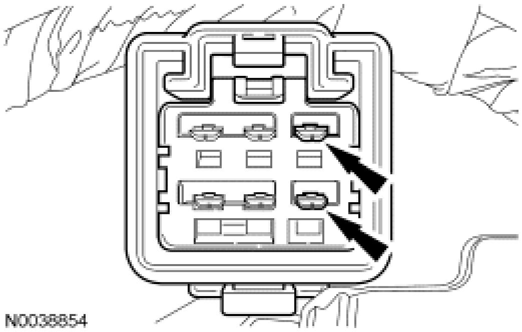

Fig. 164: Locating Power Seat Track Motor Electrical Connector Pins
Courtesy of FORD MOTOR CO.

NOTE: Note what position the locator pin on the OCS system rail goes through the OCS system rail shield and into the rear mounting point of the seat track for installation.

12. Remove the 2 front bolts and the affected OCS system rail and shield.
    - Release the OCS system rail shield rear tab from the OCS system rail.

INSTALLATION

All occupant classification sensor (OCS) system rails

NOTE: If installing a new seat track, position the seat track so the seat will be in the rearward most position before starting installation of the OCS system rails.

WARNING: **To prevent foreign material and contaminants from entering the occupant classification sensor (OCS) rail, make sure the OCS rail shield is present, is not damaged and is correctly installed to the OCS rail. Failure to follow these instructions may result in incorrect operation of the OCS system and increases the risk of serious personal injury or death in a crash.**

NOTE: Make sure the OCS system rail shield is seated correctly on the OCS system rail. Align the locator pin to the shield and attach the OCS system rail shield rear tab to the OCS system rail.

1. Position the OCS system rail shield on the OCS system rail. Then position the OCS system rail and shield on the seat track while noting the correct installation of the OCS system rail locator pin into the seat track.

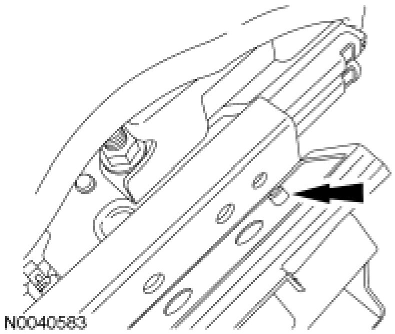

Fig. 165: Locating OCS Rail Locator Pin
Courtesy of FORD MOTOR CO.

NOTE: To make sure of correct installation, the OCS system rail bolts must be installed in the sequence shown.

2. While holding the OCS system rail and shield firmly in position, install the OCS system rail front mounting position rear bolt.

- Tighten to 25 Nm (18 lb-ft).

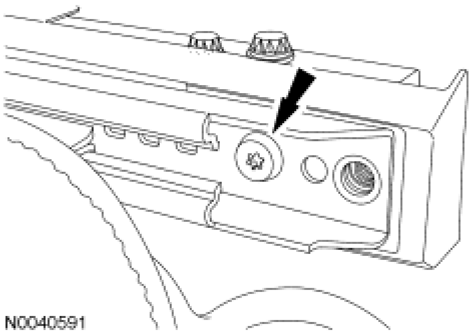

Fig. 166: Locating OCS Rail Front Mounting Position Rear Bolt
Courtesy of FORD MOTOR CO.

3. While still holding the OCS system rail and shield firmly in position, install the OCS system rail front mounting position front bolt.
   - Tighten to 25 Nm (18 lb-ft).

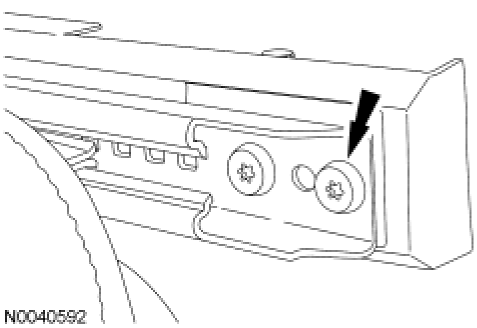

Fig. 167: Locating OCS Rail Front Mounting Position Front Bolt
Courtesy of FORD MOTOR CO.

4. Move the seat to the forward most position.
   - If equipped with a power seat track, apply power and ground to the pins shown.

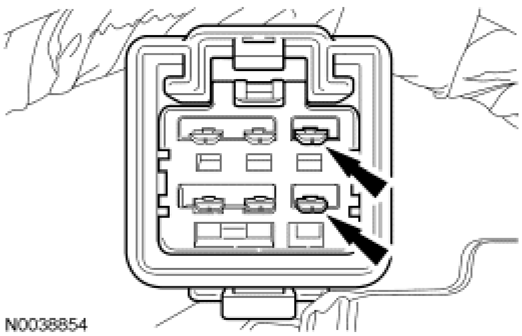

Fig. 168: Locating Power Seat Track Motor Electrical Connector Pins
Courtesy of FORD MOTOR CO.

5. Install the 2 rear OCS system rail bolts.
   - Tighten to 25 Nm (18 lb-ft).
6. Connect the OCS system rail electrical connector.
7. Center the seat track to the seat cushion pan.
   - If equipped with a power seat track, apply power and ground to the pins shown.

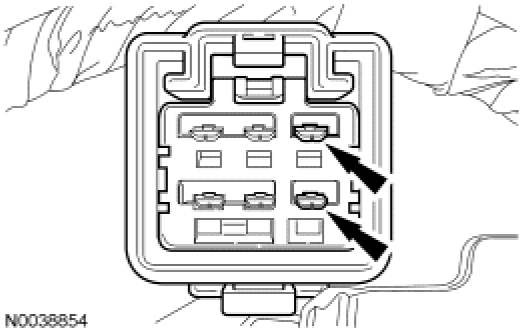

Fig. 169: Locating Power Seat Track Motor Electrical Connector Pins
Courtesy of FORD MOTOR CO.

8. If equipped, connect the power seat track motor electrical connector.

Seat receiving a new OCS system rail

9. Install the rearward seat riser and the 2 bolts.
   - Tighten to 25 Nm (18 lb-ft).
10. Install the forward seat riser and bolt.
   - Tighten to 25 Nm (18 lb-ft).

Outboard OCS system rail

11. Attach the cushion side shield.
   - Position the rear retainer clip on the cushion side shield through the hole in the backrest trim cover flap and attach it to the rear edge of the seat.
12. If equipped, install the spring clip and the manual recliner handle.
13. If equipped, install the manual lumbar control knob.

All OCS system rails

14. Install the passenger seat. **Do not prove out the SRS at this time.** For additional information, refer to **SEATING** article.
15. Carry out the appropriate procedure after installation of an OCS system component.
   - If installing the original OCS system component, carry out the Occupant Classification System (OCS) Zero Seat Weight Test and prove out the SRS. For additional information, refer to **Occupant Classification Sensor (OCS) System Zero Seat Weight Test**.

- If installing a new OCS system component, carry out the Occupant Classification Sensor (OCS) System Reset procedure and prove out the SRS. For additional information, refer to **Occupant Classification Sensor (OCS) System Reset**.

PASSENGER AIR BAG DEACTIVATION (PAD) INDICATOR

NOTE: Fusion/Milan shown, MKZ similar.

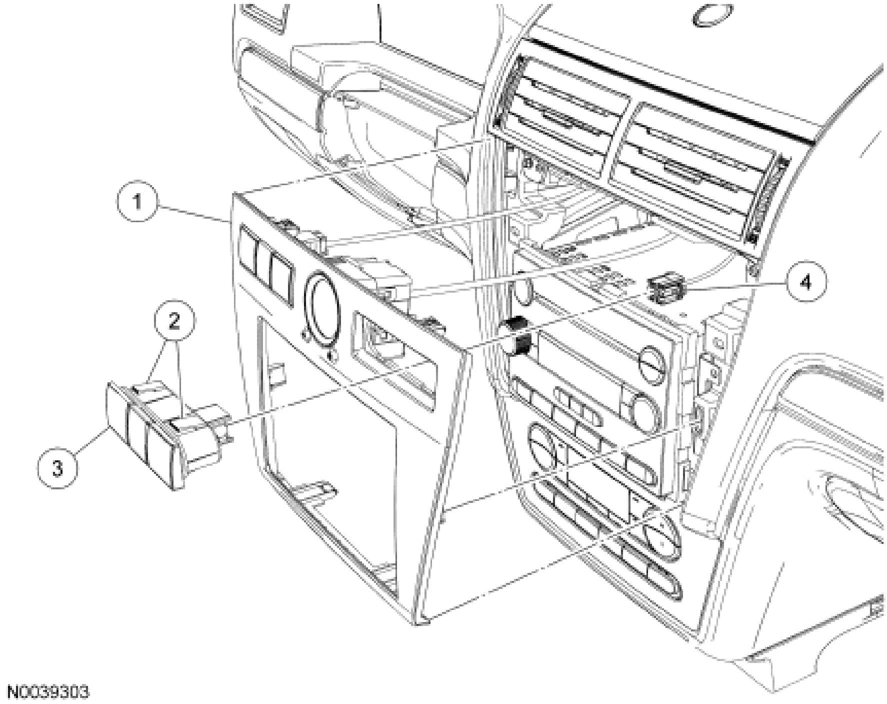

Fig. 170: Exploded View Of Passenger Air Bag Deactivation (PAD) Indicator - Fusion, Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	04338	Instrument panel center finish panel
2	-	Passenger Air Bag Deactivation (PAD) indicator locking tabs (4 required) (part of 13D734)
3	13D734	PAD indicator (part of the hazard switch/traction control switch assembly)
4	-	Electrical connector (part of 14401)

NOTE: A DTC will set in the Restraints Control Module (RCM) if the Passenger Air Bag Deactivation (PAD) electrical connector is disconnected with the ignition ON. The RCM memory must be cleared before releasing the vehicle.

1. Turn the ignition OFF and wait one minute.
2. Remove the instrument panel center trim panel. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.

3. Disconnect the PAD indicator electrical connector.
4. Release the 4 locking tabs (2 upper and 2 lower) and remove the PAD indicator assembly.
5. To install, reverse the removal procedure.

PASSENGER AIR BAG MODULE

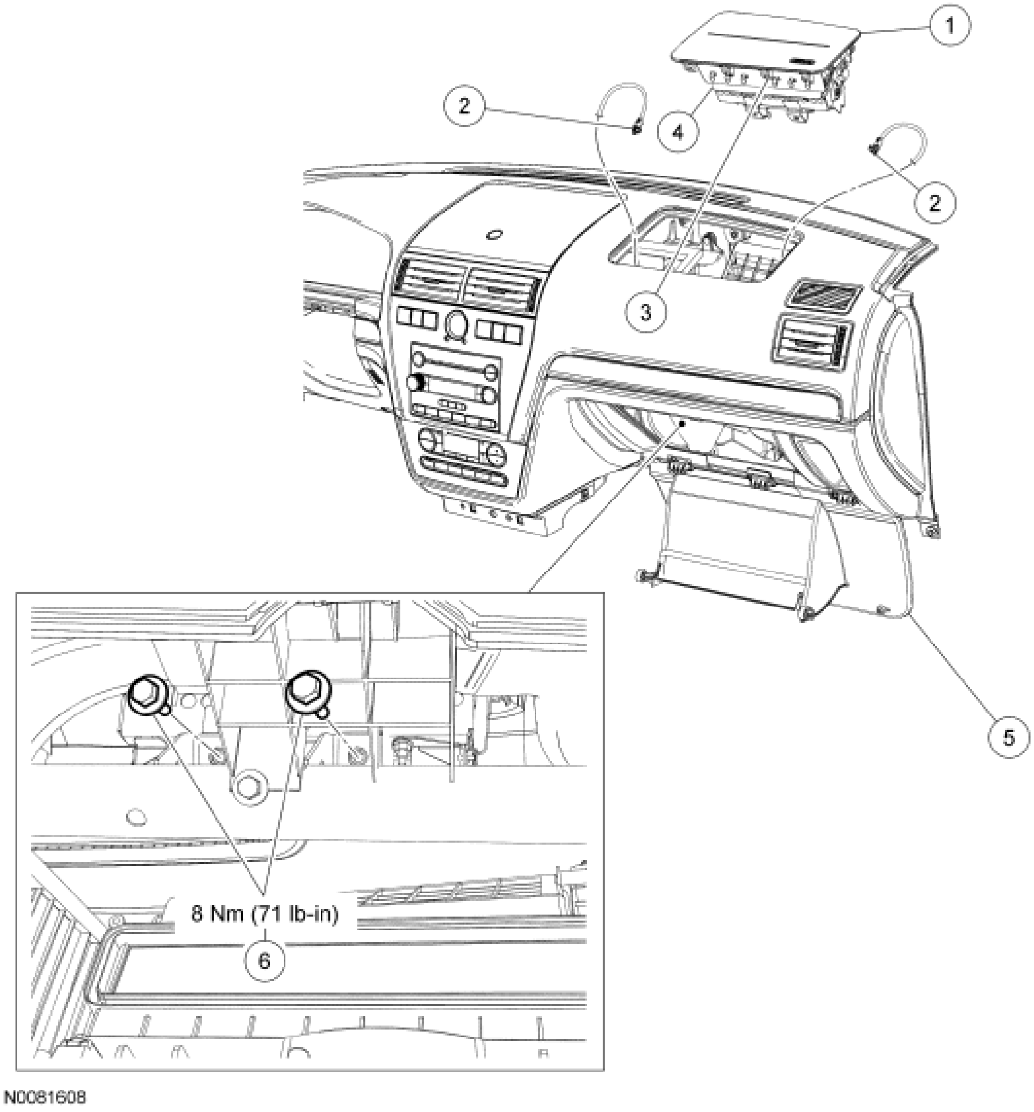

Fig. 171: Exploded View Of Passenger Air Bag Module - Fusion/Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	04338	Air bag trim cover
2	-	Passenger air bag module electrical connectors (part of 14401)
3	-	Passenger air bag cover clip

4	044A74	Passenger air bag module assembly
5	060T10	Glove compartment door
6	W505422	Passenger air bag module bolts (2 required)

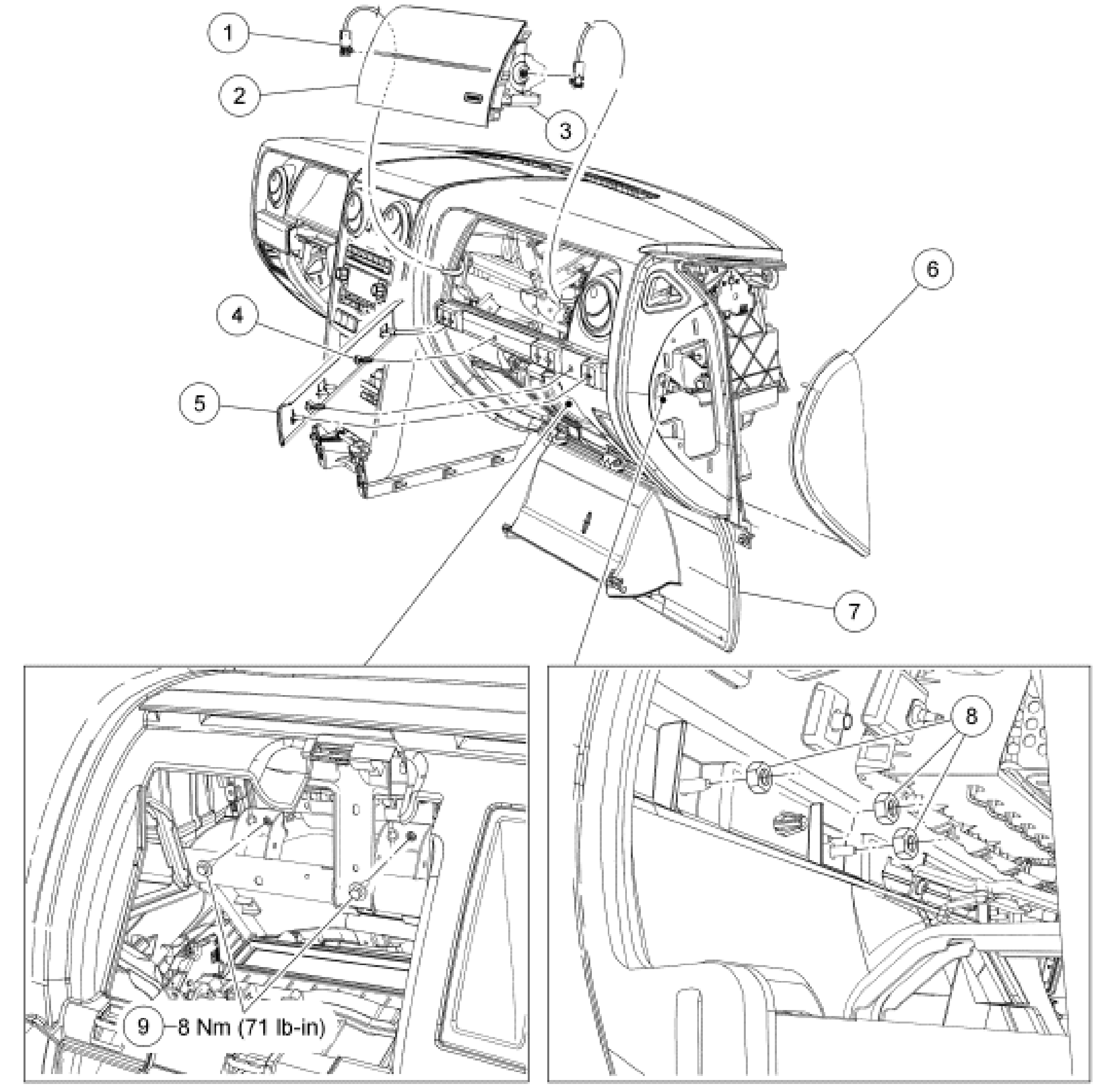

Fig. 172: Exploded View Of Passenger Air Bag Module With Torque Specification - MKZ
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Passenger air bag module electrical connector (2 required) (part of 14401)
2	04338	Air bag trim cover
3	044A74	Passenger air bag module assembly
4	-	RH instrument panel trim panel clip (2 required) (part of 044K54)

5	044K54	RH instrument panel trim panel
6	04480	Instrument panel end panel
7	060T10	Glove compartment door
8	-	RH instrument panel trim panel nuts (5 required) (044K54)
9	W505422	Passenger air bag module bolts (2 required)

REMOVAL

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

All vehicles

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Open the glove compartment door, release the door damper cable and fully lower the door.

   MKZ

3. Remove the instrument panel end panel.
4. Through the glove compartment opening, remove the 5 RH instrument panel trim panel nuts.
5. Pull out on the RH instrument panel trim panel, releasing the 2 clips, then remove the RH instrument panel trim panel.

   All vehicles

6. Remove the 2 passenger air bag module bolts.

NOTE: Do not handle the passenger air bag module by grabbing the edges of the passenger air bag cover. Damage to the air bag module may occur.

7. Through the glove compartment opening, release the passenger air bag cover clips from the instrument panel and then lift the passenger air bag module out of the instrument panel.

NOTE: RH shown, LH similar.

8. Using a small screwdriver as shown, lift up and release the locking buttons on the 2 passenger air bag module electrical connectors.

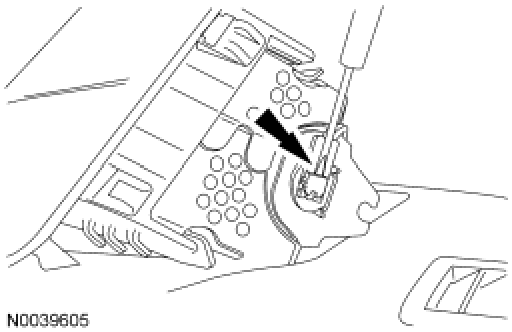

Fig. 173: Locating Passenger Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE: Do not pull the passenger air bag module electrical connectors out by the locking buttons. Damage to the locking buttons can occur.

NOTE: RH shown, LH similar.

9. With the locking buttons released, remove the 2 electrical connectors and the passenger air bag module.

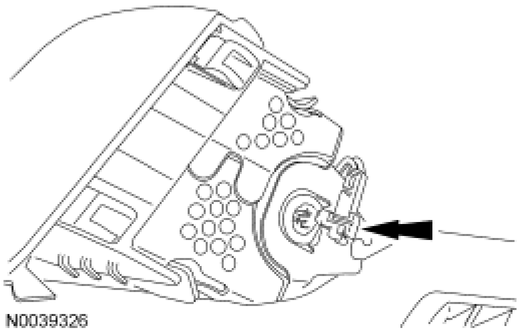

Fig. 174: Locating Passenger Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

INSTALLATION

All vehicles

NOTE: The passenger air bag module electrical connector locking buttons must

be in the released position when connected. Do not install the passenger air bag module electrical connectors by the locking buttons. Failure to follow these instructions may cause connector damage.

1. With the locking buttons released, install the 2 passenger air bag module electrical connectors fully into the passenger air bag module and seat the locking buttons.

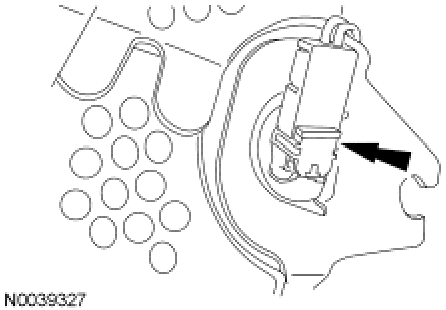

Fig. 175: Locating Passenger Air Bag Module Electrical Connectors
Courtesy of FORD MOTOR CO.

NOTE:	**Do not handle the passenger air bag module by grabbing the edges of the passenger air bag cover. Damage to the air bag module may occur.**

NOTE:	**During air bag module installation, make sure all the passenger air bag cover clips are fully seated in the instrument panel.**

2. Install the passenger air bag module in the instrument panel.
3. Install the 2 passenger air bag module bolts.
   - Tighten to 8 Nm (71 lb-in).

MKZ

4. Align the 2 clips and install the instrument panel trim panel.
5. Install the 5 RH instrument panel trim panel nuts.
6. Install the instrument panel end panel.

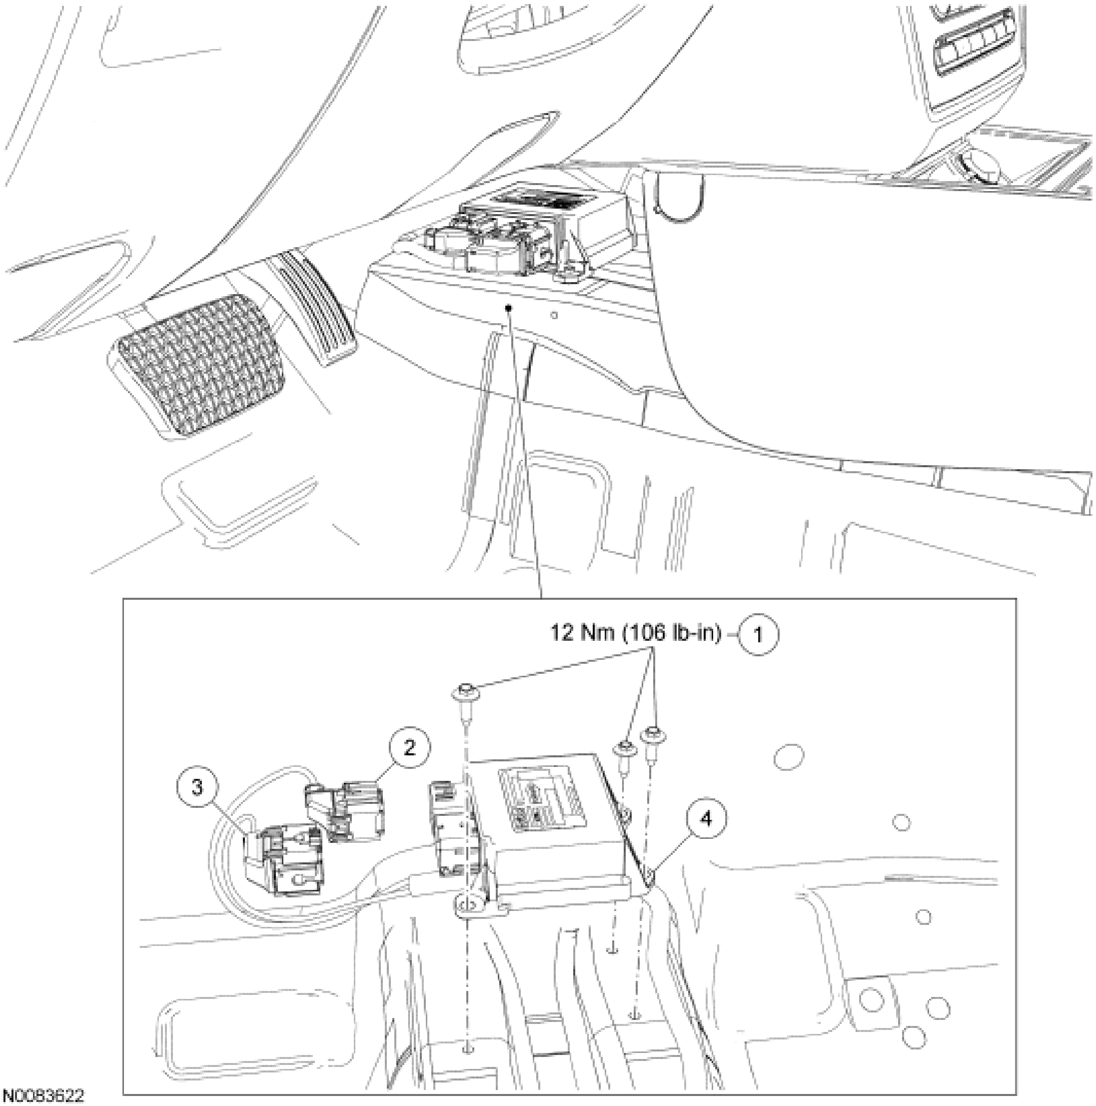
All vehicles

7. Attach the door damper cable and close the glove compartment door.
8. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

RESTRAINTS CONTROL MODULE (RCM)

Special Tools

Illustration	Tool Name	Tool Number
 ST1385-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool



N0083622

Fig. 176: Exploded View Of Restraints Control Module (RCM) With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W707722	Restraints Control Module (RCM) bolts (3 required)
2	-	RCM small connector (part of 14A005)

3	-	RCM large connector (part of 14A005)
4	14B321	RCM

REMOVAL

WARNING: **Do not handle, move or change the original horizontal mounting position of the restraints control module (RCM) while the RCM is connected and the ignition switch is ON. Failure to follow this instruction may result in the accidental deployment of the safety canopy and cause serious personal injury or death.**

WARNING: **If a vehicle has been in a crash, inspect the restraints control module (RCM) and the impact sensor (if equipped) mounting areas for deformation. If damaged, restore the mounting areas to the original production configuration. A new RCM and sensors must be installed whether or not the air bags have deployed. Failure to follow these instructions may result in serious personal injury or death in a crash.**

NOTE: **When installing a new Restraints Control Module (RCM), it is necessary to carry out Programmable Module Installation (PMI). System failure may occur if PMI is not performed. For additional information, refer to MODULE CONFIGURATION article.**

NOTE: **The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **When installing a new RCM, always make sure the correct RCM is being installed. If an incorrect RCM is installed, erroneous DTCs will result.**

NOTE: **The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

1. If installing a new RCM, carry out the steps necessary to prepare for Programmable Module Installation (PMI). For additional information, refer to **MODULE CONFIGURATION** article.
2. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
3. Remove the 2 RH side RCM bolts.
   - Position the carpet back at the RH side of the center tunnel area under the instrument panel and remove the 2 bolts.
4. Disconnect the large RCM electrical connector.
   1. Pinch the thumb tab and pivot the connector position assurance lever all the way back until it stops.
   2. Pull out and disconnect the RCM electrical connector.

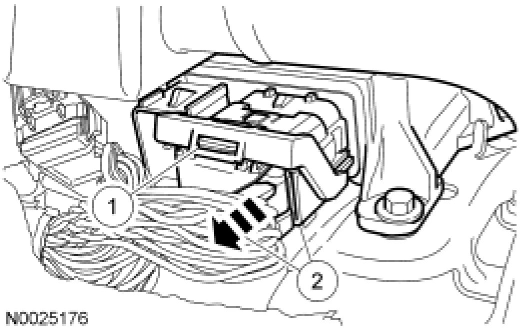


Fig. 177: Disconnecting RCM Electrical Connector
Courtesy of FORD MOTOR CO.

5. Remove the RCM.
    1. Disconnect the small RCM electrical connector.
    2. Remove the LH bolt.
    3. Remove the RCM.

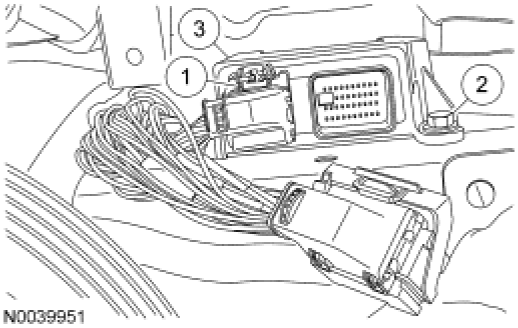

Fig. 178: Identifying RCM, Electrical Connector And Bolt
Courtesy of FORD MOTOR CO.

INSTALLATION

WARNING: **Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

1. Position the RCM.
    - Install the 2 RH side RCM bolts.
        - Tighten to 12 Nm (106 lb-in).
    - Position the carpet back at the RH side of the center tunnel area under the instrument panel.
2. Install the RCM.
    - Install the LH side RCM bolt.
        - Tighten to 12 Nm (106 lb-in).

- Connect the small RCM electrical connector.

3. Make sure the large RCM connector position assurance lever is in the full release position before attempting to connect the connector.

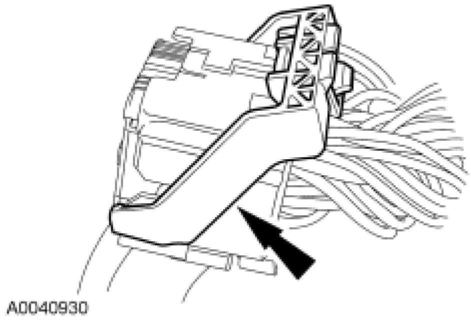

Fig. 179: View Of Connector Position Assurance Lever
Courtesy of FORD MOTOR CO.

NOTE: **Placing the large Restraints Control Module (RCM) electrical wiring connector into the RCM on an angle, can cause bad electrical connections and damaged components.**

NOTE: **The RCM has been removed for clarity.**

4. Position the large RCM electrical connector into the RCM.

NOTE: **Do not push the connector to the point where the lever pivots and seats itself. Light pressure is needed to get the connector into position on the Restraints Control Module (RCM), before using the lever to fully seat the connector. Damage to the connector or component may occur.**

- With the large RCM electrical connector uniformly aligned to the RCM, lightly push in until a subtle audible click is heard and slight resistance is felt.

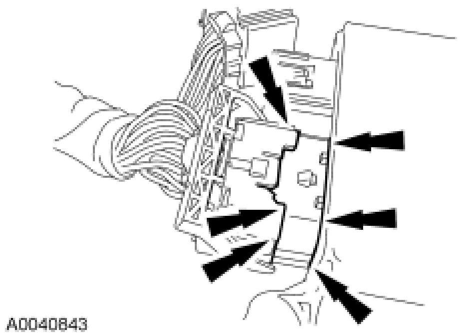

Fig. 180: Large RCM Electrical Wiring Connector
Courtesy of FORD MOTOR CO.

5. Connect the large RCM electrical connector.
    - Using the connector position assurance lever, pivot it toward the RCM, drawing the connector into the RCM.
        - Make sure the thumb tab is engaged to the retainer on the RCM and locked in place.

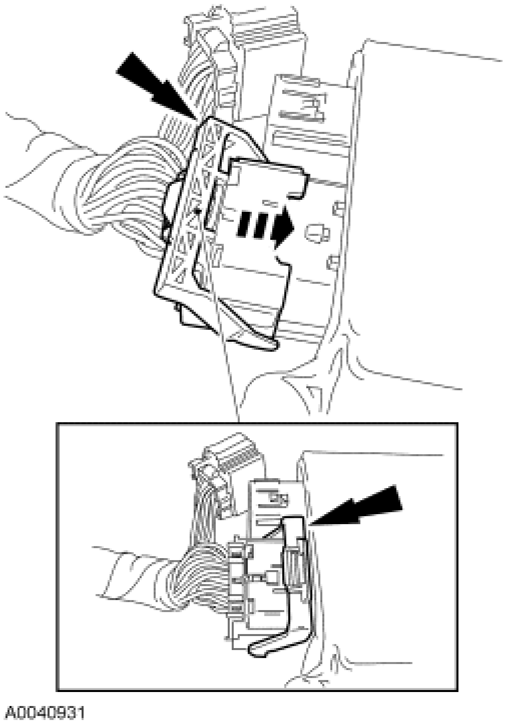

Fig. 181: Locating RCM Electrical Connector
Courtesy of FORD MOTOR CO.

6. Repower the SRS. **Do not prove out the SRS at this time.** For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
7. If installing a new RCM, Complete the PMI procedure. For additional information, refer to **MODULE CONFIGURATION** article.
8. Prove out the SRS as follows:

    Turn the ignition switch from ON to OFF. Wait 10 seconds, then turn the ignition switch back to ON and visually monitor the air bag warning indicator with the air bag modules installed. The air bag warning indicator will light continuously for approximately 6 seconds and then turn OFF. If an air bag SRS fault is present, the air bag warning indicator will:

    - fail to light.

    - remain lit continuously.

    - flash at a 5 Hz rate (RCM not configured).

The air bag warning indicator might not light until approximately 30 seconds after the ignition switch has been turned from the OFF to the ON position. This is the time required for the RCM to complete the testing of the SRS. If the air bag warning indicator is inoperative and a SRS fault exists, a chime will sound in a pattern of 5 sets of 5 beeps. If this occurs, the air bag warning indicator and any SRS fault discovered must be diagnosed and repaired.

Clear all continuous DTCs from the RCM and Occupant Classification System Module (OCSM) using a scan tool.

SIDE AIR CURTAIN MODULE

NOTE: **Right side shown, left side similar.**

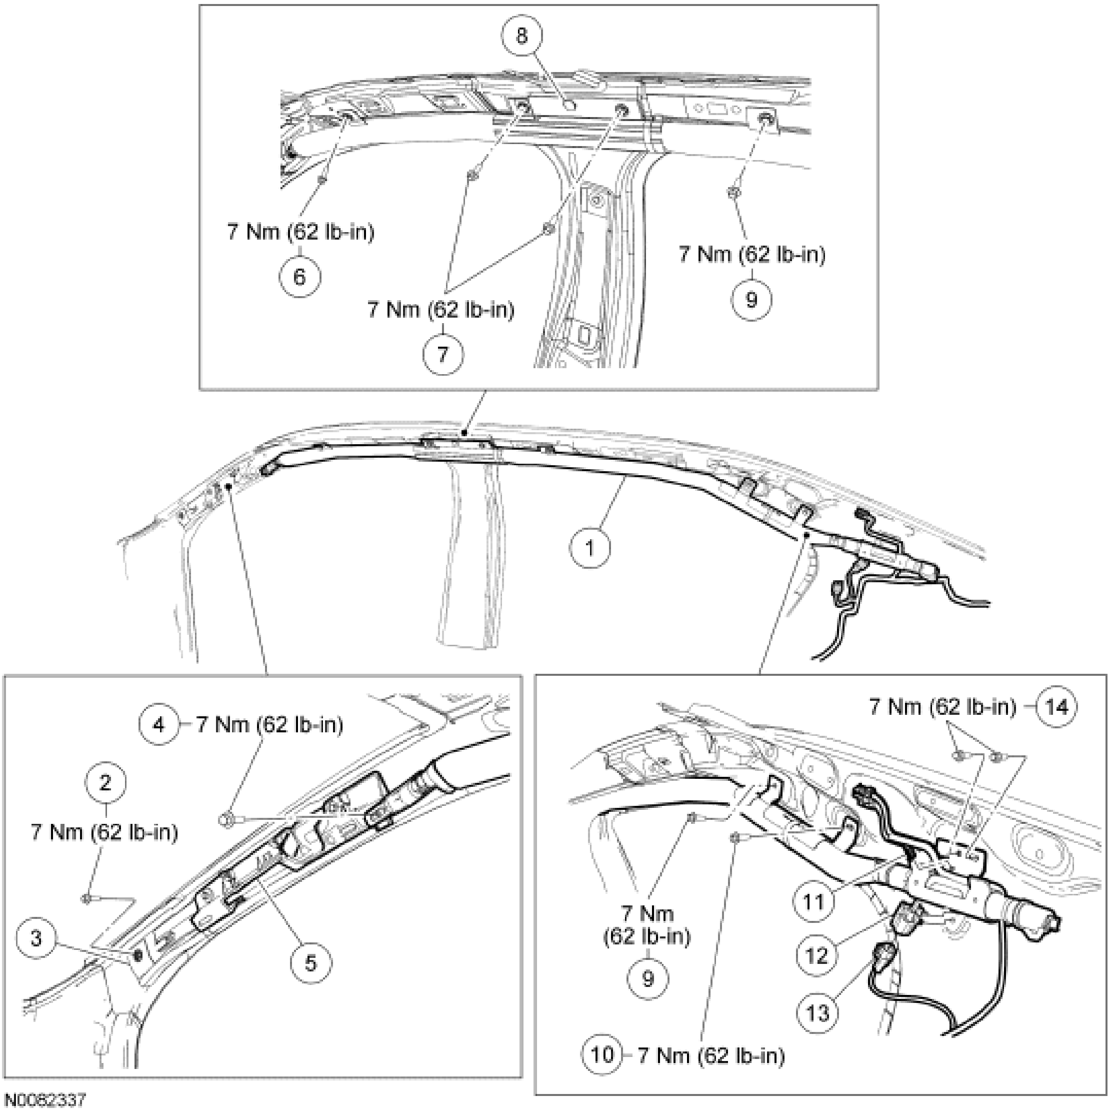

Fig. 182: Exploded View Of Side Air Curtain Module With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	042D94	Side air curtain module
2	W505254	Side air curtain module front tether bracket bolt
3	-	Side air curtain module front tether bracket (part of 042D94)
4	W505254	Side air curtain module A-pillar trim bracket bolt
5	026A53	A-pillar trim bracket
6	W505254	Side air curtain module bolt (rear of A-pillar)
7	W505254	Side air curtain module center guide bolts
8	-	Side air curtain center guide hook retainer (part of 042D94)
9	W505254	Side air curtain module middle rear bolt
10	W505254	Side air curtain module middle rear bolt (early build vehicles only)
11	-	Wiring retainer (part of 14A005) (RH only)
12	-	Side air curtain module electrical connector (part of 042D94)
13	-	Side air curtain module electrical connector (part of 14A005)
14	W505254	Side air curtain module rear bracket bolts

REMOVAL AND INSTALLATION

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Always carry or place a live safety canopy, or side air curtain module, with the module and tear seam pointed away from your body. Failure to follow this instruction may result in serious personal injury or death in the event of an accidental deployment.**

WARNING: **Before installing a safety canopy or side air curtain module, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. Install new fasteners if damaged and remove foreign material. Failure to follow these instructions may result in the safety canopy or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **When installing a new headliner on a vehicle equipped with safety canopy or side air curtain modules, make sure the headliner has the word AIRBAG on the headliner where it meets each B-pillar trim panel. Otherwise, you have the wrong headliner. Failure to follow this instruction may result in the safety canopy or side air curtain module not deploying or deploying incorrectly, increasing the risk of personal injury or death in**

a crash.

WARNING: **Anytime the safety canopy or side air curtain module has deployed, a new headliner and new A-, B- and C-pillar upper trim panels and attaching hardware must be installed. Remove any other damaged components and hardware and install new components and hardware as needed. Failure to follow these instructions may result in the safety canopy or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

WARNING: **Inspect a safety canopy or side air curtain module before installation. If the module is damaged, the cover has separated or the safety canopy/side air curtain material has been exposed, install a new module. Do not attempt to repair the module. Failure to follow these instructions may result in the safety canopy or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Do not obstruct or place objects in the deployment path of the safety canopy or side air curtain module. Failure to follow this instruction may result in the safety canopy or side air curtain module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

WARNING: **Never put any type of fastener or tie strap around any part of a safety canopy module, side air curtain module or interior trim panel. This will prevent the safety canopy or side air curtain module from deploying correctly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.**

WARNING: **Never probe the electrical connectors on air bag, safety canopy or side air curtain modules. Failure to follow this instruction may result in the accidental deployment of these modules, which increases the risk of serious personal injury or death.**

NOTE: **Early production vehicles require 2 side air curtain module middle rear bracket bolts; late production vehicles have a fabric tab and require 1 side air curtain module bolt. The side air curtain modules are NOT interchangeable between early and late production vehicles.**

NOTE: **The air bag warning indicator illuminates when the correct restraints control module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The supplemental restraint system (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

All side air curtain modules

1. Remove the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
3. Disconnect the side air curtain module electrical connector and detach the connector pin-type retainer from the C-pillar sheetmetal.

   RH side air curtain module

4. Detach the wiring retainer from the side air curtain module rear bracket.

   All side air curtain modules

5. Remove the bolt and side air curtain module front tether bracket.
   - To install, tighten to 7 Nm (62 lb-in).
6. Remove the side air curtain module bolt from the A-pillar trim bracket.
   - To install, tighten to 7 Nm (62 lb-in).
7. Remove the side air curtain module bolt, located to the rear of the A-pillar.
   - To install, tighten to 7 Nm (62 lb-in).
8. Remove the 3 side air curtain module middle rear bolts.
   - To install, tighten to 7 Nm (62 lb-in).

   NOTE: Note the position of the side air curtain module rear bracket hook for installation.

9. Remove the side air curtain module 2 rear bracket bolt(s).
   - To install, tighten to 7 Nm (62 lb-in).

   NOTE: Note the position of the side air curtain module center guide hook retainer for installation.

10. Remove the side air curtain module 2 center guide bolts. Detach the side air curtain module center guide hook retainer from the vehicle sheetmetal.
    - To install, tighten to 7 Nm (62 lb-in).

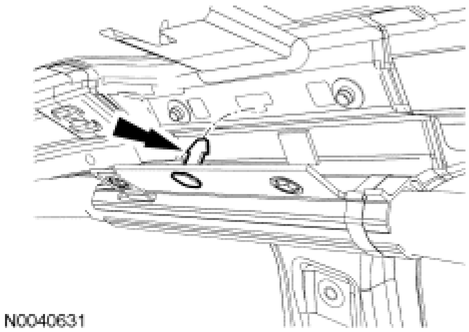

Fig. 183: Locating Side Air Curtain Module Center Guide Hook Retainer
Courtesy of FORD MOTOR CO.

11. Remove the side air curtain module.
    - Move the side air curtain module toward the front of the vehicle to release the rear bracket hook from the C-pillar sheetmetal.

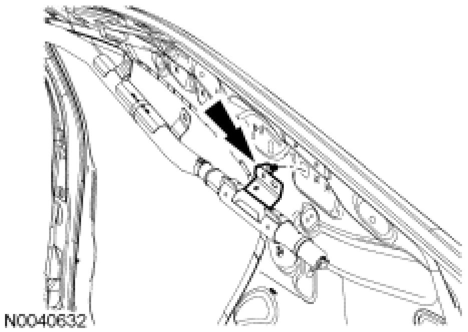

Fig. 184: Locating Rear Bracket Hook
Courtesy of FORD MOTOR CO.

WARNING: **Before installing a safety canopy or side air curtain module, inspect the roofline for any damage. If necessary, the sheet metal must be reworked to its original condition and structural integrity. Install new fasteners if damaged and remove foreign material. Failure to follow these instructions may result in the safety canopy or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Inspect a safety canopy or side air curtain module before installation. If the module is damaged, the cover has separated or the safety canopy/side air curtain material has been exposed, install a new module. Do not attempt to repair the module. Failure to follow these instructions may result in the safety canopy or side air curtain deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

WARNING: **Never put any type of fastener or tie strap around any part of a safety canopy module, side air curtain module or interior trim panel. This will prevent the safety canopy or side air curtain module from deploying correctly. Failure to follow this instruction may increase the risk of serious personal injury or death in a crash.**

NOTE: Make sure all side air curtain module bolt holes line up with all the vehicles bolt holes .

12. To install, reverse the removal procedure.
13. Install the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
14. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

SEAT POSITION SENSOR

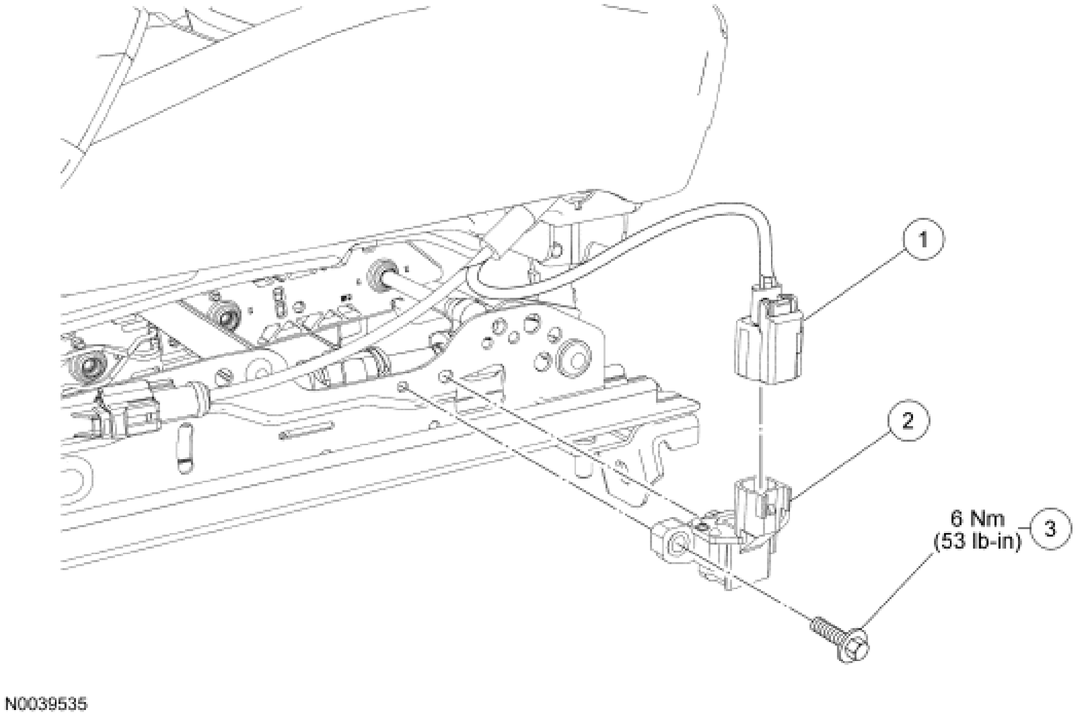

Fig. 185: Exploded View Of Seat Position Sensor With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Seat position sensor electrical connector (part of 14A699)
2	14B416	Seat position sensor
3	W505256	Seat position sensor bolt

NOTE: The air bag warning indicator illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

1. Position the front seat to the rearmost and upward position.
2. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
3. Disconnect the seat position sensor electrical connector.
4. Remove the bolt and seat position sensor.
    - To install, tighten to 6 Nm (53 lb-in).

    WARNING: Always tighten the seat position sensor retaining bolt to specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

5. To install, reverse the removal procedure.
6. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

SIDE AIR BAG MODULE

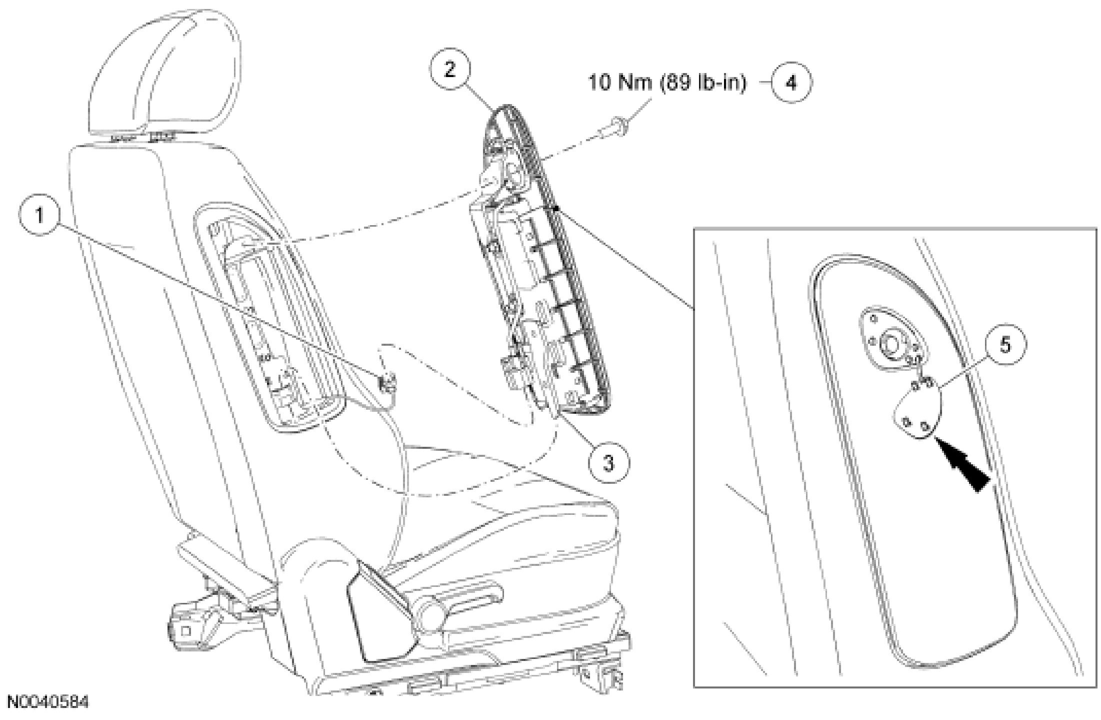

Fig. 186: Exploded View Of Side Air Bag Module With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Side air bag module electrical connector (part of 14K155)
2	611D10	Side air bag module
3	-	Side air bag module locator hook (part of 611D10)
4	N605892	Side air bag module bolt
5	-	Side air bag module bolt cover (part of 611D10)

REMOVAL AND INSTALLATION

WARNING: **Always carry or place a live air bag module with the air bag and deployment door/trim cover/tear seam pointed away from the body. Do not set a live air bag module down with the deployment door/trim cover/tear seam face down. Failure to follow these instructions may result in serious personal injury in the event of an accidental deployment.**

NOTE: The air bag warning indicator illuminates when the corect Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: RH shown, LH similar.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Detach the side air bag module bolt cover.

   NOTE: Note the side air bag module locator hook (on the seat back frame) for correct installation.

3. Remove the bolt and lift up and out, to detach the side air bag module from the seat back.
   - To install, tighten to 10 Nm (89 lb-in).
4. Slide and disengage the side air bag module electrical connector locking clip, and then release the tab and disconnect the side air bag module electrical connector.

   WARNING: **Inspect the seat side air bag module cavity in the seat backrest foam pad for any foreign material. If any foreign material is found, remove it. Failure to follow these instructions may result in the seat side air bag module deploying incorrectly and increases the risk of serious personal injury or death in a crash.**

WARNING: If the seat side air bag cover has been damaged or separated from its mounting, or if the air bag material has been exposed, install a new seat side air bag module. Never try to repair the seat side air bag module. Failure to follow these instructions may result in the seat side air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.

5. To install, reverse the removal procedure.
6. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

SIDE IMPACT SENSOR - B-PILLAR

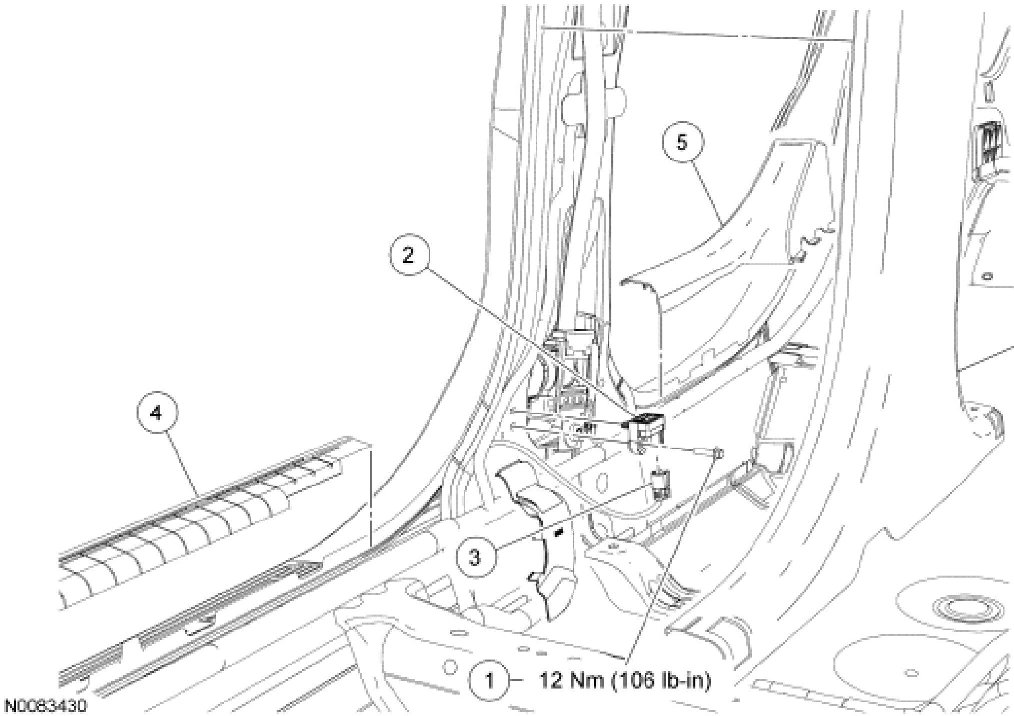

Fig. 187: Exploded View Of Side Impact Sensor With Torque Specification - B-Pillar
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W505256	Side impact sensor bolt
2	14B345	Side impact sensor
3	-	Side impact sensor electrical connector (part of 14A005)
4	13208	Front door scuff plate
5	13228	Rear door scuff plate
6	24346	Lower B-pillar trim panel

NOTE: The air bag warning indicator illuminates when the correct Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.

NOTE: The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.

NOTE: RH shown, LH similar.

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Remove the lower B-pillar trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
3. Disconnect the side impact sensor electrical connector.
4. Remove the bolt and side impact sensor.
   - To install, tighten to 12 Nm (106 lb-in).

   WARNING: **Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.**

   NOTE: Make sure the B-pillar and side impact sensor mating surfaces are clean.

5. To install, reverse the removal procedure.
6. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

SIDE IMPACT SENSOR - C-PILLAR

NOTE: RH shown, LH similar.

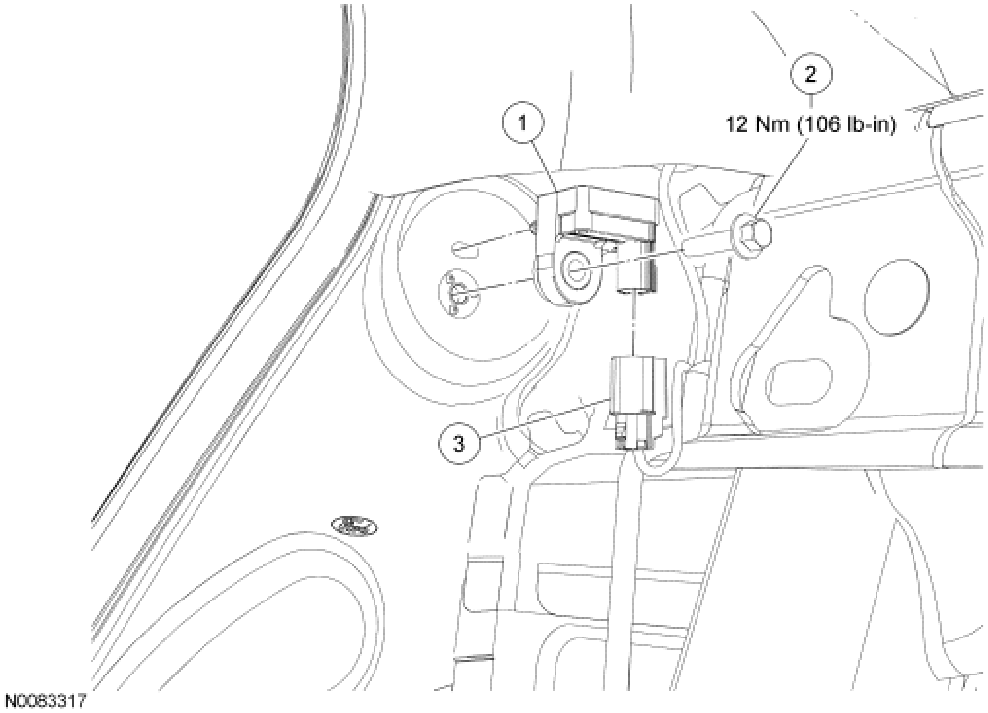

Fig. 188: Exploded View Of Side Impact Sensor With Torque Specification - C-Pillar
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14B345	Side impact sensor
2	W505256	Side impact sensor bolt
3	-	Side impact sensor electrical connector (part of 14A005)

NOTE: **The air bag warning indicator illuminates when the Restraints Control Module (RCM) fuse is removed and the ignition switch is ON.**

NOTE: **The Supplemental Restraint System (SRS) must be fully operational and free of faults before releasing the vehicle to the customer.**

1. Depower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.
2. Remove the rear seat bolster. For additional information, refer to **SEATING** article.
3. Disconnect the side impact sensor electrical connector.
4. Remove the bolt and side impact sensor.
   - To install, tighten to 12 Nm (106 lb-in).

WARNING: **Always tighten the fasteners of the restraints control module (RCM) and impact sensor (if equipped) to the specified torque. Failure to do**

so may result in incorrect restraint system operation, which increases the risk of personal injury or death in a crash.

NOTE: Make sure the C-pillar and side impact sensor mating surfaces are clean.

5. To install, reverse the removal procedure.
6. Repower the SRS. For additional information, refer to **Supplemental Restraint System (SRS) Depowering and Repowering**.

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft
Front tie-rod jam nuts	80	59
Rear camber adjustment nuts	101	74
Rear toe link jam nuts	84	62

DESCRIPTION AND OPERATION

WHEEL ALIGNMENT ANGLES

Front toe is adjusted through the use of adjustable tie-rod ends. Front caster is adjusted by installing new upper control arms with offset bushings. The upper arms can adjust caster angles ± 0.4 degrees and have separate part numbers. Front camber is not adjustable on the vehicle. Rear toe is adjusted through the use of adjustable toe links. Rear caster is not adjustable on the vehicle. Rear camber is adjusted through the use of a cam bolt that attaches the rear lower control arm to the rear subframe.

Camber

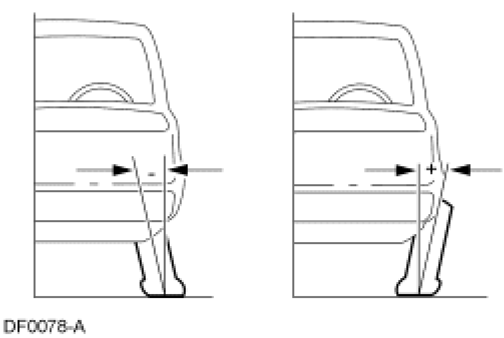

Fig. 1: Camber (Viewed from Front)
Courtesy of FORD MOTOR CO.

Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct affect on tire wear.

Caster

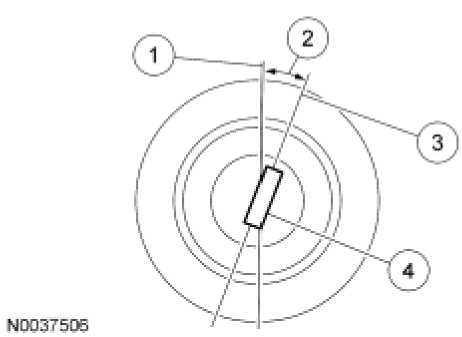

Fig. 2: Caster

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	True vertical
2	-	Positive caster angle
3	-	Shock-to-ball joint centerline
4	-	Pivot centerline

Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The **Caster Adjustment - Front** will give the vehicle the best directional stability characteristics when loaded and driven. The caster setting is not related to tire wear.

Toe

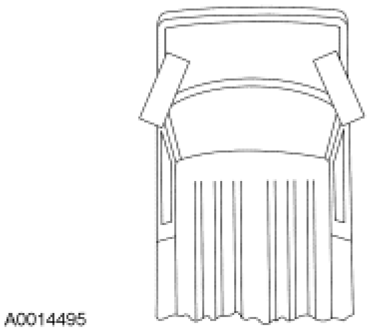

Fig. 3: Identifying Positive Toe (Toe In)
Courtesy of FORD MOTOR CO.

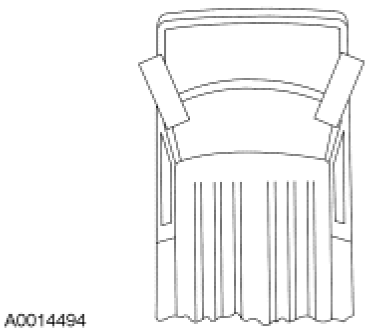

Fig. 4: Identifying Negative Toe (Toe Out)
Courtesy of FORD MOTOR CO.

The vehicle toe setting affects tire wear and directional stability.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and observed by the driver as small rotational oscillations of the steering wheel. For wheel and tire diagnosis, refer to **WHEELS AND TIRES** article.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe poor return of the steering wheel to center after a turn or steering correction.

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull may be induced by conditions external to the vehicle (for example, wind, road crown).
- A drift or pull condition may exist even if the front alignment is within specifications. To aid in correcting this condition, there are 4 additional upper control arms available with off-set bushings (2 for LH, 2 for RH). These upper control arms will allow the caster to be adjusted ±0.4 degrees. Refer to **Caster Adjustment - Front**.

Poor Groove Feel - Poor groove feel is characterized by little or no buildup of turning effort felt in the steering wheel as the wheel is rocked slowly left and right within very small turns around center or straight-ahead (under 20 degrees of steering wheel turn). Efforts may be said to be "flat on center."

- Under 20 degrees of turn, most of the turning effort that builds up comes from the mesh of gear teeth in the steering gear. In this range, the steering wheel is not yet turned enough to feel the effort from the self-aligning forces at the road wheel or tire patch.
- In the diagnosis of a roadability problem, it is important to understand the difference between wander and poor groove feel.

DIAGNOSTIC TESTS

SUSPENSION SYSTEM

Inspection and Verification

1. Road test the vehicle.
    - If any suspension alignment or ride height concerns are present, go to **Symptom Chart - Suspension System**.
    - Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are present, refer to Go to **Noise, Vibration and Harshness (NVH)**.
2. Inspect the tires.
    - Check the tire pressures with all normal loads in the vehicle and the tires cold. Refer to the vehicle certification (VC) label.
    - Verify that all tires are sized to specification. Refer to the VC label.
    - Inspect the tires for incorrect wear and damage. Install new tires as necessary.
3. Inspect the chassis and underbody.
    - Remove any excessive accumulation of mud, dirt or road deposits from the chassis and underbody.
4. Inspect for aftermarket equipment.
    - Check for aftermarket changes to the steering, suspension, and wheel and tire components (such as competition or heavy duty). The specifications shown in this article do not apply to vehicles equipped with aftermarket equipment.

VISUAL INSPECTION CHART

Mechanical
• Front or rear suspension components • Suspension fastener(s) • Incorrect spring usage • Spring(s) • Shock absorber(s) • Strut(s) • Suspension bushing(s) • Steering system components • Wheel bearing(s) • Non-OEM parts or modifications

5. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.
6. If the fault is not visually evident, go to **Symptom Chart - Suspension System** or Go to **Noise, Vibration and Harshness (NVH)**.

Symptom Chart - Suspension System

Symptom Chart - Suspension System

Condition	Possible Sources	Action

• Drift/pull	• Unequal tire pressure	• ADJUST the tire pressure.
	• Caster total split is not within specification	• CHECK the wheel alignment. ADJUST as necessary.
	• Camber total split is not within specification	• CHECK the wheel alignment. ADJUST as necessary.
	• Tires	• ROTATE the tires front to rear. REFER to **WHEELS AND TIRES** article.
	• Unevenly loaded or overloaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
	• Steering components	• INSPECT the steering system. INSTALL new components as necessary. REFER to **STEERING SYSTEM - GENERAL INFORMATION** article.
	• Brake drag	• REPAIR the base braking system as necessary. REFER to **FRONT DISC BRAKE** article or **REAR DISC BRAKE** article.
• Front bottoming or riding low	• Worn, damaged or incorrect springs	• MEASURE the ride height. REFER to **Ride Height Measurement**. INSTALL new springs as necessary. REFER to **FRONT SUSPENSION** article.
	• Worn front strut(s)	• INSTALL new struts as necessary. REFER to **FRONT SUSPENSION** article.
• Abnormal/incorrect tire wear	• Incorrect tire pressure (rapid center rib or inner and outer edge wear)	• ADJUST the tire pressure. REFER to the VC label. REFER to **WHEELS AND TIRES** article Diagnosis and Testing for further tire wear diagnosis.
	• Incorrect tire rotation intervals	• REFER to **MAINTENANCE SCHEDULE** article.
	• High-speed cornering • Excessive front or rear toe (inner or	• REFER to **WHEELS AND**

	outer edge wear) • Excessive negative or positive camber (inner or outer edge wear)	**TIRES** article Diagnosis and Testing for further tire wear diagnosis.
	• Front or rear suspension components	• INSPECT the front and rear suspension system. REPAIR or INSTALL new suspension components as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
• Sticky steering, poor returnability	• Damaged or worn front strut mount bearing(s)	• INSTALL a new front strut mount bearing(s) as necessary. REFER to **FRONT SUSPENSION** article.
	• Binding ball joints	• REFER to the **Ball Joint Inspection**.
	• Steering components	• INSPECT the steering system. INSTALL new components as necessary. REFER to **POWER STEERING** article.
	• Caster out of specification	• CHECK the wheel alignment. REFER to **Caster Adjustment - Front**. ADJUST as necessary.
• Steering wheel off-center	• Unequal front toe setting (side-to-side)	• CHECK the wheel alignment. REFER to **Toe Adjustment - Front**. ADJUST as necessary.
	• Steering components	• INSPECT the steering system. INSTALL new components as necessary. REFER to **STEERING SYSTEM - GENERAL INFORMATION** article.
• Sway or roll	• Overloaded, unevenly or incorrectly loaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
	• Loose wheel nut(s)	• TIGHTEN the wheel nut(s) to specification. REFER to **WHEELS AND TIRES** article.

	• Strut(s) or shock absorber(s)	• INSTALL new struts or shock absorbers as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
	• Loose stabilizer bracket-to-frame bolts	• TIGHTEN the bolts to specification. REFER to **FRONT SUSPENSION** article.
	• Worn stabilizer bar bushings or links	• INSTALL new stabilizer bar bushings or links as necessary. REFER to **FRONT SUSPENSION** article.
	• Damaged or broken stabilizer bar	• INSTALL a new stabilizer bar as necessary. REFER to **FRONT SUSPENSION** article.
	• Damaged spring(s)	• INSTALL new springs as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
• Vehicle leans to one side	• Unevenly loaded or overloaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
	• Front or rear suspension components	• INSPECT the front and rear suspension systems. INSTALL new suspension components as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
	• Incorrect drive axle (s) ride height. Side-to-side lean out of specification	• MEASURE the ride height. REFER to **Ride Height Measurement**. INSPECT the front and rear suspension systems. REPAIR or INSTALL new components as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear

		suspension.
• Wander	• Overloaded, unevenly or incorrectly loaded vehicle	• NOTIFY the customer of incorrect vehicle loading.
	• Ball joint(s)	• INSPECT the ball joints. REFER to the **Ball Joint Inspection**.
	• Damaged or missing front strut mount bearing(s)	• INSTALL a new front strut mount bearing(s) as necessary. REFER to **FRONT SUSPENSION** article.
	• Loose, worn or damaged front wheel bearing(s)	• INSPECT the wheel bearings. INSTALL new wheel bearings as necessary.
	• Loose, worn or damaged suspension component(s)	• INSTALL new suspension component(s) as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
	• Loose suspension fasteners	• INSPECT the suspension fasteners. TIGHTEN to specification. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
	• Steering components	• INSPECT the steering system. INSTALL new components as necessary. REFER to **STEERING SYSTEM - GENERAL INFORMATION** article.
	• Wheel alignment (excessive total front toe out)	• ADJUST as necessary. REFER to **Toe Adjustment - Front**.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: **Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be**

the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

Symptom Chart - Noise/Vibration and Harshness (NVH)

Condition	Possible Sources	Action
• Squeak or grunt - noise from the front suspension, occurs more in cold ambient temperatures. More noticeable over rough roads or when turning	• Front stabilizer bar insulators	• Under these conditions, the noise is acceptable. CHECK TSBs.
• Clunk - noise from the front suspension, occurs in and out of turns	• Loose front suspension	• INSPECT for loose nuts or bolts. TIGHTEN to specifications. REFER to **FRONT SUSPENSION** article for front suspension and **REAR SUSPENSION** article for rear suspension.
• Clunk - noise from the rear suspension, occurs when shifting from REVERSE to drive	• Loose rear suspension components	• INSPECT for loose or damaged rear suspension components. REPAIR or INSTALL new components as necessary. REFER to **REAR SUSPENSION** article.
• Click or pop - noise from the front suspension. More noticeable over rough roads or over bumps	• Worn or damaged ball joint(s)	• CARRY OUT a ball joint inspection. INSTALL new ball joint(s) or control arm(s) as necessary. REFER to **Ball Joint Inspection**.
• Front suspension noise - a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads	• Front suspension components • Loose or damaged front struts, shock absorber (s) or shock absorber bushing(s) • Damaged spring or spring mount(s) • Damaged or worn control/radius arm bushing(s) • Worn or damaged stabilizer bar bushings	• Inspect the front suspension. Install new components as necessary. REFER to **FRONT SUSPENSION** article.

	or link(s)	
• Rear suspension noise - a squeak, creak or rattle noise. Occurs mostly over bumps or rough roads	• Loose or damaged rear shock absorber(s) or shock absorber bushing (s) • Damaged spring or spring mount(s) • Damaged or worn control arm bushing(s) • Worn or damaged stabilizer bar bushing (s) or link(s)	• Inspect the rear suspension. Install new components as necessary. REFER to **REAR SUSPENSION** article.
• Shudder - occurs during acceleration from a slow speed or stop	• Incorrect ride height causing incorrect driveline angle	• REFER to **DRIVELINE SYSTEM - GENERAL INFORMATION** article for driveline angle diagnosis.
• Shimmy	• Loose wheel nut(s)	• TIGHTEN the nut(s) to specification. REFER to **WHEELS AND TIRES** article.
	• Loose front suspension fastener(s)	• TIGHTEN the fastener(s) to specification. REFER to **FRONT SUSPENSION** article.
	• Loose front wheel bearing(s)	• Inspect the front wheel bearing(s). Install new bearing (s) as necessary. REFER to **FRONT SUSPENSION** article.
	• Strut(s) or shock absorber(s)	• INSTALL new struts or shock absorbers as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
• Shimmy - most noticeable on coast/deceleration. Also hard steering condition	• Excessive positive caster	• CHECK the wheel alignment. REFER to **Caster Adjustment - Front**. ADJUST as necessary.
• Rough/harsh ride	• Incorrect tire pressure	• ADJUST the tire pressure. REFER to the VC label.
		• INSTALL new struts or shock

	• Strut(s) or shock absorber(s)	absorbers as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
	• Spring(s)	• MEASURE the ride height. REFER to **Ride Height Measurement**. INSTALL new springs as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.
	• Loose, worn or damaged suspension component(s)	• INSTALL new suspension component(s) as necessary. REFER to **FRONT SUSPENSION** article for front suspension or **REAR SUSPENSION** article for rear suspension.

Component Tests

Ball Joint Inspection

1. Prior to inspecting the ball joints for wear, inspect the wheel bearings. Install a new wheel bearing as necessary. Refer to **FRONT SUSPENSION** article.

NOTE: In order to obtain accurate measurements, the suspension must be in full rebound with the weight of the vehicle supported by the frame.

2. Raise and support the vehicle by the frame to allow the wheels to hang in the rebound position.
3. Inspect the ball joint and ball joint boot for damage.
   - If the ball joint or ball joint boot is damaged, install a new ball joint as necessary. Refer to **FRONT SUSPENSION** article.

CAUTION: Do not use any tools or equipment to move the wheel and tire assembly or suspension components while checking for relative movement. Suspension damage may occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.

NOTE: To avoid lateral movement of the steering linkage and steering components, make sure to apply hand force only at the 12 o'clock and 6 o'clock positions of the wheel and tire assembly.

4. Inspect the ball joint for relative movement by alternately pulling outward and pushing inward on the wheel and tire assembly, at the 12 o'clock and 6 o'clock positions, by hand. Note any relative movement between the wheel knuckle and both lower arms at the lower ball joints.
   - If relative movement is not felt or seen, the ball joints are OK. Do not install new ball joints.
   - If relative movement is found, continue with Step 5.

NOTE: In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the center line of the forward front lower ball joint.

5. To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the forward front lower arm and the wheel knuckle at the forward front lower ball joint.

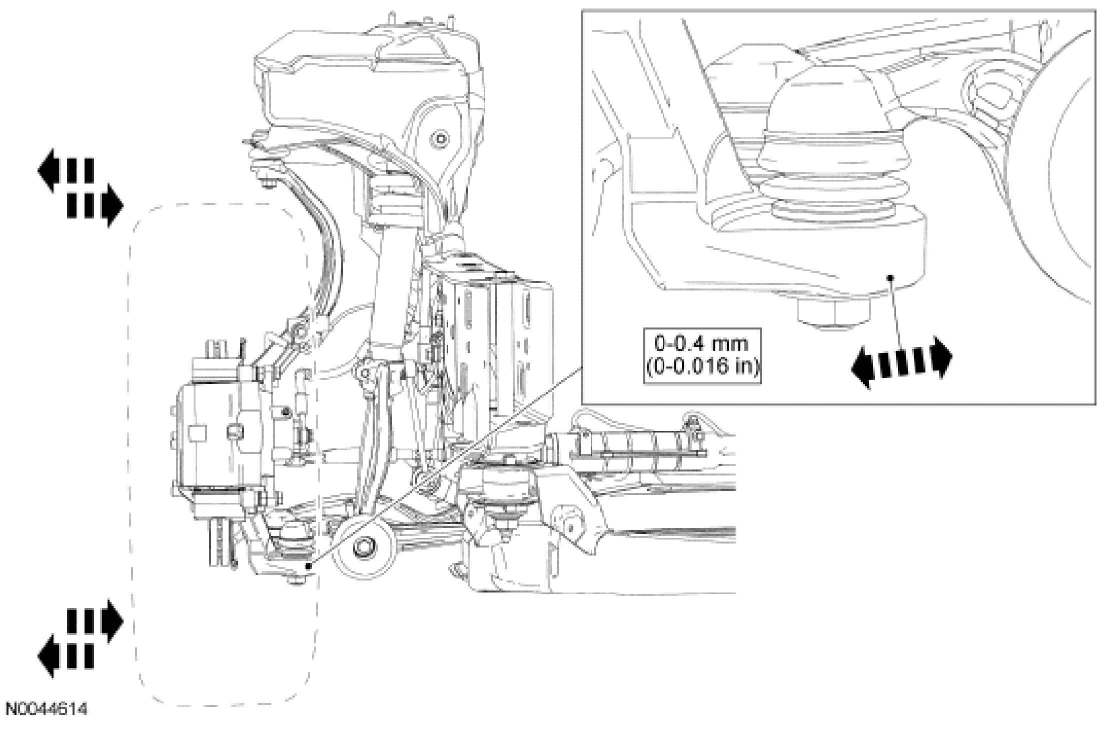

Fig. 5: Measuring Ball Joint Deflection
Courtesy of FORD MOTOR CO.

6. Measure the ball joint deflection while an assistant alternately pulls outward and pushes inward on the wheel and tire assembly, at the 12 o'clock and 6 o'clock positions, by hand.
   - If the deflection exceeds the specification, install a new forward and rearward lower ball joint. Refer to **FRONT SUSPENSION** article.
   - If the deflection meets the specification, continue with the procedure.

CAUTION: Do not use any tools or equipment to move the wheel and tire assembly or suspension components, while checking for relative movement. Suspension damage can occur. The use of tools or equipment will also create relative movement that may not exist when using hand force. Relative movement must be measured using hand force only.

7. Inspect the ball joint for relative movement by alternately pulling downward and pushing upward on the upper arm by hand. Note any relative vertical movement between the wheel knuckle and upper arm at the upper ball joint.
   - If relative movement is not felt or seen, the ball joint is OK. Do not install a new ball joint.
   - If relative movement is found, continue with Step 8.

NOTE: In order to obtain an accurate measurement, the dial indicator should be aligned as close as possible with the vertical axis of the ball joint.

8. To measure ball joint deflection, attach a suitable dial indicator with a flexible arm between the upper arm and the wheel knuckle or ball joint stud.
9. Measure the ball joint deflection while an assistant pushes up and then pulls down on the upper arm, by hand.
   - If the deflection exceeds the specification, a new ball joint must be installed. Refer to **FRONT SUSPENSION** article.
   - If the deflection meets the specification, no further action is required.

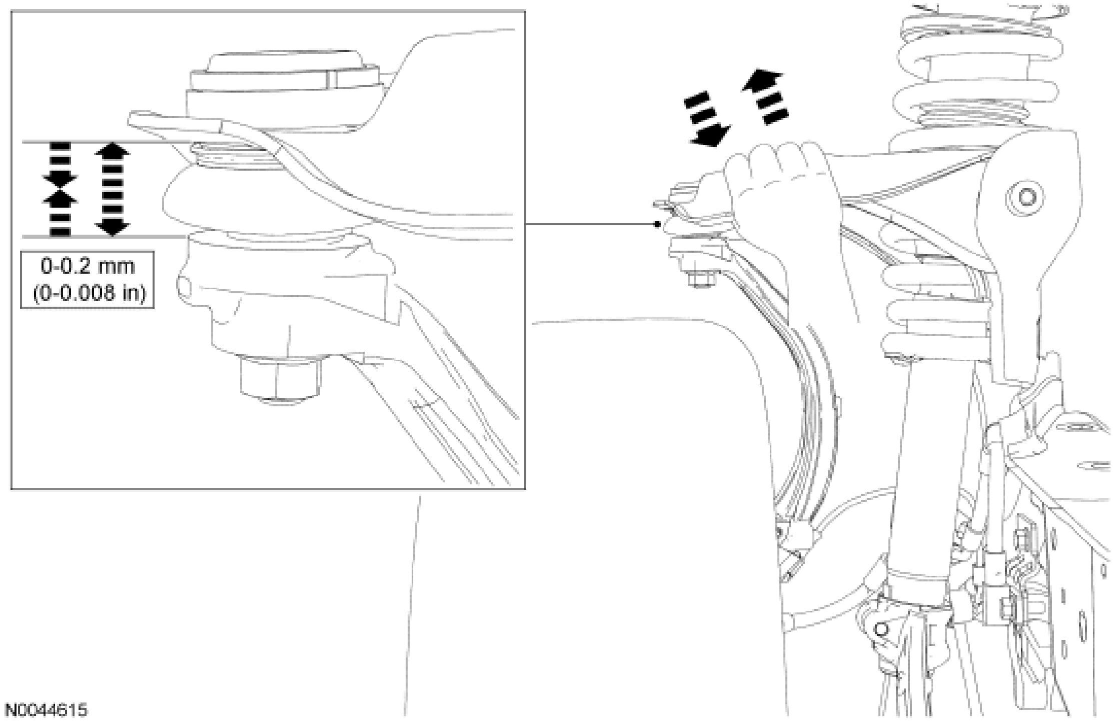

Fig. 6: Measuring Ball Joint Deflection

GENERAL PROCEDURES

RIDE HEIGHT MEASUREMENT

Front Ride Height Measurement

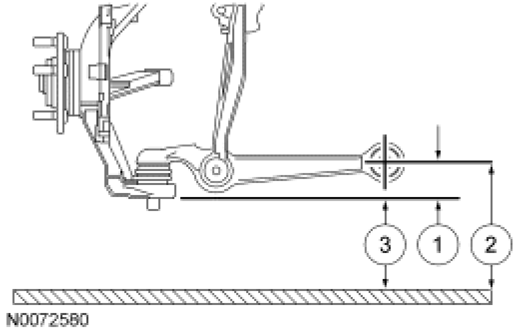

Fig. 7: Front Ride Height Measurement
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Ride height = A - B
2	-	Measurement A
3	-	Measurement B

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1. Position a suitable surface gauge (such as Starrett 57D Surface Gauge), on a flat, level surface and adjust the gauge's arm until the scriber point is located in the center of the front lower arm-to-subframe bolt.
   - Lock the surface gauge in this position.

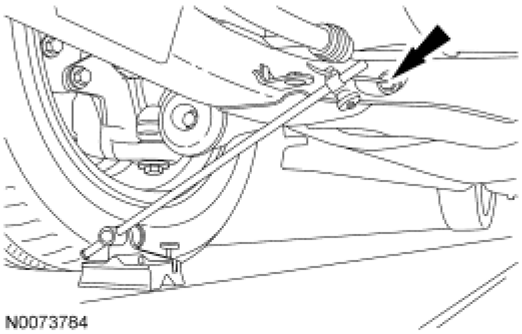

Fig. 8: Adjusting Gauge's Arm Until Scriber Point Is Located In Center Of Front Lower Arm-To-Subframe Bolt
Courtesy of FORD MOTOR CO.

2. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement A).

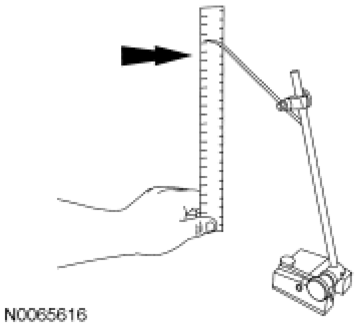

Fig. 9: Recording Measurement Of Surface Gauge Position
Courtesy of FORD MOTOR CO.

3. Position the surface gauge on the same flat, level surface as used in Step 1, adjust the gauge's arm until the scriber point is located at the wheel knuckle's lowest point, next to the front lower arm ball joint nut.
    - Lock the surface gauge in this position.

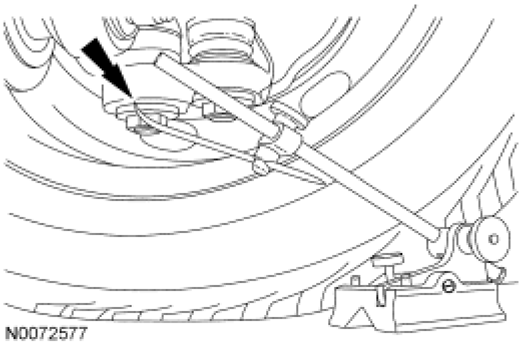

Fig. 10: Adjusting Gauge's Arm Until Scriber Point Is Located At Wheel Knuckle's Lowest Point
Courtesy of FORD MOTOR CO.

4. With the surface gauge positioned on a flat, level surface, record the measurement of the surface gauge position (measurement B).

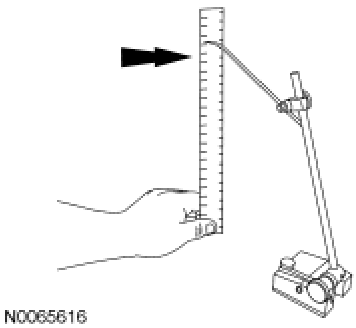

Fig. 11: Recording Measurement Of Surface Gauge Position

Courtesy of FORD MOTOR CO.

5. Subtract measurement B from measurement A to obtain the front ride height.
    - Refer to **SPECIFICATIONS**.

Rear Ride Height Measurement

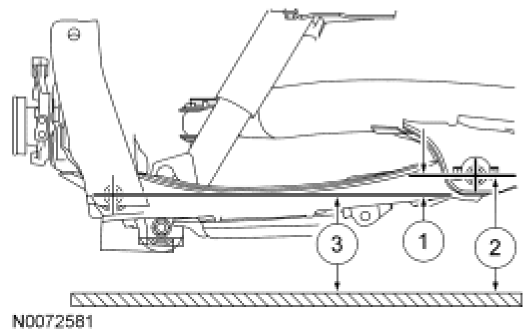

Fig. 12: Rear Ride Height Measurement
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Ride height = A - B
2	-	Measurement A
3	-	Measurement B

NOTE: Make sure that the vehicle is positioned on a flat, level surface and the tires are inflated to the correct pressure. Vehicle should have a full tank of fuel.

1. Measure the distance between the flat level surface and center of the lower arm inboard cam bolt (measurement A).
2. Measure the distance between the flat level surface and the center of the lower arm outboard bolt (measurement B).
3. Subtract measurement B from measurement A to obtain the rear ride height.

CASTER ADJUSTMENT - FRONT

NOTE: If caster adjustment is necessary to resolve a vehicle alignment issue, then installing a revised upper control arm(s) is an acceptable method. This procedure should not be routinely performed with all alignments and only after all other possible sources have been inspected and corrected as necessary.

1. Using alignment equipment and the manufacturer's instructions, measure the caster.

    NOTE: The revised upper control arms have the same base part number but they are identified by the amount of caster they change (for example, + 0.4

degrees or - 0.4 degrees)

2. Use the following table and the measurements taken in Step 1 to determine which front upper control arm should be installed.

Part Number	Degree of Change
3084 RH	+ 0.4 degree
3084 RH	- 0.4 degree
3091 LH	+ 0.4 degree
3091 LH	- 0.4 degree

3. Install a revised front upper control arm(s) as necessary. For additional information, refer to **FRONT SUSPENSION** article.
4. Recheck the front caster settings and adjust as necessary.
5. Check and, if necessary, adjust the front toe. For additional information, refer to **Toe Adjustment - Front**.

CAMBER ADJUSTMENT - REAR

NOTE: Before carrying out a camber adjustment, check the tires for the correct pressure. Inspect the tires for incorrect wear or damage. Inspect the front suspension components for wear or damage.

1. Using alignment equipment and the manufacturer's instructions, measure the rear camber.
2. Loosen the rear camber adjustment nut.

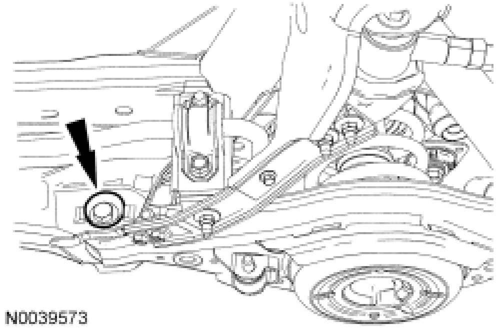

Fig. 13: Locating Rear Camber Adjustment Nut
Courtesy of FORD MOTOR CO.

3. Rotate the camber adjustment bolt until the camber setting is within specifications.

NOTE: Do not allow the camber adjustment bolt to rotate while tightening the nut.

4. Tighten the camber adjustment nut to 101 Nm (74 lb-ft).
5. Recheck the rear camber and adjust as necessary.

TOE ADJUSTMENT - FRONT

1. Start the engine and center the steering wheel.
2. Turn the engine OFF and, using a suitable steering wheel holding device, lock the steering wheel in the straight ahead position.
3. Using alignment equipment and the manufacturer's instructions, measure the front toe.
4. Remove the steering gear bellows clamps.

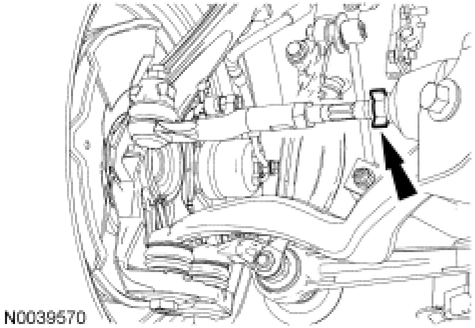

Fig. 14: Locating Steering Gear Clamps
Courtesy of FORD MOTOR CO.

5. Loosen the tie-rod jam nuts.

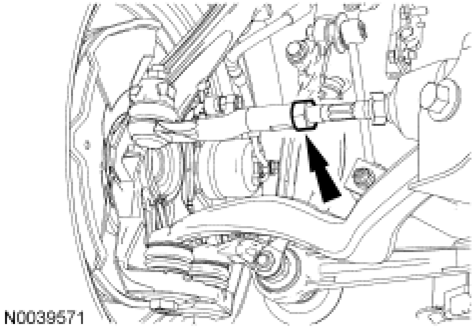

Fig. 15: Locating Tie-Rod Jam Nuts
Courtesy of FORD MOTOR CO.

NOTE: Do not allow the steering gear bellows to twist when the tie rod is rotated.

6. Rotate the tie rods until the toe setting is within specifications.

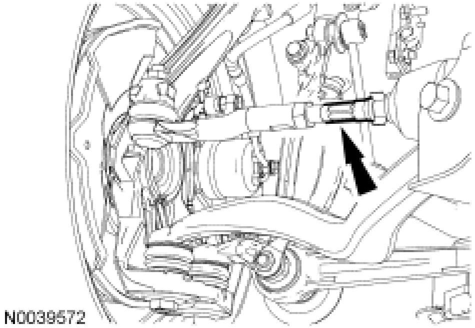

Fig. 16: Locating Tie Rods
Courtesy of FORD MOTOR CO.

7. Tighten the jam nuts to 80 Nm (59 lb-ft).
8. Install the steering gear bellows clamps.
9. Recheck the front toe settings and adjust as necessary.

TOE ADJUSTMENT - REAR

1. Using alignment equipment and the manufacturer's instructions, measure the rear toe.
2. Loosen the toe link jam nuts.

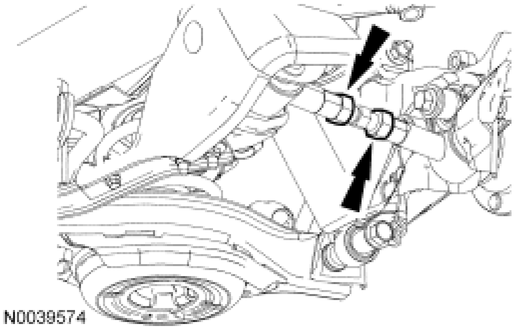

Fig. 17: Locating Toe Link Jam Nuts
Courtesy of FORD MOTOR CO.

3. Rotate the toe link adjusting rod until the toe setting is within specifications.

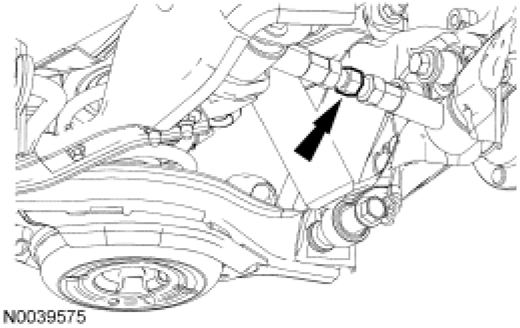

Fig. 18: Locating Toe Link Adjusting Rod
Courtesy of FORD MOTOR CO.

NOTE: **Do not allow the adjusting rod to rotate while tightening the jam nuts.**

4. Tighten the toe link jam nuts to 84 Nm (62 lb-ft).
5. Recheck the rear toe and adjust as necessary.

Transaxle/Transmission Cooling - Fusion, Milan & MKZ

SPECIFICATIONS

MATERIAL

Material

Item	Specification	Fill Capacity
FNR5 Automatic Transmission Fluid XT-9-QMM5	Mazda MES MN 117C (ATF-M V)	6.7L (7 qt)
Motorcraft Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A	7.0L (7.4 qt)

GENERAL SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Fluid	
MERCON® V, MERCON® SP, Motorcraft Premium Automatic Transmission Fluid, Motorcraft Continuously Variable Chain Type Transmission Fluid and FNR5 Automatic Transmission Fluid are not interchangeable transmission fluids. The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage. Refer to the material specification for the correct fluid. The transmission fluid should be changed every 96,560 km (60,000 mi) regardless of normal or special operating conditions.	
NOTICE: The transmission fluid used for the FNR5 and the 6-speed transaxles are unique. Do not use water-based cleaners to clean or flush the transmission fluid cooler tubes or transmission damage will occur. Mineral spirits can be used to clean the transmission fluid cooler tubes, providing the transmission fluid cooler tubes are flushed with clean automatic transmission fluid and blown dry with shop air. Use only clean automatic transmission fluid designated for this transaxle and torque converter being serviced.	

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Transmission fluid cooler tubes	10	-	89
Transmission fluid cooler tubes (at the radiator)	30	22	-
Transmission fluid fill plug (6-speed)	39	29	-

DESCRIPTION AND OPERATION

TRANSAXLE COOLING - 6 SPEED

These vehicles are equipped with an internal transmission fluid cooler. The transmission fluid cooler is mounted in the engine radiator tank. During operation, transmission fluid travels from the transaxle to the transmission fluid cooler, then back to the transaxle. The transmission fluid cooler transfers heat from the transmission fluid to the engine coolant.

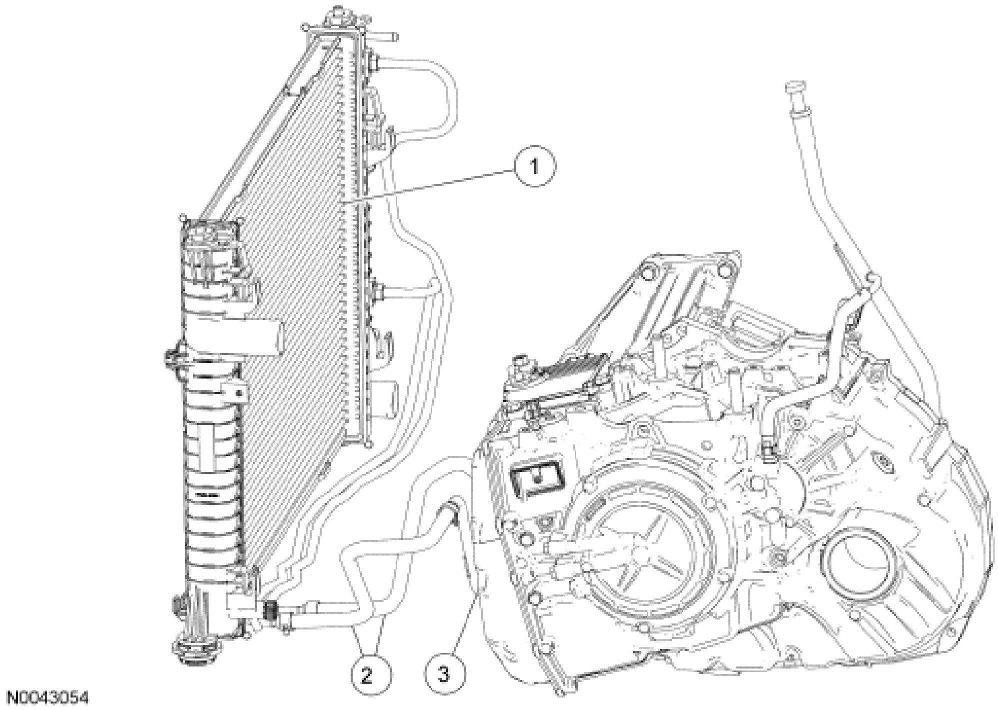

Fig. 1: Transaxle Cooling - 6-Speed

Item	Part Number	Description
1	8005	Radiator
2	7H420	Transmission fluid cooler tube assembly
3	19710-A	Transmission mounted fluid cooler tube

TRANSAXLE COOLING - FNR5

These vehicles are equipped with an internal transmission fluid cooler. The transmission fluid cooler is mounted in the engine radiator tank. During operation, transmission fluid travels from the transaxle to the transmission fluid cooler, then back to the transaxle. The transmission fluid cooler transfers heat from the transmission fluid to the engine coolant.

Motorcraft Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

Inspection and Verification

1. Verify the customer's concern by operating the vehicle to duplicate the condition.
2. If the inspection reveals an obvious concern(s) that can be readily identified, repair as necessary.
3. Install new components if a transmission fluid leak is found in any of the transaxle cooling components.
4. If the concern(s) remains after the inspection, determine the symptom(s). Go to **Symptom Chart - Transaxle Cooling** or Go to **Symptom Chart - NVH**.

Symptom Chart - Transaxle Cooling

Symptom Chart - Transaxle Cooling

Condition	Possible Sources	Action
• Transaxle overheating	• Clogged transmission fluid coolers or tubes	• INSPECT the transmission fluid cooler and transmission fluid cooler tubes for damage or plugging.
	• Bent or crushed transmission fluid cooler tubes	• INSTALL a new transmission fluid cooler or transmission fluid cooler tubes as necessary.
	• System leaks	• INSPECT transmission fluid cooler and transmission fluid cooler tubes for leaks. REPAIR as required.
	• Internal transmission concerns	• REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article.

Symptom Chart - NVH

NOTE: **NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.**

Symptom Chart - NVH

Condition	Possible Sources	Action
• Vibration - a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed	• Transmission fluid cooler tubes grounded	• CHECK the transmission fluid cooler tubes. REPAIR as necessary.

Check Transmission Fluid Level and Condition

NOTE: The vehicle should not be driven if the transmission fluid level indicator shows the transmission fluid below the minimum fluid level mark or internal failure may result.

If the vehicle has been operated for an extended period of time at highway speeds, in city traffic, in hot weather or while pulling a trailer, the transmission fluid needs to cool down to obtain an accurate reading.

The transmission fluid level reading on the transmission fluid level indicator will differ depending on operating and ambient temperatures. The correct reading should be within the normal operating temperature range.

Transmission Fluid Level Check

NOTE: The transmission fluid should be checked at normal operating temperature 60°C-70°C (140°F-158°F) on a level surface. Normal operating temperature can be reached after approximately 32 km (20 mi) of driving and can be checked using the scan tool.

Under normal circumstances the transmission fluid level should be checked during normal maintenance. If the transaxle starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.

1. With the transaxle in PARK, the engine at idle, foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever in the PARK position.
2. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.
3. Wipe the transmission fluid level indicator with a clean cloth.
4. Install the transmission fluid level indicator back in the fluid indicator tube until it is fully seated, then remove the indicator. The transmission fluid level should be within the normal operating range.

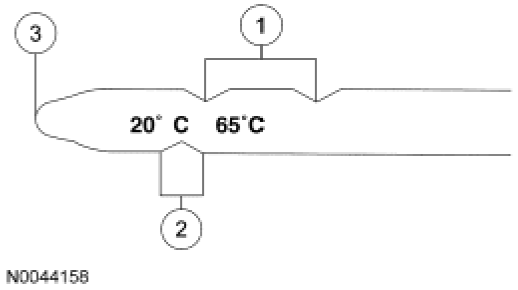

Fig. 3: Transmission Fluid Level Check
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Transmission fluid level at operating temperature 60°C-70°C (140°F-158°F)

2	-	Transmission fluid level cool 15°C-25°C (59°F-77°F)
3	-	Do not drive mark

High Transmission Fluid Level

A transmission fluid level that is too high may cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of transmission fluid from the vent tube and possible transaxle malfunction and/or damage. If an overfill reading is indicated, refer to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article.

Low Transmission Fluid Level

A low transmission fluid level could result in poor transaxle engagement, slipping, malfunction and/or damage. This could also indicate a leak in one of the transaxle seals or gaskets.

Adding Transmission Fluid

NOTE: **MERCON® V, MERCON® SP, Motorcraft Premium Automatic Transmission Fluid, Motorcraft Continuously Variable Chain Type Transmission Fluid and FNR5 Automatic Transmission Fluid are not interchangeable transmission fluids. The use of any fluid other than what is recommended for this transaxle will cause transaxle damage.**

If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the indicator tube. Do not overfill the transaxle. For transmission fluid type, refer to the **SPECIFICATIONS**.

Transmission Fluid Condition Check

1. Check the transmission fluid level.
2. Observe the color and the odor. The color under normal circumstances should be a dark red color, not brown or black or have a burnt odor.
3. Hold the transmission fluid level indicator over a white facial tissue and allow the transmission fluid to drip onto the facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.
5. If the stain is a foamy pink color, this may indicate coolant in the transaxle. The engine cooling system should also be inspected at this time.
6. If transmission fluid contamination or transaxle failure is confirmed by the sediment in the bottom of the fluid pan, install a new transaxle. If installing a new transaxle, the transmission fluid cooler and transmission fluid cooler tubes should be cleaned.
7. If the transaxle is to be overhauled or if installing a new transaxle, the fluid cooler must be back flushed. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article.

DESCRIPTION AND OPERATION

POWER TRANSFER UNIT (PTU)

The All-Wheel Drive (AWD) system consists of the following:

- Power Transfer Unit (PTU)
- Rear driveshaft
- 4X4 control module
- Rear axle with coupling device

The PTU is a gearbox that attaches to the transaxle. The RH intermediate shaft passes through the PTU and engages the differential side gear as in normal Front Wheel Drive (FWD) applications. The PTU directs power to the rear driveshaft through a helical gear spline coupled to the transaxle differential case, a helical gear drop

(idler gear) and hypoid/helical ring gear assembly and pinion set. The PTU is sealed from the transaxle and has its own oil sump.

Serviceable components of the PTU are limited to the output shaft seal and flange, intermediate shaft seal and deflector, the cover seal and the PTU-transaxle compression seal. The internal components are not serviced. Do not remove the cover of the PTU. If any of the geared components, bearings, case cover or internal shafts are worn or damaged, a new PTU must be installed.

DIAGNOSTIC TESTS

POWER TRANSFER UNIT (PTU)

Principles of Operation

The Power Transfer Unit (PTU) is a gearbox that attaches to the transaxle. The RH intermediate shaft passes through the PTU and engages the differential side gear as in normal Front Wheel Drive (FWD) applications. The PTU directs power to the rear driveshaft through a helical gear spline coupled to the transaxle differential case, a helical gear drop (idler gear) and hypoid/helical ring gear assembly and pinion set. The PTU is sealed from the transaxle and has its own oil sump.

Serviceable components of the PTU are limited to the output shaft seal and flange, intermediate shaft seal and deflector, the cover seal and the PTU-transaxle compression seal. The internal components are not serviced. Do not remove the cover of the PTU. If any of the geared components, bearings, case cover or internal shafts are worn or damaged, a new PTU must be installed.

Heat Protection Mode - During very extreme off-road operation, the All-Wheel Drive (AWD) system utilizes a heat protection mode to protect the Active Torque Coupling (ATC) solenoid (part of rear axle) from damage. If the system detects an overheat condition, it enters a locked mode. If the heat in the system continues to rise once in the locked mode, the 4X4 control module disables the ATC solenoid. Allow the system to cool down at least 10 minutes with the ignition switch in the ON position.

For concerns with the 4X4 control module or ATC, refer to **FOUR WHEEL DRIVE (4WD) SYSTEMS** article.

Inspection and Verification

1. Verify the customer concern.
2. Inspect for obvious signs of mechanical damage.

VISUAL INSPECTION CHART

Mechanical
• Power Transfer Unit (PTU) • Halfshafts and CV joints • Driveshaft and U-joints • Wheel/tire size and brand

- Matching tire size and brand
- Tire pressure

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and Go to **Symptom Chart - Power Transfer Unit (PTU)**.

Symptom Chart - Power Transfer Unit (PTU)

Symptom Chart - Power Transfer Unit (PTU)

Condition	Possible Sources	Action
• The Power Transfer Unit (PTU) makes noise	• Tire inflation pressure • Tire and wheel size	• MAKE SURE all tires and wheels are the same size and brand and the inflation pressures are correct.
	• Fluid level	• FILL with the correct type and amount of lubricant. REFER to **Power Transfer Unit (PTU) Draining and Filling**.
	• Internal components	• OPERATE the vehicle in all gears. If there is noise in the transaxle in NEUTRAL, or in some gears and not in others, REMOVE and REPAIR the transaxle. Refer to the appropriate Automatic Transmission article for the procedure. If there is noise in all gears, INSTALL a new PTU. REFER to **Power Transfer Unit (PTU)**.
• Leaking fluid from the PTU vent	• PTU over filled	• REFER to **Analysis of Leakage**.
• Leaking automatic transmission fluid	• PTU intermediate shaft seal • PTU compression seal	• REFER to **Analysis of Leakage**.
• Leaking gear lubricant from the seals	• The PTU vent is plugged (located on top of the PTU)	• INSTALL a new PTU. REFER to **Power Transfer Unit (PTU)**.
	• Damaged seals	• REFER to **Analysis of Leakage**.
• Vehicle has no or inadequate torque at rear wheels	• Rear axle	• REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.

• Vehicle binds in a turn or resists turning/pulsates or shudders in a straight line	• PTU mechanical failure	• REFER to **Power Transfer Unit (PTU)**.
	• Wheels/tires	• REFER to **WHEELS AND TIRES** article.
	• Brake system	• REFER to **BRAKE SYSTEM - GENERAL INFORMATION** article.
	• Wheel bearings	• REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.
	• Halfshafts	• REFER to **DRIVELINE SYSTEM - GENERAL INFORMATION** article.
	• Wheel speed sensor (s)	• REFER to **VEHICLE DYNAMIC SYSTEMS** article.
	• ABS module	• REFER to **VEHICLE DYNAMIC SYSTEMS** article.

Analysis of Leakage

The PTU may leak different color fluids, red oil leak for an automatic transmission fluid and brown/black gear lube for PTU fluid. The PTU seals prevent these types of fluids from leaking. It is important to note which color of fluid is leaking to conduct the most appropriate service procedure.

PTU Leaks From the RH Side

NOTE: **Remove and replace leaking seals using the information found in the Intermediate Shaft Seal and Deflector or Cover Seal replacement procedure. The specified tools called out in this procedure will allow seal replacement without causing damage to the Power Transfer Unit (PTU) casing/drive gear.**

If the leak is red automatic transmission fluid, this indicates the differential seals in the transaxle are also leaking and need to be replaced along with the intermediate shaft seal. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article to replace the differential seals before replacing the intermediate shaft seal. Refer to the **Intermediate Shaft Seal and Deflector** procedure to replace the intermediate seal.

If the leak is brown/black gear lube, then the PTU larger cover seal needs replacement. This is located on the PTU cover behind the deflector. Refer to **Cover Seal** procedure.

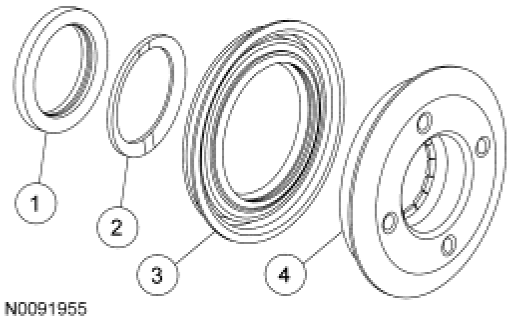

Fig. 1: Identifying Intermediate Shaft Seal
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Intermediate shaft seal (part of kit 7275)
2	-	Alignment washer (part of kit 7275)
3	-	Cover seal (part of kit 7275)
4	-	Seal deflector (part of kit 7275)

PTU Leaks From the LH Side

If the leak is the red automatic transmission fluid, the compression seal needs replacement. This is between the PTU and transmission. Refer to **Power Transfer Unit (PTU)** in the Removal portion of this section.

If the leak is brown/black, the PTU is overfilled and venting fluid from the top of the PTU. Flush and fill the PTU. Refer to **Power Transfer Unit (PTU) Draining and Filling**.

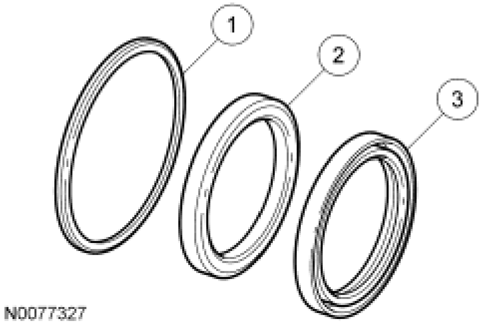

Fig. 2: PTU Leaks From LH Side
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Power Transfer Unit (PTU)-to-transaxle compression seal (7086)
2	-	Transfer case driver gear seal (not serviceable)
3	-	Transfer case driver gear seal (not serviceable)

GENERAL PROCEDURES

POWER TRANSFER UNIT (PTU) DRAINING AND FILLING

Material

Item	Specification
Motorcraft SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A

NOTE: **A new Power Transfer Unit (PTU) must be installed any time the PTU has been submerged in water.**

NOTE: **The Power Transfer Unit (PTU) is not to be drained unless contamination is suspected. To drain the PTU fluid, the PTU must be removed from the vehicle. The fluid that is drained may appear black and have a pungent odor. Do not mistake this for contaminated fluid. For additional information, refer to Power Transfer Unit (PTU) in the Removal portion of this section.**

NOTE: **Fill level checks are done in-vehicle only. Let the vehicle sit 10 minutes after the road test before checking the fluid level.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Clean the area around the filler plug before removing.

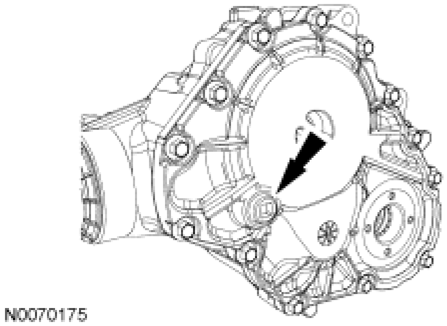

Fig. 3: Locating Fill Plug
Courtesy of FORD MOTOR CO.

3. Remove and discard the filler plug.
4. With the vehicle on a flat, level surface, fill the PTU with lubricant. The fluid must be even with the bottom of the fill opening.
   - Fluid capacity is 0.53L (18 oz).
5. Install a new filler plug.
   - Tighten to 20 Nm (177 lb-in).

IN-VEHICLE SERVICING

COVER SEAL

Special Tools

Illustration	Tool Name	Tool Number
 ST3082-A	Handle, Driver 32 in	205-907
 ST2572-A	Installer, Halfshaft Oil Seal	308-431
 ST1164-A	Installer, Shaft Bearing Cup	308-221 (T94P-7025-BH)
 ST2446-A	Remover, Halfshaft	205-241
 ST1605-A	Slide Hammer	100-01 (T50T-100-A)

REMOVAL

NOTE: **The Power Transfer Unit (PTU) may leak different color fluids, red oil leak for automatic transmission fluid and brown/black gear lube for PTU fluid. The PTU seals prevent these types of fluids from leaking. It is important to note which color fluid is leaking to conduct the most appropriate service procedure. This procedure will correct a brown/black (gear lube) leak from the RH side of the PTU. For additional information, refer to Analysis of Leakage.**

NOTE: **This procedure is to be performed through the RH wheel opening. It is not necessary to remove the exhaust components to complete this repair.**

1. Remove the intermediate shaft seal and deflector. For additional information, refer to **Intermediate Shaft Seal and Deflector**.

NOTE: There is a bearing inside the PTU directly behind the cover seal. The bearing is not serviced.

2. Remove the cover seal using the Slide Hammer, the extension from the Halfshaft Remover and a suitable seal puller inserted into the groove of the seal.

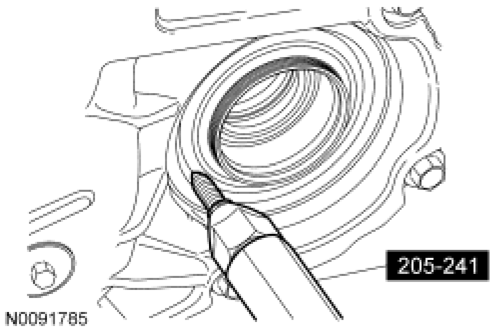

Fig. 4: Removing Cover Seal Using Slide Hammer
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Assemble the Driver Handle, the Halfshaft Oil Seal Installer and the Shaft Bearing Cup Installer as shown.

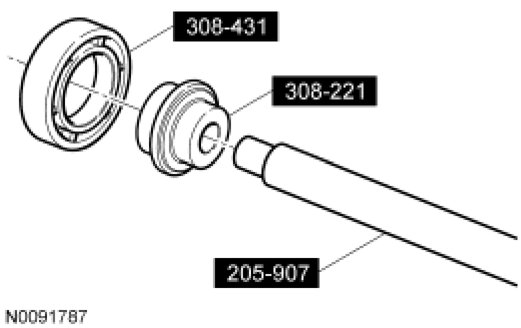

Fig. 5: Assembling Driver Handle, Halfshaft Oil Seal Installer & Shaft Bearing Cup Installer
Courtesy of FORD MOTOR CO.

2. Using the Driver Handle, the Halfshaft Oil Seal Installer and the Shaft Bearing Cup Installer, install the cover seal in the PTU.

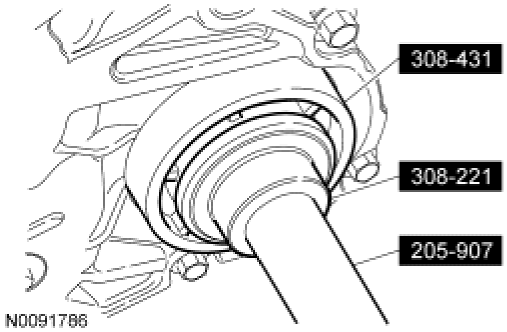

Fig. 6: Installing Cover Seal In PTU
Courtesy of FORD MOTOR CO.

3. Install the intermediate shaft seal and deflector. For additional information, refer to **Intermediate Shaft Seal and Deflector**.
4. Fill the PTU fluid as necessary. For additional information, refer to **Power Transfer Unit (PTU) Draining and Filling** in this section.

OUTPUT SHAFT SEAL

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	Holding Fixture, Drive Pinion Flange	205-126 (T78P-4851-A)
 ST2571-A	Installer, PTU Drive Gear Outer Oil Seal	308-430
 ST2937A	Remover, Output Flange	307-523

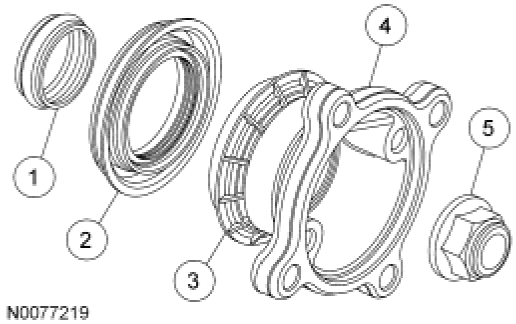

Fig. 7: Output Shaft Seal and Flange
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Collapsible spacer (part of 7275 kit)
2	-	Output shaft seal (part of 7275 kit)
3	-	Output shaft seal deflector (part of 7275 kit)
4	-	Output pinion flange (part of 7275 kit)
5	-	Pinion flange nut (part of 7275 kit)

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the exhaust flexible pipe. For additional information, refer to **EXHAUST SYSTEM** article.

NOTE: Index-mark both the driveshaft flanges for installation.

3. Remove the 4 driveshaft-to-Power Transfer Unit (PTU) output flange bolts. Disconnect the driveshaft from the PTU and position it aside.
   - Using mechanic's wire, support the driveshaft.

NOTE: Rotational torque of the PTU rear output shaft flange must be measured and recorded using a Nm (lb-in) torque wrench for correct pinion bearing preload when reassembled. This will be the torque-to-turn measurement.

4. Using a suitable torque wrench, measure and record the rotational torque.

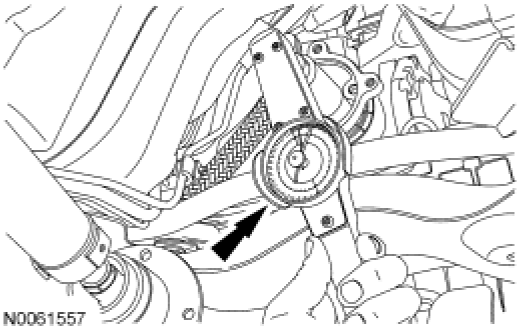

Fig. 8: Measuring Rotational Torque Using A Suitable Torque Wrench
Courtesy of FORD MOTOR CO.

5. Using the Drive Pinion Flange Holding Fixture, hold the output pinion flange. Remove and discard the pinion nut.

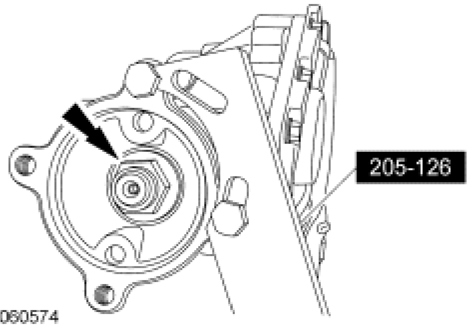

Fig. 9: Holding Output Pinion Flange Using Special Tool (205-126)
Courtesy of FORD MOTOR CO.

NOTE: Index-mark the output pinion flange to the pinion shaft.

6. Using the Output Flange Remover, remove the output pinion flange.

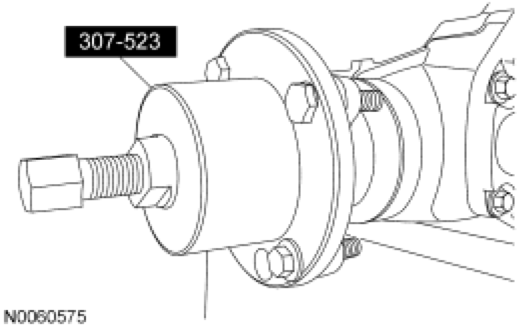

Fig. 10: Removing Output Pinion Flange Using Special Tool (307-523)
Courtesy of FORD MOTOR CO.

7. Remove and discard the output shaft seal deflector.

8. Remove and discard the output shaft seal.
9. Remove and discard the collapsible spacer.

INSTALLATION

1. Install the new collapsible spacer.
2. Using the PTU Drive Gear Outer Oil Seal Installer, install the output shaft seal.

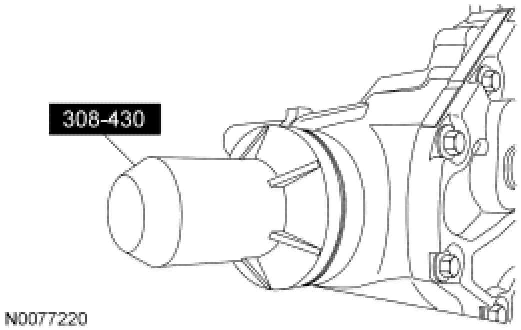

Fig. 11: Installing Output Shaft Seal Using Special Tool (308-430)
Courtesy of FORD MOTOR CO.

3. Using the PTU Drive Gear Outer Oil Seal Installer, install the output shaft seal deflector.

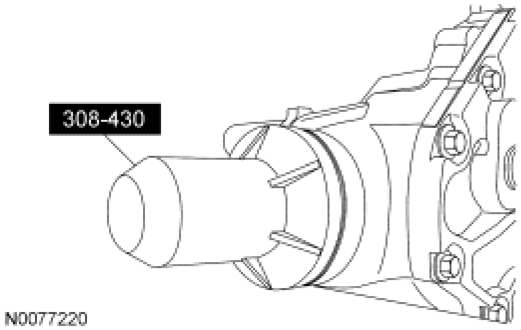

Fig. 12: Installing Output Shaft Seal Using Special Tool (308-430)
Courtesy of FORD MOTOR CO.

NOTE: **Install the output pinion flange to engage the spline as previously marked.**

4. Install the output pinion flange.

NOTE: **Refer to the rotational torque previously recorded with the Nm (lb-in) torque wrench. Tighten the pinion nut in small increments until it is within 0.3 Nm (3 lb-in) of the reference measurement. If 0.3 Nm (3 lb-in) is exceeded, then the collapsible spacer will be damaged and a new collapsible spacer will be required.**

5. Using the Drive Pinion Flange Holding Fixture to hold the output pinion flange, install and tighten the new pinion flange nut.

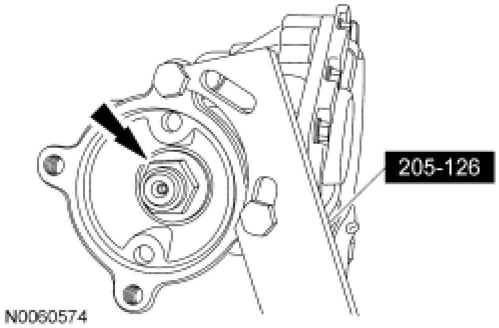

Fig. 13: Holding Output Pinion Flange Using Special Tool (205-126)
Courtesy of FORD MOTOR CO.

6. Position the driveshaft using the index mark and install the 4 driveshaft-to-PTU output flange bolts. Tighten bolts in a star pattern.
   - Tighten to 70 Nm (52 lb-ft).
7. Install the exhaust flexible pipe. For additional information, refer to **EXHAUST SYSTEM** article.
8. Fill the PTU, if necessary. For additional information, refer to **Power Transfer Unit (PTU) Draining and Filling**.

INTERMEDIATE SHAFT SEAL AND DEFLECTOR

Special Tools

Illustration	Tool Name	Tool Number
	Bearing Cup Remover	308-125 (T87P-7120-D)
	Handle, Driver 32 in	205-907
	Installer, PTU Link shaft Seal	205-883

 ST3053-A	Installer, PTU Link shaft Seal Dust Shield	205-882
 ST2446-A	Remover, Halfshaft	205-241

General Equipment

5/8 in (16 mm) washer (used with 308-125)

Material

Item	Specification
Metal Brake Parts Cleaner PM-4-A or PM-4-B (US); CPM-4 (Canada)	-
Motorcraft MERCON® LV Automatic Transmission Fluid XT-10-QLV	MERCON® LV
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

REMOVAL

NOTE: **The Power Transfer Unit (PTU) may leak different color fluids, red oil leak for automatic transmission fluid and brown/black gear lube for PTU fluid. The PTU seals prevent these types of fluids from leaking. It is important to note which color fluid is leaking to conduct the most appropriate service procedure. This procedure will correct a red oil leak (automatic transmission fluid) from the intermediate shaft seal on the RH side of the PTU. If the leak is red automatic transmission fluid, this indicates that the differential seals in the transaxle are also leaking and need to be replaced along with the intermediate shaft seal. Refer to AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21 article to replace the differential seals before replacing the intermediate shaft seal. For additional information, refer to Analysis of Leakage.**

NOTE: **This procedure is to be performed through the RH wheel opening. It is not necessary to remove the exhaust components to complete this repair.**

1. Remove the intermediate shaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.

NOTE: The following instruction will prevent the Bearing Cup Remover from opening too far which would make removing the intermediate shaft seal deflector difficult.

2. Place a 16 mm (5/8 in) washer between the components of the Bearing Cup Remover as shown.

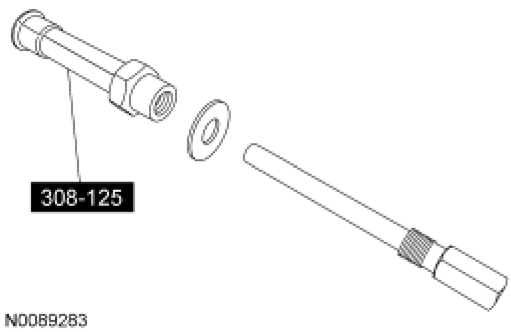

Fig. 14: Placing Washer Between Components Of Bearing Cup Remover
Courtesy of FORD MOTOR CO.

NOTE: Using a 5-pound or larger slide hammer eases the removal of the seal deflector.

3. Using the Bearing Cup Remover, the extension from the Halfshaft Remover, and a suitable slide hammer, remove the seal deflector.
   - The seal deflector will have been damaged during removal. Remove all foreign material from the PTU before continuing with the repair.

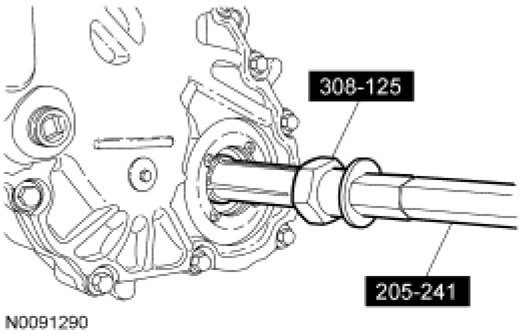

Fig. 15: Removing Seal Deflector
Courtesy of FORD MOTOR CO.

4. Using the Bearing Cup Remover, the extension from the Halfshaft Remover, and a suitable slide hammer, remove the intermediate shaft seal, and if equipped, the alignment washer.

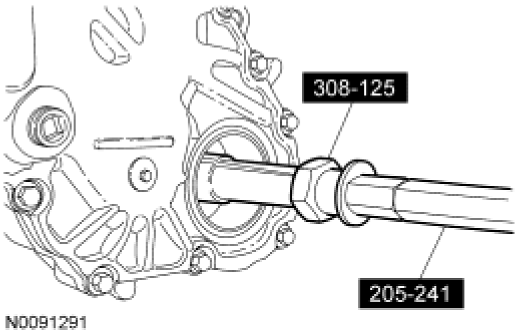

Fig. 16: Removing Intermediate Shaft Seal
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: **The following illustration shows the correct orientation of the seal components when installed in the vehicle.**

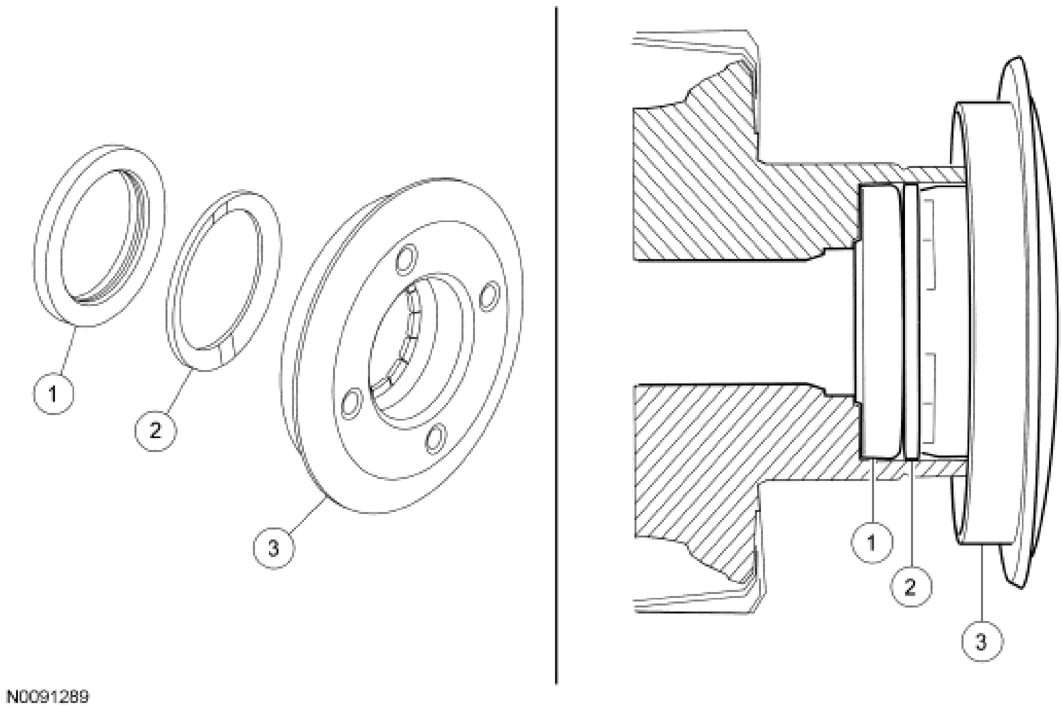

Fig. 17: View Of Correct Orientation Of Seal Components When Installed In Vehicle
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Intermediate shaft seal (part of 7275 kit)
2	-	Alignment washer (part of 7275 kit)
3	-	Seal deflector (part of 7275 kit)

1. Place the intermediate shaft seal on the PTU Link shaft Seal Installer and Driver Handle with the spring side facing away from the tool.

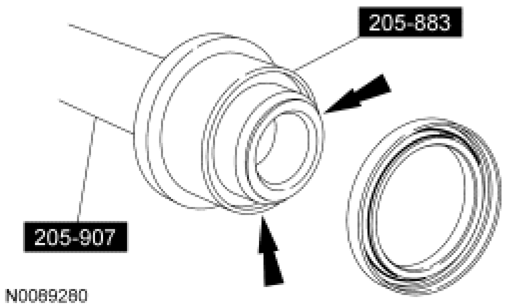

Fig. 18: Placing Intermediate Shaft Seal On PTU Link shaft Seal Installer
Courtesy of FORD MOTOR CO.

2. Using the PTU Link shaft Seal Installer and Driver Handle, install the intermediate shaft seal.

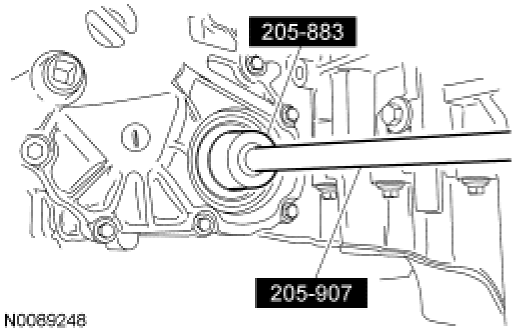

Fig. 19: Installing Intermediate Shaft Seal
Courtesy of FORD MOTOR CO.

3. Place the alignment washer on the PTU Link shaft Seal Installer and Driver Handle with the beveled edge (white-striped side) facing towards the tool.

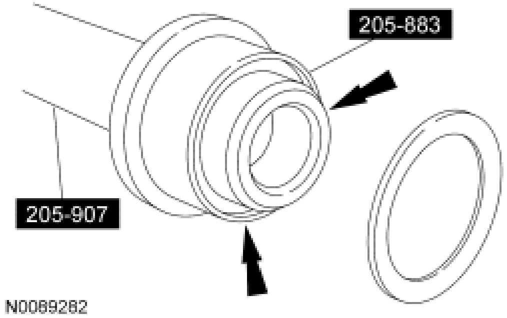

Fig. 20: Placing Intermediate Shaft Seal On PTU Link shaft Seal Installer
Courtesy of FORD MOTOR CO.

NOTE: **Do not use force when installing the alignment washer or damage to the washer can occur.**

4. Using the PTU Link shaft Seal Installer and Driver Handle, install the alignment washer by hand, pushing it in until it bottoms against the seal.
   - When installed, the white-striped side should be facing out.

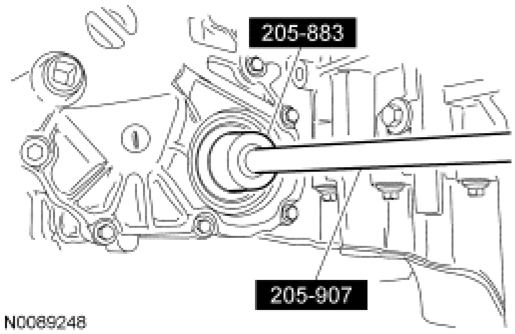

Fig. 21: Installing Alignment Washer By Hand
Courtesy of FORD MOTOR CO.

NOTE: **Do not overheat (melt) the seal deflector. Monitor the temperature of the deflector with a suitable temperature measuring device, such as a digital temperature laser or infrared thermometer, while heating. Do not allow the temperature to exceed 100°C (212°F). Overheating will damage the deflector. If the deflector is damaged, a new deflector must be used.**

NOTE: **Apply a small amount of silicone brake caliper grease and dielectric compound to the inner lip of the deflector where it installs on the tube inside the PTU before heating. This will ease the installation of the deflector.**

5. Position the deflector on the PTU Link shaft Seal Dust Shield Installer using silicone brake caliper grease and dielectric compound to retain it to the installer. Using a suitable heat gun, heat the deflector to a minimum of 66°C (150°F) and a maximum of 100°C (212°F) by concentrating the heat across the back of the installer while rotating, not directly on the deflector itself.
   - As an alternative method to heating the seal deflector, place the deflector in boiling water for 3 to 5 minutes. Dry off the deflector and install.

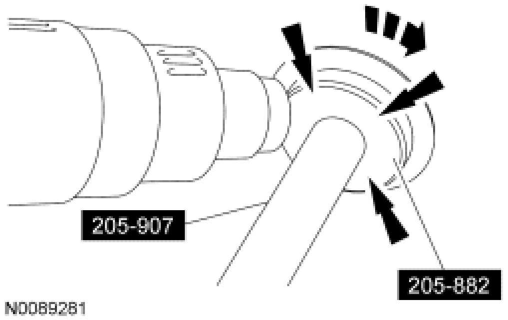

Fig. 22: Applying Small Amount Of Silicone Brake Caliper Grease & Dielectric Compound To Inner Lip Of Deflector
Courtesy of FORD MOTOR CO.

6. Install the seal deflector immediately after heating using the PTU Link shaft Seal Dust Shield Installer and Driver Handle.

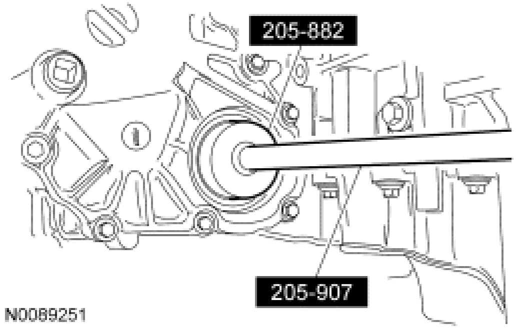

Fig. 23: Installing Seal Deflector
Courtesy of FORD MOTOR CO.

7. Make sure the deflector is completely seated all the way around and there are no cracks on the face or inner diameter white-colored tab. The deflector is correctly installed when the face of the deflector is recessed 3-5 mm (0.12-0.20 in) into the pocket all the way around.

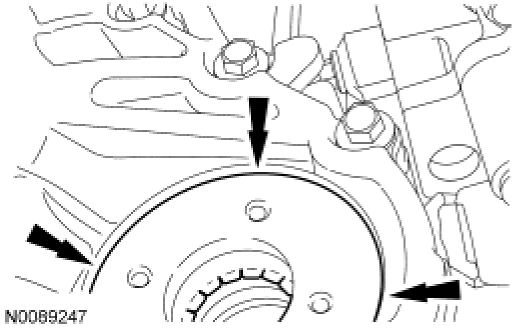

Fig. 24: Making Sure Deflector Is Completely Seated All The Way Around
Courtesy of FORD MOTOR CO.

NOTE: Some residual fluid will collect between the seal and deflector during this

repair. This is a normal condition and should not be misinterpreted as a leak after the repair is complete.

8. Using brake parts cleaner, thoroughly clean the deflector and intermediate shaft area of any residual fluid that may have accumulated during the repair.
9. Install the intermediate shaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.
10. Top off the transmission fluid as necessary.

REMOVAL

POWER TRANSFER UNIT (PTU)

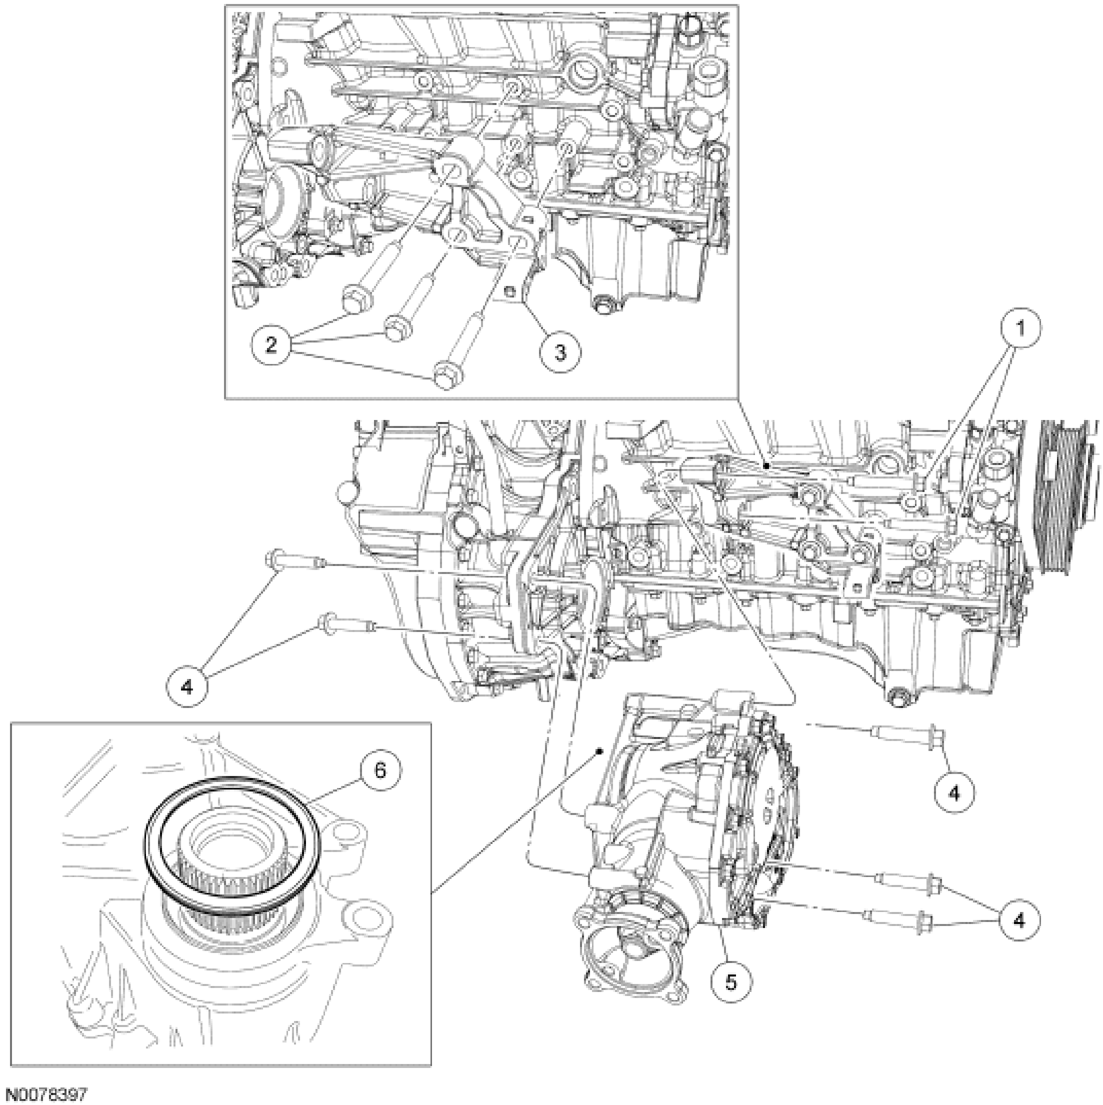

Fig. 25: Exploded View Of Power Transfer Unit (PTU)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W500724	Power Transfer Unit (PTU)-to-support bracket bolts (2 required)
2	W500724	PTU support bracket-to-engine block bolts (3 required)
3	7A444	PTU support bracket
4	W500741	PTU-to-transaxle bolts (3 required)
5	7251	PTU
6	7087	Compression seal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the driveshaft. For additional information, refer to **DRIVESHAFT** article.
3. Remove the RH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.
4. Remove the 2 Power Transfer Unit (PTU)-to-support bracket bolts, then remove the 3 PTU support bracket bolts and the PTU support bracket.

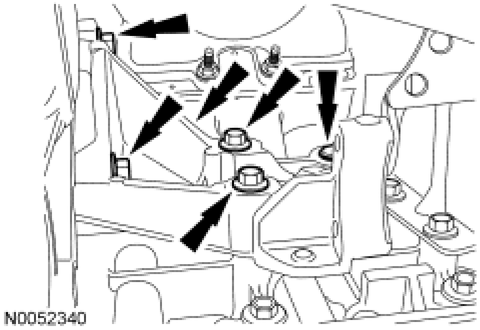

Fig. 26: Locating Power Transfer Unit (PTU) Support Bracket & Bolts
Courtesy of FORD MOTOR CO.

5. Remove the 5 PTU-to-transaxle bolts.

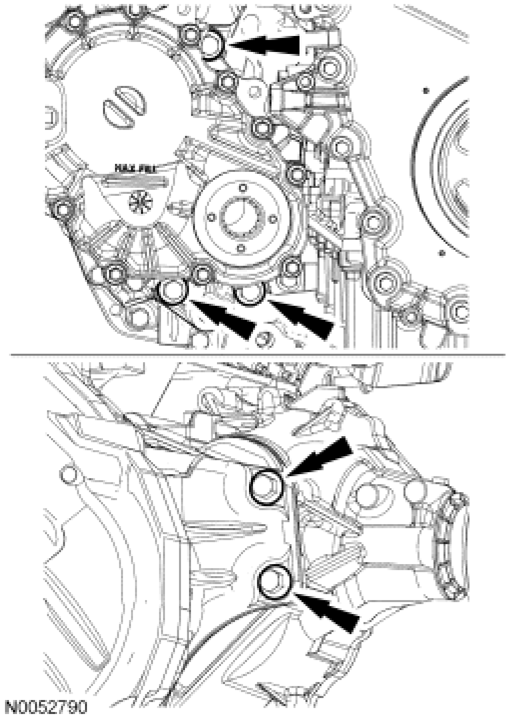

Fig. 27: Locating PTU Bolts
Courtesy of FORD MOTOR CO.

6. Separate the PTU from the transaxle. Remove the PTU from the vehicle.

NOTE: **A new compression seal must be installed whenever the PTU is removed from the vehicle.**

7. Using a suitable tool, remove the compression seal and discard.

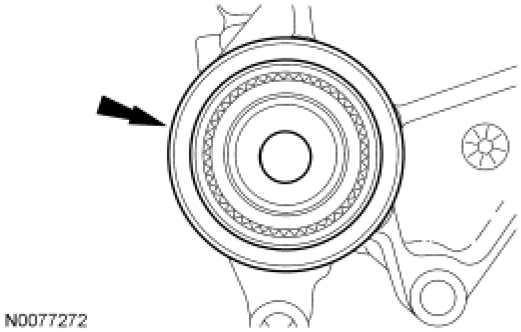

Fig. 28: Identifying Compression Seal
Courtesy of FORD MOTOR CO.

INSTALLATION

POWER TRANSFER UNIT (PTU)

Material

Item	Specification
Motorcraft SAE 75W-140 Synthetic Rear Axle Lubricant XY-75W140-QL (US); CXY-75W140-1L (Canada)	WSL-M2C192-A

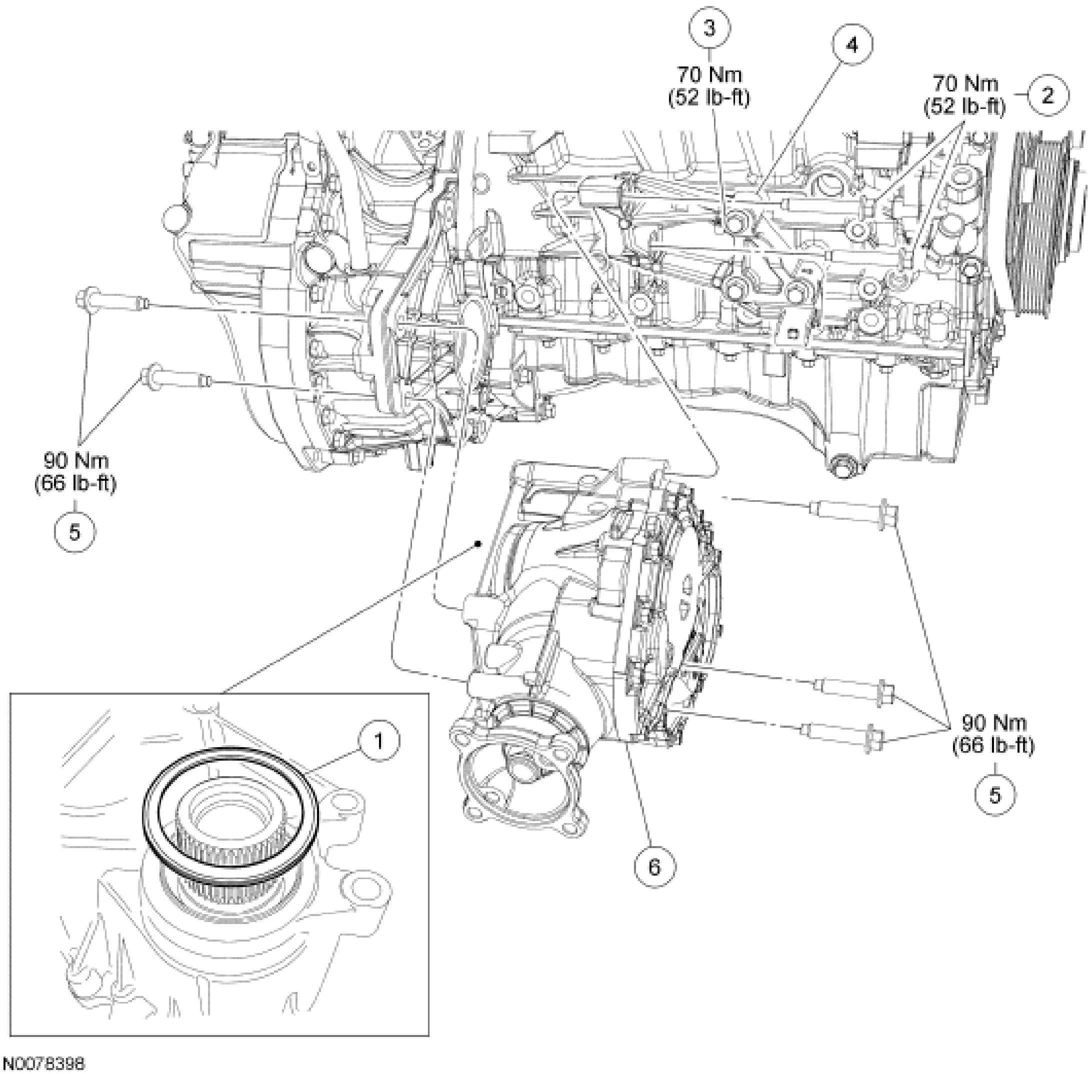

Fig. 29: Exploded View Of Power Transfer Unit (PTU) With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	7087	Compression seal
2	W500724	Power Transfer Unit (PTU)-to-support bracket bolts (2 required)
3	W500724	PTU support bracket-to-engine block bolt (3 required)
4	7A444	PTU support bracket

5	W500741	PTU-to-transaxle bolts (5 required)
6	7251	PTU

NOTE: A new compression seal must be installed whenever the Power Transfer Unit (PTU) is removed from the vehicle.

1. Using a suitable tool, install the new compression seal.

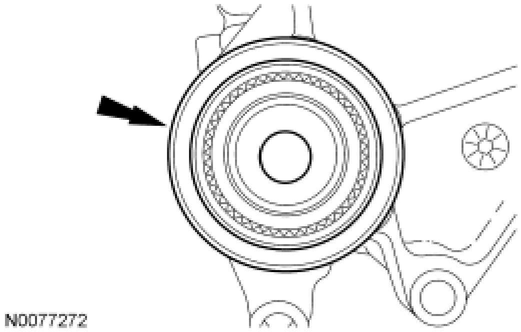

Fig. 30: Identifying Compression Seal
Courtesy of FORD MOTOR CO.

NOTE: A new PTU intermediate shaft seal and deflector must be installed whenever the intermediate shaft or PTU is removed from the vehicle.

2. Position the PTU to the transaxle. Install the 5 PTU-to-transaxle bolts.
   - Tighten to 90 Nm (66 lb-ft).

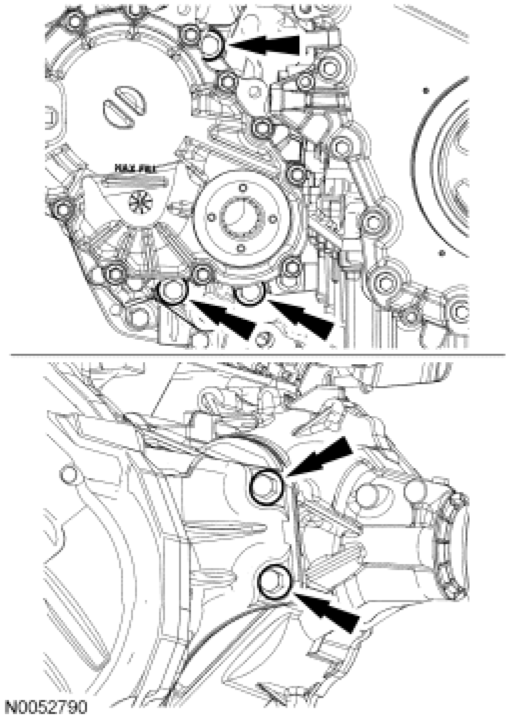

Fig. 31: Locating PTU Bolts
Courtesy of FORD MOTOR CO.

3. Position the PTU support bracket into place and install the 5 PTU support bracket bolts.
    1. Tighten the bolts to the transaxle to 70 Nm (52 lb-ft).
    2. Tighten the bolts to the engine to 70 Nm (52 lb-ft).

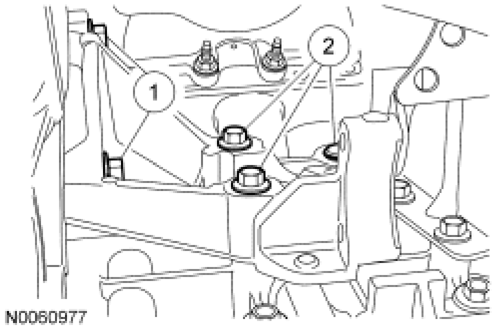

Fig. 32: Identifying Transaxle Bolts & Engine Bolts
Courtesy of FORD MOTOR CO.

4. Install the driveshaft. For additional information, refer to **DRIVESHAFT** article.
5. Install the RH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.
6. Top off all fluids as necessary.

GENERAL INFORMATION

Trouble Shooting - Basic Procedures

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC CHARGING SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Vehicle Will Not Start	
Dead battery	Check battery cells, alternator belt tension and alternator output
Loose or corroded battery connections	Check all charging system connections
Ignition circuit or switch malfunction	Check and replace as necessary
Alternator Light Stays On With Engine Running	
Loose or worn alternator drive belt	Check alternator drive tension and condition, See Belt Adjustment in TUNE-UP article in the TUNE-UP section
Loose alternator wiring connections	Check all charging system connections

Short in alternator light wiring	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Defective alternator stator or diodes	See Bench Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Alternator Light Stays Off With Ignition Switch ON	
Blown fuse	See WIRING DIAGRAMS
Defective alternator	See Testing in ALTERNATOR article
Defective indicator light bulb or socket	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Alternator Light Stays OFF With Ignition Switch ON	
Short in alternator wiring	See On-Vehicle Tests in ALTERNATOR article
Defective rectifier bridge	See Bench Tests in ALTERNATOR article
Lights or Fuses Burn Out Frequently	
Defective alternator wiring	See On-Vehicle Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Defective battery	Check and replace as necessary
Ammeter Gauge Shows Discharge	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in TUNE-UP article in the TUNE-UP section
Defective wiring	Check all wires and wire connections
Defective alternator or regulator	See Bench Tests and On-Vehicle Tests in ALTERNATOR article
Defective ammeter, or improper ammeter wiring connection	See Testing in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Noisy Alternator	
Loose drive pulley	Tighten drive pulley attaching nut

Loose mounting bolts	Tighten all alternator mounting bolts
Worn or dirty bearings	See Bearing Replacement ALTERNATOR article
Defective diodes or stator	See Bench Test in ALTERNATOR article
Battery Does Stay Charged	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in appropriate TUNE-UP article in the TUNE-UP section
Loose or corroded battery connections	Check all charging system connections
Loose alternator connections	Check all charging system connections
Defective alternator or battery	See On-Vehicle Tests and Bench Tests in ALTERNATOR article
Add-on electrical accessories exceeding alternator capacity	Install larger alternator
Battery Overcharged-Uses Too Much Water	
Defective battery	Check alternator output and repair as necessary
Defective alternator	See On-Vehicle Test and Bench Tests in ALTERNATOR article
Excessive alternator voltage	Check alternator output and repair as necessary

IGNITION SYSTEM TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

STARTER TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole	See STARTER article shoes
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion gear damage
Starter Will Not Crank Engine	
Faulty overrunning clutch	See STARTER article
Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check

	for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearing	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article
Broken starter clutch	See STARTER article
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article
Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as

	necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch	Replace ignition switch contacts sticking
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	
Weak battery	Charge or replace battery as necessary
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid
Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	solenoid
Low Current Draw	
Worn brushes or weak brush springs	Replace brushes or brush springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

AIR CONDITIONING & HEAT

AIR CONDITIONING TROUBLE SHOOTING

WARNING: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC AIR CONDITIONING TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Compressor Not Working	Compressor clutch circuit open.
.....	Compressor clutch coil inoperative.
.....	Poor clutch ground connection.
.....	Fan belts loose.
.....	Thermostatic switch inoperative.
.....	Thermostatic switch not adjusted.
.....	Ambient temperature switch open.
.....	Superheat fuse blown.
Excessive Noise or Vibration	Missing or loose mounting bolts.
.....	Bad idler pulley bearings.
.....	Fan belts not tightened correctly.
.....	Compressor clutch contacting body.
.....	Excessive system pressure.
.....	Compressor oil level low.
.....	Damaged clutch bearings.
.....	Damaged reed valves.
.....	Damaged compressor.
Insufficient or No Cooling; Compressor Working	Expansion valve inoperative.
.....	Heater control valve stuck open.
.....	Low system pressure.
.....	Blocked condenser fins.
.....	Blocked evaporator fins.
.....	Vacuum system leak.
.....	Vacuum motors inoperative.
.....	Control cables improperly adjusted.
.....	Restricted air inlet.
.....	Mode doors binding.
.....	Blower motor inoperative.

.....	Temperature above system capacity.

HEATER SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC HEATER SYSTEM TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Insufficient, Erratic, or No Heat	Low Coolant Level
.....	Incorrect thermostat.
.....	Restricted coolant flow through core.
.....	Heater hoses plugged.
.....	Misadjusted control cable.
.....	Sticking heater control valve.
.....	Vacuum hose leaking.
.....	Vacuum hose blocked.
.....	Vacuum motors inoperative.
.....	Blocked air inlet.
.....	Inoperative heater blower motor.
.....	Oil residue on heater core fins.
.....	Dirt on heater core fins.
Too Much Heat	Improperly adjusted cables.
.....	Sticking heater control valve.
.....	No vacuum to heater control valve.
.....	Temperature door stuck open.
Air Flow Changes During Acceleration	Vacuum system leak.
.....	Bad check valve or reservoir.
Air From Defroster At All Times	Vacuum system leak.
.....	Improperly adjusted control cables.
.....	Inoperative vacuum motor.
Blower Does Not Operate Correctly	Blown fuse.
.....	Blower motor windings open.
.....	Resistors burned out.
.....	Motor ground connection loose.
.....	Wiring harness connections loose.
.....	Blower motor switch inoperative.
.....	Blower relay inoperative.

.....	Fan binding or foreign object in housing.
.....	Fan blades broken or bent.

BRAKES

BRAKE SYSTEM TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BRAKE SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Brakes Pull Left or Right	
Incorrect tire pressure	Inflate tires to proper pressure
Front end out of alignment	See WHEEL ALIGNMENT
Mismatched tires	Check tires sizes
Restricted brake lines or hoses	Check hose routing
Loose or malfunctioning caliper	See DISC BRAKES or BRAKE SYSTEM
Bent shoe or oily linings	See DRUM BRAKES or BRAKE SYSTEM
Malfunctioning rear brakes	See DRUM, DISC BRAKES or BRAKE SYSTEM
Loose suspension parts	See SUSPENSION
Noises Without Brakes Applied	
Front linings worn out	Replace linings
Dust or oil on drums or rotors	See DRUM, DISC BRAKES or BRAKE SYSTEM
Noises With Brakes Applied	
Insulator on outboard shoe damaged	See DISC BRAKES or BRAKE SYSTEM
Incorrect pads or linings	Replace pads or linings
Brake Rough, Chatters or Pulsates	
Excessive lateral runout	Check rotor runout
Parallelism not to specifications	Reface or replace rotor
Wheel bearings not adjusted	See SUSPENSION
Rear drums out-of-round	Reface or replace drums
Disc pad reversed, steel against rotor	Remove and reinstall pad
Excessive Pedal Effort	
Malfunctioning power unit	See POWER BRAKES or

	BRAKE SYSTEM
Partial system failure	Check fluid and pipes
Worn disc pad or lining	Replace pad or lining
Caliper piston stuck or sluggish	See DISC BRAKES or BRAKE SYSTEM
Master cylinder piston stuck	See MASTER CYLINDERS or BRAKE SYSTEM
Brake fade due to incorrect pads for linings	Replace pads or linings
Linings or pads glazed	Replace pads or linings
Worn drums	Reface or replace drums
Excessive Pedal Travel	
Partial brake system failure	Check fluid and pipes
Insufficient fluid in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Air trapped in system	See BRAKE BLEEDING or BRAKE SYSTEM
Rear brakes not adjusted	See Adjustments in DRUM BRAKES or BRAKE SYSTEM
Bent shoe or lining	See DRUM BRAKES or BRAKE SYSTEM
Plugged master cylinder cap	See MASTER CYLINDERS or BRAKE SYSTEM
Improper brake fluid	Replace brake fluid
Pedal Travel Decreasing	
Compensating port plugged	See MASTER CYLINDERS or BRAKE SYSTEM
Swollen cup in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Master cylinder piston not returning	See MASTER CYLINDERS or BRAKE SYSTEM
Weak shoe retracting springs	See DRUM BRAKES BRAKE SYSTEM
Wheel cylinder piston sticking	See DRUM BRAKES or BRAKE SYSTEM
Dragging Brakes	
Master cylinder pistons not returning	See MASTER CYLINDERS BRAKE SYSTEM
Restricted brake lines or hoses	Check line routing
Incorrect parking brake adjustment	See DRUM BRAKES BRAKE SYSTEM
Parking Brake cables frozen	See DRUM BRAKES BRAKE SYSTEM

Incorrect installation of inboard disc pad	Remove and replace correctly
Power booster output rod too long	See POWER BRAKE UNITS BRAKE SYSTEM
Brake pedal not returning freely	See DISC, DRUM BRAKES BRAKE SYSTEM
Brakes Grab or Uneven Braking Action	
Malfunction of combination valve	See CONTROL VALVE or BRAKE SYSTEM
Malfunction of power brake unit	See POWER BRAKE UNITS or BRAKE SYSTEM
Binding brake pedal	See DISC, DRUM BRAKES or BRAKE SYSTEM
Pulsation or Roughness	
Uneven pad wear caused by caliper	See DISC BRAKES or BRAKE SYSTEM
Uneven rotor wear	See DISC BRAKES or BRAKE SYSTEM
Drums out-of-round	Reface or replace drums

ENGINE MECHANICAL

COOLING SYSTEM TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

COOLING SYSTEM TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Overheating	
Coolant Leak	Fill/Pressure Test System
A/C Condenser Fins Clogged	Remove/Clean Condenser
Radiator Fins Clogged	Remove/Clean Radiator
Thermostat Stuck Closed	Replace Thermostat
Clogged Cooling System Passages	Clean/Flush Cooling System
Water Pump Malfunction	Replace Water Pump
Fan Clutch Malfunction	Replace Fan Clutch
Retarded Ignition Timing	Reset Ignition Timing
Cooling Fan Malfunction	Test Cooling Fan/Circuit
Cooling Fan Motor Malfunction	Test Fan Motor
Cooling Fan Relay Malfunction	Test Fan Relay

Faulty Radiator Cap	Replace Radiator Cap
Broken/Slipping Fan Belt	Replace Fan Belt
Restricted Exhaust	Repair Exhaust System
Corrosion	
Impurities In Coolant	Clean/Flush System
Coolant Leakage	
Damaged hose	Replace Hose
Leaky Water Pump	Replace Water Pump
Damaged Radiator Seam	Replace/Repair Radiator
Leaky Thermostat Cover	Replace Thermostat Cover
Cylinder Head Problem	Check Head/Head Gasket
Leaky Freeze Plugs	Replace Freeze Plugs
Recovery System Inoperative	
Loose and/or Defective Radiator Cap	Replace Radiator Cap
Overflow Tube Clogged and/or Leaking	Repair Tube
Recovery Bottle Vent Restricted	Clean Vent
No Heater Core Flow	
Collapsed Heater Hose	Replace Heater Hose
Plugged Heater Core	Clean/Replace Heater Core
Faulty Heater Valve	Replace Heater Valve

GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Lopes At Idle	
Intake manifold-to-head leaks	Replace manifold gasket, See ENGINES
Blown head gasket	Replace head gasket, See ENGINES
Worn timing gears, chain or sprocket	Replace gears, chain or sprocket
Worn camshaft lobes	Replace camshaft, See ENGINES
Overheated engine	Check cooling system, See COOLING
Blocked crankcase vent valve	Remove restriction

Leaking EGR valve	Repair leak and/or replace valve
Faulty fuel pump	Replace fuel pump
Engine Has Low Power	
Leaking fuel pump	Repair leak and/or replace fuel pump
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Sticking valves or weak valve springs	Check valve train components, See ENGINES
Incorrect valve timing	Reset valve timing, See ENGINES
Worn camshaft lobes	Replace camshaft, See ENGINES
Blown head gasket	Replace head gasket. See ENGINES.
Clutch slipping	Adjust pedal and/or replace components, See ENGINES
Engine overheating	Check cooling system, See COOLING
Auto. Trans. pressure regulator valve faulty	Replace pressure regulator valve
Auto. Trans. fluid level too low	Add fluid as necessary
Improper vacuum diverter valve operation	Replace vacuum diverter valve
Vacuum leaks	Inspect vacuum system and repair as required
Leaking piston rings	Replace piston rings, See ENGINES
Faulty High Speed Operation	
Low fuel pump volume	Replace fuel pump
Leaking valves or worn	Replace valves and/or springs, See ENGINES
Incorrect valve timing	Reset valve timing,See ENGINES
Intake manifold restricted	Remove restriction
Worn distributor shaft	Replace distributor
Faulty Acceleration	
Improper fuel pump stroke	Remove pump and reset pump stroke
Incorrect ignition timing	Reset ignition timing, See TUNE-UP
Leaking valves	Replace valves, See ENGINES

Worn fuel pump diaphragm or piston	Replace diaphragm or piston
Intake Backfire	
Improper ignition timing	Reset ignition timing, See TUNE-UP
Faulty accelerator pump discharge	Replace accelerator pump
Improper choke operation	Check choke and adjust as required
Defective EGR valve	Replace EGR valve
Fuel mixture too lean	Reset air/fuel mixture, See TUNE-UP
Choke valve initial clearance too large	Reset choke valve initial clearance
Exhaust Backfire	
Vacuum leak	Inspect and repair vacuum system
Faulty vacuum diverter valve	Replace vacuum diverter valve
Faulty choke operation	Check choke and adjust as required
Exhaust system leak	repair exhaust system leak
Engine Detonation	
Ignition timing too far advanced	Reset ignition timing, See TUNE-UP
Faulty ignition system	Check ignition timing, See TUNE-UP
Spark plugs loose or faulty	Retighten or replace plugs
Fuel delivery system clogged	Inspect lines, pump and filter for clog
EGR valve inoperative	Replace EGR valve
PCV system inoperative	Inspect and/or replace hoses or valve
Vacuum leaks	Check vacuum system and repair leaks
Excessive combustion chamber deposits	Remove built-up deposits
Leaking, sticking or broken valves	Inspect and/or replace valves
External Oil Leakage	
Fuel pump improperly seated or worn gasket	Remove pump, replace gasket and seat properly
Oil pan gasket broken or pan bent	Straighten pan and replace gasket
Timing chain cover gasket broken	Replace timing chain cover gasket
Rear main oil seal worn	Replace rear main oil seal

Oil pan drain plug not seated properly	Remove and reinstall drain plug
Camshaft bearing drain hole blocked	Remove restriction
Oil pressure sending switch leaking	Remove and reinstall sending switch
Excessive Oil Consumption	
Worn valve stems or guides	Replace stems or guides, See ENGINES
Valve "O" ring seals damaged	Replace "O" ring seals, See ENGINES
Plugged oil drain back holes	Remove restrictions
Improper PCV valve operation	Replace PCV valve
Engine oil level too high	Remove excess oil
Engine oil too thin	Replace thicker oil
Valve stem oil deflectors damaged	Replace oil deflectors
Incorrect piston rings	Replace piston rings, See ENGINES
Piston ring gaps not staggered	Reinstall piston rings, See ENGINES
Insufficient piston ring tension	Replace rings, See ENGINES
Piston ring grooves or oil return	slots clogged Replace piston rings, See ENGINES
Piston rings sticking in grooves	Replace piston rings, See ENGINES
Piston ring grooves excessively worn	Replace piston and rings, See ENGINES
Compression rings installed upside down	Replace compression rings correctly, See ENGINES
Worn or scored cylinder walls	Rebore cylinders or replace block
Mismatched oil ring expander and rail	Replace oil ring expander and rail, See ENGINES
Intake gasket dowels too long	Replace intake gasket dowels
Excessive main or connecting rod bearing clearance	Replace main or connecting rod bearings, See ENGINES
No Oil Pressure	
Low oil level	Add oil to proper level
Oil pressure sender or gauge broken	Replace sender or gauge
Oil pump malfunction	Remove and overhaul oil pump, See ENGINES
Oil pressure relief valve sticking	Remove and reinstall valve
Oil pump passages blocked	Overhaul oil pump, See ENGINES

Oil pickup screen or tube blocked	Remove restriction
Loose oil inlet tube	Tighten oil inlet tube
Loose camshaft bearings	Replace camshaft bearings, See ENGINES
Internal leakage at oil passages	Replace block or cylinder head
Low Oil Pressure	
Low engine oil level	Add oil to proper level
Engine oil too thin	Remove and replace with thicker oil
Excessive oil pump clearance	Reduce oil pump clearance, See ENGINES
Oil pickup tube or screen blocked	Remove restrictions
Main, rod or cam bearing clearance excessive	Replace bearing to reduce clearance, See ENGINES
High Oil Pressure	
Improper grade of oil	Replace with proper oil
Oil pressure relief valve stuck closed	Eliminate binding
Oil pressure sender or gauge faulty	Replace sender or gauge
Noisy Main Bearings	
Inadequate oil supply	Check oil delivery to main bearings
Excessive main bearing clearance	Replace main bearings, See ENGINES
Excessive crankshaft end play	Replace crankshaft, See ENGINES
Loose flywheel or torque converter	Tighten attaching bolts
Loose or damaged vibration damper	Tighten or replace vibration damper
Crankshaft journals out-of-round	Re-grind crankshaft journals
Excessive belt tension	Loosen belt tension
Noisy Connecting Rods	
Excessive bearing clearance or missing bearing	Replace bearing, See ENGINES
Crankshaft rod journal out-of-round	Re-grind crankshaft journal
Misaligned connecting rod or cap	Remove rod or cap and realign
Incorrectly tightened rod bolts	Remove and re-tighten rod bolts
Noisy Pistons and Rings	
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Bore tapered or out-of-round	Rebore block

Piston ring broken	Replace piston rings, See ENGINES
Piston pin loose or seized	Replace piston pin, See ENGINES
Connecting rods misaligned	Realign connecting rods
Ring side clearance too loose or tight	Replace with larger or smaller rings
Carbon build-up on piston	Remove carbon
Noisy Valve Train	
Worn or bent push rods	Replace push rods, See ENGINES
Worn rocker arms or bridged pivots	Replace push rods, See ENGINES
Dirt or chips in valve lifters	Remove lifters and remove dirt/chips
Excessive valve lifter leak-down	Replace valve lifters, See ENGINES
Valve lifter face worn	Replace valve lifters, See ENGINES
Broken or cocked valve springs	Replace or reposition springs
Too much valve stem-to-guide clearance	Replace valve guides, See ENGINES
Valve bent	Replace valve, See ENGINES
Loose rocker arms	Retighten rocker arms, See ENGINES
Excessive valve seat run-out	Reface valve seats, See ENGINES
Missing valve lock	Install new valve lock
Excessively worn camshaft lobes	Replace camshaft, See ENGINES
Plugged valve lifter oil holes	Eliminate restriction or replace lifter
Faulty valve lifter check ball	Replace lifter check ball, See ENGINES
Rocker arm nut installed upside down	Remove and reinstall correctly
Valve lifter incorrect for engine	Remove and replace valve lifters
Faulty push rod seat or lifter plunger	Replace plunger or push rod
Noisy Valves	
Improper valve lash	Re-adjust valve lash, See ENGINES
Worn or dirty valve lifters	Clean and/or replace lifters
Worn valve guides	Replace valve guides, See ENGINES

Excessive valve seat or face run-out	Reface seats or valve face
Worn camshaft lobes	Replace camshaft, See ENGINES
Loose rocker arm studs	Re-tighten rocker arm studs, See ENGINES
Bent push rods	Replace push rods, See ENGINES
Broken valve springs	Replace valve springs, See ENGINES
Burned,Sticking or Broken Valves	
Weak valve springs or warped valves	Replace valves and/or springs, See ENGINES
Improper lifter clearance	Re-adjust clearance or replace lifters
Worn guides or improper guide clearance	Replace valve guides, See ENGINES
Out-of-round valve seats or improper seat width	Re-grind valve seats
Gum deposits on valve stems, seats or guide	Remove deposits
Improper spark timing	Re-adjust spark timing
Broken Pistons/Rings	
Undersize pistons	Replace with larger pistons, See ENGINES
Wrong piston rings	Replace with correct rings, See ENGINES
Out-of-round cylinder bore	Re-bore cylinder bore
Improper connecting rod alignment	Remove and realign connecting rods
Excessively worn ring grooves	Replace pistons, See ENGINES
Improperly assembled piston pins	Re-assemble pin-to-piston, See ENGINES
Insufficient ring gap clearance	Install new rings, See ENGINES
Engine overheating	Check cooling system
Incorrect ignition timing	Re-adjust ignition timing, See TUNE-UP
Excessive Exhaust Noise	
Leaks at manifold to head, or to pipe	Replace manifold or pipe gasket
Exhaust manifold cracked or broken	Replace exhaust manifold, See ENGINES

ENGINE PERFORMANCE

CARBURETOR TROUBLE SHOOTING:

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC COLD START SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Choke not closing	Check choke operation, see FUEL SYSTEMS
Choke linkage bent	Check linkage, see FUEL SYSTEM
Engine Starts, Then Dies	
Choke vacuum kick setting too wide	Check setting and adjust see, FUEL SYSTEMS
Fast idle RPM too low	Reset RPM to specification, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Vacuum leak	Inspect vacuum system for leaks
Low fuel pump outlet	Repair or replace pump, see FUEL SYSTEMS
Low carburetor fuel level	Check float setting see FUEL SYSTEM
Engine Quits Under Load	
Choke vacuum kick setting incorrect	Reset vacuum kick setting,see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEM
Incorrect hot fast idle speed RPM	Reset fast idle RPM, see TUNE-UP
Engine Starts, Runs Up, Then Idles, Slowly With Black Smoke	
Choke vacuum kick set too narrow	Reset vacuum kick, see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Hot fast idle RPM too low	Reset fast idle RPM, see TUNE-UP

BASIC HOT START SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Engine flooded	Allow fuel to evaporate

BASIC COLD ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Stalls in Gear	
Choke vacuum kick setting incorrect	Reset choke vacuum kick, see FUEL SYSTEMS
Fast idle RPM incorrect	Reset fast idle RPM, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam see FUEL SYSTEMS
Acceleration Sag or Stall	
Defective choke control switch	Replace choke control switch
Choke vacuum kick setting incorrect	Reset choke vacuum kick see, FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, FUEL SYSTEMS
Accelerator pump defective	Repair or replace pump see FUEL SYSTEMS
Secondary throttles not closed	Inspect lockout adjustment, see FUEL SYSTEMS
Sag or Stall After Warmup	
Defective choke control switch	Replace choke control switch, see FUEL SYSTEMS
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, see FUEL SYSTEMS
Backfiring & Black Smoke	
Plugged heat crossover system	Remove restriction

BASIC WARM ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Hesitation With Small Amount of Gas Pedal Movement	
Vacuum leak	Inspect vacuum lines
Accelerator pump weak or inoperable	Replace pump, see FUEL SYSTEMS
Float level setting too low	Reset float level, see,FUEL SYSTEMS
Metering rods sticking or binding	Inspect and/or replace rods, see FUEL SYSTEMS

Carburetor idle or transfer system plugged	Inspect system and remove restriction
Frozen or binding heated air inlet	Inspect heated air door for binding
Hesitation With Heavy Gas Pedal Movement	
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Metering rod carrier sticking or binding	Remove restriction
Large vacuum leak	Inspect vacuum system and repair leak
Float level setting too low	Reset float level, see FUEL SYSTEMS
Defective fuel pump, lines or filter	Inspect pump, lines and filter
Air door setting incorrect	Adjust air door setting, see FUEL

DIESEL ENGINE TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

NOTE: Diesel engines mechanical diagnosis is the same as gasoline engines for items such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.

BASIC DIESEL ENGINE TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Crank	
Bad battery connections or dead batteries	Check connections and/or replace batteries
Bad starter connections or bad starter	Check connections and/or replace starter
Engine Cranks Slowly, Won't Start	
Bad battery connections or dead batteries	Check connections and/or replace batteries
Engine oil too heavy	Replace engine oil
Engine Cranks Normally, But Will Not Start	
Glow plugs not functioning	Check glow plug system, see FUEL SYSTEMS
Glow plug control not functioning	Check controller, see FUEL SYSTEMS

Fuel not injected into cylinders	Check fuel injectors, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Fuel filter blocked	Replace fuel filter
Fuel tank filter blocked	Replace fuel tank filter
Fuel pump not operating	Check pump operation and/or replace pump
Fuel return system blocked	Inspect system and remove restriction
No voltage to fuel solenoid	Check solenoid and connections
Incorrect or contaminated fuel	Replace fuel
Incorrect injection pump timing	Re-adjust pump timing, see FUEL SYSTEMS
Low compression	Check valves, pistons, rings, see ENGINES
Injection pump malfunction	Inspect and/or replace injection pump
Engine Starts, Won't Idle	
Incorrect slow idle adjustment	Reset idle adjustment, see TUNE-UP
Fast idle solenoid malfunctioning	Check solenoid and connections
Fuel return system blocked	Check system and remove restrictions
Glow plugs go off too soon	See glow plug diagnosis in FUEL SYSTEMS
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Incorrect or contaminated fuel	Replace fuel
Low compression	Check valves, piston, rings, see ENGINES
Injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Fuel solenoid closes in RUN position	Check solenoid and connections
Engines Starts/Idles Rough W/out Smoke or Noise	
Incorrect slow idle adjustment	Reset slow idle, see TUNE-UP
Injection line fuel leaks	Check lines and connections
Fuel return system blocked	Check lines and connections
Air in fuel system	Bleed air from system
Incorrect or contaminated fuel	Replace fuel

Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS
Engines Starts and Idles Rough W/out Smoke or Noise, But Clears After Warm-Up	
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Engine not fully broken in	Put more miles on engine
Air in system	Bleed air from system
Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS
Engine Idles Correctly, Misfires Above Idle	
Blocked fuel filter	Replace fuel filter
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Incorrect or contaminated fuel	Replace fuel
Engine Won't Return To Idle	
Fast idle adjustment incorrect	Reset fast idle, see TUNE-UP
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
External linkage binding	Check linkage and remove binding
Fuel Leaks On Ground	
Loose or broken fuel line	Check lines and connections
Internal injection pump seal leak	Replace injection pump, see FUEL SYSTEMS
Cylinder Knocking Noise	
Injector nozzles sticking open	Test injectors, see FUEL SYSTEMS
Very low nozzle opening pressure	Test injectors and/or replace
Loss of Engine Power	
Restricted air intake	Remove restriction
EGR valve malfunction	Replace EGR valve
Blocked or damaged exhaust system	Remove restriction and/or replace components
Blocked fuel tank filter	Replace filter
Restricted fuel filter	Remove restriction and/or replace filter
Block vent in gas cap	Remove restriction and/or replace cap
Tank-to-injection pump fuel supply blocked	Check fuel lines and connections
Blocked fuel return system	Remove restriction
Incorrect or contaminated fuel	Replace fuel
Blocked injector nozzles	Check nozzle for blockage, see

	FUEL SYSTEMS
Low compression	Check valves, rings, pistons, see ENGINES
Loud Engine Noise With Black Smoke	
Basic timing incorrect	Reset timing, see FUEL SYSTEMS
EGR valve malfunction	Replace EGR valve
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Incorrect injector pump housing pressure	Check pressure, see FUEL SYSTEMS
Engine Overheating	
Cooling system leaks	Check cooling system and repair leaks
Belt slipping or damaged	Check tension and/or replace belt
Thermostat stuck closed	Remove and replace thermostat, see ENGINE COOLING
Head gasket leaking	Replace head gasket
Oil Light on at Idle	
Low oil pump pressure	Check oil pump operation, see ENGINES
Oil cooler or line restricted	Remove restriction and/or replace cooler
Engine Won't Shut Off	
Injector pump fuel solenoid does not return fuel valve to OFF position	Remove and check solenoid and replace if needed

VACUUM PUMP DIAGNOSIS

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

FUEL INJECTION TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble**

Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC FUEL INJECTION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start (Cranks Normally)	
Cold start valve inoperative	Test valve and circuit
Poor connection;vacuum or wiring	Check vacuum and electrical connections
Contaminated fuel	Test fuel for water or alcohol
Defective fuel pump relay or circuit	Test relay and wiring
Battery too low	Charge and test battery
Low fuel pressure	Test pressure regulator and fuel pump, check for restricted lines and filters
No distributor reference pulses	Repair ignition system as necessary
Open coolant temperature sensor circuit	Test sensor and wiring
Shorted W.O.T. switch in T.P.S.	Disconnect W.O.T. switch, engine should start
Defective ECM	Replace ECM
Fuel tank residual pressure valve leaks	Test for fuel pressure drop after shut down
Hard Starting	
Disconnected hot air tube to air cleaner	Reconnect tube and test control valve
Defective Idle Air Control (IAC) valve	Test valve operation and circuit
Shorted, open or misadjusted T.P.S.	Test and adjust or replace T.P.S.
EGR valve open	Test EGR valve and control circuit
Poor Oxygen sensor signal	Test for shorted or circuit
Incorrect mixture from PCV system	Test PCV for flow, check sealing of oil filter cap
Poor High Speed Operation	
Low fuel pump volume	Faulty pump or restricted fuel lines or filters
Poor MAP sensor signal	Test MAP sensor, vacuum hose and wiring
Poor Oxygen sensor signal	Test for shorted or open sensor or circuit

Open coolant temperature sensor circuit	Test sensor and wiring
Faulty ignition operation	Check wires for cracks or poor con- nections, test secondary voltage with oscilloscope
Contaminated fuel	Test fuel for water or alcohol
Intermittent ECM ground	Test ECM ground connection for resistance
Restricted air cleaner	Replace air cleaner
Restricted exhaust system	Test for exhaust manifold back pressure
Poor MAF sensor signal	Check leakage between sensor and manifold
Poor VSS signal	If tester for ALCL hook-up is available check that VSS reading matches speedometer
Ping or Knock on Acceleration	
Poor Knock sensor signal	Test for shorted or open sensor or circuit
Poor Baro sensor signal	Test for shorted or open sensor or circuit
Improper ignition timing	See VEHICLE EMISSION CONTROL LABEL (where applicable)
Check for engine overheating problems	Low coolant, loose belts or electric cooling fan inoperative

NOTE: For additional electronic fuel injection trouble shooting information, see the appropriate article in the ENGINE PERFORMANCE section (not all vehicles have Computer Engine Control articles). Information is provided there for diagnosing fuel system problems on vehicles with electronic fuel injection.

IGNITION SYSTEM TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

Ignition Secondary Trouble Shooting Chart

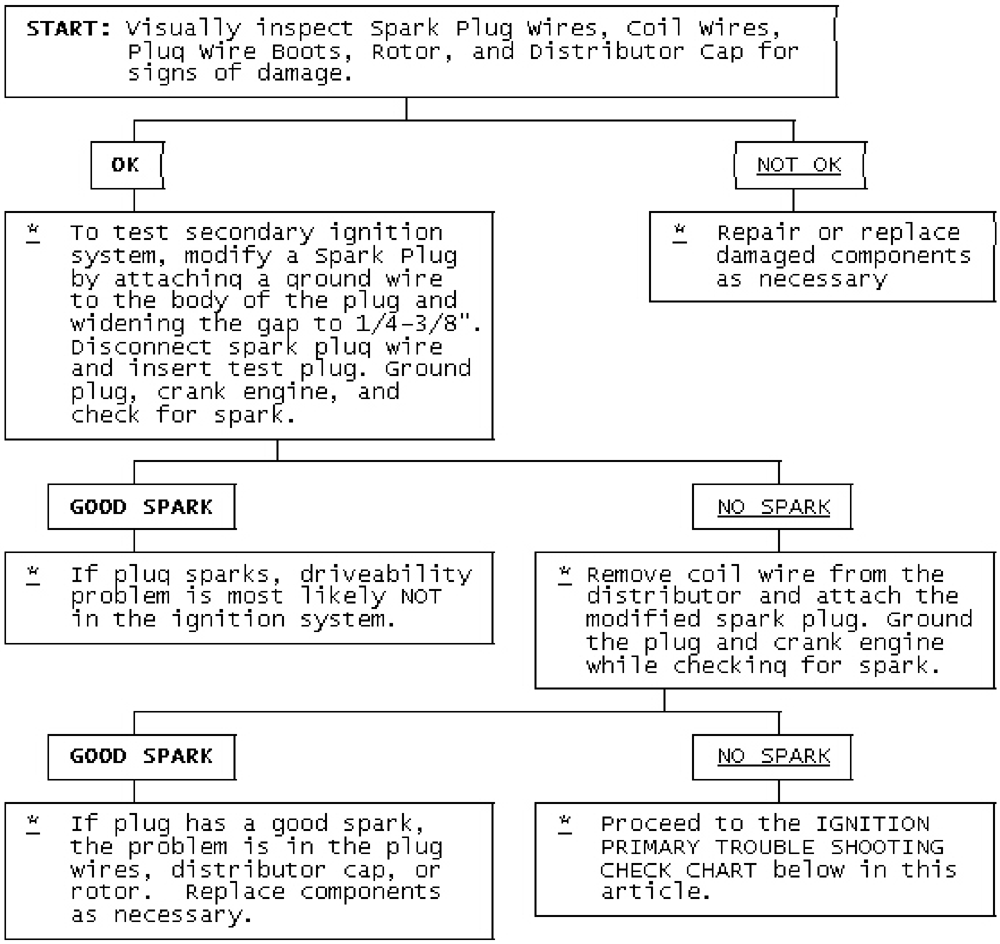

Fig. 3: Ignition Secondary Trouble Shooting Chart

Ignition Primary Trouble Shooting Chart

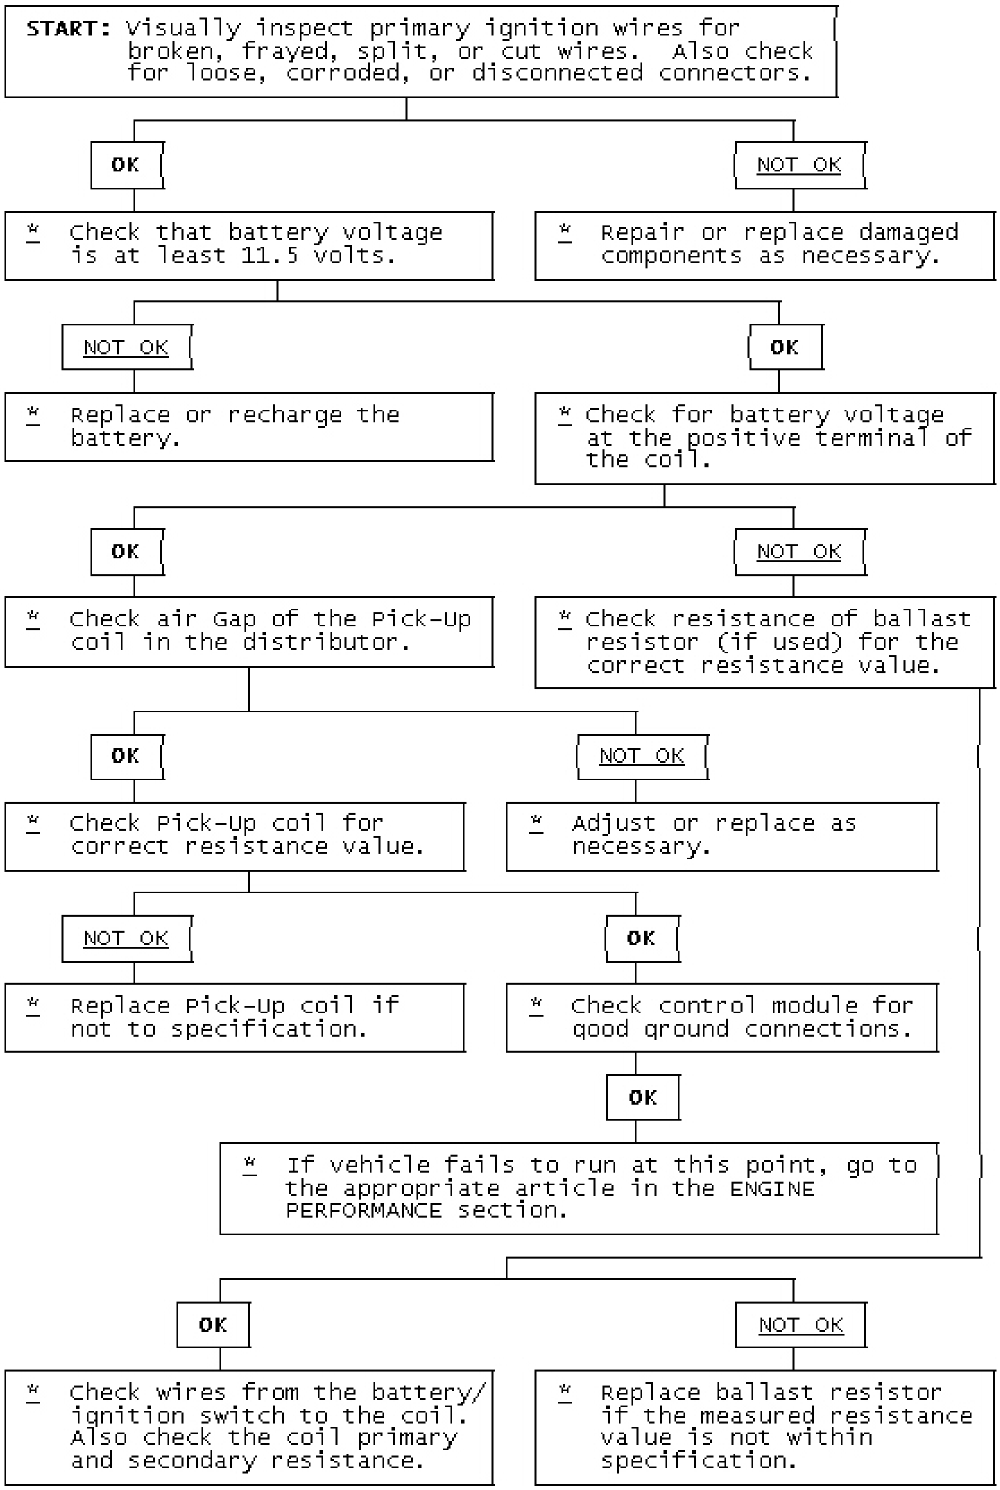

Fig. 4: Ignition Primary Trouble Shooting Chart

STARTER TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	See Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole shoes	See STARTER article
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion gear damage
Starter Will Not Crank Engine	

Faulty overrunning clutch	See STARTER article
Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearings	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article
Broken starter clutch	See STARTER article
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article
Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER

	article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch contacts sticking	Replace ignition switch
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	
Weak battery	Charge or replace battery as necessary
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid
Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	Replace solenoid
Low Current Draw	
Worn brushes or weak	Replace brushes or brush springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that

	correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

TUNE-UP TROUBLE SHOOTING - GAS ENGINE VEHICLES

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC SPARK PLUG TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Normal Spark Plug Condition	
Light Tan or Gray deposits	No Action
Electrode not burned or fouled	No Action
Gap tolerance not changed	No Action
Cold Fouling or Carbon Deposits	
Overrich air/fuel mixture	Adjust air/fuel mixture, see ENGINE PERFORMANCE section
Faulty choke	Replace choke assembly, see ENGINE PERFORMANCE section
Clogged air filter	Clean and/or replace air filter
Incorrect idle speed or dirty carburetor	Reset idle speed and/ or clean carburetor
Faulty ignition wires	Replace ignition wiring
Prolonged operation at idle	Shut engine off during long idle
Sticking valves or worn valve guide seals	Check valve train
Wet Fouling or Oil Deposits	
Worn rings and pistons	Install new rings and pistons
Excessive cylinder wear	Rebore or replace block
Excessive valve guide clearance	Worn or loose bearing
Gap Bridged	
Deposits in combustion chamber becoming fused to electrode	Clean combustion chamber of deposits
Blistered Electrode	
Engine overheating	Check cooling system

Wrong type of fuel	Replace with correct fuel
Loose spark plugs	Retighten spark plugs
Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Pre-Ignition or Melted Electrodes	
Incorrect type of fuel	Replace with correct fuel
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Burned valves	Replace valves
Engine Overheating	Check cooling system
Wrong type of spark plug, too hot	Replace with correct spark plug, see ENGINE PERFORMANCE
Chipped Insulators	
Severe detonation	Check for over-advanced timing or combustion
Improper gapping procedure	Re-gap spark plugs
Rust Colored Deposits	
Additives in unleaded fuel	Try different fuel brand
Water In Combustion Chamber	
Blown head gasket or cracked head	Repair or replace head or head gasket

NOTE: **Before diagnosing an electronic ignition system, ensure that all wiring is connected properly between distributor, wiring connector and spark plugs. Ignition problem will show up either as: Engine Will Not Start or Engine Runs Rough.**

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Open circuit between distributor and bulkhead connector	Repair circuit
Open circuit between bulkhead connector and ignition switch	Repair circuit
Open circuit between ignition switch and starter solenoid	Repair circuit
Engine Runs Rough	
Fuel lines leaking or clogged	Tighten fitting, remove restriction
Initial timing incorrect	Reset ignition timing see ENGINE PERFORMANCE
Centrifugal advance malfunction	Repair distributor advance
Defective spark plugs or wiring	Replace plugs or plug wiring
Component Failure	
Spark arc-over on cap, rotor or coil	Replace cap, rotor or or coil

Defective pick-up coil	Replace pick-up coil
Defective ignition coil	Replace ignition coil
Defective vacuum unit	Replace vacuum unit
Defective control module	Replace control module

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS - USING OSCILLOSCOPE PATTERNS

CONDITION & POSSIBLE CAUSE	CORRECTION
Firing Voltage Lines are the Same, but Abnormally High	
Retarded ignition timing	Reset ignition timing, see ENGINE PERFORMANCE section
Fuel mixture too lean	Readjust carburetor, see ENGINE PERFORMANCE
High resistance in coil wire	Replace coil wire
Corrosion in coil tower terminal	Clean and/or replace coil
Corrosion in distributor coil terminal	Clean and/or replace distributor cap
Firing Voltage Lines are the Same but Abnormally Low	
Fuel mixture too rich	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in coil wire causing arcing	Replace coil wire
Cracked coil tower causing arcing	Replace coil
Low coil output	Replace coil
Low engine compression	Determine cause and repair
One or More, But Not All Firing Voltage Lines are Higher Than Others	
Carburetor idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
EGR valve stuck open	Clean and/or replace valve
High resistance in spark plug wires	Replace spark plug wires
Cracked or broken spark plug insulator	Replace spark plugs
Intake vacuum leak	Repair leak
Defective spark plugs	Replace spark plugs
Corroded spark plug terminals	Replace spark plugs
One or More, But Not All Firing Voltage Lines Are Lower Than Others	
Curb idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in plug wires	Replace plug wires causing arcing
Cracked coil tower causing arcing	Replace coil
Low compression	Determine cause and repair
Defective spark plugs	Replace spark plugs

Corroded spark plugs	Replace spark plugs
Cylinders Not Firing	
Cracked distributor cap terminals	Replace distributor cap
Shorted spark plug wire	Determine cause and repair
Mechanical problem in engine	Determine cause and repair
Defective spark plugs	Replace spark plugs
Spark plugs fouled	Replace spark plugs

BASIC DRIVEABILITY PROBLEMS TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Hard Starting	
Binding carburetor linkage	Eliminate binding
Binding choke linkage	Eliminate binding
Binding choke piston	Eliminate binding
Restricted choke vacuum	Check vacuum lines for blockage
Worn or dirty needle valve and seat	Clean carburetor, see ENGINE PERFORMANCE
Float sticking	Readjust or replace float see the ENGINE PERFORMANCE section
Incorrect choke adjustment	Reset choke adjustment see ENGINE PERFORMANCE
Defective coil	Replace coil
Improper spark plug gap	Regap spark plugs
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Detonation	
Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective spark plugs	Replace spark plugs
Fuel lines clogged	Clean fuel lines
EGR system malfunction	Check and repair EGR system
PCV system malfunction	Repair PCV system
Vacuum leaks	Check and repair vacuum system
Loose fan belts	Tighten or replace fan belts, see ENGINE PERFORMANCE
Restricted airflow	Remove restriction
Vacuum advance malfunction	Check distributor operation
Dieseling	
Binding carburetor linkage	Eliminate binding

Binding throttle linkage	Eliminate blinding
Binding choke linkage or fast idle cam	Eliminate binding
Defective idle solenoid	Replace idle solenoid see ENGINE PERFORMANCE
Improper base idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Incorrect idle mixture setting	Reset idle mixture, see ENGINE PERFORMANCE
Faulty Acceleration	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Engine cold and choke too lean	Adjust choke and allow engine to warm-up
Defective spark plugs	Replace spark plugs
Defective coil	Replace coil
Faulty Low Speed Operation	
Clogged idle transfer slots	Clean idle transfer slots, see FUEL
Restricted idle air bleeds and passages	Disassemble and clean carburetor, see FUEL
Clogged air cleaner	Replace air filter
Defective spark plugs	Replace spark plugs
Defective ignition wires	Replace ignition wire see ENGINE PERFORMANCE
Defective distributor cap	Replace distributor cap
Faulty High Speed Operation	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective distributor centrifugal advance	Replace advance mechanism
Defective distributor vacuum advance	Replace advance unit
Incorrect spark plugs or plug gap	Check gap and/or replace spark plugs
Faulty choke operation	Check choke and repair as required
Clogged vacuum passages	Remove restrictions
Improper size or clogged main jet	Check jet size and clean, see FUEL
Restricted air cleaner	Check filter and replace as necessary
Defective distributor cap, rotor or coil	Replace cap, rotor or coil
Misfire at All Speeds	

Defective spark plugs	Replace spark plugs
Defective spark plug wires	Replace spark plug wires
Defective distributor cap, rotor, or coil	Replace cap, rotor, or coil
Cracked or broken vacuum hoses	Replace vacuum hoses
Vacuum leaks	Repair vacuum leaks
Fuel lines clogged	Remove restriction
Hesitation	
Cracked or broken vacuum	Replace vacuum hoses hoses
Vacuum leaks	Repair Vacuum leaks
Binding carburetor linkage	Eliminate binding
Binding throttle linkage	Eliminate binding
Binding choke linkage or fast idle cam	Eliminate binding
Improper float setting	Readjust float setting, see FUEL
Cracked or broken ignition wires	Replace ignition wires
Rough Idle, Missing or Stalling	
Incorrect curb idle or fast idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect basic timing	Reset ignition timing see ENGINE PERFORMANCE
Improper idle mixture adjustment	Reset idle mixture, see ENGINE PERFORMANCE
Improper feedback system operation	Check feedback system see ENGINE PERFORMANCE
Incorrect spark plug gap	Reset spark plug gap, see ENGINE PERFORMANCE
Moisture in ignition components	Dry components
Loose or broken ignition wires	Replace ignition wires
Damaged distributor cap or or rotor	Replace distributor cap or rotor
Faulty ignition coil	Replace ignition coil
Fuel filter clogged or worn	Replace fuel filter
Damaged idle mixture screw	Replace idle mixture screw, see FUEL
Improper fast idle cam adjustment	Reset fast idle cam adjustment, see TUNE- see ENGINE PERFORMANCE
Improper EGR valve operation	Replace EGR valve
Faulty PCV valve air flow	Replace PCV valve
Choke binding or improper choke setting	Reset choke or eliminate binding
Vacuum leak	Repair vacuum leak
Improper float bowl fuel level	Reset float adjustment, see

	FUEL
Clogged air bleed or idle passages	Clean carburetor passages, see FUEL
Clogged or worn air cleaner filter	Replace air filter
Faulty choke vacuum diaphragm	Replace diaphragm, see ENGINE PERFORMANCE
Exhaust manifold heat valve inoperative	Replace heat valve
Improper distributor spark advance	Check distributor operation
Leaking valves or valve components	Check and repair valvetrain
Improper carburetor mounting	Remove and remount carburetor
Excessive play in distributor shaft	Replace distributor
Loose or corroded wiring connections	Repair or replace as required
Engine Surges	
Improper PCV valve airflow	Replace PCV valve
Vacuum leaks	Repair vacuum leaks
Clogged air bleeds	Remove restriction
EGR valve malfunction	Replace EGR valve
Restricted air cleaner filter	Replace air filter
Cracked or broken vacuum hoses	Replace vacuum hoses
Cracked or broken ignition wires	Replace ignition wires
Vacuum advance malfunction	Check unit and replace as necessary
Defective or fouled spark plugs	Replace spark plugs
Ping or Spark Knock	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Distributor centrifugal or vacuum advance malfunction	Check operation and replace as necessary
Carburetor setting too lean	Readjust mixture setting, see ENGINE PERFORMANCE
Vacuum leak	Eliminate vacuum leak
EGR valve malfunction	Replace EGR valve
Poor Gasoline Mileage	
Cracked or broken vacuum	Replace vacuum hoses hoses
Vacuum leaks	Repair vacuum leaks
Defective ignition wires	Replace wires
Incorrect choke setting	Readjust setting, see ENGINE PERFORMANCE
Defective vacuum advance	Replace vacuum advance
Defective spark plugs	Replace spark plugs
Binding carburetor power piston	Eliminate binding

Dirt in carburetor jets	Clean and/or replace jets
Incorrect float adjustment	Readjust float setting, see FUEL
Defective power valve	Replace power valve, see ENGINE PERFORMANCE
Incorrect idle speed	Readjust idle speed
Engine Stalls	
Improper float level	Readjust float level
Leaking needle valve and seat	Replace needle valve and seat
Vacuum leaks	Eliminate vacuum leaks

VACUUM PUMP - DIESEL TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

NOTE: **Diesel engines mechanical diagnosis is the same as gasoline engines for items such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.**

VACUUM PUMP (DIESEL) TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

MANUAL TRANSMISSION

MANUAL TRANSMISSION TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

MANUAL TRANSMISSION/TRANSAXLE TROUBLE SHOOTING

Condition	Possible Cause
Noisy In Forward Gears	Low gear oil level, Loose bell housing bolts, Worn bearings or gears
Clunk On Deceleration (FWD Only)	Loose engine mounts, Worn inboard CV joints, Worn differential pinion shaft, Side gear hub counterbore in case worn oversize
Gear Clash When Shifting Forward Gears	Clutch Out Of Adjustment, Shift linkage damaged or out of adjustment, Gears or synchronizers damaged, Low gear oil level
Transmission Noisy When Moving (RWD Only) Quiet In Neutral With Clutch Engaged	Worn rear outputshaft bearing
Gear Rattle	Worn bearings, Wrong gear oil, Low gear oil, Worn gears
Steady Ticking At Idle (Increases With RPM)	Broken tooth on gear
Gear Clash When Shifting Forward Gears	Worn or broken synchronizers
Loud Whine In Reverse	Normal condition (1)
Noise When Stepping On Clutch	Bad release bearing, Worn pilot bearing
Ticking Or Screeching As Clutch Is Engaged	Faulty release bearing, Uneven pressure plate fingers
Click Or Snap When Clutch Is Engaged	Worn clutch fork, Worn or broken front bearing retainer
Transmission Shifts Hard	Clutch not releasing, Shift mechanism binding, Clutch installed backwards
Will Not Shift Into One Gear, Shifts Into All Others	Bent shift fork, Worn detent balls
Locked Into Gear, Cannot Shift	Clutch adjustment, Worn detent balls
Transmission Jumps Out Of Gear	Pilot bearing worn, Bent shift fork, Worn gear teeth or face, Excessive gear train end play, Worn synchronizers, Missing detent ball spring, Shift mechanism worn or out of adjustment, Engine or transmission mount bolts loose or out of adjustment, Transmission not aligned
Shift Lever Rattle	Worn shift lever or detents, Worn shift forks, Worn synchronizers sleeve
Shift Lever Hops Under Acceleration	Worn engine or transmission mounts
(1) Most units use spur cut gears in reverse and are noisy	

POWERTRAIN

CLUTCH TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble**

Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC CLUTCH TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Chattering or Grabbing	
Incorrect clutch adjustment	Adjust clutch
Oil, grease or glaze on facings	Disassemble and clean or replace
Loose "U" joint flange	See DRIVE AXLES article
Worn input shaft spline	Replace input shaft
Binding pressure plate	Replace pressure plate
Binding release lever	See CLUTCH article
Binding clutch disc hub	Replace clutch disc
Unequal pressure plate contact	Replace worn/misaligned components
Loose/bent clutch disc	Replace clutch disc
Incorrect transmission alignment	Realign transmission
Worn pressure plate, disc or flywheel	Replace damaged components
Broken or weak pressure springs	Replace pressure plate
Sticking clutch pedal	Lubricate clutch pedal & linkage
Incorrect clutch disc facing	Replace clutch disc
Engine loose in chassis	Tighten all mounting bolts
Failure to Release	
Oil or grease on clutch facings	Clean or replace clutch clutch disc
Incorrect release lever or pedal adjustment	See CLUTCH article
Worn or broken clutch facings	Replace clutch disc
Bent clutch disc or pressure plate	Replace damaged components
Clutch disc hub binding on input shaft	Clean or replace clutch disc and/or input shaft
Binding pilot bearing	Replace pilot bearing
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Binding clutch cable	See CLUTCH article
Defective clutch master	Replace master cylinder
Defective clutch slave	Replace slave cylinder
Air in hydraulic system	Bleed hydraulic system
Rattling	
Weak or broken release lever spring	Replace spring and check alignment
Damaged pressure plate	Replace pressure plate

Broken clutch return spring	Replace return spring
Worn splines on clutch disc or input shaft	Replace clutch disc and/or input shaft
Worn clutch release bearing	Replace release bearing
Dry or worn pilot bearing	Lubricate or replace pilot bearing
Unequal release lever contact	Align or replace release lever
Incorrect pedal free play	Adjust free play
Warped or damaged clutch disc	Replace damaged components
Slipping	
Pressure springs worn or	Release pressure plate
Oily, greasy or worn facings	Clean or replace clutch disc
Incorrect clutch alignment	Realign clutch assembly
Warped clutch disc or pressure plate	Replace damaged components
Binding release levers or clutch pedal	Lubricate and/or replace release components
Squeaking	
Worn or damaged release	Replace release bearing
Dry or worn pilot or release bearing	Lubricate or replace assembly
Pilot bearing turning in crankshaft	Replace pilot bearing and/or crankshaft
Worn input shaft bearing	Replace bearing and seal
Incorrect transmission alignment	Realign transmission
Dry release fork between pivot	Lubricate release fork and pivot
Heavy and/or Stiff Pedal	
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Dry or binding clutch pedal hub	Lubricate and align components
Floor mat interference with pedal	Lay mat flat in proper area
Dry or binding ball/fork pivots	Lubricate and align components
Faulty clutch cable	Replace clutch cable
Noisy Clutch Pedal	
Faulty interlock switch	Replace interlock switch
Self-adjuster ratchet noise	Lubricate or replace self-adjuster
Speed control interlock switch	Lubricate or replace interlock switch
Clutch Pedal Sticks Down	
Binding clutch cable	See CLUTCH article
Springs weak in pressure plate	Replace pressure plate
Binding in clutch linkage	Lubricate and free linkage
Noisy	
Dry release bearing	Lubricate or replace release bearing

Dry or worn pilot bearing	Lubricate or replace bearing
Worn input shaft bearing	Replace bearing
Transmission Click	
Weak springs in pressure	Replace pressure plate plate
Release fork loose on ball stud	Replace release fork and/or ball stud
Oil on clutch disc damper	Replace clutch disc
Broken spring in slave cylinder	Replace slave cylinder

DRIVE AXLE - NOISE DIAGNOSIS

Unrelated Noises

Some driveline trouble symptoms are also common to the engine, transmission, wheel bearings, tires, and other parts of the vehicle. Ensure cause of trouble actually is in the drive axle before adjusting, repairing, or replacing any of its parts.

Non-Drive Axle Noises

A few conditions can sound just like drive axle noise and have to be considered in pre-diagnosis. The 4 most common noises are exhaust, tires, CV/universal joints and wheel trim rings.

In certain conditions, the pitch of the exhaust gases may e gear whine. At other times, it may be mistaken for a wheel bearing rumble.

Tires, especially radial and snow, can have a high-pitched tread whine or roar, similar to gear noise. Also, some non-standard tires with an unusual tread construction may emit a roar or whine.

Defective CV/universal joints may cause clicking noises or excessive driveline play that can be improperly diagnosed as drive axle problems.

Trim and moldings also can cause a whistling or whining noise. Ensure none of these components are causing the noise before disassembling the drive axle.

Gear Noise

A "howling" or "whining" noise from the ring and pinion gear can be caused by an improper gear pattern, gear damage, or improper bearing preload. It can occur at various speeds and driving conditions, or it can be continuous.

Before disassembling axle to diagnose and correct gear ke sure that tires, exhaust, and vehicle trim have been checked as possible causes.

Chuckle

This is a particular rattling noise that sounds like a stick against the spokes of a spinning bicycle wheel. It occurs while decelerating from 40 MPH and usually can be heard until vehicle comes to a complete stop. The

frequency varies with the speed of the vehicle.

A chuckle that occurs on the driving phase is usually caused ive clearance due to differential gear wear, or by a damaged tooth on the coast side of the pinion or ring gear. Even a very small tooth nick or a ridge on the edge of a gear tooth is enough the cause the noise.

This condition can be corrected simply by cleaning the gear tooth nick or ridge with a small grinding wheel. If either gear is damaged or scored badly, the gear set must be replaced. If metal has broken loose, the carrier and housing must be cleaned to remove particles that could cause damage.

Knock

This is very similar to a chuckle, though it may be louder, and occur on acceleration or deceleration. Knock can be caused by a gear tooth that is damaged on the drive side of the ring and pinion gears. Ring gear bolts that are hitting the carrier casting can cause knock. Knock can also be due to excessive end play in the axle shafts.

Clunk

Clunk is a metallic noise heard when an automatic transmission is engaged in Reverse or Drive, or when throttle is applied or released. It is caused by backlash somewhere in the driveline, but not necessarily in the axle. To determine whether driveline clunk is caused by the axle, check the total axle backlash as follows:

1. Raise vehicle on a frame or twinpost hoist so that drive wheels are free. Clamp a bar between axle companion flange and a part of the frame or body so that flange cannot move.
2. On conventional drive axles, lock the left wheel to keep it from turning. On all models, turn the right wheel slowly until it is felt to be in Drive condition. Hold a chalk marker on side of tire about 12" from center of wheel. Turn wheel in the opposite direction until it is again felt to be in Drive condition.
3. Measure the length of the chalk mark, which is the total axle backlash. If backlash is one inch or less, drive axle is not the source of clunk noise.

Bearing Whine

Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by malfunctioning pinion bearings. Pinion bearings operate at drive shaft speed. Roller wheel bearings may whine in a similar manner if they run completely dry of lubricant. Bearing noise will occur at all driving speeds. This distinguishes it from gear whine, which usually comes and goes as speed changes.

Bearing Rumble

Bearing rumble sounds like marbles being tumbled. It is usually caused by a malfunctioning wheel bearing. The lower pitch is because the wheel bearing turns at only about 1/3 of drive shaft speed.

Chatter On Turns

This is a condition where the entire front or rear of vehicle vibrates when vehicle is moving. The vibration is plainly felt as well as heard. Extra differential thrust washers installed during axle repair can cause a condition of partial lock-up that creates this chatter.

Axle Shaft Noise

Axle shaft noise is similar to gear noise and pinion bearing whine. Axle shaft bearing noise will normally distinguish itself from gear noise by occurring in all driving modes (Drive, cruise, coast and float), and will persist with transmission in Neutral while vehicle is moving at problem speed.

If vehicle displays this noise condition, remove suspect parts, replace wheel seals and install a new set of bearings. Re-evaluate vehicle for noise before removing any internal components.

Vibration

Vibration is a high-frequency trembling, shaking or grinding condition (felt or heard) that may be constant or variable in level and can occur during the total operating speed range of the vehicle.

The types of vibrations that can be felt in the vehicle can d into 3 main groups:

- Vibrations of various unbalanced rotating parts of the vehicle.
- Resonance vibrations of the body and frame structures caused by rotating of unbalanced parts.
- Tip-in moans of resonance vibrations from stressed engine or exhaust system mounts or driveline flexing modes.

DRIVE AXLE - RWD TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing. For definitions of listed noises or sounds, see DRIVE AXLE - NOISE DIAGNOSIS under POWERTRAIN.**

DRIVE AXLE (RWD) TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Knocking or Clunking	
Differential Side Gear Clearance	Check Clearance
Worn Pinion Shaft	Replace Pinion Shaft
Axle Shaft End Play	Check End Play
Missing Gear Teeth	Check Differential/Replace Gear
Wrong Axle Backlash	Check Backlash
Misaligned Driveline	Realign Driveline
Clinking During Engagement	
Side Gear Clearance	Check Clearance
Ring and Pinion Backlash	Check Backlash
Worn/Loose Pinion Shaft	Replace Shaft/Bearing

Bad "U" Joint	Replace "U" Joint
Sticking Slip Yoke	Lube Slip Yoke
Broken Rear Axle Mount	Replace Mount
Loose Drive Shaft Flange	Check Flange
Click/Chatter On Turns	
Differential Side Gear Clearance	Check Clearance
Wrong Turn On Plates [1]	Replace Clutch Plates
Wrong Differential Lubricant [1]	Change Lubricant
Knock Or Click	
Flat Spot on Rear Wheel Bearing	Replace Wheel Bearing
Low Vibration At All Speeds	
Faulty Wheel Bearing	Replace Wheel Bearing
Faulty "U" Joint	Replace "U" Joint
Faulty Drive Shaft	Balance Drive Shaft
Faulty Companion Flange	Replace Flange
Faulty Slip Yoke Flange	Replace Flange
(1) Limited slip differential only.	

FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Grease Leaks	CV boot torn or cracked
Clicking Noise on Cornering	Damaged outer CV
Clunk Noise on Acceleration	Damaged inner CV
Vibration or Shudder on Acceleration	Sticking, damaged or worn CV Misalignment or spring height

STEERING & SUSPENSION

MANUAL STEERING GEAR TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT,

DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC MANUAL STEERING GEAR TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise in Rack and Pinion	
Rack and pinion mounting bracket loose	Tighten all mounting bolts
Lack of/or incorrect lubricant	Correct as necessary
Steering gear mounting bolts loose	Tighten all mounting bolts
Excessive Play	
Front wheel bearing improperly adjusted	See FRONT SUSPENSION article
Loose or worn steering linkage	See STEERING LINKAGE article
Loose or worn steering gear shift	See MANUAL STEERING GEAR article
Steering arm loose on gear shaft	See MANUAL STEERING GEAR article
Steering gear housing bolts loose	Tighten all mounting bolts
Steering gear adjustment too loose	See MANUAL STEERING GEAR article
Steering arms loose on knuckles	Tighten and check steering linkage
Rack and pinion mounting loose	Tighten all mounting bolts
Rack and pinion out of adjustment	See adjustment in STEERING article
Tie rod end loose	Tighten and check steering linkage
Excessive Pitman shaft-to-ball nut lash	Repair as necessary
Poor Returnability	
Lack of lubricant in ball joint or linkage	Lubricate and service systems
Binding in linkage or ball joints	See STEERING LINKAGE and SUSPENSION article
Improper front end alignment	See WHEEL ALIGNMENT article
Improper tire pressure	Inflate to proper pressure
Tie rod binding	Inflate to proper pressure
Shaft seal rubbing shaft	See STEERING COLUMN article
Excessive Vertical Motion	
Improper tire pressure	Inflate to proper pressure
Tires, wheels or rotors out of balance	Balance tires then check wheels and rotors
Worn or faulty shock absorbers	Check and replace if necessary

Loose tie rod ends or steering	Tighten or replace if necessary
Loose or worn wheel bearings	See SUSPENSION article
Steering Pulls to One Side	
Improper tire pressure	Inflate to proper pressure
Front tires are different sizes	Rotate or replace if necessary
Wheel bearings not adjusted properly	See FRONT SUSPENSION article
Bent or broken suspension components	See FRONT SUSPENSION article
Improper wheel alignment	See WHEEL ALIGNMENT article
Brakes dragging	See BRAKES article
Instability	
Low or uneven tire pressure	Inflate to proper pressure
Loose or worn wheel bearings	See FRONT SUSPENSION article
Loose or worn idler arm bushing	See FRONT SUSPENSION article
Loose or worn strut bushings	See FRONT SUSPENSION article
Incorrect front wheel alignment	See WHEEL ALIGNMENT article
Steering gear not centered	See MANUAL STEERING GEARS article
Springs or shock	Check and replace if necessary
Improper cross shaft	See MANUAL STEERING GEARS article

POWER STEERING TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC POWER STEERING TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise	
Pressure hoses touching engine parts	Adjust to proper clearance
Loose Pitman shaft	Adjust or replace if necessary
Tie rods ends or Pitman arm loose	Tighten and check system
Rack and pinion mounts loose	Tighten all mounting bolts

Free play in worm gear	See POWER STEERING GEAR article
Loose sector shaft or thrust bearing adjustment	See POWER STEERING GEAR
Free play in pot coupling	See STEERING COLUMN article
Worn shaft serrations	See STEERING COLUMN article
Growl in Steering Pump	
Excessive pressure in hoses	Restricted hoses, see POWER STEERING GEAR article
Scored pressure plates	See POWER STEERING GEAR article
Scored thrust plates or rotor	See POWER STEERING GEAR article
Extreme wear of cam ring	See POWER STEERING GEAR article
Rattle in Steering Pump	
Vanes not installed	See POWER STEERING PUMP article
Vanes sticking in rotor	See POWER STEERING PUMP article
Swish noise in Pump	
Defective flow control valve	See POWER STEERING PUMP article
Groan in Steering Pump	
Air in fluid	See POWER STEERING PUMP article
Poor pressure hose connection	Tighten and check, replace if necessary
Squawk When Turning	
Damper "O" ring on valve spool cut	See POWER STEERING PUMP article
Moan or Whine in Pump	
Pump shaft bearing scored	Replace bearing and fluid
Air in fluid or fluid level low	See POWER STEERING PUMP article
Hose or column grounded	Check and replace if necessary
Cover "O" ring missing or damaged	See POWER STEERING PUMP article
Valve cover baffle missing or damaged	See POWER STEERING PUMP article
Interference of components in pump	See POWER STEERING

	PUMP article
Loose or poor bracket alignment	Correct or replace if necessary
Hissing When Parking	
Internal leakage in steering gear	Check valved assembly first
Chirp in Steering Pump	
Loose or worn power steering belt	Adjust or replace if necessary
Buzzing When Not Steering	
Noisy pump	See POWER STEERING PUMP article
Free play in steering shaft bearing	See STEERING COLUMN article
Bearing loose on shaft serrations	See STEERING COLUMN article
Clicking Noise in Pump	
Pump slippers too long	See POWER STEERING PUMP article
Broken slipper springs	See POWER STEERING PUMP article
Excessive wear or nicked rotors	See POWER STEERING PUMP article
Damaged cam contour	See POWER STEERING PUMP article
Poor Return of Wheel	
Wheel rubbing against turn signal	See STEERING COLUMN SWITCHES article
Flange rubbing steering gear adjuster	See STEERING COLUMN article
Tight or frozen steering shaft bearing	See STEERING COLUMN article
Steering gear out of adjustment	See POWER STEERING GEAR article
Sticking or plugged spool valve	See POWER STEERING PUMP article
Improper front end alignment	See WHEEL ALIGNMENT article
Wheel bearings worn or loose	See FRONT SUSPENSION article
Ties rods or ball joints binding	Check and replace if necessary
Intermediate shaft joints binding	See STEERING COLUMN article
Kinked pressure hoses	Correct or replace if necessary
Loose housing head spanner nut	See POWER STEERING GEAR article

Damaged valve lever	See POWER STEERING GEAR article
Sector shaft adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article
Worm thrust bearing adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article
Reaction ring sticking in cylinder	See POWER STEERING GEAR article
Reaction ring sticking in housing head	See POWER STEERING GEAR article
Steering pump internal leakage	See POWER STEERING PUMP article
Steering gear-to-column misalignment	See STEERING COLUMN article
Lack of lubrication in linkage	Service front suspension
Lack of lubrication in ball joints	Service front suspension
Increased Effort When Turning Wheel Fast Foaming, Milky Power Steering Fluid, Low Fluid Level or Low Pressure	
High internal pump leakage	See POWER STEERING PUMP article
Power steering pump belt slipping	Adjust or replace if necessary
Low fluid level	Check and fill to proper level
Engine idle speed to low	Adjust to correct setting
Air in pump fluid system	See POWER STEERING PUMP article
Pump output low	See POWER STEERING PUMP article
Steering gear malfunctioning	See POWER STEERING GEAR article
Wheel Surges or Jerks	
Low fluid level	Check and fill to proper level
Loose fan belt	Adjust or replace if necessary
Insufficient pump pressure	See POWER STEERING PUMP article
Sticky flow control valve	See POWER STEERING PUMP article
Linkage hitting oil pan at full turn	Replace bent components
Kick Back or Free Play	
Air in pump fluid system	See POWER STEERING PUMP article
Worn poppet valve in steering gear	See POWER STEERING PUMP article

Excessive over center lash	See POWER STEERING GEAR article
Thrust bearing out of adjustment	See POWER STEERING GEAR article
Free play in pot coupling	See POWER STEERING PUMP article
Steering gear coupling loose on shaft	See POWER STEERING PUMP article
Steering disc mounting bolts loose	Tighten or replace if necessary
Coupling loose on worm shaft	Tighten or replace if necessary
Improper sector shaft adjustment	See POWER STEERING GEAR article
Excessive worm piston side play	See POWER STEERING GEAR article
Damaged valve lever	See POWER STEERING GEAR article
Universal joint loose	Tighten or replace if necessary
Defective rotary valve	See POWER STEERING GEAR article
No Power When Parking	
Sticking flow control valve	See POWER STEERING PUMP article
Insufficient pump pressure output	See POWER STEERING PUMP article
Excessive internal pump leakage	See POWER STEERING PUMP article
Excessive internal gear leakage	See POWER STEERING PUMP article
Flange rubs against gear adjust plug	See STEERING COLUMN article
Loose pump belt	Adjust or replace if necessary
Low fluid level	Check and add proper amount of fluid
Engine idle too low	Adjust to correct setting
Steering gear-to-column misaligned	See STEERING COLUMN article
No Power, Left Turn	
Left turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Left turn reaction seal damaged/missing	See POWER STEERING GEAR article

Cylinder head "O" ring damaged	See POWER STEERING PUMP article
No Power, Right Turns	
Column pot coupling bottomed	See STEERING COLUMN article
Right turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Right turn reaction seal damaged	See POWER STEERING GEAR article
Internal leakage through piston end plug	See POWER STEERING GEAR article
Internal leakage through side plugs	See POWER STEERING GEAR article

Unbalanced steering gear valve	See POWER STEERING GEAR article
Low Pressure Due to Steering Pump	
Flow control valve stuck or inoperative	See POWER STEERING PUMP article
Pressure plate not flat against cam ring	See POWER STEERING PUMP article
Extreme wear of cam ring	Replace and check adjustments
Scored plate, thrust plate or rotor	See POWER STEERING PUMP article
Vanes not installed properly	See POWER STEERING PUMP article
Vanes sticking in rotor slots	See POWER STEERING PUMP article
Cracked/broken thrust or pressure plate	See POWER STEERING PUMP article

STEERING COLUMN TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC STEERING COLUMN TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Noise in Steering	
Coupling pulled apart	See STEERING COLUMNS article
Column not correctly aligned	See STEERING COLUMNS article
Broken lower joint	Replace joint
Horn contact ring not	See STEERING COLUMN article
Bearing not lubricated	See STEERING COLUMN article
Shaft snap ring not properly seated	Reseat or replace snap ring
Plastic spherical joint not lubricated	See STEERING COLUMN article
Shroud or housing loose	Tighten holding screws
Lock plate retaining ring not seated	See STEERING COLUMN article
Loose sight shield	Tighten holding screws
High Steering Shaft Effort	
Column assembly misaligned	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Tight steering universal joint	See STEERING COLUMN article
High Shift Effort	
Column is out of alignment	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Seals or bearings not lubricated	See STEERING COLUMNS article
Mounting bracket screws too long	Replace with new shorter screws
Burrs on shift tube	Remove burrs or replace tube
Lower bowl bearing assembled wrong	See STEERING COLUMN article
Shift tube bent or broken	Replace as necessary
Improper adjustment of shift levers	See STEERING COLUMN article
Improper Trans. Shifting	
Sheared shift tube joint	Replace as necessary
Sheared lower shaft lever	Replace as necessary
Improper shift lever adjustment	See STEERING COLUMN

	article
Improper gate plate adjustment	See STEERING COLUMN article
Excess Play in Column	
Instrument panel bracket bolts loose	Tighten bolts and check bracket
Broken weld nut on jacket	See STEERING COLUMN article
Instrument bracket capsule sheared	See STEERING COLUMN article
Column bracket/jacket bolts loose	Tighten bolts and check bracket
Steering Locks in Gear	
Release lever mechanism	See STEERING COLUMN article

SUSPENSION TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC SUSPENSION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Front End Noise	
Loose or worn wheel	See Wheel Bearing Adjustment in SUSPENSION
Worn shocks or shock mountings	Replace struts or strut mountings
Worn struts or strut mountings	Replace struts or strut mountings
Loose or worn lower control arm	See SUSPENSION
Loose steering gear-to-frame bolts	See STEERING
Worn control arm bushings	See SUSPENSION
Ball joints not lubricated	Lubricate ball joints & see Ball Joint Checking in SUSPENSION
Front Wheel Shake, Shimmy, or Vibration	
Tires or wheels out of balance	Check tire balance
Incorrect wheel alignment	See WHEEL ALIGNMENT
Drive shaft unbalanced	Check drive shaft balance
Loose or worn wheel bearings	See WHEEL ALIGNMENT

Loose or worn tie rod ends	See SUSPENSION
Worn upper ball joints	See Ball Joint Checking in SUSPENSION
Worn shock absorbers	Replace shock absorbers
Worn strut bushings	Replace strut bushings
Car Pulls to One Side	
Mismatched or uneven tires	Check tire condition
Broken or sagging springs	See SUSPENSION
Loose or worn strut bushings	See SUSPENSION
Improper wheel alignment	See WHEEL ALIGNMENT
Improper rear axle alignment	Check rear axle alignment
Power steering gear unbalanced	See STEERING
Front brakes dragging	See BRAKES
Abnormal Tire Wear	
Unbalanced tires	Check tire balance & rotation
Sagging or broken springs	See SUSPENSION
Incorrect front end alignment	See WHEEL ALIGNMENT
Faulty shock absorbers	Replace chock absorbers
Scuffed Tires	
Toe-In incorrect	See WHEEL ALIGNMENT
Suspension arm bent or twisted	See appropriate SUSPENSION article
Springs Bottom or Sag	
Bent or broken springs	See SUSPENSION
Leaking or worn shock absorbers	Replace shock absorbers
Frame misalignment	Check frame for damage
Spring Noises	
Loose "U" Bolts	See SUSPENSION
Loose or worn bushings	See SUSPENSION
Worn or missing interliners	See SUSPENSION
Shock Absorber Noise	
Loose shock mountings	Check & tighten mountings
Worn bushings	Replace bushings
Air in system	Bleed air from system
Undercoating on shocks	Remove undercoating
Car Leans or Sways on Corners	
Loose stabilizer bar	See SUSPENSION
Faulty shocks or mountings	Replace shocks or mountings
Broken or sagging springs	See SUSPENSION
Shock Absorbers Leaking	
Worn seals or reservoir tube crimped	See SUSPENSION

Broken Springs	
Loose "U" bolts	See SUSPENSION
Inoperative shock absorbers	Replace shock absorbers

WHEEL ALIGNMENT TROUBLE SHOOTING

NOTE: This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC WHEEL ALIGNMENT TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Premature Tire Wear	
Improper tire inflation	Check tire pressure
Front alignment out of tolerance	See ALIGNMENT SPECS in WHEEL ALIGNMENT section
Suspension components worn	See SUSPENSION section
Steering system components worn	See STEERING section
Improper standing height	See WHEEL ALIGNMENT
Uneven or sagging springs	See SUSPENSION section
Bent wheel	See WHEEL ALIGNMENT
Improper torsion bar adjustment	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARING ADJ. in SUSPENSION section
Worn or defective shock	Replace shock absorbers
Tires out of balance	Check tire balance
Pulls to One Side	
Improper tire inflation	Check tire pressure
Brake dragging	See BRAKE section
Mismatched tires	See WHEEL ALIGNMENT
Broken or sagging spring	See SUSPENSION section
Broken torsion bar	See SUSPENSION section
Power steering valve not centered	See STEERING section
Front alignment out of tolerance	See WHEEL ALIGNMENT section
Defective wheel bearing	See WHEEL BEARINGS in SUSPENSION section
Uneven sway bar links	See SUSPENSION section
Frame bent	Check for frame damage
Steering system bushing worn	See STEERING section

Hard Steering	
Idler arm bushing too tight	See STEERING LINKAGE in STEERING section
Ball joint tight or seized	See SUSPENSION section
Steering linkage too tight	See STEERING LINKAGE in STEERING section
Power steering fluid low	Add proper amount of fluid
Power steering drive belt loose	See STEERING section
Power steering pump defective	See STEERING section
Steering gear out of adjustment	See STEERING section
Incorrect wheel alignment	See WHEEL ALIGNMENT
Damaged steering gear	See STEERING section
Damaged suspension	See SUSPENSION section
Bent steering knuckle or supports	See SUSPENSION section
Vehicle "Wanders"	
Strut rod or control arm bushing worn	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARINGS in SUSPENSION section
Improper tire inflation	Check tire pressure
Stabilizer bar missing or defective	See SUSPENSION section
Wheel alignment out of tolerance	See Adjustment in WHEEL ALIGNMENT section
Broken spring	See SUSPENSION section
Defective shock absorber	Replace shock absorbers
Worn steering & suspension components	See SUSPENSION section
Front End Shimmy	
Tire out of balance/round	Check tire balance
Excessive wheel runout	See WHEEL ALIGNMENT
Insufficient or improper caster	See WHEEL ALIGNMENT section
Worn suspension or steering components	See SUSPENSION section
Defective shock absorbers	Replace shock absorber
Wheel bearings worn or loose	See WHEEL BEARING ADJ. in SUSPENSION section
Power steering reaction Bracket loose	See STEERING section
Steering gear box (rack) mounting loose	See STEERING section
Steering gear adjustment loose	See STEERING section
Worn spherical joints	See SUSPENSION section
Toe-In Not Adjustable

DESCRIPTION AND OPERATION

SUBFRAME AND MOUNTING SYSTEMS

Front Subframe - The front subframe is bolted to the body and is used to:

- aid in structural support.
- provide mounting surfaces for the front suspension control arms.
- provide a mounting point for the engine isolators.
- provide the mounting surface for the steering gear.
- provide the mounting surface for the sway bar.

Rear Subframe - The rear subframe is bolted to the body and is used to:

- aid in structural support.
- provide the mounting surface for the rear suspension upper control arms, rear suspension lower control arms and (if equipped) a mounting location for the rear differential.

Underbody misalignment can affect front and rear wheel alignment, the operation of the suspension parts and drivetrain operation. Window glass cracks, door and window opening concerns and air or water leaks at the doors are often caused by incorrectly tightened bolts and body misalignment. For information on underbody dimensions, refer to **BODY REPAIRS** article.

REMOVAL AND INSTALLATION

REMOVAL AND INSTALLATION

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

   NOTE: MKZ shown, all other vehicles similar.

2. Remove the bolts and the underbody shield, if equipped.
   - To install, tighten to 7 Nm (62 lb-in).

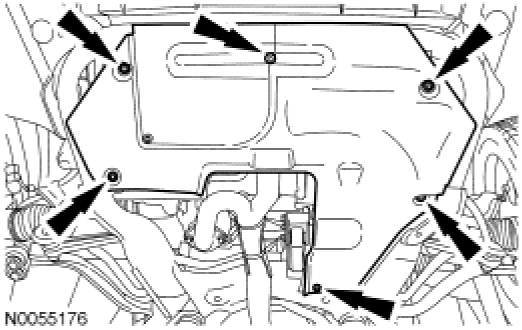

Fig. 2: Locating Underbody Shield Screws
Courtesy of FORD MOTOR CO.

Vehicles with 3.0L

3. Remove the exhaust flexible pipe. For additional information, refer to **EXHAUST SYSTEM** article.
4. Remove the 2 bolts and the heat shield.

All vehicles

5. Remove the bolt from the engine roll restrictor.
   - To install, tighten to 90 N.m (66 lb-ft).

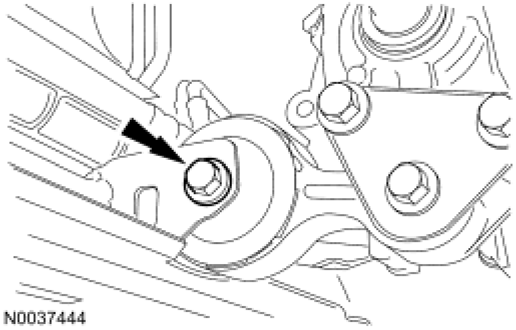

Fig. 3: Locating Engine Roll Restrictor Bolt
Courtesy of FORD MOTOR CO.

6. Remove the 4 screws and position the RH fender splash shield aside.

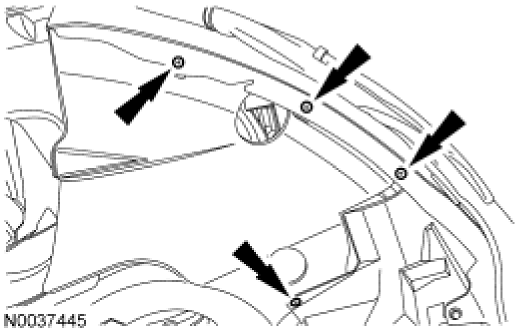

Fig. 4: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

7. Remove the 6 pin-type retainers and the RH front structure-to-subframe splash shield.

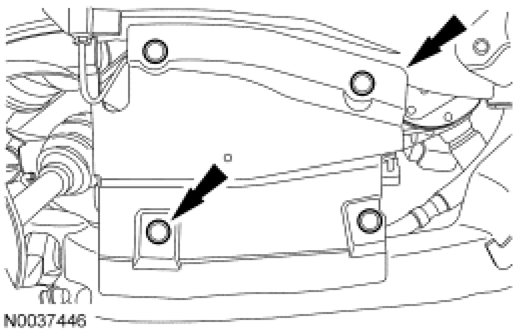

Fig. 5: Locating Splash Shield Pin-Type Retainers
Courtesy of FORD MOTOR CO.

8. Remove the 4 screws and position the LH fender splash shield aside.

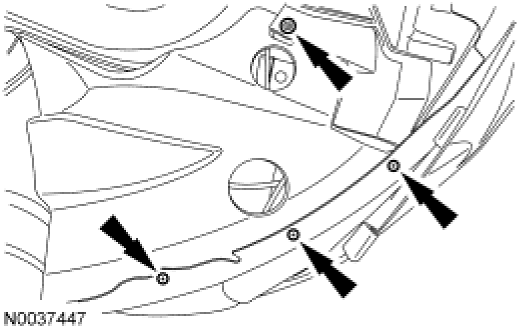

Fig. 6: Locating LH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

9. Remove the 6 pin-type retainers and the LH front structure-to-subframe splash shield.

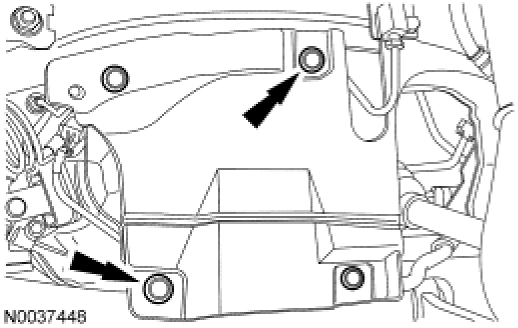

Fig. 7: Locating LH Splash Shield And Pin-Type Retainers
Courtesy of FORD MOTOR CO.

10. Remove the 3 power steering return line bolts.
    - To install, tighten to 9 N.m (80 lb-in).

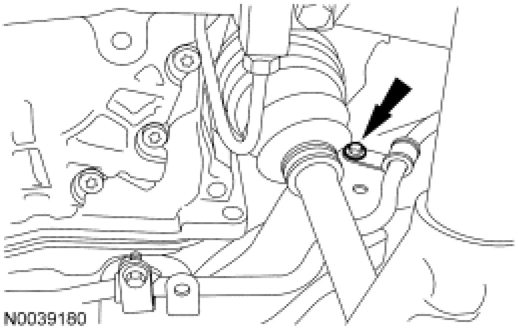

Fig. 8: Locating Power Steering Return Line Bolts
Courtesy of FORD MOTOR CO.

Vehicles with 2.3L

11. Remove the power steering pressure line bracket bolt.
    - To install, tighten to 9 N.m (80 lb-in).

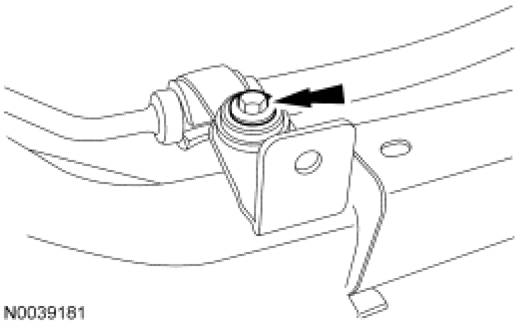

Fig. 9: Locating Power Steering Pressure Line Bracket Bolt
Courtesy of FORD MOTOR CO.

All vehicles

12. Remove the 3 steering gear mounting bolts.
    - To install, tighten to 107 N.m (79 lb-ft).

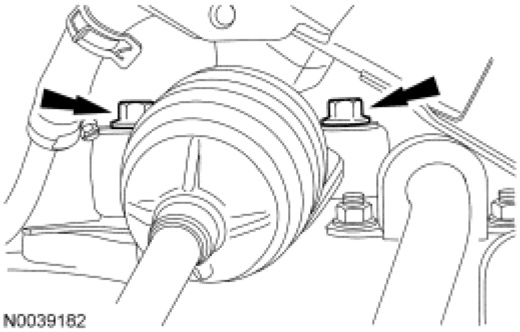

Fig. 10: Locating Steering Gear Mounting Bolts
Courtesy of FORD MOTOR CO.

NOTE: The steering gear is not removed with the front subframe and must be positioned aside.

13. Position the steering gear aside using mechanic's wire.
14. Remove the 2 (one each side) lower stabilizer bar link nuts and separate from the stabilizer bar.
    - To install, tighten to 42 N.m (31 lb-ft).

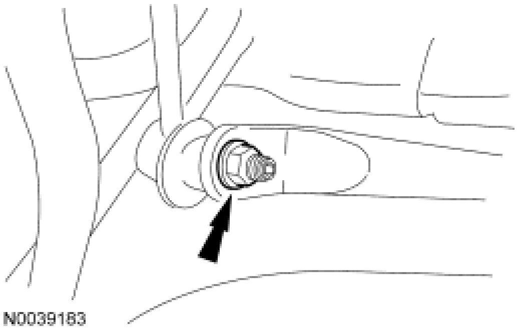

Fig. 11: Locating Lower Stabilizer Bar Link Nuts
Courtesy of FORD MOTOR CO.

15. Remove the RH and LH lower ball joint nuts.
    - To install, tighten to 200 N.m (148 lb-ft).

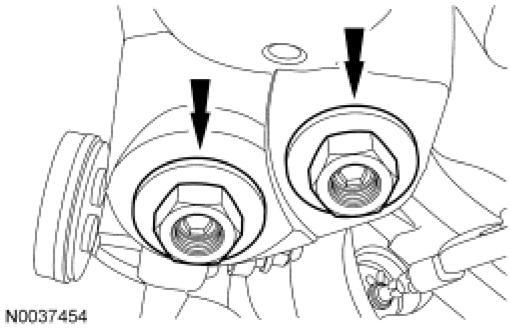

Fig. 12: Locating Lower Ball Joint Nuts
Courtesy of FORD MOTOR CO.

CAUTION: When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer constant velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.

NOTE: Once pressure is applied to the ball joint with the Ball Joint Separator and the Adapter, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.

16. Using the Ball Joint Separator and the Adapter, separate the RH and LH ball joints.

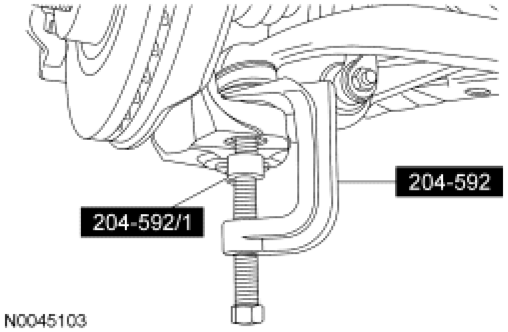

Fig. 13: Identifying Special Tools (204-592/1, 204-592)
Courtesy of FORD MOTOR CO.

17. Remove the lower control arm-to-strut through bolts and flag nuts.
    - To install, tighten to 103 N.m (76 lb-ft).

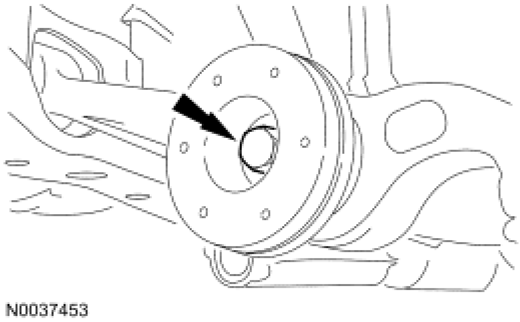

Fig. 14: Locating Lower Control Arms Through Bolt
Courtesy of FORD MOTOR CO.

18. Position the Powertrain Lift Table under the subframe.

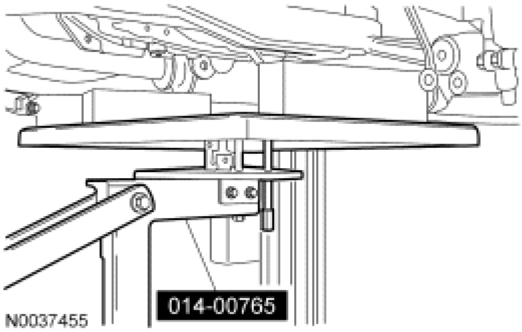

Fig. 15: Positioning Special Tool (014-00765) Under Subframe Assembly
Courtesy of FORD MOTOR CO.

19. Remove the 2 rear mounting nuts and washers from the front subframe.
    - To install, tighten to 150 N.m (111 lb-ft).

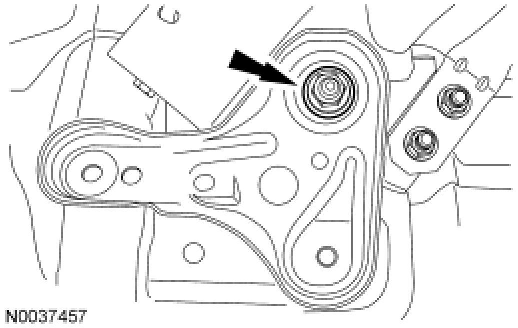

Fig. 16: Locating Subframe Nuts
Courtesy of FORD MOTOR CO.

20. Remove the 4 bolts and the 2 subframe support brackets.
    - To install, tighten to 103 N.m (76 lb-ft).

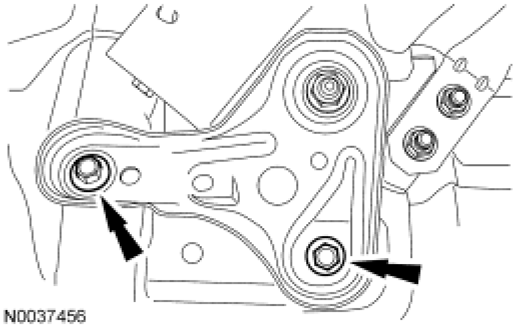

Fig. 17: Locating Subframe Bracket-To-Body Bolts
Courtesy of FORD MOTOR CO.

21. Remove the 2 front mounting nuts and washers from the front subframe.
    - To install, tighten to 150 N.m (111 lb-ft).

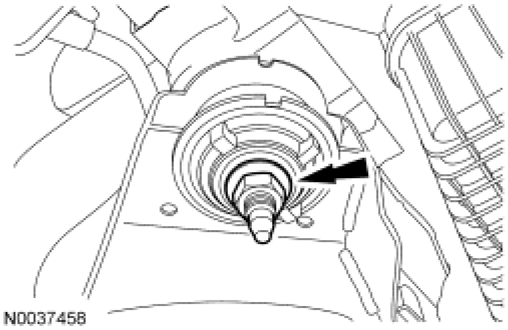

Fig. 18: Locating Front Subframe Nuts
Courtesy of FORD MOTOR CO.

22. Lower the subframe from the vehicle.
    - To install, reverse the removal procedure.

SUBFRAME - REAR

Special Tools

Illustration	Tool Name	Tool Number

Item	Part Number	Description
1	5E118	Front bushing brace-to-body bolt (4 required)
2	W520515	Rear subframe nut (4 required)
3	5K067	Rear subframe
4	5E028	Rear subframe washer (4 required)

CAUTION: Suspension fasteners are critical parts because they affect performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a replacement part of lesser quality or substitute design. Torque values must be used as specified

during reassembly to make sure of correct retention of these parts.

All vehicles

1. Remove the rear wheels. For additional information, refer to **WHEELS AND TIRES** article.
2. With a wax pencil, mark the relationship alignment of the rear subframe to the underbody at the mounting locations.

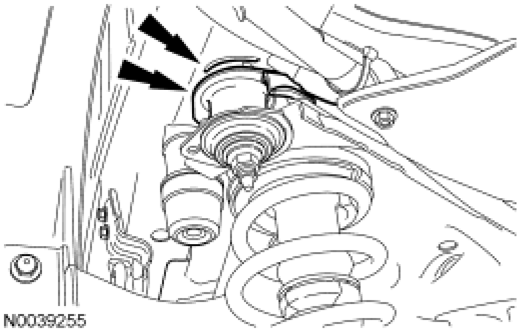

Fig. 20: Locating Rear Subframe Mark
Courtesy of FORD MOTOR CO.

3. Remove the LH and RH rear lower control arms. For additional information, refer to **REAR SUSPENSION** article.
4. Remove the catalytic converter, muffler and tailpipe as an assembly.

All wheel drive (AWD) only

NOTE: Index-mark the rear axle pinion flange and the driveshaft yoke.

5. Remove the 4 driveshaft bolts.
   - To install, tighten to 83 Nm (61 lb-ft).

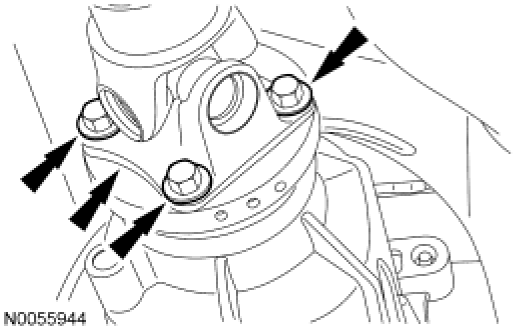

Fig. 21: Identifying Driveshaft Bolts
Courtesy of FORD MOTOR CO.

All vehicles

6. Remove the bolt from the LH and RH wheel speed sensors.

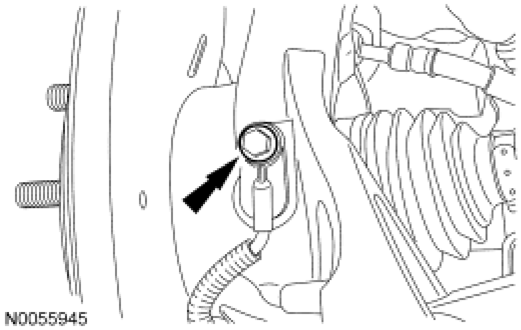

Fig. 22: Identifying LH & RH Wheel Speed Sensors Bolt
Courtesy of FORD MOTOR CO.

7. Remove the RH and LH wheel speed sensor nuts from the stud and position aside.

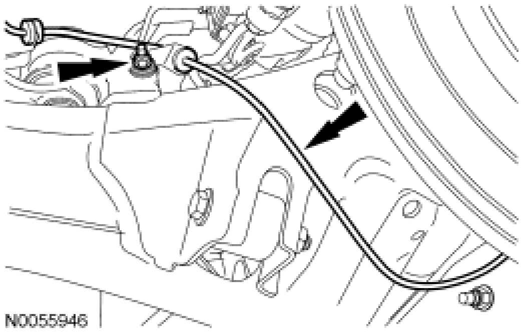

Fig. 23: Identifying LH & RH Wheel Speed Sensors Nuts
Courtesy of FORD MOTOR CO.

AWD only

8. Disconnect the differential electrical connector on the LH of the subframe.

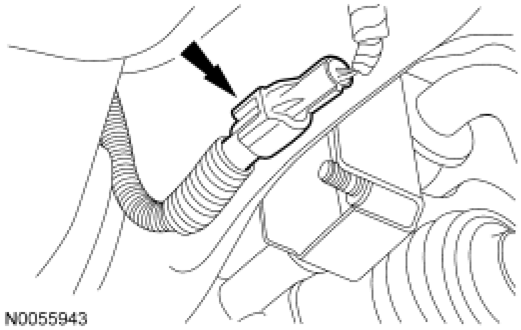

Fig. 24: Identifying Differential Electrical Connector On LH Of Subframe
Courtesy of FORD MOTOR CO.

All vehicles

9. Remove the 4 bolts (2 each side) from the rear hub spindle-to-brake caliper.
   - To install, tighten to 59 N.m (44 lb-ft).

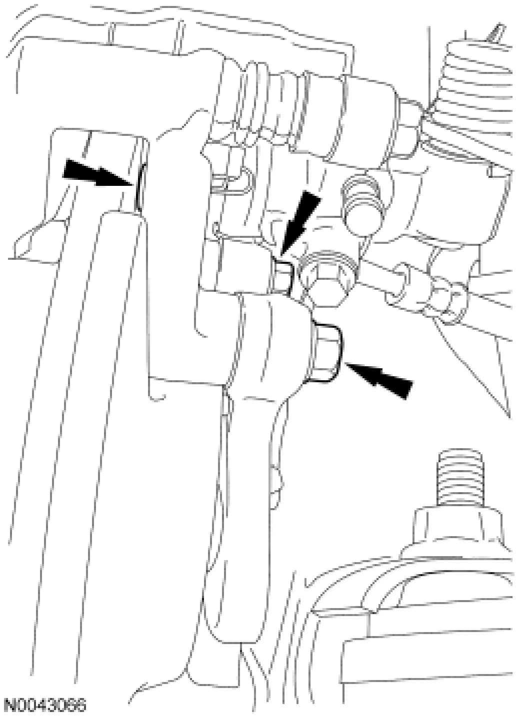

Fig. 25: Locating Rear Hub Spindle-To-Brake Caliper Bolts
Courtesy of FORD MOTOR CO.

10. Position the brake calipers aside using mechanic's wire. It is not necessary to disconnect the hydraulic brake lines.

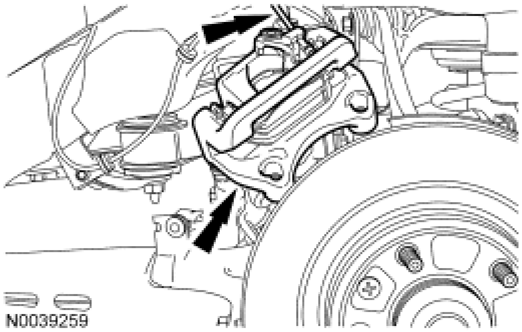

Fig. 26: Locating Hydraulic Brake Lines
Courtesy of FORD MOTOR CO.

11. Remove the bolts from the parking brake cable-to-trailing link bracket.
    - To install, tighten to 22 N.m (16 lb-ft).

Fig. 27: Locating Parking Brake Cable-To-Trailing Link Bracket Bolt
Courtesy of FORD MOTOR CO.

12. Remove and discard the rear shock-to-trailing link lower bolts and flag nuts.
    - To install, tighten to 115 N.m (85 lb-ft) with the suspension at the bushing fastener tightening position.

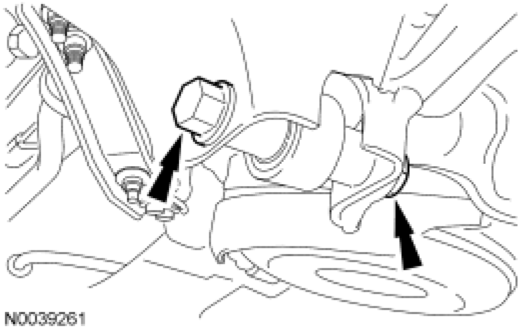

Fig. 28: Locating Rear Shock-To-Trailing Link Lower Bolts
Courtesy of FORD MOTOR CO.

13. Remove the 4 bolts and cone washers (2 each side) from the trailing links-to-vehicle body.
    - To install, tighten to 103 N.m (76 lb-ft).

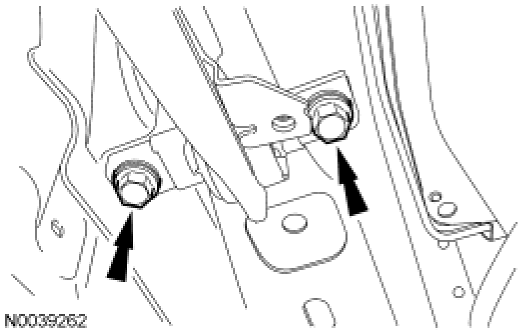

Fig. 29: Locating Trailing Links-To-Vehicle Body Bolts
Courtesy of FORD MOTOR CO.

CAUTION: The rear subframe must be secured to the lifting table. The rear

subframe can become unstable and fall from the lifting table.

NOTE: **For all wheel drive (AWD) vehicles, the rear differential is removed with the rear subframe.**

14. Position the Powertrain Lift Table under the rear subframe.

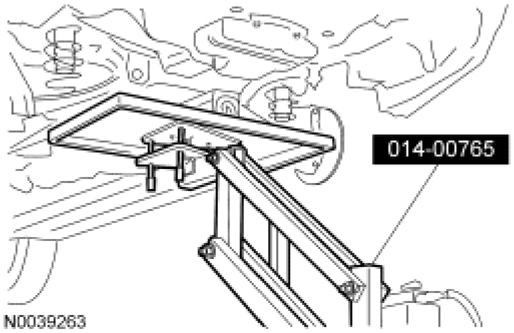

Fig. 30: Positioning Lifting Table Under Rear Subframe Using Special Tool (014-00765)
Courtesy of FORD MOTOR CO.

15. Remove the 4 front (2 each side) bushing brace-to-body bolts.
    - To install, tighten to 25 N.m (18 lb-ft).

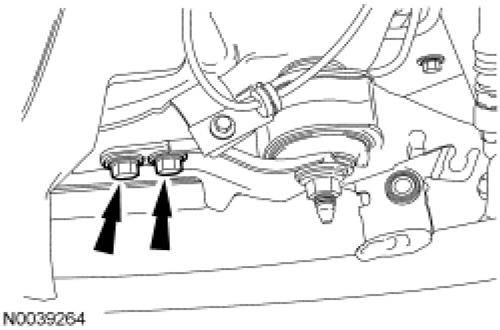

Fig. 31: Locating Bushing Brace-To-Body Bolts
Courtesy of FORD MOTOR CO.

16. Remove the 2 front (1 each side) mounting nuts and washers.
    - To install, tighten to 115 N.m (85 lb-ft).

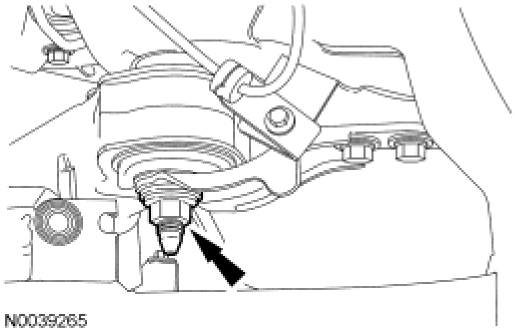

Fig. 32: Locating Front Mounting Nuts
Courtesy of FORD MOTOR CO.

17. Remove the 2 rear mounting nuts.
    - To install, tighten to 115 N.m (85 lb-ft).

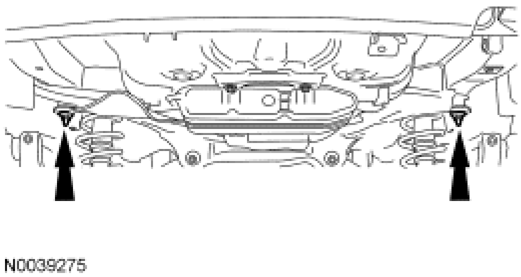

Fig. 33: Locating Rear Mounting Nuts
Courtesy of FORD MOTOR CO.

18. Remove the rear subframe.
19. Transfer the components as necessary.

CAUTION: Before tightening any suspension bushing fasteners, the suspension must be at the bushing fastener tightening position. Use a suitable jack to raise the suspension until the distance between the center of the hub and the lip of the fender is equal to 395 mm (15.55 in).

20. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

ANTI-LOCK CONTROL

ABS

The ABS consists of the following components:

- ABS module
- Front wheel speed sensor
- Front wheel speed sensor ring (integral to the front axle halfshaft)

- Hydraulic control unit (HCU)
- Rear wheel speed sensor
- Rear wheel speed sensor ring (integral to the wheel bearing/hub assembly)
- Traction control switch (TCS) (PCM controlled)

The ABS prevents wheel lock-up by monitoring the wheel speed sensors and actuating the valves in the HCU which modulates the brake pressure to the brake calipers. By preventing the wheels from locking up, the driver is able to maintain steering control and stop in the shortest possible distance under most conditions. The traction control system utilizes the same components as the ABS to prevent wheel spin and help maintain vehicle control during acceleration.

DIAGNOSTIC TESTS

ANTI-LOCK CONTROL

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2574-A	Flex Probe Kit	105-R025B or equivalent
 ST2621-A	Rotunda Active Wheel Speed Sensor Tester	105-R0110
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operations

Anti-Lock Control

The ABS module receives wheel speed readings from each wheel speed sensor and processes this information

to determine if an ABS event is necessary. The wheel speed sensor electrically senses each tooth of the wheel speed sensor indicators as it passes through the wheel speed sensor magnetic field.

The active wheel speed sensor generates a signal that is sent to the ABS module. The wheel speed sensor circuitry connects to the ABS module through 2 wires and a connector at each wheel speed sensor. When the ignition is turned to the RUN position, the ABS module carries out a self-test by sending a reference voltage to all of the wheel speed sensors through their circuitry to determine if they are functional.

The ABS module continuously monitors and compares the rotational speed of each wheel and when it detects an impending wheel lock, modulates brake pressure to the appropriate brake caliper. This is accomplished by triggering the hydraulic control unit (HCU) to open and close the appropriate solenoid valves. Once the affected wheel returns to normal speed, the ABS module returns the solenoid valves to their normal position, and normal (base) braking resumes.

The HCU has additional internal solenoid valves incorporated to enable control modulation of the wheel brake pressures.

The ABS module is self-monitoring. When the ignition switch is turned to the RUN position, the ABS module will do a preliminary electrical check of the wheel speed sensors by sending voltage through the sensor and checking for the voltage to return. At speeds above 20 km/h (12 mph), without the brake pedal being pressed, the pump motor will be commanded ON for approximately 1/2 second to check pump motor operation. Also, during all phases of operation the ABS module, with the vehicle in motion, checks for correct operation of the wheel speed sensors. Any malfunction of the ABS will cause the ABS to deactivate. Normal power assisted braking, however, remains.

Traction Control System - Front Wheel Drive (FWD)

The traction control system is designed to limit wheel spin by modulating engine torque, in order to achieve maximum traction, when driving on slippery or loose surfaces. On front wheel drive (FWD) vehicles, the ABS module sends the PCM wheel speed information over the high-speed controller area network (HS-CAN) bus. The PCM uses this information to determine if traction control is necessary. When the drive wheels lose traction and begin to spin at different speeds than the non-drive wheels, the PCM reduces engine torque to maintain vehicle traction by minor incremental timing changes and fewer fuel injector pulses until the speed of the driven wheels return to the desired speed. The PCM also sends a request to the instrument cluster to flash the traction control indicator.

The traction control system can be disabled by pressing the traction control switch and is indicated by the traction control indicator in the instrument cluster. The traction control system will reset and return to normal operation when the ignition switch is cycled or when the traction control switch is pressed and released a second time during the same ignition cycle.

Traction Control System - All Wheel Drive (AWD)

The traction control system is designed to limit wheel spin by modulating engine torque, in order to achieve maximum traction, when driving on slippery or loose surfaces. On all wheel drive (AWD) vehicles, the ABS module communicates with the PCM to assist with traction control. When the drive wheels lose traction and begin to spin at different speeds than the non-drive wheels, with vehicle speed under 100 km/h (62 mph), the ABS module requests the PCM to reduce engine torque while simultaneously activating the HCU to apply and

release the appropriate brake caliper(s) to maintain vehicle traction. The PCM reduces engine torque by minor incremental timing changes and fewer fuel injector pulses until the ABS module ends the traction control request. The request ends when the speed of the driven wheels return to the desired speed. After the vehicle speed exceeds 100 km/h (62 mph), traction control is accomplished only through the PCM torque control.

The traction control system can be disabled by pressing the traction control switch and is indicated by the traction control light in the instrument cluster. The traction control system will reset and return to normal operation when the ignition switch is cycled or when the traction control switch is pressed and released a second time during the same ignition cycle.

ABS Module Configuration

ABS module configuration is not required on this vehicle.

Traction Control System Configuration - Front Wheel Drive (FWD)

The traction control system, for front wheel drive (FWD) vehicles, is contained in the PCM and is configured when the PCM is configured. Refer to Programmable Module Installation in **MODULE CONFIGURATION** article.

Traction Control System Configuration - All Wheel Drive (AWD)

Traction control system configuration is not required on all wheel drive (AWD) vehicles.

Inspection and Verification

1. Verify the customer concern.
2. Verify the stoplamps operate correctly by pressing and releasing the brake pedal with the ignition switch in the ON position. If the stoplamps do not operate correctly, refer to **EXTERIOR LIGHTING** article. If the stoplamps operate correctly, proceed to the next step.
3. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Incorrectly inflated tires
• Mismatched wheels or tires on vehicle
• Base brake system
• Wheel speed sensor
• Wheel speed sensor tone ring
• Hydraulic control unit (HCU)
	• Battery junction box (BJB) fuse(s):
	  ○ 8 (40A)
	  ○ 10 (20A)
	  ○ 49 (15A)
	• Smart junction box (SJB) fuse 28 (10A)
	• Wiring, terminals or connectors
	• Stoplamp switch
	• Traction control switch

	• Wheel speed sensors • ABS module

4. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

5. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

6. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
8. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
9. Clear the continuous DTCs and carry out the self-test diagnostics for the ABS module.
10. If the DTCs retrieved are related to the concern, go to the ABS Module DTC Chart or the Instrument Cluster DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
11. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

ABS MODULE DTC CHART

DTCs	Description	Source	Action
B1342	ECU is Faulted	ABS Module	CLEAR the DTCs. RETRIEVE the DTCs. REPEAT the self-test. If other DTCs are retrieved, ADDRESS those DTCs before addressing DTC B1342. If only DTC B1342 is retrieved, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. REPEAT the self-test.

B1483	Brake Pedal Input Open Circuit	ABS Module	Go to **Pinpoint Test A**.
B1676	Battery Pack Voltage Out of Range	ABS Module	Go to **Pinpoint Test B**.
B2900	VIN Mismatch	ABS Module	If DTC U1900 is also present, REPAIR that DTC before repairing B2900. VERIFY the vehicle information number (VIN) information retrieved by the scan tool matches the VIN tag on the vehicle. If the VIN does not match, RECONFIGURE the PCM. CLEAR the DTC. REPEAT the self-test. If the VIN matches, INSTALL a new ABS module. CLEAR the DTC. REPEAT the self-test.
C1095	ABS Hydraulic Pump Motor Circuit Failure	ABS Module	Go to **Pinpoint Test E**.
C1145	Wheel Speed Sensor RF Input Circuit Failure	ABS Module	Go to **Pinpoint Test C**.
C1155	Wheel Speed Sensor LF Input Circuit Failure	ABS Module	Go to **Pinpoint Test C**.
C1165	Wheel Speed Sensor RR Input Circuit Failure	ABS Module	Go to **Pinpoint Test C**.
C1175	Wheel Speed Sensor LR Input Circuit Failure	ABS Module	Go to **Pinpoint Test C**.
C1233	Wheel Speed LF Signal Fault	ABS Module	Go to **Pinpoint Test D**.
C1234	Wheel Speed RF Signal Fault	ABS Module	Go to **Pinpoint Test D**.
C1235	Wheel Speed RR Signal Fault	ABS Module	Go to **Pinpoint Test D**.
C1236	Wheel Speed LR Signal Fault	ABS Module	Go to **Pinpoint Test D**.
C1288	Pressure Sensor Main/Primary Input Circuit Failure	ABS Module	CLEAR the DTCs. REPEAT the self-test. If DTC C1288 is present, make sure all HCU and ABS module fasteners are tightened to their correct torque specification. If all fasteners are tightened to their correct torque specification, INSTALL a new HCU. REFER to **Hydraulic Control Unit (HCU)**.
C1440	Pressure Sensor Main/Primary Signal Faulted	ABS Module	CLEAR the DTCs. REPEAT the self-test. If DTC C1440 is present, make sure all HCU and ABS module fasteners are tightened to their correct torque specification. If all fasteners are tightened to their correct torque specification, INSTALL a new HCU. REFER to **Hydraulic Control Unit (HCU)**.
C1805	Mismatched PCM and/or ABS Module	ABS Module	If DTC U1900 is also present, REPAIR that DTC before repairing C1805. The messages received by the ABS module from the PCM do not match what the ABS module is expecting. VERIFY that the ABS module

			installed is the correct module for the vehicle configuration. If the ABS module is OK, RECONFIGURE the PCM as necessary. FOLLOW the scan tool directions. CLEAR the DTC. REPEAT the self-test.
U1900	CAN communication Bus Fault - Receive Error	ABS Module	REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the high-speed controller area network (HS-CAN) bus.
U2050	No Application Present	ABS Module	VERIFY that the ABS module installed is the correct module for the vehicle configuration. If the ABS module is OK, CLEAR the DTCs. CARRY OUT the self-test, RETRIEVE and RECORD any DTCs. If DTC U2050 is retrieved again, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CLEAR the DTC. REPEAT the self-test.
U2023	One or More Calibration Files Missing or Corrupt	ABS Module	Invalid data has been received by the ABS module from another module. REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the HS-CAN bus.

INSTRUMENT CLUSTER DTC CHART

DTC	Description	Source	Action
C1093	Traction Control Disable Switch Circuit Failure	Instrument Cluster	Go to **Pinpoint Test G**.
-	All Other Instrument Cluster DTCs	Instrument Cluster	REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the ABS module	• Fuse • Wiring, terminals or connectors • ABS module	• REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication problem.
• No communication with the instrument cluster	• Wiring, terminals or connectors • Instrument cluster	• REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication problem.
	• Wiring, terminals or	• REFER to Diagnosis and Testing in

• The red brake warning indicator is always/never on	connectors • Brake fluid level switch • Parking brake switch • Instrument cluster	**INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
• The yellow ABS warning indicator is always/never on	• Wiring, terminals or connectors • Instrument cluster • ABS module	• RETRIEVE and RECORD any ABS module DTCs. If DTCs are present, go to the ABS Module DTC Chart. If no DTCs are present, REFER to Diagnosis and Testing in **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
• Spongy brake pedal with no warning indicator	• Air in the brake hydraulic system	• INSPECT the brake pedal and bracket for damage or incorrect installation. REPAIR or INSTALL new as necessary. If the brake pedal and bracket are OK, BLEED the brake system and hydraulic control unit (HCU). REFER to Brake System Bleeding in **BRAKE SYSTEM - GENERAL INFORMATION** article.
• Poor vehicle tracking during anti-lock function	• Air in the hydraulic brake system • HCU	• Go to **Pinpoint Test F**.
	• Base brake system	• REFER to **BRAKE SYSTEM - GENERAL INFORMATION** article.
• Unintended ABS activation with no DTCs present	• Incorrect or worn tires • Underinflated tire(s) • Suspension components • Missing, damaged or misaligned wheel speed sensor tone rings	• INSPECT the wheels and tires, front and rear suspension and the wheel speed sensor tone rings. REPAIR or INSTALL new as necessary.
• The traction control indicator is always/never on	• Traction control system • PCM • Instrument cluster	• REFER to Diagnosis and Testing in **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.
• The traction control system is inoperative	• Traction control system is turned off	• VERIFY that the system is turned on. CARRY OUT the ABS module and instrument cluster self-tests. RETRIEVE and RECORD any DTCs. REFER to the ABS Module

		DTC Chart and/or the Instrument Cluster DTC Chart.
	• PCM not configured for traction control (front wheel drive [FWD] only)	• VERIFY that the PCM is configured correctly. REFER to Programmable Module Installation in **MODULE CONFIGURATION** article.
	• ABS wheel speed sensor fault	• CARRY OUT the ABS module self-test. RETRIEVE and RECORD any DTCs. REFER to the ABS Module DTC Chart.
	• High-speed controller area network (HS-CAN) communication bus	• REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication problem.
• The traction control system cannot be disabled	• Wiring, terminals or connectors • Traction control switch • Instrument cluster	• Go to **Pinpoint Test G**.

Pinpoint Tests

Pinpoint Test A: DTC B1483 - Brake Pedal Input Open Circuit

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

Battery junction box (BJB) fuse 49 (15A) supplies fused ignition voltage to the brake pedal position (BPP) switch, along circuit CBP49 (VT/GY), with the ignition switch in the RUN/START position. With the brake pedal released, the switch is closed and voltage is supplied to the ABS module along circuit CES09 (VT/OG). When the brake pedal is applied, the switch opens and the voltage supply is interrupted.

- DTC B1483 Brake Pedal Input Open Circuit - If during normal operation or the on-demand self test, the ABS module detects an open circuit on the BPP switch circuit, DTC B1483 will be set.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- BPP switch
- ABS module

PINPOINT TEST A: DTC B1483 - BRAKE PEDAL INPUT OPEN CIRCUIT

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

A1 CHECK THE STOPLAMPS

- Apply the brake pedal while observing the stoplamps.
- **Do the stoplamps illuminate?**

  YES : Go to A2.

  NO : REFER to **EXTERIOR LIGHTING** article to continue diagnosis of the stoplamps.

A2 CHECK THE VOLTAGE TO THE ABS MODULE

- Key in OFF position.
- Disconnect: ABS Module C135
- Key in ON position.

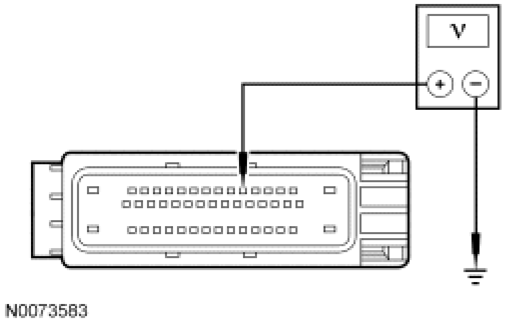

Fig. 1: Checking Voltage To ABS Module
Courtesy of FORD MOTOR CO.

- Measure the voltage between ABS module C135-6, circuit CES09 (VT/OG), harness side and ground with the brake pedal not pressed.
- **Is the voltage greater than 10 volts?**

  YES : Go to A6.

  NO : Go to A3.

A3 CHECK CIRCUIT CES09 (VT/OG) FOR AN OPEN

- Key in OFF position.
- Disconnect: BPP Switch C278

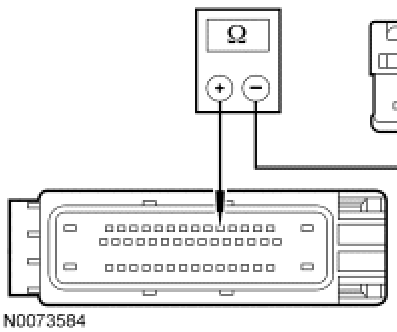

Fig. 2: Checking Circuit CES09 (VT/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between ABS module C135-6, circuit CES09 (VT/OG), harness side and BPP switch C278-3, circuit CES09 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A4.

  NO : REPAIR circuit CES09 (VT/OG). CLEAR the DTC. REPEAT the self-test.

A4 ISOLATE THE BPP SWITCH

- Measure the resistance between BPP switch C278 pin-2 and pin-3, component side, while pressing and releasing the brake pedal.
- **Is the resistance greater than 10,000 ohms with the pedal pressed and less than 5 ohms with the pedal released?**

  YES : Go to A5.

  NO : INSTALL a new BPP switch. REFER to Stoplamp Switch in **EXTERIOR LIGHTING** article. CLEAR the DTC. REPEAT the self-test.

A5 CHECK THE VOLTAGE TO THE BPP SWITCH

- Key in ON position.

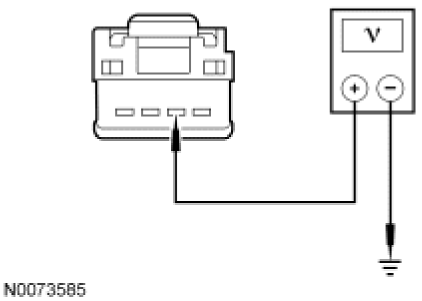

Fig. 3: Checking Voltage To BPP Switch
Courtesy of FORD MOTOR CO.

- Measure the voltage between BPP C278-2, circuit CBP49 (VT/GY), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A6.

NO : VERIFY BJB fuse 49 (15A) is OK. If OK, REPAIR circuit CES09 (VT/OG). CLEAR the DTCs. REPEAT the self-test.

A6 CHECK FOR CORRECT ABS MODULE OPERATION

- Check ABS module C135 for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect: ABS Module C135
- Make sure the connector seats correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: DTC B1676 - Battery Pack Voltage Out of Range

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The operating voltage required to supply the ABS module, hydraulic pump and isolation valves is in a range between 10 and 16 volts.

Fused battery voltage is supplied to the ABS module from battery junction box (BJB) fuse 10 (30A) along circuit SBB10 (YE/RD) and fuse 8 (40A) along circuit SBB08 (VT/RD). Fused ignition voltage is supplied to the ABS module from smart junction box (SJB) fuse 28 (10A) along CBP19 (BN/WH) and ground is provided to the module along circuit GD123 (BK/GY).

- DTC B1676 Battery Pack Voltage Out of Range - If during normal operation, the vehicle battery voltage becomes less than 9.7 volts for more than 210 ms with vehicle speed greater than 20 km/h (12 mph), or the vehicle battery voltage becomes greater than 18 volts, DTC B1676 will be set. Also, if during the ABS module self-test the vehicle battery voltage becomes higher than 18 volts, DTC B1676 will be set.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Charging system
- ABS module

PINPOINT TEST B: DTC B1676 - BATTERY PACK VOLTAGE OUT OF RANGE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

B1 CHECK THE BATTERY VOLTAGE

- Measure the battery voltage between the positive and negative battery terminals with the key ON engine OFF (KOEO), and with the engine running.
- **Is the battery voltage between 10 and 13 volts with KOEO, and between 13 and 16 volts with the engine running?**

  YES : Go to B2.

  NO : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to continue diagnosis of the charging system. CLEAR the DTCs. REPEAT the self-test.

B2 CHECK THE VOLTAGE TO THE ABS MODULE

- Key in OFF position.
- Disconnect: ABS Module C135
- Key in ON position.

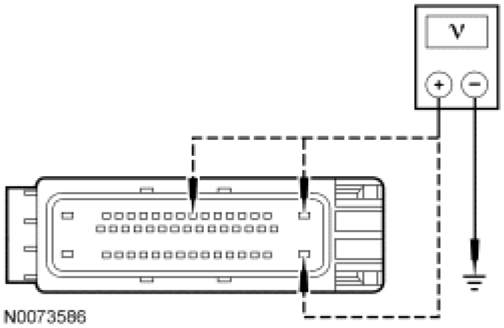

Fig. 4: Measuring Voltage Between ABS Module C155-1, C155-8 & C155-32
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and:
  - ABS module C135-1, SBB36 (GN/RD), harness side.
  - ABS module C135-8, CBP19 (BN/WH), harness side.
  - ABS module C135-32, SBB10 (YE/RD), harness side.
- **Are the voltages greater than 10 volts?**

  YES : Go to B3.

  NO : VERIFY BJB fuse 8 (40A) is OK. If OK, REPAIR circuit SBB08 (VT/RD).

  VERIFY SJB fuse 28 (10A) is OK. If OK, REPAIR circuit CBP19 (BN/WH).

  VERIFY BJB fuse 10 (20A) is OK. If OK, REPAIR circuit SBB10 (YE/RD).

CLEAR the DTCs. REPEAT the self-test.

B3 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN

- Key in OFF position.

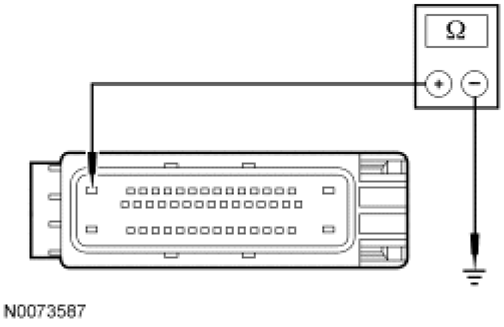

Fig. 5: Measuring Resistance Between ABS Module C155-16, Circuit GD120 (BK/GN) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ABS module C135-16, circuit GD123 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : CLEAR the DTCs. REPEAT the self-test. If DTC B1676 is retrieved again, go to B4.

  NO : REPAIR circuit GD123 (BK/GY). CLEAR the DTCs. REPEAT the self-test.

B4 CHECK FOR CORRECT ABS MODULE OPERATION

- Check ABS module C135 for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect: ABS Module C135
- Make sure the connector seats correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: DTCs C1145, C1155, C1165 and C1175 - Wheel Speed Sensor Input Circuit Failure

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

Active wheel speed sensors generate a square wave signal that is sent to the ABS module. The wheel speed sensor circuitry connects to the ABS module through 2 wires and a connector at each wheel speed sensor. When the ignition switch is turned to the RUN position, the ABS module carries out a self-test by sending a reference voltage through the wheel speed sensors and their circuitry to determine if they are functional.

Voltage and ground signals are supplied to the wheel speed sensors from the ABS module.

DTC Description	Fault Trigger Condition
• DTC C1145 RF Wheel Speed Sensor Input Circuit Failure • DTC C1155 LF Wheel Speed Sensor Input Circuit Failure • DTC C1165 RR Wheel Speed Sensor Input Circuit Failure • DTC C1175 LR Wheel Speed Sensor Input Circuit Failure	When the vehicle speed exceeds 5 km/h (3 mph), if the ABS module detects an open, short to ground or voltage or a defective wheel speed sensor input circuit, the appropriate DTC will be set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Wheel speed sensor ring (part of the wheel bearing and hub assembly)
- Wheel speed sensors
- ABS module

PINPOINT TEST C: DTCs C1145, C1155, C1165 AND C1175 - WHEEL SPEED SENSOR INPUT CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

C1 CHECK FOR FAULT REPEATABILITY

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Clear the Continuous DTCs
- Drive the vehicle at least 16 km/h (10 mph).
- Retrieve and document continuous DTCs.
- **Is DTC C1145, C1155, C1165 or C1175 retrieved?**

  YES : If the active wheel speed sensor tool is available, go to C2. If the active wheel speed sensor tool is not available, go to C4.

  NO : INSPECT the wheel speed sensors, wheel speed sensor wiring and wheel speed sensor tone

rings. REPAIR or INSTALL new as necessary. If any other DTCs are retrieved, go to the ABS Module DTC Chart.

C2 CHECK THE ABS MODULE OUTPUT USING THE SPECIAL TOOL

- Key in OFF position.
- Disconnect: Suspect Wheel Speed Sensor
- Connect the special tool to the wheel speed sensor connectors.
- Key in ON position.
- Select the correct system polarity on the special tool and turn the special tool power switch to the ON position.
- **Is the module output LED illuminated?**

  YES : Go to C3.

  NO : Go to C6.

C3 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE SPECIAL TOOL

- Raise the suspect wheel until it can spin freely. Refer to **JACKING AND LIFTING** article.
- While monitoring the special tool, slowly spin the suspect wheel.
- **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**

  YES : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

  NO : If the current level LED is not illuminated and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. For the front wheel speed sensor, REFER to **Wheel Speed Sensor - Front**. For the rear wheel speed sensor, REFER to **Wheel Speed Sensor - Rear, Front Wheel Drive (FWD)** or **Wheel Speed Sensor - Rear, All Wheel Drive (AWD)**. CLEAR the DTCs. REPEAT the self-test.

  If the current level LED is not illuminated and the sensor output LEDs illuminate green but do not flash, INSPECT the wheel speed sensor tone ring and INSTALL new if necessary. If the tone ring is OK, INSTALL a new wheel speed sensor. For the front wheel speed sensor, REFER to **Wheel Speed Sensor - Front**. For the rear wheel speed sensor, REFER to **Wheel Speed Sensor - Rear, Front Wheel Drive (FWD)** or **Wheel Speed Sensor - Rear, All Wheel Drive (AWD)**. CLEAR the DTCs. REPEAT the self-test.

C4 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO VOLTAGE

CAUTION: No measurements should be taken with the wheel speed sensor connected. Damage to the wheel speed sensor will result.

NOTE: Both circuits must be checked for each DTC.

- Key in OFF position.
- Disconnect: ABS Module C135
- Disconnect: Suspect Wheel Speed Sensor

- Key in ON position.
- **For DTC C1145** , measure the voltage between ground and:
  - ABS module C135-34, circuit VCA05 (GY/VT), harness side.
  - ABS module C135-33, circuit RCA19 (VT), harness side.
- **For DTC C1155** , measure the voltage between ground and:
  - ABS module C135-45, circuit VCA03 (VT/WH), harness side.
  - ABS module C135-46, circuit RCA17 (YE), harness side.
- **For DTC C1165** , measure the voltage between ground and:
  - ABS module C135-43, circuit VCA06 (WH/OG), harness side.
  - ABS module C135-42, circuit RCA20 (BN), harness side.
- **For DTC C1175** , measure the voltage between ground and:
  - ABS module C135-36, circuit VCA04 (BU/OG), harness side.
  - ABS module C135-37, circuit RCA18 (BN/GN), harness side.
- **Is voltage present?**

  YES : REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

  NO : Go to C5.

C5 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO GROUND

NOTE: Both circuits must be checked for each DTC.

- Key in OFF position.
- **For DTC C1145** , measure the resistance between ground and:
  - ABS module C135-34, circuit VCA05 (GY/VT), harness side.
  - ABS module C135-33, circuit RCA19 (VT), harness side.
- **For DTC C1155** , measure the resistance between ground and:
  - ABS module C135-45, circuit VCA03 (VT/WH), harness side.
  - ABS module C135-46, circuit RCA17 (YE), harness side.
- **For DTC C1165** , measure the resistance between ground and:
  - ABS module C135-43, circuit VCA06 (WH/OG), harness side.
  - ABS module C135-42, circuit RCA20 (BN), harness side.
- **For DTC C1175** , measure the resistance between ground and:
  - ABS module C135-36, circuit VCA04 (BU/OG), harness side.
  - ABS module C135-37, circuit RCA18 (BN/GN), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to C6.

  NO : REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

C6 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR AN OPEN

NOTE: Both circuits must be checked for each DTC.

- Key in OFF position.
- Disconnect: ABS Module C135
- Disconnect: Suspect Wheel Speed Sensor
- **For DTC C1145** , measure the resistance between:
  - ABS module C135-34, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side.
  - ABS module C135-33, circuit RCA19 (VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.
- **For DTC C1155** , measure the resistance between:
  - ABS module C135-45, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side.
  - ABS module C135-46, circuit RCA17 (YE), harness side and LF wheel speed sensor C150-2, circuit RCA17 (YE), harness side.
- **For DTC C1165** , measure the resistance between:
  - ABS module C135-43, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-3, circuit VCA06 (WH/OG), harness side.
  - ABS module C135-42, circuit RCA20 (BN), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side.
- **For DTC C1175** , measure the resistance between:
  - ABS module C135-36, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-3, circuit VCA04 (BU/OG), harness side.
  - ABS module C135-37, circuit RCA18 (BN/GN), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to C7.

  NO : REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the ABS self-test.

C7 CHECK FOR SHORTED WHEEL SPEED SENSOR CIRCUITS

- **For DTC C1145** , measure the resistance between:
  - RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.
- **For DTC C1155** , measure the resistance between:
  - LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-2, circuit RCA17 (YE), harness side.
- **For DTC C1165** , measure the resistance between:
  - RR wheel speed sensor C426-3, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side.
- **For DTC C1175** , measure the resistance between:
  - LR wheel speed sensor C440-3, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.

- **Are the resistances greater than 10,000 ohms?**

  YES : Go to C8.

  NO : REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

C8 CHECK THE ABS MODULE OUTPUT

- Connect: ABS Module C135
- Key in ON position.
- **For DTC C1145** , measure the voltage between:
  - RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.
- **For DTC C1155** , measure the voltage between:
  - LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-2, circuit RCA17 (YE), harness side.
- **For DTC C1165** , measure the voltage between:
  - RR wheel speed sensor C426-3, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side.
- **For DTC C1175** , measure the voltage between:
  - LR wheel speed sensor C440-3, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.
- **Are the voltages greater than 10 volts?**

  YES : INSTALL a new wheel speed sensor. REFER to **Wheel Speed Sensor - Front**, **Wheel Speed Sensor - Rear, All Wheel Drive (AWD)** or **Wheel Speed Sensor - Rear, Front Wheel Drive (FWD)**. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to C9.

C9 CHECK FOR CORRECT ABS MODULE OPERATION

- Key in OFF position.
- Disconnect: ABS Module C135
- Check the connector for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect: ABS Module C135
- Make sure the connector seats correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: DTCs C1233, C1234, C1235 and C1236 - Wheel Speed Sensor Signal Fault

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The wheel speed sensor and sensor ring generate a square wave signal to the ABS module that is proportional to the wheel speed. The ABS module compares the wheel speed inputs from all the wheel speed sensors to determine an impending wheel lockup.

DTC Description	Fault Trigger Condition
• DTC C1233 LF Wheel Speed Sensor Signal Fault • DTC C1234 RF Wheel Speed Sensor Signal Fault • DTC C1235 RR Wheel Speed Sensor Signal Fault • DTC C1236 LR Wheel Speed Sensor Signal Fault	When the vehicle speed exceeds 15 km/h (9 mph), if the ABS module does not receive a signal from the wheel speed sensor, the appropriate DTC will be set. These DTCs can also be set by an excessive wheel speed sensor-to-tone ring air gap or a damaged tone ring

This pinpoint test is intended to diagnose the following:

- Mismatched tire sizes
- Wheel speed sensor ring (part of the wheel bearing and hub assembly)
- Wheel speed sensor
- ABS module

PINPOINT TEST D: DTCs C1233, C1234, C1235 AND C1236 - WHEEL SPEED SENSOR SIGNAL FAULT

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

D1 CHECK THE DTCs FROM THE SELF-TEST

- Using the recorded results from the ABS module self-test:
- **Are DTCs C1145, C1155, C1165 or C1175 present?**

YES : Go to **Pinpoint Test C**.

NO : Go to D2.

D2 MONITOR THE WHEEL SPEED SENSOR PIDs

- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: ABS DataLogger

- Using the scan tool, monitor the following PIDS while driving the vehicle at a constant speed.
  - Left front wheel speed sensor (LF_WSPD)
  - Right front wheel speed sensor (RF_WSPD)
  - Left rear wheel speed sensor (LR_WSPD)
  - Right rear wheel speed sensor (RR_WSPD)
- **Are all wheel speed sensor PID values similar?**

  YES : CLEAR the DTCs. DRIVE the vehicle. RETRIEVE the DTCs. If DTC C1233, C1234, C1235 or C1236 is present, go to D12.

  NO : If the active wheel speed sensor is available, go to D3.

  If the active wheel speed sensor tool is not available, go to D6.

D3 CHECK THE ABS MODULE OUTPUT USING THE SPECIAL TOOL

- Key in OFF position.
- Disconnect: Suspect Wheel Speed Sensor
- Connect the special tool to the wheel speed sensor connectors.
- Key in ON position.
- Select the correct system polarity on the special tool and turn the special tool power switch to the ON position.
- **Is the module output LED illuminated?**

  YES : Go to D5.

  NO : Go to D4.

D4 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR AN OPEN

NOTE: Both circuits must be checked for each DTC.

- Key in OFF position.
- Disconnect: ABS Module C135
- **For DTC C1233** : measure the resistance between:
  - ABS module C135-45, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side.
  - ABS module C135-46, circuit RCA17 (YE), harness side and LF wheel speed sensor C150-2, circuit RCA17 (YE), harness side.
- **For DTC C1234** : measure the resistance between:
  - ABS module C135-34, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side.
  - ABS module C135-33, circuit RCA19 (VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.
- **For DTC C1235** : measure the resistance between:
  - ABS module C135-43, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor

C426-3, circuit VCA06 (WH/OG), harness side.
    - ABS module C135-42, circuit RCA20 (BN), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side.
- **For DTC C1236** : measure the resistance between:
    - ABS module C135-36, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-3, circuit VCA04 (BU/OG), harness side.
    - ABS module C135-37, circuit RCA18 (BN/GN), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to D12.

  NO : REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test.

D5 CHECK THE WHEEL SPEED SENSOR OUTPUT WITH THE SPECIAL TOOL

- Raise the suspect wheel until it can spin freely. Refer to **JACKING AND LIFTING** article.
- While monitoring the special tool, slowly spin the suspect wheel.
- **Do the sensor output LEDs illuminate and flash and is the current overload LED not illuminated?**

  YES : INSPECT the wheel speed sensor tone ring for damage and looseness. INSTALL new components as necessary. If the tone ring is OK, the concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

  NO : If the current level LED is not illuminated and the sensor output LEDs do not illuminate or if the current level LED is illuminated red, INSTALL a new wheel speed sensor. For the front wheel speed sensor, REFER to **Wheel Speed Sensor - Front**. For the rear wheel speed sensor, REFER to **Wheel Speed Sensor - Rear, Front Wheel Drive (FWD)** or **Wheel Speed Sensor - Rear, All Wheel Drive (AWD)**. CLEAR the DTCs. REPEAT the self-test.

  If the current level LED is not illuminated and the sensor output LEDs illuminate green but do not flash, INSPECT the wheel speed sensor tone ring and INSTALL new if necessary. If the tone ring is OK, INSTALL a new wheel speed sensor. For the front wheel speed sensor, REFER to **Wheel Speed Sensor - Front**. For the rear wheel speed sensor, REFER to **Wheel Speed Sensor - Rear, Front Wheel Drive (FWD)** or **Wheel Speed Sensor - Rear, All Wheel Drive (AWD)**. CLEAR the DTCs. REPEAT the self-test.

D6 CHECK FOR CORRECT ABS MODULE OUTPUT

- Key in OFF position.
- Disconnect: Suspect Wheel Speed Sensor
- Key in ON position.
- **For DTC C1233** , measure the voltage between:
    - RF wheel speed sensor C160-1, circuit VCA05 (GY/VT), harness side and RF wheel speed sensor C160-2, circuit RCA19 (VT), harness side.
- **For DTC C1234** , measure the voltage between:
    - LF wheel speed sensor C150-1, circuit VCA03 (VT/WH), harness side and LF wheel speed sensor C150-2, circuit RCA17 (YE), harness side.

- **For DTC C1235** , measure the voltage between:
  - RR wheel speed sensor C426-3, circuit VCA06 (WH/OG), harness side and RR wheel speed sensor C426-1, circuit RCA20 (BN), harness side.
- **For DTC C1236** , measure the voltage between:
  - LR wheel speed sensor C440-3, circuit VCA04 (BU/OG), harness side and LR wheel speed sensor C440-1, circuit RCA18 (BN/GN), harness side.
- **Are the voltages greater than 10 volts?**

  YES : INSTALL a new wheel speed sensor. REFER to **Wheel Speed Sensor - Front**, **Wheel Speed Sensor - Rear, All Wheel Drive (AWD)** or **Wheel Speed Sensor - Rear, Front Wheel Drive (FWD)**. CLEAR the DTCs. REPEAT the self-test.

  NO : Go to D7.

D7 INSPECT THE WHEEL SPEED SENSOR MOUNTING

- Key in OFF position.
- With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article.
- Inspect the suspect wheel speed sensor(s) for looseness.
- **Is the wheel speed sensor(s) loose?**

  YES : TIGHTEN the wheel speed sensor bolt to specification. REFER to **SPECIFICATIONS**.

  NO : Go to D8.

D8 INSPECT THE WHEEL SPEED SENSOR FOR DAMAGE

CAUTION: **Inspect the wheel speed sensor wire carefully with a good light source. Failure to verify damage in the wheel speed sensor wire can lead to unnecessary installation of a new component.**

- Inspect the suspect wheel speed sensor(s) for general damage.
- **Is the wheel speed sensor(s) OK?**

  YES : Go to D9.

  NO : INSTALL a new wheel speed sensor. REFER to **Wheel Speed Sensor - Front**, **Wheel Speed Sensor - Rear, All Wheel Drive (AWD)** or **Wheel Speed Sensor - Rear, Front Wheel Drive (FWD)**. CLEAR the DTCs. REPEAT the self-test.

D9 INSPECT THE WHEEL SPEED SENSOR RING FOR DAMAGE

- Remove the suspect wheel speed sensor(s). Refer to **Wheel Speed Sensor - Front**, **Wheel Speed Sensor - Rear, All Wheel Drive (AWD)** or **Wheel Speed Sensor - Rear, Front Wheel Drive (FWD)**.
- Inspect the suspect wheel speed sensor ring(s) for damage or missing teeth. Rotate the wheel to verify that no teeth are missing.
- **Is the wheel speed sensor ring(s) OK?**

  YES : Go to D10.

  NO : INSTALL new wheel bearing and wheel hubs as necessary. REFER to **FRONT SUSPENSION** article for the front wheel bearing and wheel hub or **REAR SUSPENSION** article for the rear wheel bearing and wheel hub.

D10 INSPECT THE WHEEL BEARINGS FOR DAMAGE

- Inspect the wheel bearings for damage.
- **Are the wheel bearings OK?**

  YES : Go to D11.

  NO : INSTALL new wheel bearing and wheel hubs as necessary. REFER to **FRONT SUSPENSION** article for the front wheel bearing and wheel hub or **REAR SUSPENSION** article for the rear wheel bearing and wheel hub.

D11 RECHECK THE WHEEL SPEED SENSOR PIDs

- Connect: Suspect Wheel Speed Sensor
- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: ABS DataLogger
- Using the scan tool, monitor the following PIDS while driving the vehicle at a constant speed.
  - Left front wheel speed sensor (LF_WSPD)
  - Right front wheel speed sensor (RF_WSPD)
  - Left rear wheel speed sensor (LR_WSPD)
  - Right rear wheel speed sensor (RR_WSPD)
- **Are all wheel speed sensor PID values similar?**

  YES : The vehicle is OK. The concern may have been caused by a loose or damaged wheel speed sensor, a damaged wheel speed sensor ring or a damaged wheel bearing.

  NO : Go to D9.

D12 CHECK FOR CORRECT ABS MODULE OPERATION

- Key in OFF position.
- Disconnect: ABS Module C135
- Check the connector for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect: ABS Module C135
- Make sure the connector seats correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSPECT the wheel speed sensor tone ring for damage and looseness. INSTALL new components as necessary. If the tone ring is OK, INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: DTC C1095 - ABS Hydraulic Pump Motor Circuit Failure

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Vehicle Dynamic Systems for schematic and connector information.

Normal Operation

The operating voltage required to supply the hydraulic pump motor is in a range between 10 and 16 volts. Fused battery voltage for the hydraulic pump is supplied to the ABS module from battery junction box (BJB) fuse 8 (40A) SBB08 (VT/RD) along circuit SBB08 (VT/RD). Ground for the hydraulic pump is provided through the ABS module along circuit GD123 (BK/GY).

- DTC C1095 ABS Hydraulic Pump Motor Circuit Failure - If the ABS module detects an open circuit, a short to voltage or ground or a defective internal power transistor during normal operation or the ABS module self-test, DTC C1095 will be set. The ABS module will command the pump motor ON for 100 ms (±6 ms), then command the motor OFF and measure the voltage produced by the motor after 6 ms. If the voltage indicates that the motor is spinning at less than 500 rpm there may be a locked motor. If this condition is detected 4 times, then DTC C1095 will be set. The pump motor is also checked for an open circuit 2 seconds after the most recent successful pump motor off command. If the pump motor feedback remains greater than 0.75 volt for more than 50 ms (±6 ms) after these conditions have been met, then DTC C1095 will be set

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- ABS module

PINPOINT TEST E: DTC C1095 - ABS HYDRAULIC PUMP MOTOR CIRCUIT FAILURE

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

E1 CHECK THE ABS PUMP MOTOR

- Key in ON position.
- **Is the ABS pump motor running all the time?**

  YES : Go to E5.

  NO : Go to E2.

E2 CHECK THE PUMP MOTOR OUTPUT COMMAND (PMP_MOTOR)

- Key in OFF position.
- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: ABS DataLogger
- Toggle the PMP_MOTOR output command ON.
- **Does the ABS pump motor run for approximately 3 seconds?**

YES : TOGGLE the PMP_MOTOR output command OFF. CLEAR the DTCs.

CHECK the yellow ABS warning indicator while driving the vehicle (brakes must not be applied) above 20 km/h (12 mph). If the yellow ABS warning indicator illuminates, RETRIEVE the DTCs.

If DTC C1095 is retrieved, go to E5.

If a different DTC is retrieved, refer to the ABS Module DTC Chart.

If the yellow ABS warning indicator does not illuminate, the system is OK.

NO : TOGGLE the PMP_MOTOR output command OFF. Go to E3 .

E3 CHECK THE VOLTAGE TO THE ABS MODULE

- Key in OFF position.
- Disconnect: ABS Module C135
- Key in ON position.

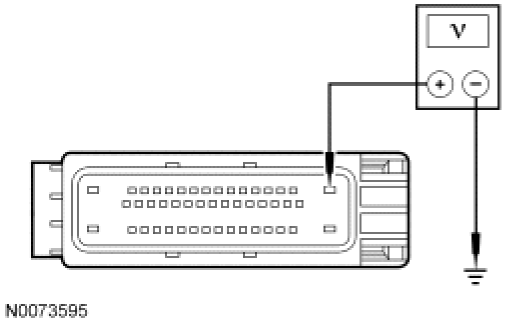

Fig. 6: Measuring Voltage Between ABS Module C155-1, Circuit SBB06 (BN/RD) & Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between ABS module C135-1, circuit SBB08 (VT/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to E4.

  NO : VERIFY BJB fuse 8 (40A) is OK. If OK, REPAIR circuit SBB08 (VT/RD). CLEAR the DTCs. REPEAT the self-test.

E4 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN

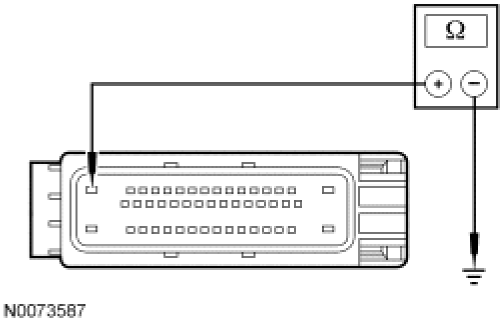

Fig. 7: Measuring Resistance Between ABS Module C155-16, Circuit GD120 (BK/GN) & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ABS module C135-16, circuit GD123 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E5.

  NO : REPAIR circuit GD123 (BK/GY). CLEAR the DTCs. REPEAT the self-test.

E5 CHECK FOR CORRECT ABS MODULE OPERATION

- Key in OFF position.
- Disconnect: ABS Module C135
- Check the connector for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect: ABS Module C135
- Make sure the connector seats correctly, then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new ABS module. REFER to **Anti-Lock Brake System (ABS) Module**. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: Poor Vehicle Tracking During Anti-Lock Function

Normal Operation

The operating voltage required to supply the ABS module, hydraulic pump and isolation valves is in a range between 10 and 16 volts.

Fused battery voltage is supplied to the ABS module from battery junction box (BJB) fuse 10 (30A) along circuit SBB10 (YE/RD) and fuse 8 (40A) along circuit SBB08 (VT/RD). Fused ignition voltage is supplied to

the ABS module from smart junction box (SJB) fuse 28 (10A) along CBP19 (BN/WH) and ground is provided to the module along circuit GD123 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Base brake system
- Hydraulic control unit (HCU)

PINPOINT TEST F: POOR VEHICLE TRACKING DURING ANTI-LOCK FUNCTION

F1 BLEED THE BRAKE SYSTEM

- Bleed the brake system using the scan tool. Refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.
- Test drive the vehicle.
- **Does the vehicle still track poorly?**

  YES : Go to F2.

  NO : The brake system is operating correctly. The concern may have been caused by air in the hydraulic system or a sticky valve.

F2 CHECK THE ABS INLET VALVE (CLOSED POSITION)

- With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article.
- Rotate all the wheels to make sure they rotate freely (the transaxle must be in NEUTRAL).
- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: ABS DataLogger: Left Front Inlet Valve (LF_INLET) Output Command
- Toggle the LF_INLET output command ON.
- Apply moderate brake pedal effort.
- Have an assistant attempt to rotate the LF wheel.
- **Does the LF wheel rotate?**

  YES : TOGGLE the LF_INLET output command OFF. Go to F3.

  NO : TOGGLE the LF_INLET output command OFF. INSTALL a new HCU. REFER to **Hydraulic Control Unit (HCU)**. TEST the system for normal operation.

F3 CHECK THE ABS INLET VALVE (OPEN POSITION)

- Apply moderate brake pedal effort.
- Have an assistant attempt to rotate the LF wheel.
- **Does the LF wheel rotate?**

  YES : INSTALL a new HCU. REFER to **Hydraulic Control Unit (HCU)**. TEST the system for normal operation.

  NO : Go to F4.

F4 CHECK THE ABS OUTPUT VALVE (OPEN POSITION)

- Apply moderate brake pedal effort.

- Enter the following diagnostic mode on the diagnostic tool: ABS DataLogger
- Toggle the left front inlet valve (LF_INLET) output command ON.

NOTE: Each activation of the output command will run the pump for 2 seconds.

- Toggle the hydraulic pump motor (PMP_MOTOR) output command ON for 6 seconds (the trigger must be pressed 3 times).
- Toggle the left front inlet valve (LF_OUTLET) output command ON, then toggle the LF_OUTLET output command. Repeat 3 times.
- Have an assistant attempt to rotate the LF wheel.
- **Does the LF wheel rotate?**

  YES : TOGGLE all output commands OFF. Go to F5.

  NO : TOGGLE all output commands OFF. INSTALL a new HCU. REFER to **Hydraulic Control Unit (HCU)**. TEST the system for normal operation.

F5 CHECK THE ABS INLET AND OUTLET VALVE (CLOSED POSITION)

- Apply moderate brake pedal effort.
- Have an assistant attempt to rotate the LF wheel.
- **Does the LF wheel rotate?**

  YES : INSTALL a new HCU. REFER to **Hydraulic Control Unit (HCU)**. TEST the system for normal operation.

  NO : Beginning with Step F2, REPEAT this procedure for the RF, LR and RR wheels using the appropriate output commands. If no failure occurs the system is operating normally.

Pinpoint Test G: The Traction Control System Cannot Be Disabled

The traction control system can be disabled by pressing the traction control switch located on the instrument panel. When the system is disabled, the traction control system indicator in the instrument cluster will illuminate solidly.

The instrument cluster sends 5 volts to the traction control switch along circuit CCA15 (YE/GY). When the traction control switch is pressed, this voltage is sent through the switch and to ground along circuit GD116 (BK/VT).

When the instrument cluster receives input from the traction control switch, it will send a message over the high-speed controller area network (HS-CAN) bus to the ABS module disabling the traction control. The traction assist system will reset and return to normal operation when the ignition switch is cycled or when the switch is pressed and released a second time during the same ignition cycle.

- DTC C1093 Traction Control Disable Switch Circuit Failure - If the traction control switch closed for more than 2 minutes or if there is a short to ground on circuit CCA15 (YE/GY) during normal operation, DTC C1093 will be set. If the traction control switch closed during the instrument cluster self-test and for more than 2 minutes in during normal operation, DTC C1093 will be set.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Hazard/PAD/traction switch
- Instrument cluster

PINPOINT TEST G: THE TRACTION CONTROL SYSTEM CANNOT BE DISABLED

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multi-meter probes.

G1 CHECK FOR ANY COMMUNICATION DTCs

- Connect the diagnostic tool.
- Key in ON position.
- Check the instrument cluster, the PCM and the ABS module for any communication DTCs.
- **Are any communication DTCs present?**

  YES : For ABS DTCs, go to the ABS Module DTC Chart.

  For instrument cluster and PCM DTCs, REFER to the Master DTC Chart in **MULTIFUNCTION ELECTRONIC MODULES** article.

  NO : Go to G2.

G2 CHECK FOR ANY INSTRUMENT CLUSTER NON-COMMUNICATION DTCs

- Check the instrument cluster for any non-communication DTCs.
- **Is DTC C1093 present?**

  YES : Go to G6.

  NO : If no DTCs are present, go to G3.

  For all other instrument cluster DTCs, REFER to the Master DTC Chart in **MULTIFUNCTION ELECTRONIC MODULES** article.

G3 CHECK FOR VOLTAGE AT THE TRACTION CONTROL SWITCH

- Key in OFF position.
- Disconnect: Hazard/PAD/Traction Switch C2355
- Key in ON position.

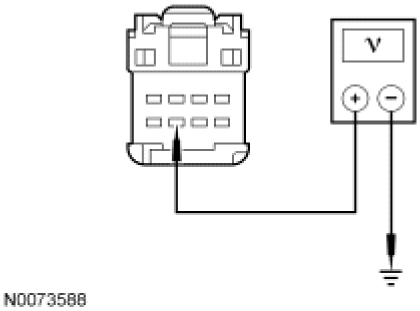

Fig. 8: Checking Voltage At Traction Control Switch
Courtesy of FORD MOTOR CO.

- Measure the voltage between hazard/PAD/traction switch C2355-7, circuit CCA15 (YE/GY), harness side and ground.
- **Is the voltage approximately 5 volts?**

  YES : Go to G4.

  NO : Go to G5.

G4 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

- Key in OFF position.

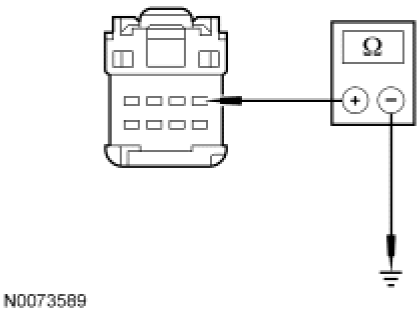

Fig. 9: Checking Circuit GD116 (BK/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between hazard/PAD/traction switch C2355-1, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to G7.

  NO : REPAIR circuit GD116 (BK/VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

G5 CHECK CIRCUIT CCA15 (YE/GY) FOR AN OPEN

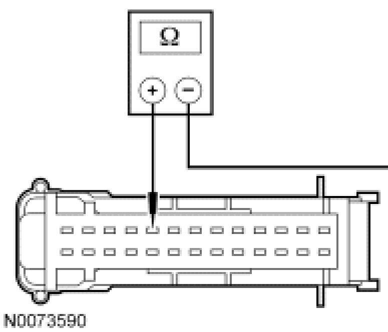

Fig. 10: Checking Circuit CCA15 (YE/GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between hazard/PAD/traction switch C2355-7, circuit CCA15 (YE/GY), harness side and instrument cluster C220-22, circuit CCA15 (YE/GY), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to G6.

  NO : REPAIR circuit CCA15 (YE/GY). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

G6 CHECK CIRCUIT CCA15 (YE/GY) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: Instrument Cluster C220

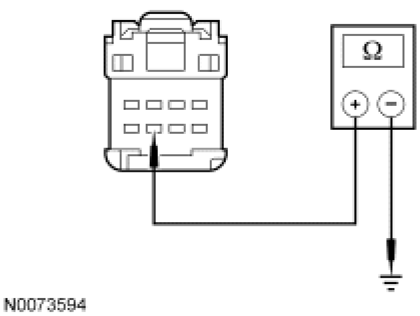

Fig. 11: Checking Circuit CCA15 (YE/GY) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between hazard/PAD/traction switch C2355-7, circuit CCA15 (YE/GY), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to G7.

  NO : REPAIR circuit CCA15 (YE/GY). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

G7 CHECK THE TRACTION CONTROL SWITCH

- Measure the resistance between hazard/PAD/traction switch C2355-7, component side and hazard/PAD/traction switch C2355-1, component side, while pressing and releasing the traction

control switch.

- **Is the resistance less than 5 ohms with the switch pressed and greater than 10,000 ohms with the switch released?**

  YES : Go to G8.

  NO : INSTALL a new hazard/PAD/traction switch. REFER to **EXTERIOR LIGHTING** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

G8 CHECK THE INSTRUMENT CLUSTER CONNECTORS

- Key in OFF position.
- Disconnect: Instrument Cluster C220
- Check the connector for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.
- Connect: Instrument Cluster C220
- Make sure the connector is seated correctly then operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new instrument cluster. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

REMOVAL AND INSTALLATION

HYDRAULIC CONTROL UNIT (HCU)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

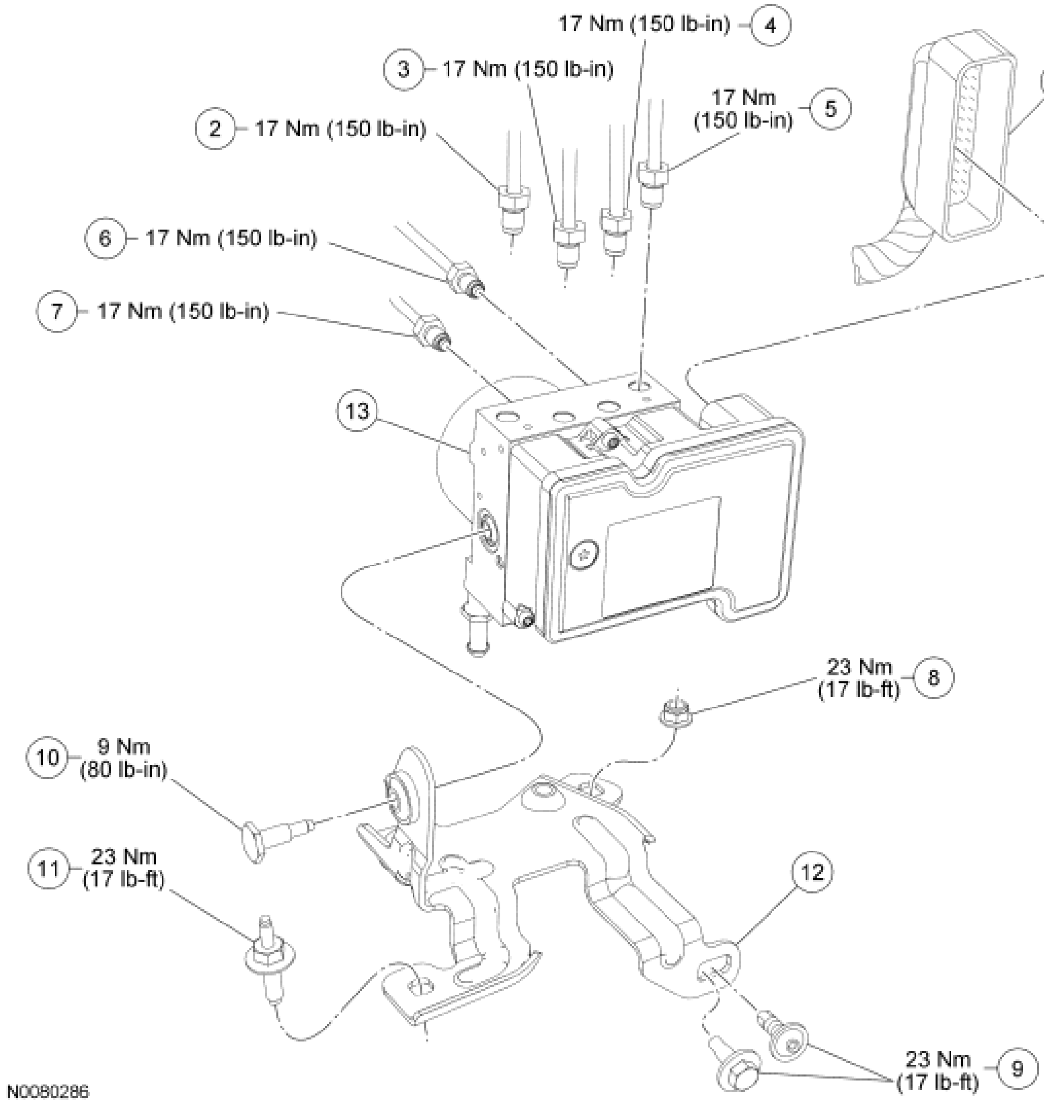

Fig. 12: Exploded View Of Hydraulic Control Unit (HCU) With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	ABS module electrical connector (part of 14290)
2	-	Master cylinder secondary brake tube fitting (part of 2C360)
3	-	RH front brake tube fitting (part of 2263)
4	-	Rear back pressure valve brake tube fitting (part of 2C360)
5	-	Master cylinder primary brake tube fitting (part of 2C360)
6	-	Rear back pressure valve brake tube fitting (part of 2C360)
7	-	LH front brake tube fitting (part of 2C360)
8	W520102	Hydraulic control unit (HCU) bracket-to-frame nut
9	W505433	HCU bracket-to-frame bolt (hex head) (2.3L and 3.0L)
9	W712710	HCU bracket-to-frame bolt (Torx head) (3.5L only)

10	2C398	HCU bracket-to-HCU bolt
11	W704925	HCU bracket-to-frame stud bolt
12	2C304	HCU bracket
13	2C346	HCU

REMOVAL AND INSTALLATION

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the degas bottle. For additional information, refer to **ENGINE COOLING** article.
2. Disconnect the ABS module electrical connector.
3. Disconnect the brake tube fittings.
   - To install, tighten to 17 Nm (150 lb-in).
4. Remove the hydraulic control unit (HCU) bracket-to-frame nut.
   - To install, tighten to 23 Nm (17 lb-ft).

NOTE: If installing a new bolt, use only the Torx head type for vehicles equipped with a 3.5L engine.

5. Remove the HCU bracket-to-frame bolt.
   - To install, tighten to 23 Nm (17 lb-ft).
6. Remove the HCU bracket-to-frame stud.
   - To install, tighten to 23 Nm (17 lb-ft).
7. Remove the HCU and bracket.
8. Remove the HCU bracket-to-HCU bolt and remove the bracket.
   - To install, tighten to 9 Nm (80 lb-in).

NOTE: Make sure the HCU and ABS module are clean and free of any brake fluid or foreign material before separating the components.

9. To install, reverse the removal procedure.
   - Bleed the brake system. For additional information, refer to **BRAKE SYSTEM - GENERAL INFORMATION** article.

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

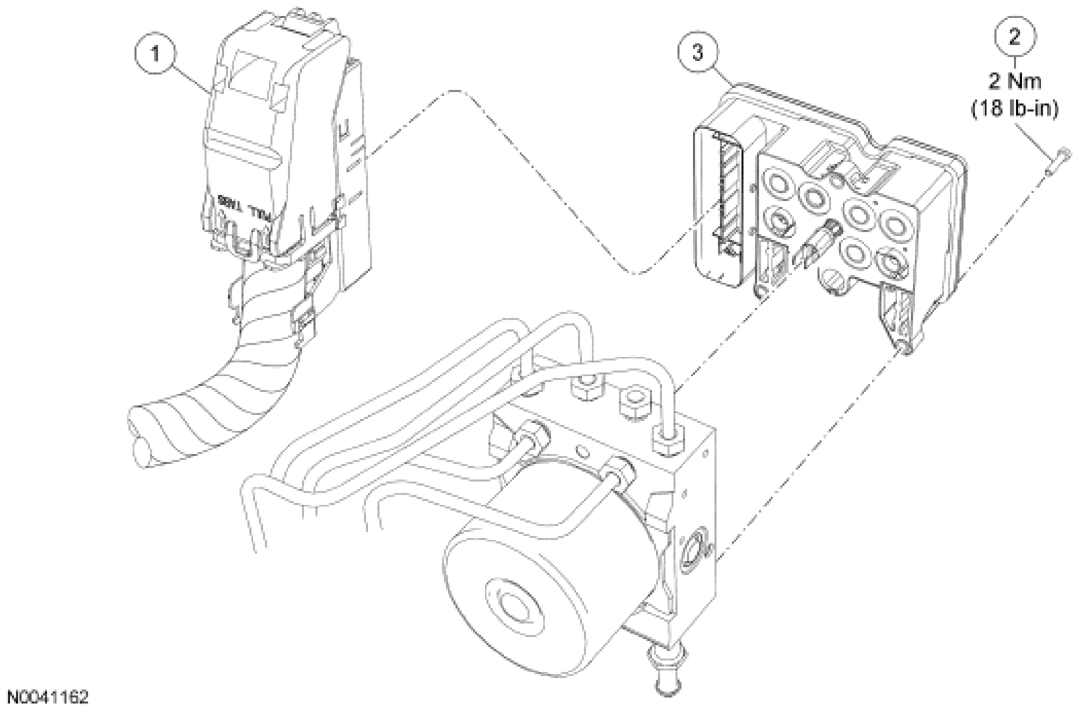

Fig. 13: Exploded View Of Anti-Lock Brake System (ABS) Module With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	ABS module electrical connector (part of 14290)
2	2M101	ABS module screw (3 required)
3	2C219	ABS module

REMOVAL AND INSTALLATION

CAUTION: Electronic modules are sensitive to electrical charges. The anti-lock brake system (ABS) module can be damaged if exposed to these charges.

CAUTION: Do not allow any brake fluid or foreign material to enter the mating side of the anti-lock brake system (ABS) module or damage to the solenoids can occur.

1. Remove the degas bottle. For additional information, refer to **ENGINE COOLING** article.
2. Disconnect the ABS module electrical connector.
3. Remove the 3 ABS module screws and the ABS module.
   - To install, tighten to 2 Nm (18 lb-in).

NOTE: Visually inspect the ABS module terminals for damage before installation.

4. To install, reverse the removal procedure.

WHEEL SPEED SENSOR - FRONT

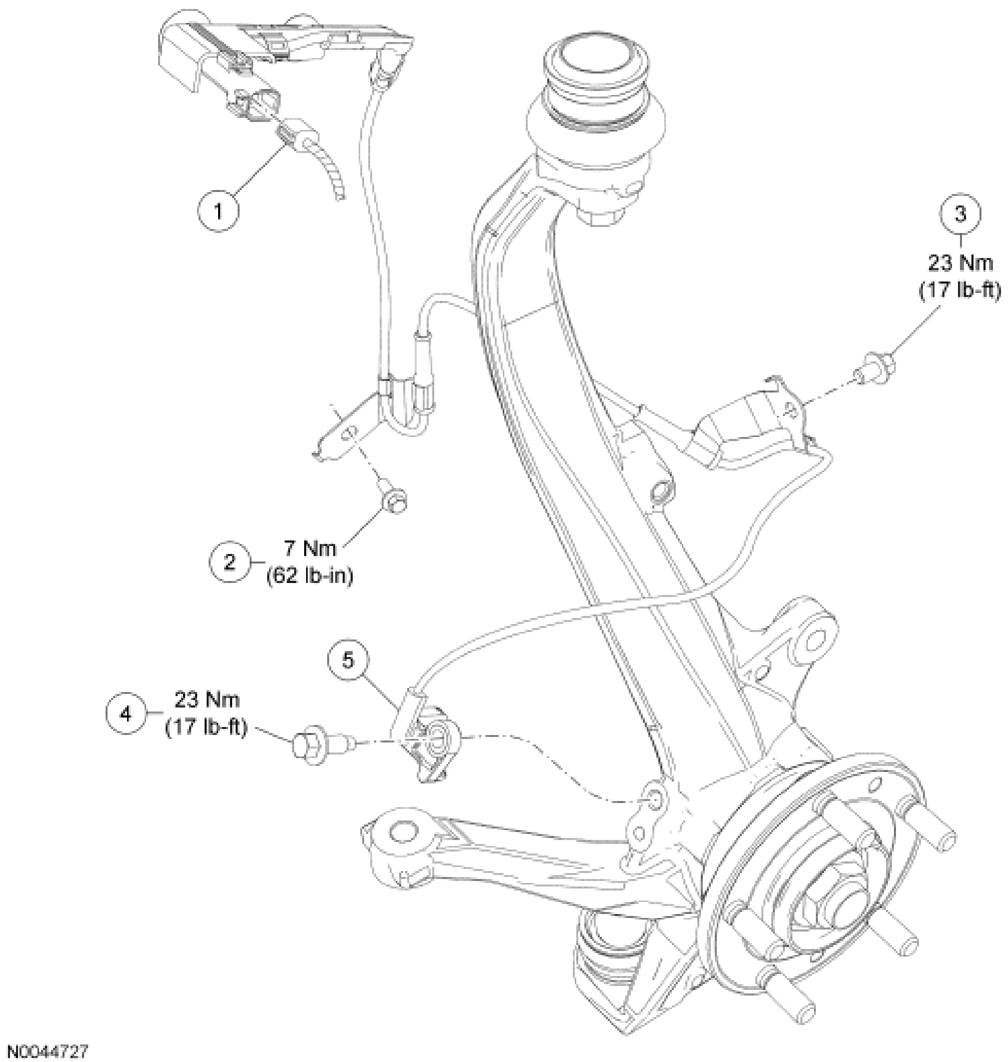

Fig. 14: Exploded View Of Front Wheel Speed Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Wheel speed sensor electrical connector (part of 14A227)
2	W500020	Wheel speed sensor harness bracket-to-body bolt
3	-	Wheel speed sensor harness bracket-to-wheel knuckle bolt
4	W500222	Wheel speed sensor bolt
5	2C204 RH/ 2C205 LH	Wheel speed sensor

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the retainers and position the fender splash shield aside.
3. Disconnect the wheel speed sensor electrical connector.
4. Remove the 2 wheel speed sensor harness bracket bolts.
   - To install:
     - Tighten the bracket-to-wheel knuckle bolt to 23 Nm (17 lb-ft).
     - Tighten the bracket-to-body bolt to 7 Nm (62 lb-in).
5. Remove the front wheel speed sensor bolt from the knuckle and remove the wheel speed sensor.
   - To install, tighten to 23 Nm (17 lb-ft).
6. To install, reverse the removal procedure.

WHEEL SPEED SENSOR - REAR, FRONT WHEEL DRIVE (FWD)

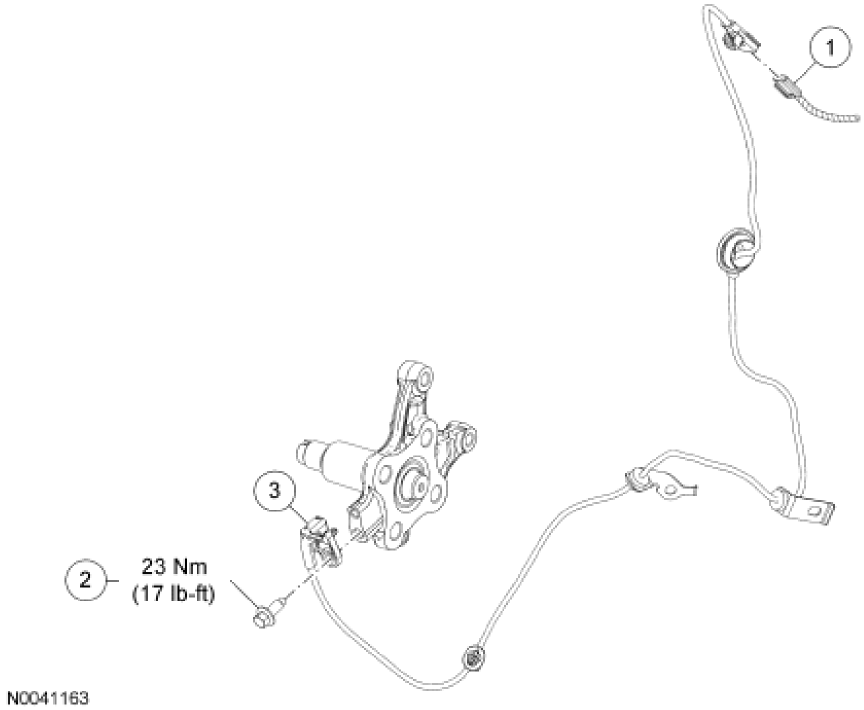

Fig. 15: Exploded View Of Rear Wheel Speed Sensor With Torque Specification - Front Wheel Drive (FWD)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Wheel speed sensor electrical connector (part of 14A227)
2	W500222	Wheel speed sensor bolt
3	2C186 RH/ 2C187 LH	Wheel speed sensor

REMOVAL AND INSTALLATION

1. Remove the rear seat bolster. For additional information, refer to **SEATING** article.
2. Disconnect the wheel speed sensor electrical connector.
3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
4. Using a suitable tool, disconnect the grommet from the body.

NOTE: It is not necessary to remove the harness routing brackets.

5. Disconnect the wheel speed sensor harness from the brackets.
6. Remove the wheel speed sensor wire bolt and the wheel speed sensor.
   - To install, tighten to 23 Nm (17 lb-ft).
7. To install, reverse the removal procedure.

WHEEL SPEED SENSOR - REAR, ALL WHEEL DRIVE (AWD)

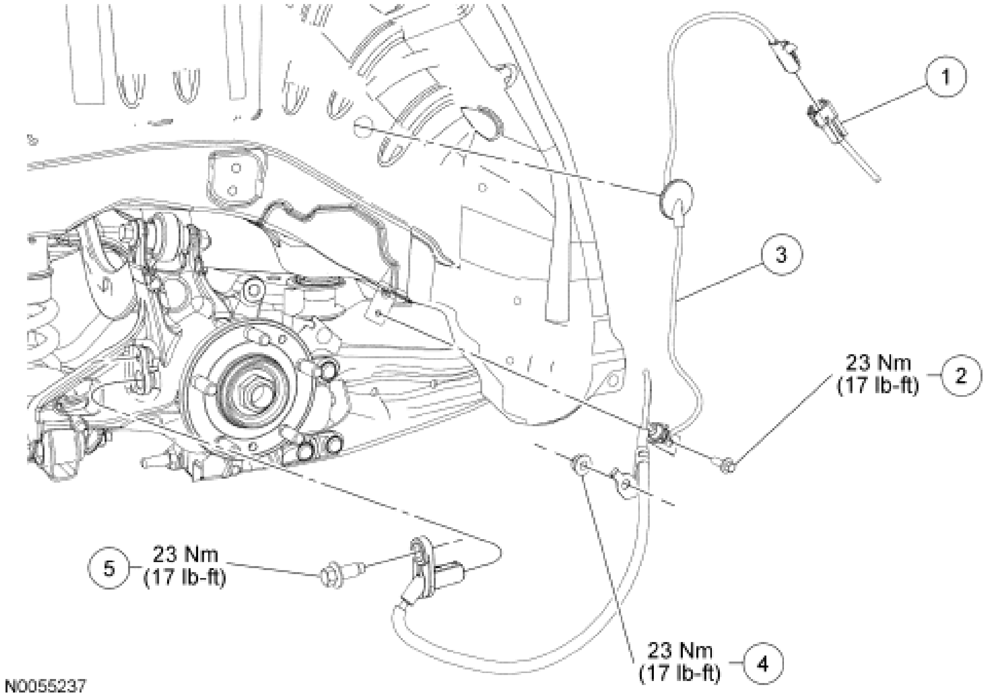

Fig. 16: Exploded View Of Rear Wheel Speed Sensor With Torque Specifications - All Wheel Drive (AWD)

Item	Part Number	Description
1	-	Wheel speed sensor electrical connector (part of 14A227)
2	W505253	Wheel speed sensor harness bolt
3	2C186 RH/ 2C187 LH	Wheel speed sensor
4	W520102	Wheel speed sensor harness nut
5	W500222	Wheel speed sensor bolt

REMOVAL AND INSTALLATION

1. Remove the rear seat bolster. For additional information, refer to **SEATING** article.
2. Disconnect the wheel speed sensor electrical connector.
3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
4. Using a suitable tool, disconnect the grommet from the body.
5. Remove the wheel speed sensor harness nut and bolt.
   - To install, tighten to 23 Nm (17 lb-ft).
6. Remove the wheel speed sensor wire bolt and the wheel speed sensor.
   - To install, tighten to 23 Nm (17 lb-ft).
7. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

WHEELS AND TIRES

Safety Precautions

WARNING: **Vehicle may have multiple drive wheels. Do not use engine to power the**

driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.

WARNING: **Always match the tire size to the wheel size during assembly. Incorrect matching can result in tire bead damage or tire separation from the wheel. Failure to follow this instruction may result in serious personal injury to technician or vehicle occupant(s).**

WARNING: **Before servicing any tire, ask the customer if anyone injected a tire sealant into the tire. Tire sealants may be flammable and can burn or explode if exposed to an ignition source. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Replacement wheels must be equivalent to the original equipment wheels in:**

- **load carrying capacity.**
- **diameter, width and offset.**
- **pilot hole and bolt circle.**

Combined load carrying capacity of replacement wheels for a given axle, must be equal to or greater than that axle's gross axle weight rating (GAWR) identified on the vehicle's Safety Compliance Certification label. All other specifications should be evaluated by measurement of both the original wheel and the replacement wheel. If specifications are not equivalent, the safety and handling of the vehicle may be degraded, which may result in serious injury to the vehicle occupant(s).

WARNING: **Never use wheels different than the original equipment. Additionally, never use wheel nuts different than the original equipment. Failure to follow these instructions may result in damage to the wheel or mounting system. This damage could cause the wheel to come off while the vehicle is being driven, which could result in serious personal injury or death to vehicle occupant(s).**

WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

WARNING: **Keep eyes away from valve stem when deflating tires. Reduce air pressure in tire as much as possible by pushing in valve core plunger prior to removing the core. Escaping air can carry particles that can injure the eyes. Failure to follow these instructions may result in serious personal injury.**

WARNING: Only use replacement tires that are the same size, load index, speed rating and type (such as P-metric versus LT-metric or all-season versus all-terrain) as those originally provided by Ford. The recommended tire and wheel size may be found on either the Safety Compliance Certification Label or the Tire Label, which is located on the B-pillar or edge of the driver's door. If the information is not found on these labels, consult a Ford dealer. Use of any tire or wheel not recommended by Ford can affect the safety and performance of the vehicle, which could result in an increased risk of loss of vehicle control, vehicle rollover, personal injury and death. Additionally, the use of non-recommended tires and wheels could cause steering, suspension, axle or transfer case/power transfer unit failure.

NOTE: Do not clean aluminum wheels with steel wool, abrasive-type cleaners or strong detergents or damage to the wheel finish may occur. Use Wheel and Tire Cleaner ZC-27-A or -B or equivalent.

Factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including full-rated load capacity when inflated to recommended inflation pressures.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

To equalize tire wear, the tires should be rotated at recommended intervals.

Tire Pressure Monitoring System (TPMS)

NOTE: The Smart Junction Box (SJB) is also identified as the Generic Electronic Module (GEM).

The Tire Pressure Monitoring System (TPMS) includes:

- the SJB, TPMS functionality is integrated within the SJB.
- four tire pressure sensors.
- four tire pressure sensor cradles.
- four tire pressure sensor straps.
- an instrument cluster indicator.
- a message center (if equipped).

Tire Pressure Monitoring System (TPMS) Module

The SJB contains the TPMS functionality. Refer to **Tire Pressure Monitoring System** in Diagnosis and Testing for TPMS fault diagnosis and repair.

The SJB compares the information of each tire pressure sensor transmission against a pressure limit. If the SJB

determines that the tire pressure has fallen below the low limit, the SJB communicates this to the instrument cluster on the vehicle communication bus.

Tire Pressure Monitoring System (TPMS) Pressure Sensor

The SJB monitors the air pressure in the 4 road tires with tire pressure sensors. The sensors transmit radio frequency signals to the SJB approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph).

The tire pressure sensors are battery operated and are mounted to metal brackets (called cradles) on the wheels inside the tires. The sensors are mounted 180 degrees from the valve stem.

The tire pressure sensor can be serviced separately from the cradle and the strap.

Tire Pressure Monitoring System (TPMS) Pressure Sensor Cradle

The tire pressure sensor cradles are mounted to the wheels with metal straps and have an adhesive strip to aid in their retention to the wheel.

The sensor cradle is available with the strap in a kit. To service the sensor cradle, the strap must be removed and discarded.

Tire Pressure Monitoring System (TPMS) Pressure Sensor Strap

The sensor strap keeps the sensor and the cradle retained to the wheel. A factory-installed strap is joined together with a one-time-use buckle and a dealer-installed strap is joined together with a worm gear (similar to a radiator hose clamp). Both straps should be discarded after removal and should not be reused.

The cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter.

Instrument Cluster and Message Center

The instrument cluster illuminates the TPMS indicator when it receives a message from the SJB to do so and displays the appropriate message(s) in the message center (if equipped).

The instrument cluster and message center are diagnosed and serviced in their own respective workshop article parts. Refer to the appropriate Instrumentation and Warning Systems article for the procedure.

DIAGNOSTIC TESTS

WHEELS AND TIRES

Inspection and Verification

WARNING: **Vehicle may have multiple drive wheels. Do not use engine to power the driveline unless all drive wheels are elevated off the ground. Drive wheels in contact with ground could cause unexpected vehicle movement. Failure to follow this instruction may result in serious personal injury.**

Be sure to follow all warnings when carrying out Inspection and Verification.

Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, go to **NVH**.

To maximize tire performance, inspect for signs of incorrect inflation and uneven wear, which may indicate a need for balancing, rotation or front suspension alignment.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increase tire wear.

Replacement tires must follow the recommended:

- tire sizes.
- speed rating.
- load range.
- tire construction type.

The use of any other tire/wheel size, load range or type can seriously affect:

- ride.
- handling.
- speedometer/odometer calibration.
- vehicle ground clearance.
- tire clearance between the body and chassis.

- wheel bearing life.
- braking performance.

New wheels need to be installed when the vehicle wheels:

- are bent.
- are cracked.
- are dented.
- are heavily corroded.
- are leaking.
- have elongated wheel hub bolt holes.
- have excessive lateral or radial runout.

It is mandatory to use only the tire sizes recommended on the tire label located on the driver door or door pillar attached to the vehicle. Larger or smaller tires can damage the vehicle, affect durability and require changing the speedometer calibration. Make sure wheel size and offsets match those recommended for the tire in use.

1. Inspect the tires for signs of uneven wear. Refer to the following descriptions to identify the type of wear and Go to **Tire Wear** for the appropriate repair action to be carried out.
2. Check the tires for:
   - cuts.
   - stone bruises.
   - abrasions.
   - blisters.
   - embedded objects.
3. Tread wear indicators are molded into the bottom of the tread grooves. Install a new tire when the indicator bands become less than 1.58 mm (0.062 in).

Tire Wear

Tire wear is commonly defined as a loss of tread depth. Tire tread wear occurs due to friction with the contact surface (road/pavement). The tread should wear down uniformly all the way around the circumference of the tire and all the way across the tread face. When this does not occur, the tire may have abnormal/incorrect wear.

Normal Tire Wear

Normal tire wear is identified as even wear around and across the tread. Because there are many factors (driving style, road surfaces, type of vehicle, type of tire) that can affect tire wear, there is no absolute mileage expectation for a normal wear condition. A tire is considered worn-out when the tread has worn to the level of the tread-wear indicators.

Abnormal/Incorrect Tire Wear

Abnormal/incorrect tire wear is identified as tire wear that is not even around or across the tread and that creates

performance-related issues.

Abnormal/incorrect wear can be caused by numerous factors, some of which include driving style (aggressive, passive), climate (hot, cold), road conditions, vehicle loading and maintenance (correct tire pressure, rotation intervals and balance). It is important to determine the root cause of wear on a vehicle before carrying out repair. Tires exhibiting abnormal/incorrect tire wear may still be serviceable provided that the minimum tread depth is greater than 1.58 mm (0.062 in) and the tire is not causing a vehicle performance (noise/vibration) concern.

Some abnormal/incorrect wear patterns look the same all the way around the tread of the tire, other wear patterns are not consistent and can occur in various spots on the tread area. The underlying causes of the 6 wear categories are different. Refer to the following descriptions to identify the type of wear and Go to **Tire Wear** for the appropriate repair action to be carried out.

Inner Edge/Shoulder Wear

Inner edge (or shoulder) wear occurs on the inside edge of the tire and is usually caused by excessive toe-out and/or excessive negative camber. If the tread depth of the outer shoulder is at least 50% greater than the tread depth of the inner shoulder, the tire is experiencing inner edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, it may be necessary to measure the tread depth of each rib and compare it to that of the shoulder.

NOTE: **RF tire shown, others similar.**

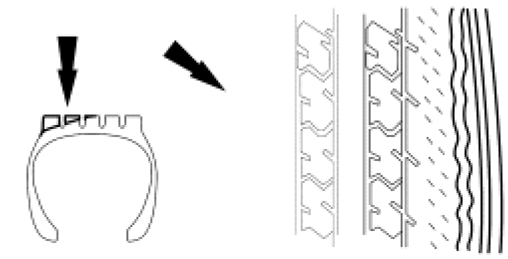

Fig. 1: Identifying Inner Edge/Shoulder Wear
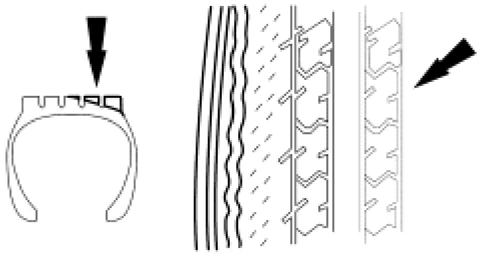
Courtesy of FORD MOTOR CO.

Outer Edge/Shoulder Wear

Outer edge (or shoulder) wear occurs on the outside edge of the tire and is usually caused by excessive toe-in and/or excessive positive camber. If the tread depth of the inner shoulder is at least 50% greater than the tread depth of the outer shoulder, the tire is experiencing outer edge/shoulder wear. To determine whether tires have this type of wear, visually inspect the tires. In some instances, it may be necessary to measure the tread depth of each rib and compare it to that of the shoulder.

NOTE: **RF tire shown, others similar.**

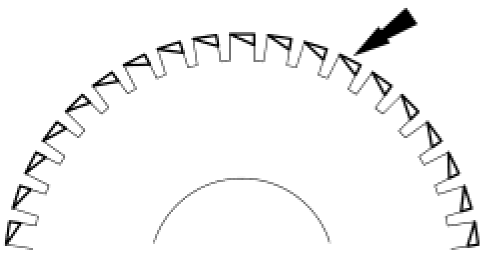


N0046312

Fig. 2: Identifying Outer Edge/Shoulder Wear
Courtesy of FORD MOTOR CO.

Heel/Toe Wear

Heel/toe wear (also known as feathering) occurs along the outside or inside edge/shoulder of the tire. To determine whether tires have this type of wear, visually inspect the tires in both the inside and outside shoulder ribs. In some instances, it may be necessary to measure the difference in tread depth of leading versus trailing edge of each lug in the inside and outside shoulder rib.



N0046118

Fig. 3: Identifying Heel/Toe Wear
Courtesy of FORD MOTOR CO.

Diagonal Wear

Diagonal wear occurs diagonally across the tread area and around the circumference of the tire. To determine whether tires have this type of wear, visually inspect the tires to determine if the wear pattern runs diagonally across the tread and around the circumference of the tire. In some instances, the difference in tread depth along the diagonal wear pattern may need to be measured.

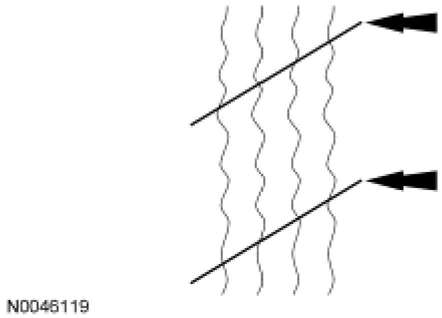


Fig. 4: Identifying Diagonal Wear
Courtesy of FORD MOTOR CO.

Symptom Chart - Tire Wear

NOTE: For suspension system and additional alignment diagnosis, refer to SUSPENSION SYSTEM - GENERAL INFORMATION article.

Symptom Chart - Tire Wear

Condition	Possible Sources	Action
• Inner edge/shoulder wear	• Excessive toe out and/or negative camber • Incorrect wheel and tire assembly rotation intervals • High-speed cornering	• Go to **Pinpoint Test A**. • Go to **Pinpoint Test A**. • Go to **Pinpoint Test A**.
• Outer edge/shoulder wear	• Excessive toe in and/or positive camber • Incorrect wheel and tire assembly rotation intervals • High-speed cornering	• Go to **Pinpoint Test B**. • Go to **Pinpoint Test B**. • Go to **Pinpoint Test B**.
• Heel/toe wear	• Excessive toe in/out • Incorrect wheel and tire assembly rotation intervals	• ROTATE the wheel and tire assemblies. CHECK the alignment, ADJUST as necessary.
• Diagonal wear	• Excessive toe in/out • Incorrect tire rotation intervals • Loose, worn or damaged suspension components	• Go to **Pinpoint Test C**. • Go to **Pinpoint Test C**. • REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

Symptom Chart - NVH

NOTE: **NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.**

Symptom Chart - NVH

Condition	Possible Sources	Action
• Wobble or shimmy	• Bent wheel • Damaged tire • Loose wheel nuts	• INSTALL a new wheel as necessary. • INSTALL a new tire as necessary. • TIGHTEN to specification.
• High-speed shake	• Tires/wheels	• REFER to Wheel and Tire Runout **Component Tests**.
• Vehicle vibration	• Tires/wheels	• REFER to Wheel and Tire Runout **Component Tests**.

Pinpoint Tests

For a description of the various tire wear patterns, refer to Inspection and Verification.

Pinpoint Test A: Inner Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:

- Excessive toe out
- Incorrect wheel and tire rotation

PINPOINT TEST A: INNER EDGE/SHOULDER WEAR

A1 MEASURE THE TREAD DEPTH

- Using a tread depth gauge or similar tool, measure the inside edge/shoulder tread depth.
- **Is the tread depth greater than 1.58 mm (0.062 in)?**

  YES : ROTATE the wheel and tire assemblies.

  CHECK and ADJUST the toe to nominal +0.15 degrees (toe in). CHECK and ADJUST caster and camber to nominal. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

NO : INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

Pinpoint Test B: Outer Edge/Shoulder Wear

This pinpoint test is intended to diagnose the following:

- Excessive toe in
- Incorrect wheel and tire rotation

PINPOINT TEST B: OUTER EDGE/SHOULDER WEAR

B1 MEASURE THE TREAD DEPTH

- Using a tread depth gauge or similar tool, measure the outside edge/shoulder tread depth.
- **Is the tread depth greater than 1.58 mm (0.062 in)?**

YES : ROTATE the wheel and tire assemblies.

CHECK and ADJUST the toe to nominal -0.15 degrees (toe out). CHECK and ADJUST caster and camber to nominal. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

NO : INSTALL a new tire(s). CHECK and ADJUST the toe to nominal. CHECK and ADJUST caster and camber to nominal. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

Pinpoint Test C: Diagonal Wear

This pinpoint test is intended to diagnose the following:

- Incorrect wheel and tire rotation
- Excessive toe in/out
- Incorrect tire inflation
- Loose, worn or damaged suspension components

PINPOINT TEST C: DIAGONAL WEAR

C1 MEASURE THE TREAD DEPTH

- Using a tread depth gauge or similar tool, measure the tread depth of the wear pattern.
- **Is the tread depth greater than 1.58 mm (0.062 in)?**

YES : If no performance concerns (noise/vibration) are present, the tire can remain in service. CHECK the air pressure in the tires, ADJUST as necessary. ROTATE the wheel and tire assemblies. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

NO : INSTALL a new tire(s). CHECK the air pressure in the tires, ADJUST as necessary.

ROTATE the wheel and tire assemblies. INSPECT for loose, worn or damaged suspension components. INSTALL new components as necessary. CHECK the alignment and ADJUST as necessary. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.

Component Tests

Some vehicles may exhibit a wheel and tire vibration caused by excessive runout. Runout measurements of the wheel and tire assembly can be taken both on and off the vehicle. Runout measurements can be taken both radially and laterally using a runout gauge. The runout gauge is a delicate, precision instrument and should be handled as such. The runout gauge should be mounted on a heavy solid base to eliminate gauge movement when measuring run outs. The measurements are taken using a runout gauge, which defines total runout in 64th or thousandths of an inch (depending on the brand of gauge used) and locates the high and low points of the runout.

Radial Runout

Radial runout is the egg-shaped deviation from a perfect circle and is measured perpendicular on a circumference. On a wheel and tire assembly, this usually means measuring the center tire tread rib, although other tread ribs can be measured as well. The center rib is usually a solid rib, easy to measure and normally indicative of the condition of the tire as a whole. It is important to keep in mind that any rib with excessive runout can cause a concern. Total runout is the reading from the gauge. The high spot is the location of maximum runout.

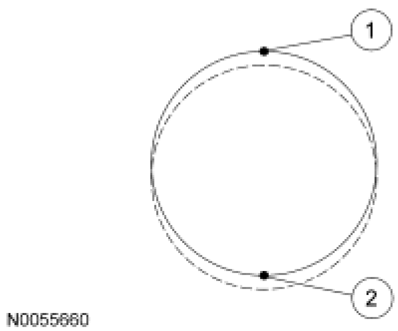

Fig. 5: Identifying Radial Runout
Courtesy of FORD MOTOR CO.

Item	Description
1	High spot
2	Low spot

NOTE: Warm up the tires prior to taking any measurements, this will eliminate slight flat spotting. This is done during a road test.

NOTE: Place the air chuck straight on the valve stem to inflate the tire. Do not cock the air chuck during the inflation cycle. Doing so may damage the valve stem and cause air leaks.

NOTE: **Use only the Digital Tire Gauge any time tire pressures are measured to be sure that accurate values are obtained.**

1. Make sure that the tire pressures are set to the correct pressure as indicated on the vehicle label.
2. With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article.
3. Make sure that all 4 positions can be measured. If measurements are to be taken with the wheel and tire assembly off the vehicle, mount each assembly on a suitable dynamic balancing machine.
4. For future reference of the original wheel and tire assembly's position on the wheel hub, index-mark the wheel and a wheel stud.
5. Position the runout gauge to take a radial measurement.
   - Rotate the wheel and tire assembly (or wheel) to locate the low spot.
   - Adjust the runout gauge to read 0.
   - Rotate the wheel and tire assembly (or wheel) one complete revolution to make sure that the low spot has been found and that the runout gauge dial returns to a 0 reading.

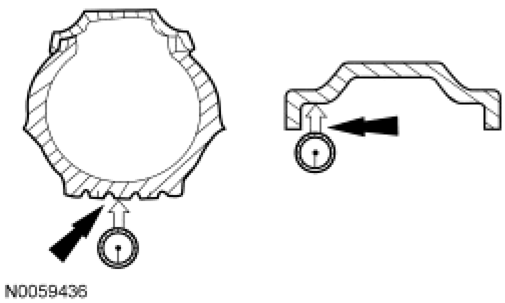

Fig. 6: Measuring Radial Runout
Courtesy of FORD MOTOR CO.

NOTE: **If there is a vast difference in measurements taken from a wheel and tire assembly checked on the vehicle compared to readings taken off the vehicle, check for excessive bolt circle runout, excessive hub runout or a fitting concern between the hub and wheel.**

6. While slowly and constantly rotating the wheel and tire assembly (or wheel), measure the radial runout.
   - Note the variance (runout) from 0 on the dial of the gauge.
   - If the runout reading of a wheel and tire assembly is not within 1.27 mm (0.050 in), locate and mark the high spot and proceed to Match Mounting Step 1 to correct the concern.
   - If the runout reading of a wheel is not within 1.27 mm (0.050 in), install a new wheel.

Lateral Runout

Lateral runout is a sideways variation causing a twist or wobble and is measured on a side surface. On the wheel and tire assembly, the lateral runout measurement should be taken as close to the tread shoulder as possible. Total runout is the reading from the gauge.

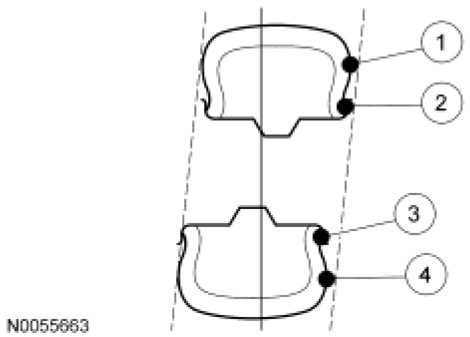

Fig. 7: Positioning Runout Gauge To Take Lateral Measurement
Courtesy of FORD MOTOR CO.

Item	Description
1	Tire high spot
2	Wheel high spot
3	Tire low spot
4	Wheel low spot

1. Position the runout gauge to take a lateral measurement.
    - Rotate the wheel and tire assembly (or wheel) to locate the low spot.
    - Adjust the runout gauge to read 0.
    - Rotate the wheel and tire assembly (or wheel) one complete revolution to make sure that the low spot has been found and that the dial returns to a 0 reading.

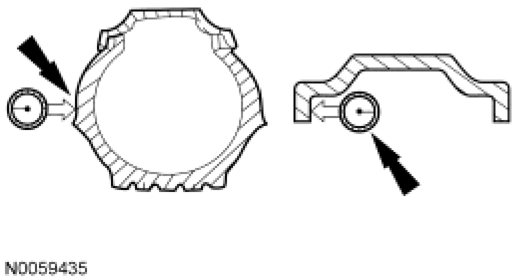

Fig. 8: Measuring Lateral Runout
Courtesy of FORD MOTOR CO.

NOTE: **If there is a vast difference in measurements taken from a wheel and tire assembly checked (on the vehicle) compared to readings taken (off the vehicle), check for excessive bolt circle runout, excessive hub runout or a fitting concern between the hub and wheel.**

2. While slowly and constantly rotating the wheel and tire assembly (or wheel), measure the lateral runout.
    - Note the variance (runout) from 0 on the dial of the gauge.

- If the runout reading of a wheel and tire assembly is not within 1.27 mm (0.050 in), locate and mark the high spot and proceed to Match Mounting Step 1 to correct the concern.
- If the runout reading of a wheel is not within 1.27 mm (0.050 in), install a new wheel.

Match Mounting

Match mounting is a technique used to reduce radial and lateral run outs on wheel and tire assemblies. Excessive runout is a source of ride quality complaints and match mounting can be used to minimize the runout. Match mounting can be accomplished by changing the position of the tire on the wheel or by changing the position of the wheel and tire assembly on the hub.

1. Remove the wheel and tire. Refer to **Wheel and Tire**.
2. Position the wheel and tire assembly on a suitable tire machine and put a reference mark on the tire sidewall at the valve stem position.

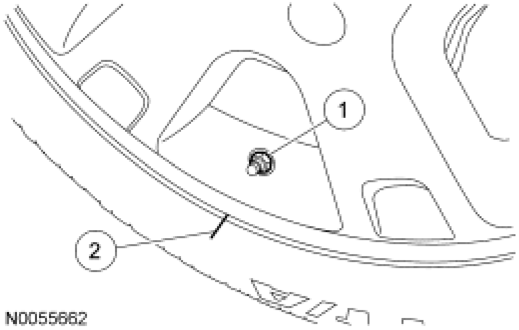

Fig. 9: Locating Mark On Tire Side Wall At Valve Stem Position
Courtesy of FORD MOTOR CO.

Item	Description
1	Valve stem
2	Reference mark

NOTE: For tires equipped with a Tire Pressure Monitoring System (TPMS), the sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Dismount the tire from the wheel as instructed in the Disassembly and Assembly procedure. Failure to follow these instructions may result in TPMS component damage.

3. Using a suitable tire machine, break the tire down from the wheel.
   - Position the tire 180 degrees (half-way around) on the rim so the tire reference mark made in Step 2 is opposite the valve stem.
4. Re-inflate the wheel and tire assembly to the specified air pressure and measure the assembly runout again. Mark the second high spot on the tire.
   - If the runout is reduced to within specifications, the runout concern has been solved.
5. If the second runout measurement is still not within specification and both measurements are close to

each other (within 101.6 mm [4 in]), the root cause is probably the tire.

NOTE: To be SURE that the tire is causing the high runout, there must be 2 runout measurements that are not within specification and the high spots must be in approximately the same location on the tire's sidewall. In other words, the high spot followed the tire when it was repositioned 180 degrees on the wheel.

- If the second high spot is not within 101.6 mm (4 in) of the first high spot, proceed to the next step.

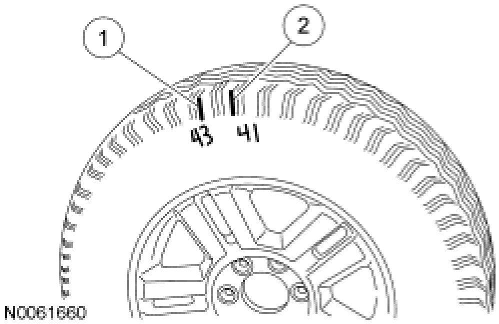

Fig. 10: High Spotting On Tire
Courtesy of FORD MOTOR CO.

Item	Description
1	First high spot on the tire
2	Second high spot on the tire

6. If the second high spot is still above specification and is within 101.6 mm (4 in) of being opposite the first high spot on the wheel, the root cause is probably the wheel (the high spot followed the wheel). Dismount the tire from the wheel, mount the wheel on a balancer and check the wheel runout. Install a new wheel if the wheel runout exceeds 1.27 mm (0.050 in).

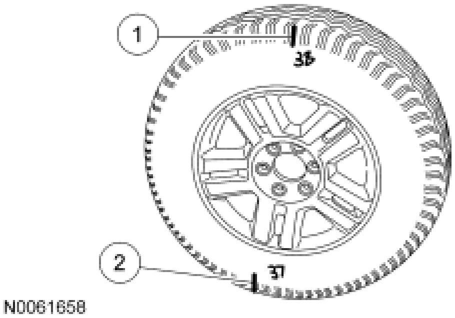

Fig. 11: High Spotting On Each End Of Tire
Courtesy of FORD MOTOR CO.

Item	Description

1	First high spot on the tire
2	Second high spot on the tire

NOTE: If the second high spot did not follow the wheel or the tire and the runout is still not within specification, improvements may be made by rotating the tire 90 degrees (one-fourth turn).

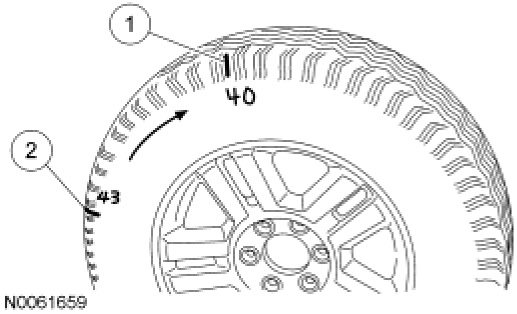

Fig. 12: Drawing Arrow On Tire Side Wall From Second High Spot Towards First High Spot
Courtesy of FORD MOTOR CO.

7. Draw an arrow on the tire sidewall from the second high spot towards the first high spot (in the shortest direction).
   - Rotate the tire 90 degrees (one-fourth turn) in the direction of the arrow.

Item	Description
1	First high spot on the tire
2	Second high spot on the tire

8. Install the wheel and tire. Refer to **Wheel and Tire**.
   - Align the wheel and tire assembly using the index mark made on the wheel and wheel stud during removal.

TIRE PRESSURE MONITORING SYSTEM

Special Tools

Illustration	Tool Name	Tool Number
	Activation Tool, Tire Pressure Monitor	204-363
	Digital Tire Gauge	204-354

 ST1438-A		
 ST1185-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

Principles of Operation

NOTE: The Smart Junction Box (SJB) is also referred to as the Generic Electronic Module (GEM).

The Tire Pressure Monitoring System (TPMS) monitors the air pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit via radio frequency signals, to the SJB. TPMS functionality is integral to the SJB. These transmissions are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The TPMS function compares each tire pressure sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the SJB communicates this on the vehicle communication bus to the instrument cluster. The instrument cluster then illuminates the TPMS indicator and displays the appropriate message(s) in the message center (if equipped).

For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressures must be adjusted and the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate.

For vehicles with the same tire pressures for front and rear tires, tire rotation will not affect the system.

Ambient Temperature Change and Tire Pressure

WARNING: **The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.**

Tire pressures fluctuate with temperature changes. For this reason, tire pressure must be set to specification when tires are at outdoor ambient temperatures. If the vehicle is allowed to warm up to shop temperatures, and the outside temperature is less than shop temperature, the tire inflation pressure must be adjusted accordingly.

If the tires are inflated to specification at shop temperatures, and the vehicle is moved outdoors when the

outdoor ambient temperature is significantly lower, the tire pressure may drop enough to be detected by the TPMS and activate the TPMS warning lamp.

As the ambient temperature decreases by 6°C (10°F), tire pressure decreases 7 kPa (1 psi). Adjust the tire pressure by 7 kPa (1 psi) for each 6°C (10°F) ambient temperature drop as necessary to keep the tire at the specified Vehicle Certification (VC) label pressure. Refer to the following tables to adjust the tire pressure indoors for colder outside temperatures.

Table 1. Use Table to Adjust Tire Pressure Inside Garage for Colder Outside Temperature[1]

** Do Not Inflate Tire Higher than Maximum Pressure Stamped on Tire Sidewall. **

Table is based on a Garage Temperature of 70°F. Max Pressure Adjustment is 7 psi.

Outside Temperature (°F)	Tire Placard Pressure (PSI)																	
	30	32	34	35	38	40	41	42	45	50	55	60	65	70	75	80	85	90
70	30	32	34	35	38	40	41	42	45	50	55	60	65	70	75	80	85	90
60	31	33	35	36	39	41	42	43	46	51	56	61	67	72	77	82	87	92

Tire Pressure Monitoring System (TPMS) Indicator and Message Center Messages

The TPMS indicator and vehicle message center (if equipped) sometimes displays faults that cannot be resolved by the customer. Treat these messages as TPMS faults that must be serviced.

Tire Pressure Monitoring System (TPMS) Indicator Illuminates Continuously

NOTE: If the spare tire is in use, the damaged road tire must be repaired and installed on the vehicle to restore complete TPMS functionality before carrying out any diagnosis.

NOTE: For vehicles with different front and rear tire pressures (such as E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will result in a false low tire pressure event, which will cause the TPMS indicator to illuminate.

1. The TPMS indicator remains on continuously for the following condition:
    - Low Tire Pressure - The TPMS indicator is illuminated solid and the message center displays LOW TIRE PRESSURE (if equipped). This is displayed when any of the tire pressures are low. When this condition exists, the tire pressure must be adjusted to the recommended cold pressure as indicated on the VC label.

    NOTE: The TPMS sensors do not transmit when the vehicle is stationary. If the vehicle has been stationary for more than 30 minutes, it will be necessary to wake up the sensors so they will transmit the latest tire pressure information to the SJB.

2. If the vehicle has been stationary for more than 30 minutes, carry out the **Tire Pressure Monitoring System (TPMS) Sensor Activation** procedure.

Tire Pressure Monitoring System (TPMS) Indicator Flashes

The TPMS indicator flashes for 70 seconds, then remains ON solid when the ignition switch is turned to the ON position, for the following conditions:

1. Tire Pressure Sensor Fault - If equipped, the message center will display TIRE PRESSURE SENSOR FAULT when a tire pressure sensor is malfunctioning. Go to **Symptom Chart**.
2. No communication with the SJB (TPMS is integral to the SJB) - The TPMS indicator is illuminated when the instrument cluster has not received any signals from the SJB for more than 5 seconds. If equipped, the message center displays TIRE PRESSURE MONITOR FAULT. Go to **Symptom Chart**.
3. Tire Pressure Monitor Fault - If equipped, the message center will display TIRE PRESSURE MONITOR FAULT when the tire pressure monitoring system is malfunctioning or communication with the instrument cluster has been lost. Go to **Symptom Chart**.

Inspection and Verification

NOTE: The tire pressure sensors are not designed to be used with aftermarket wheels.

NOTE: The use of run-flat tires (tires with steel body cord plies in the tire sidewall) where not originally equipped, may cause the TPMS to malfunction and is

therefore not recommended.

1. Verify the customer concern by inspecting the vehicle and observing the message center (if equipped) and the TPMS indicator.

NOTE: **The valve-mounted TPMS sensors and the strap-mounted TPMS sensors are not compatible. Swapping wheels from one vehicle to another with the different systems will set a TPMS fault.**

NOTE: **Swapping wheels between vehicles with the same TPMS will cause a TPMS fault to be set if the sensors are not trained. Refer to Tire Pressure Monitoring System (TPMS) Sensor Training.**

NOTE: **Non-OEM modifications made to the vehicle may result in false TPMS warnings.**

2. Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical
• Low tire pressure • Tire Pressure Monitoring System (TPMS) sensor damaged or missing • Spare tire installed as a road wheel • Incorrect TPMS sensor installed • TPMS sensor installed incorrectly • Sensors not trained after a tire rotation on vehicles with different front and rear tire pressures • Non-OEM wheels installed (aftermarket rims) • Non-OEM equipped run-flat tires installed • Other non-OEM modifications (roll	• Wiring, terminals or connectors • Smart Junction Box (SJB) damaged • Aftermarket electronic accessories

cages, service barriers, part racks, ladder racks)	

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

NOTE: The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no power to the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self test diagnostics for the SJB (the TPMS is part of the SJB).
9. If the DTCs retrieved are related to the concern, go to the Tire Pressure Monitoring System (TPMS) DTC Chart. For all other DTCs, refer to the Master DTC Chart in **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

TIRE PRESSURE MONITORING SYSTEM (TPMS) DTC CHART

DTC	Description	Source	Action
B106A	Pressure Sensor Range Bit Incorrect State	Smart Junction Box (SJB)	Go to **Pinpoint Test G**.
B106B	Tire Pressure Sensor Low Battery	SJB	DTC B106B can be set during SJB configuration. Go to **Pinpoint Test H**.
B106D	Tire Pressure Monitoring System	SJB	DTC B106D is only present when a new SJB

	(TPMS) Initiators Not Configured		is installed, the SJB is incorrectly flashed or the SJB is incorrectly configured. Successfully configuring the SJB is the only way to clear this DTC. VERIFY the SJB is correctly configured. If DTC B106D is still present, REFER to **MODULE CONFIGURATION** article.
B2477	Module Configuration Failure/Mismatch	SJB	DTC B2477 is only present when a new SJB is installed, the SJB is incorrectly flashed or the SJB is incorrectly configured. Successfully configuring the SJB is the only way to clear this DTC. MAKE SURE the SJB is configured correctly. If DTC B2477 is still present, REFER to **MODULE CONFIGURATION** article.
B2868	LF Tire Pressure Sensor Fault	SJB	DTC B2868 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
B2869	RF Tire Pressure Sensor Fault	SJB	DTC B2869 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
B2870	RR Tire Pressure Sensor Fault	SJB	DTC B2870 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
B2871	LR Tire Pressure Sensor Fault	SJB	DTC B2871 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
B2872	Tire Pressure Sensor Fault	SJB	**NOTE:** **If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB.**

			ACTIVATE the TPMS sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Activation**. Go to **Pinpoint Test F**.
B287A	Tire Pressure System Fault	SJB	Go to **Pinpoint Test F**.
C2780	ECU in Manufacturing Mode	SJB	DTC C2780 is only present when a new SJB is installed, the SJB is flashed or the SJB is reconfigured. TRAIN the tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
U0155	Lost Communication with Instrument Cluster	SJB	REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no communication problem.
All other SJB DTCs	-	SJB	REFER to the Master DTC Chart in **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart

NOTE: **For vehicles with different front and rear tire pressure (such as E-Series and certain F-Series), the tire pressures must be adjusted and the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will result in a false low tire pressure event, which will cause the Tire Pressure Monitoring System (TPMS) indicator to illuminate.**

For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.

Failure of a TPMS component may not cause the message center to display a fault message or a DTC to be stored. The Symptom Chart is a starting point to begin diagnosis of these concerns.

Symptom Chart

Condition	Possible Sources	Action
• Tire Pressure Monitoring System (TPMS) indicator ON solid and message center (if equipped) displays LOW TIRE PRESSURE	• Spare tire currently in use	• INSTALL the repaired road wheel/tire in place of the spare tire.
	• Air pressure not set to specifications listed on the Vehicle Certification (VC) label	• Go to **Pinpoint Test D**.

	• Sensors not trained following tire rotation	• ADVISE customer that on vehicles with different front and rear tire pressure, the sensors must be trained as directed in their Owner's Literature.
• Smart Junction Box (SJB) will not enter sensor training mode when using the TPMS sensor training procedure	• Brake ON/OFF switch • Ignition switch • Vehicle communication bus • SJB	• Go to **Pinpoint Test E**.
• TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE PRESSURE SENSOR FAULT and DTC B2872 is present	• TPMS sensor(s) • TPMS sensor(s) not trained to the SJB • SJB	**NOTE:** **If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB.** • ACTIVATE the TPMS sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Activation**. Go to **Pinpoint Test F**.
• Tire Pressure Monitoring System (TPMS) indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if equipped) displays TIRE PRESSURE MONITOR FAULT and DTC B287A is present	• All TPMS sensors not trained to the SJB or all TPMS sensors are not installed	**NOTE:** **If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the SJB.** • ACTIVATE the TPMS sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Activation**. Go to **Pinpoint Test F**.
• TPMS indicator FLASHES for 70 seconds and then remains ON solid when the ignition key is turned to the ON position, the message center (if	• Vehicle communication issue between the SJB and the instrument cluster	• REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the no

equipped) displays TIRE PRESSURE MONITOR FAULT and there are no DTCs present		communication concern.
	• SJB	• REFER to **MULTIFUNCTION ELECTRONIC MODULES** article to diagnose the SJB.
• One or more sensors will not train	• TPMS sensor(s) • Vehicle communication issue • SJB	• RETRIEVE and RECORD DTCs. REFER to Tire Pressure Monitoring System (TPMS) DTC Chart.
• One or more sensors will not train and no DTCs are present	• TPMS sensor(s)	• TRAIN all 4 tire pressure sensors. REFER to **Tire Pressure Monitoring System (TPMS) Sensor Training**. • For any sensor(s) that did not train, ATTEMPT to activate the same sensor with the activation tool. If the sensor still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth turn and ATTEMPT to activate the same sensor again. • If the sensor(s) fail to train a second time, INSTALL a new sensor(s). REFER to **Tire Pressure Monitoring System (TPMS) Sensor**.

Pinpoint Tests

Pinpoint Test D: Tire Pressure Monitoring System (TPMS) Indicator ON Solid and Message Center (if equipped) Displays LOW TIRE PRESSURE

Normal Operation

The Tire Pressure Monitoring System (TPMS) monitors the air pressure of all 4 road tires. The wheel-mounted tire pressure sensors transmit via radio frequency signals, to the Smart Junction Box (SJB). TPMS functionality is integral to the SJB. These transmissions are sent approximately every 60 seconds when the vehicle speed exceeds 32 km/h (20 mph). The TPMS function (integral to the SJB) compares each tire pressure sensor transmission against a low-pressure limit. If it has been determined that the tire pressure has fallen below this limit, the SJB communicates this on the vehicle communication bus to the instrument cluster. The instrument cluster then illuminates the TPMS indicator and displays the appropriate message(s) in the message center (if equipped).

This symptom can also be caused by a spare tire currently being used in place of a road tire. Make sure that the spare tire is not currently in use. On vehicles with different front and rear tire pressures, if the sensors are not trained following a tire rotation, this symptom will also be present. Advise the customer that on vehicles with

different front and rear tire pressures, the sensors must be trained as directed in the Owner's Literature.

This pinpoint test is intended to diagnose the following:

- Low air pressure in tire(s)
- Tire pressure sensor(s)

PINPOINT TEST D: Tire Pressure Monitoring System (TPMS) INDICATOR ON SOLID AND MESSAGE CENTER (IF EQUIPPED) DISPLAYS LOW TIRE PRESSURE

NOTE: **Use only the Digital Tire Gauge any time tire pressures are measured to be sure that accurate values are obtained.**

NOTE: **If a warranty case is opened for an actual TPMS fault, document and include the actual tire pressure data in all warranty communications.**

D1 CHECK THE TIRE PRESSURE

- Measure and record the air pressure in all 4 road tires.
- Adjust the air pressure for those found to be below the specification listed on the Vehicle Certification (VC) label.

  NOTE: **If the vehicle has been stationary for more than 30 minutes, activate each TPMS sensor. Refer to Tire Pressure Monitoring System (TPMS) Sensor Activation. The TPMS sensor does not transmit when the vehicle is stationary.**

- Verify system operation.
- **Have the TPMS indicator and the message center (if equipped) warnings gone out?**

  YES : The system is functioning normally, diagnosis is complete. INFORM the customer of correct tire pressure maintenance as instructed in the scheduled maintenance guide and the Owner's Literature.

  NO : Go to D2.

D2 CHECK THE SYSTEM COMPONENTS

- Train all 4 tire pressure sensors. Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
- Connect the scan tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger SJB
- Read and record the following PIDs:
  - Left Front Tire Pressure (LF_PRES)
  - Right Front Tire Pressure (RF_PRES)
  - Left Rear Outer Tire Pressure (LRO_PRES)
  - Right Rear Outer Tire Pressure (RRO_PRES)

- Compare the air pressure readings recorded from the function test to those recorded in D1.
- **Do the compared tire pressure values match within ±5 psi, and have the TPMS indicator and the message center (if equipped) warnings gone out?**

  YES : The system is functioning normally, diagnosis complete.

  NO : **Before installing a new sensor(s):** If a sensor(s) does not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensor(s) with the Tire Pressure Monitor Activation Tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth turn and ATTEMPT to activate the same sensor(s) again.

  INSTALL new tire pressure sensors for those with discrepancies or those that fail to activate. REFER to **Tire Pressure Monitoring System (TPMS) Sensor**.

Pinpoint Test E: Smart Junction Box (SJB) Will Not Enter Sensor Training Mode When Using the Tire Pressure Monitoring System (TPMS) Sensor Training Procedure

Normal Operation

For the Smart Junction Box (SJB) to enter Tire Pressure Monitoring System (TPMS) sensor training mode, the SJB must receive valid inputs from the Brake Pedal Position (BPP) switch (OFF-ON-OFF) and ignition switch (both OFF and RUN), and it must receive valid vehicle speed sensor input (0 km/h [0 mph]). Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training** for the complete sensor training procedure.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Brake ON/OFF switch
- Ignition switch
- SJB

PINPOINT TEST E: Smart Junction Box (SJB) WILL NOT ENTER SENSOR TRAINING MODE WHEN USING THE Tire Pressure Monitoring System (TPMS) SENSOR TRAINING PROCEDURE

E1 CHECK THE SJB BRAKE ON/OFF (GEM_BOO) PID

- Connect the scan tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger SJB
- Monitor the GEM_BOO PID (SJB reads the brake switch directly).
- Press and release the brake pedal while monitoring the PID.
- **Do the brake pedal PID values match the brake pedal positions?**

  YES : Go to E2.

  NO : REFER to **EXTERIOR LIGHTING** article to continue diagnosis of the stoplamp switch.

E2 CHECK THE SJB IGNITION SWITCH PIDs

- Monitor the following ignition switch PIDs:
  - Ignition Switch Off (IGN_O_ECU)

    - Ignition Switch RUN (IGN_R_ECU)
- Cycle the ignition switch to the RUN and OFF position while monitoring the PIDs (SJB reads the ignition switch directly).
- **Do the ignition switch status PID values match the ignition switch positions?**

  YES : Go to E3.

  NO : REFER to **STEERING COLUMN SWITCHES** article to continue diagnosis of the ignition switch.

E3 CHECK THE SJB VEHICLE SPEED (VSS_GEM) PID

- Monitor the VSS_GEM PID (SJB receives vehicle speed from the instrument cluster).
- **Does the vehicle speed PID value match the speed of the vehicle?**

  YES : Go to E4.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnosis of the instrument cluster/vehicle speed concern.

E4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check the connectors for:
    - corrosion.
    - pushed-out pins.
    - spread terminals.
- Connect all the SJB connectors and make sure that they are seated correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CLEAR the DTCs. REPEAT the self test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self test.

Pinpoint Test F: Tire Pressure Monitoring System (TPMS) Indicator FLASHES for 70 Seconds and Then Remains ON Solid When the Ignition Key is Turned to the ON Position, the Message Center (if equipped) Displays TIRE PRESSURE SENSOR or MONITOR FAULT and DTC B2872 or B287A is Present

Normal Operation

If there is a fault with 1, 2 or 3 of the Tire Pressure Monitoring System (TPMS) sensors, DTC B2872 will be set, the TPMS warning indicator will flash for 70 seconds and then remain ON solid when the ignition switch is turned to the ON position and the message center (if equipped) will display TIRE PRESSURE SENSOR FAULT.

If the Smart Junction Box (SJB) does not get a response from all 4 of the TPMS sensors, DTC B287A will be set and the message center (if equipped) will display TIRE PRESSURE MONITOR FAULT.

- B2872 Tire Pressure Sensor Fault - When 1, 2 or 3 of the tire pressure sensors are faulted or not responding, the SJB will set DTC B2872.

- B287A Tire Pressure Monitor Fault - When **all** 4 of the tire pressure sensors are faulted, not responding or not heard by the SJB, the SJB will set DTC B287A.

This pinpoint test is intended to diagnose the following:

- TPMS sensor(s) missing
- TPMS sensor(s) not trained to the vehicle
- TPMS sensor(s) swapped due to wheel swap
- TPMS sensor(s) damaged
- Vehicle communication issue
- SJB

PINPOINT TEST F: Tire Pressure Monitoring System (TPMS) INDICATOR FLASHES FOR 70 SECONDS AND THEN REMAINS ON SOLID WHEN THE IGNITION KEY IS TURNED TO THE ON POSITION, THE MESSAGE CENTER (IF EQUIPPED) DISPLAYS TIRE PRESSURE SENSOR OR MONITOR FAULT AND DTC B2872 OR B287A IS PRESENT

NOTE: If a warranty case is opened for an actual TPMS fault, document and include the actual tire pressure data in all warranty communications.

F1 CHECK THE SENSOR IDs AND SYSTEM STATUS PIDs

- Connect the scan tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: DataLogger SJB
- Read and record the following PIDs:
  - Left Front Tire Transmitter Identifier (LF_ID)
  - Right Front Tire Transmitter Identifier (RF_ID)
  - Left Rear Tire Transmitter Identifier (LR_ID)
  - Right Rear Tire Transmitter Identifier (RR_ID)
- Monitor the TPMS system status (TP_STAT) PID.
- **Does the TP_STAT PID display SENSOR FAULT?**

  YES : Go to F2.

  NO : If the TP_STAT PID displays SYSTEM FAULT, go to F3.

F2 CARRY OUT THE SENSOR TRAINING PROCEDURE

- Train all 4 tire pressure sensors. Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
- **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB?**

  YES : Using the scan tool, LOCATE the updated TPMS sensor identifiers trained to the SJB module.

  COMPARE these values to those recorded prior to the TPMS sensor training procedure. Disregarding sensor position, any sensor identifiers that do not match those retrieved from the

module were changed, but not retrained. The sensors are now trained to the vehicle, diagnosis is complete.

DOCUMENT all TPMS sensor identifiers on the applicable warranty claim.

VERIFY system operation.

NO : **Before installing a new sensor(s)** : If a sensor(s) does not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensor(s) with the Tire Pressure Monitor Activation Tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor(s) again.

If the sensor(s) fails to train a second time, INSTALL a new tire pressure sensor(s). REFER to **Tire Pressure Monitoring System (TPMS) Sensor**.

F3 TP_STAT PID EQUALS SYSTEM FAULT WITH DTC B287A PRESENT

- Train all 4 tire pressure sensors. Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
- **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB?**

YES : Using the scan tool, LOCATE the updated TPMS sensor identifiers trained to the SJB module.

COMPARE these values to those recorded prior to the TPMS sensor training procedure. Disregarding sensor position, any sensor identifiers that do not match those retrieved from the module were changed, but not retrained. The sensors are now trained to the vehicle, diagnosis is complete.

DOCUMENT all TPMS sensor identifiers on the applicable warranty claim.

VERIFY system operation.

NO : **Before diagnosing the SJB** : If the sensors do not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensors with the Tire Pressure Monitor Activation Tool a second time. If the sensors still do not respond, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensors again.

If the sensors fail to train a second time, go to F4.

F4 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB electrical connectors.
- Check the connectors for:
  - corrosion.
  - pushed-out pins.
  - spread terminals.

- Connect all the SJB connectors and make sure that they are seated correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : **NOTE:** The sensors may not be present. DISMOUNT the tire. REFER to **Wheel and Tire**. VERIFY that the sensors are present and mounted to the wheels. If missing, INSTALL new sensors.

  If the sensors are present, INSTALL a new SJB module. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CLEAR the DTCs. REPEAT the self test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self test.

Pinpoint Test G: DTC B106A - Pressure Sensor Range Bit Incorrect State

Normal Operation

This DTC may be encountered if a sensor designed for a different application is installed. Low pressure applications utilize a black- or blue-colored sensor, while heavy duty applications utilize a green-colored sensor. The Smart Junction Box (SJB) will only allow one type of sensor to be trained using the Tire Pressure Monitoring System (TPMS) sensor training procedure. Make sure the correct sensors are used to avoid compatibility issues.

- B106A Pressure Sensor Range Bit Incorrect State - When an attempt has been made to train a non-compatible sensor, the SJB will set DTC B106A.

This pinpoint test is intended to diagnose the following:

- Incorrect tire pressure sensor(s) installed

PINPOINT TEST G: DTC B106A - PRESSURE SENSOR RANGE BIT INCORRECT STATE

G1 DETERMINE IF THE VEHICLE IS EQUIPPED WITH AN INCORRECT SENSOR

- Train all 4 tire pressure sensors. Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
- **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB?**

  YES : CLEAR the DTCs. REPEAT the self test. VERIFY system operation.

  NO : **Before installing a new sensor(s)** : If a sensor(s) does not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensor(s) with the Tire Pressure Monitor Activation Tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor(s) again.

  If the sensor(s) fails to train a second time, INSTALL a new tire pressure sensor(s). REFER to **Tire Pressure Monitoring System (TPMS) Sensor**.

Pinpoint Test H: DTC B106B - Tire Pressure Sensor Low Battery

Normal Operation

If there is a fault in the Tire Pressure Monitoring System (TPMS), such as a damaged or missing sensor(s), damaged module or a communication issue within the vehicle, DTCs are set in the Smart Junction Box (SJB), the TPMS warning indicator will flash for 70 seconds and then remain ON solid when the ignition switch is turned to the ON position and the message center (if equipped) will display TIRE PRESSURE SENSOR FAULT.

The tire pressure sensor is battery powered.

This DTC may be set when attempting to train a tire pressure sensor(s) with a low battery.

This pinpoint test is intended to diagnose the following:

- Tire pressure sensor battery
- Tire pressure sensor(s)

PINPOINT TEST H: DTC B106B - TIRE PRESSURE SENSOR LOW BATTERY

H1 DETERMINE WHICH SENSOR HAS A LOW BATTERY

- Train all 4 tire pressure sensors. Refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.
- **Did all of the tire pressure sensors transmit correctly and did the horn sound when each tire pressure sensor transmitted to the SJB?**

  YES : CLEAR the DTCs. REPEAT the self test. VERIFY system operation.

  NO : **Before installing a new sensor(s)** : If a sensor(s) does not respond to the Tire Pressure Monitor Activation Tool, ATTEMPT to activate the same sensor(s) with the Tire Pressure Monitor Activation Tool. If the sensor(s) still does not respond, MOVE the vehicle to rotate the wheels at least one-fourth of a turn and ATTEMPT to activate the same sensor(s) again.

  If the sensor(s) fails to train a second time, INSTALL a new tire pressure sensor(s). REFER to **Tire Pressure Monitoring System (TPMS) Sensor**.

GENERAL PROCEDURES

TIRE PRESSURE MONITORING SYSTEM (TPMS) SENSOR TRAINING

Special Tools

Illustration	Tool Name	Tool Number
	Activation Tool, Tire Pressure Monitor	204-363

 ST1385-A		
 ST1185-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

NOTE: **If the vehicle has been stationary for more than 30 minutes, the sensors will go into a "sleep mode" to conserve battery power. It will be necessary to wake them up so they will transmit the latest tire pressure information to the Smart Junction Box (SJB). For additional information, refer to Tire Pressure Monitoring System (TPMS) Sensor Activation.**

NOTE: **The tire pressure sensor training procedure must be done on a single vehicle, in an area without radio frequency noise and at least 1 m (3 ft) away from other vehicles equipped with a Tire Pressure Monitoring System (TPMS).**

Radio frequency noise is generated by electrical motors and appliance operation, cellular telephones, remote transmitters, power inverters and portable entertainment equipment.

NOTE: **If a sensor does not respond to the Tire Pressure Monitor Activation Tool, attempt to activate the same sensor with the Tire Pressure Monitor Activation Tool. If the sensor still does not respond, move the vehicle to rotate the wheels at least one-fourth of a turn and attempt to activate the same sensor again.**

NOTE: **The SJB has a 2-minute time limit between sensor responses. If the SJB does not recognize any 1 of the 4 tire pressure sensors during this time limit, the horn will sound twice and the message center (if equipped) will display TIRE NOT TRAINED REPEAT and the entire procedure must be repeated.**

NOTE: **For vehicles with different front and rear tire pressures (such as the E-Series and certain F-Series), the tire pressure sensors must be trained following a tire rotation. Failure to train the sensors will cause the TPMS indicator to illuminate. For vehicles with the same tire pressure for front and rear tires, tire rotation will not affect the system.**

NOTE:

1. Turn the ignition switch to the OFF position, then press and release the brake pedal.

2. Cycle the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.
3. Press and release the brake pedal.
4. Turn the ignition switch to the OFF position.
5. Turn the ignition switch from the OFF position to the RUN position 3 times, ending in the RUN position.
    - The horn will sound once and the TPMS indicator will flash if the training mode has been entered successfully. If equipped, the message center will display TRAIN LF TIRE.

NOTE: It may take up to 6 seconds to activate a tire pressure sensor. During this time, the Tire Pressure Monitor Activation Tool must remain in place 180 degrees from the valve stem.

6. Place the Tire Pressure Monitor Activation Tool on the LF tire sidewall opposite (180 degrees) from the valve stem. Press and release the test button on the Tire Pressure Monitor Activation Tool. The horn will sound briefly to indicate that the tire pressure sensor has been recognized by the SJB.

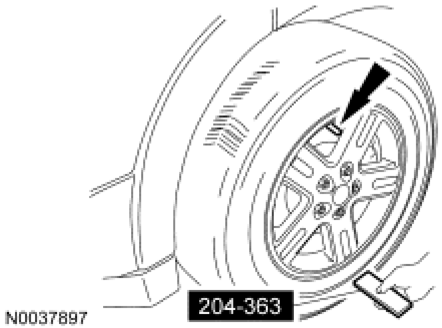

Fig. 14: Identifying Special Tool On LF Tire Side Wall Opposite (180 Degrees) From Valve Stem
Courtesy of FORD MOTOR CO.

7. Within 2 minutes of the horn sounding, place the Tire Pressure Monitor Activation Tool on the RF tire sidewall opposite (180 degrees) from the valve stem and press and release the test button to train the RF tire pressure sensor.

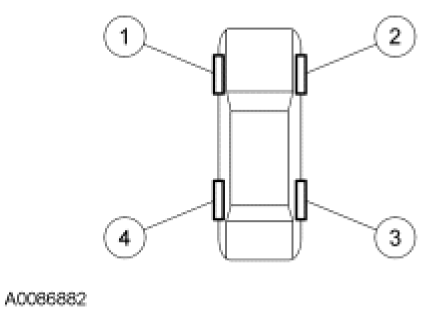

Fig. 15: Identifying Position Of Activation Tool
Courtesy of FORD MOTOR CO.

NOTE: Do not wait more than 2 minutes between training each sensor or the SJB will time out and the entire procedure must be repeated.

8. Repeat Step 7 for the RR and LR tires.

   The procedure is completed after the last tire has been trained. When the training procedure is complete, the message center (if equipped) will display TIRE TRAINING COMPLETE.

   For vehicles not equipped with a message center, successful completion of the training procedure will be verified by turning the ignition switch to the OFF position without the horn sounding. If the horn sounds twice when the switch is turned to the OFF position, the training procedure was not successful.

9. Using the scan tool, locate the updated TPMS sensor identifiers trained to the SJB and document them on the applicable warranty claim.

   NOTE: This step is required to clear DTC C2780, cause the SJB to exit the manufacturing mode and to make sure there are no other concerns with a newly programmed SJB.

10. If the sensors are being trained due to the installation of a new SJB, clear any DTCs and carry out the SJB On-Demand Self Test.

TIRE PRESSURE MONITORING SYSTEM (TPMS) SENSOR ACTIVATION

Special Tools

Illustration	Tool Name	Tool Number
 ST1385-A	Activation Tool, Tire Pressure Monitor	204-363

NOTE: The tire pressure sensors will go into a "sleep mode" after 30 minutes of inactivity to conserve battery power. The sensors do not transmit information while in sleep mode. It will be necessary to wake them up so they will transmit the latest tire pressure information.

1. Turn the ignition switch to the ON position.
2. Position the Tire Pressure Monitor Activation Tool against the LF tire sidewall, 180 degrees from the tire valve stem.

   NOTE: The Tire Pressure Monitor Activation Tool will provide feedback in the form of a flashing green light and a beep sound for each successful response from a tire pressure sensor.

3. Press the test button on the Tire Pressure Monitor Activation Tool to activate the sensor, activate the sensor at least 2 times.
4. Repeat Steps 2 and 3 for the remaining tires.
5. If the Tire Pressure Monitoring System (TPMS) indicator remains illuminated after adjusting and activating each sensor, refer to the **Symptom Chart**.

REMOVAL AND INSTALLATION

WHEEL AND TIRE

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

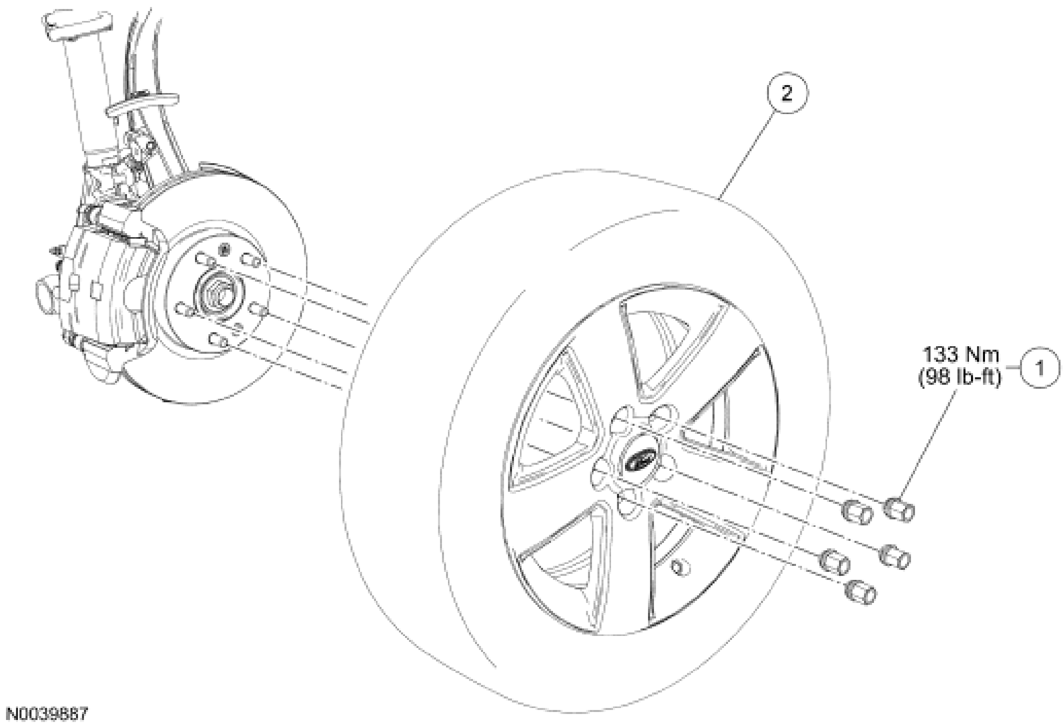

Fig. 16: Exploded View Of Wheel & Tire Assembly With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	1012	Wheel nut (5 required)
2	-	Wheel and tire assembly

REMOVAL

NOTE: Do not use heat to loosen a seized wheel nut or damage to the wheel and wheel bearing can occur.

1. With the weight of the vehicle on the wheels, loosen the wheel nuts.
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
3. Remove the 5 wheel nuts.
4. Remove the wheel and tire assembly.

INSTALLATION

WARNING: When a wheel is installed, always remove any corrosion, dirt or foreign material present on the mounting surface of the wheel and the mounting surface of the wheel hub, brake drum or brake disc. Make sure that any fasteners that attach the rotor to the hub are secured so they do not interfere with the mounting surfaces of the wheel. Failure to follow these instructions when installing wheels may result in the wheel nuts loosening and the wheel coming off while the vehicle is in motion, which could result in loss of control, leading to serious injury or death to vehicle occupant(s).

1. Clean the wheel mounting surfaces and apply a thin coat of silicone grease and dielectric compound to the wheel hub pilot surface (wheel only).
2. Install the wheel and tire assembly.

WARNING: Retighten wheel nuts within 160 km (100 mi) after a wheel is reinstalled. Wheels can loosen after initial tightening. Failure to follow this instruction may result in serious injury to vehicle occupant(s).

NOTE: Failure to tighten the wheel nuts in a star pattern can result in high brake disc runout, which will speed up the development of brake roughness, shudder and vibration.

3. Install the 5 wheel nuts.
   - Tighten the wheel nuts in a star pattern.
   - Tighten to 133 Nm (98 lb-ft).

DISASSEMBLY AND ASSEMBLY

WHEEL AND TIRE

Special Tools

Illustration	Tool Name	Tool Number

	Digital Tire Gauge	204-354

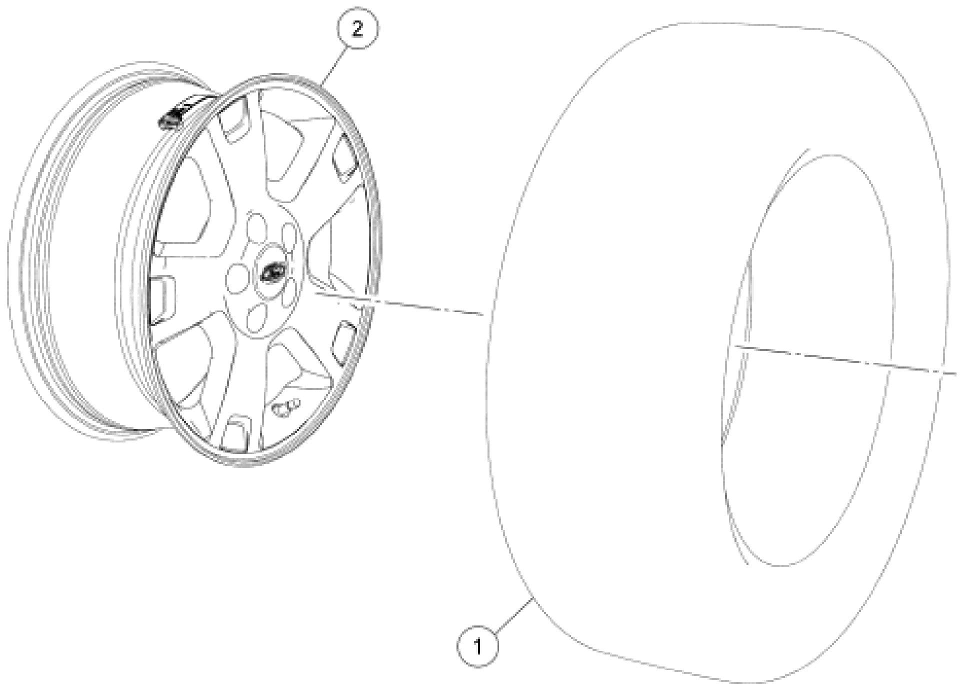

Fig. 17: Exploded View Of Wheel & Tire
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	1508	Tire
2	1007	Wheel

DISASSEMBLY

NOTE: **Failure to follow the instructions below may result in damage to the Tire Pressure Monitoring System (TPMS) sensor.**

NOTE: **Use only the Digital Tire Gauge any time tire pressures are measured to be sure that accurate values are obtained.**

NOTE: **A wheel and tire equipped with a Tire Pressure Monitoring System (TPMS) sensor will have the following verbiage stamped or cast on the wheel: SENSOR MAY BE INSIDE.**

NOTE: The TPMS sensor is mounted to the wheel 180 degrees opposite of the valve stem and is held in place by a stainless steel strap. The sensor is not mounted to the valve stem.

1. Remove the wheel and tire. For additional information, refer to **Wheel and Tire**.

NOTE: Do not allow the tire beads to move beyond the wheel mid-plane (middle of the wheel) when separating the beads from the wheels, damage to the Tire Pressure Monitoring System (TPMS) sensor may occur.

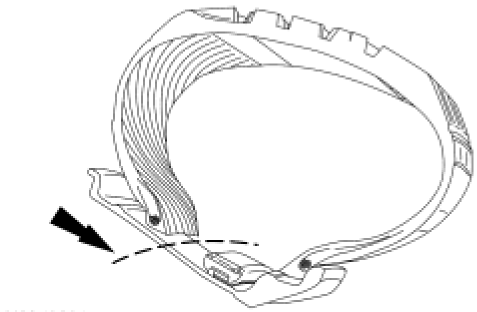

Fig. 18: Locating Tire Pressure Monitoring System (TPMS) Sensor
Courtesy of FORD MOTOR CO.

NOTE: Tire and valve stem position is critical to prevent damage to the Tire Pressure Monitoring System (TPMS) sensor when using a paddle-type bead separator.

NOTE: Some machines may have a nylon roller bead separator at the 12 o'clock position instead of the paddle-type bead separator at the 3 o'clock position.

2. Position the wheel and tire assembly on a suitable tire machine and separate both beads of the tire from the wheel.
   - For a paddle-type tire machine, position the valve stem at the 12 o'clock or 6 o'clock position and the paddle at the 3 o'clock position.
   - For a roller-type tire machine, align the valve stem with the roller at any position.

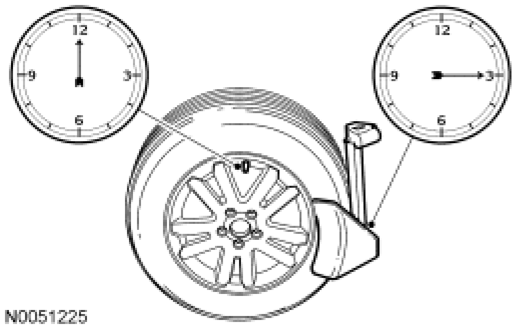

Fig. 19: Identifying Valve Stem And Paddle Position
Courtesy of FORD MOTOR CO.

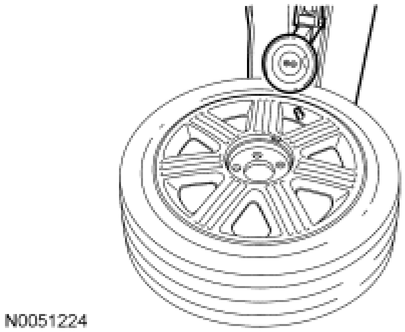

Fig. 20: Identifying Valve Stem And Roller
Courtesy of FORD MOTOR CO.

NOTE:

NOTE: **Index-mark the valve stem and wheel weight positions on the tire.**

3. Place the wheel and tire assembly on the turntable of the tire machine with the valve stem between the 5 o'clock and 6 o'clock positions and the machine arm at the 12 o'clock position and dismount the outer bead from the wheel.

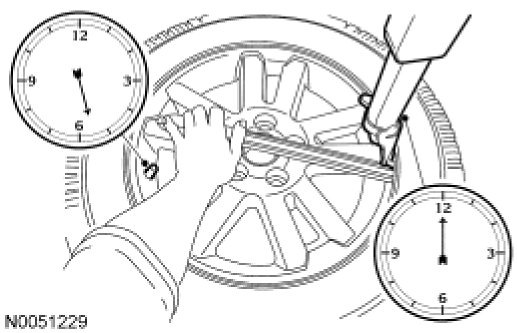

Fig. 21: Identifying Wheel And Tire Assembly On Turntable Tire Machine (Dismounting Outer Bead)
Courtesy of FORD MOTOR CO.

4. Reset the wheel and tire assembly on the turntable of the tire machine with the valve stem between the 5 o'clock and 6 o'clock positions and the machine arm at the 12 o'clock position and dismount the inner bead from the wheel.

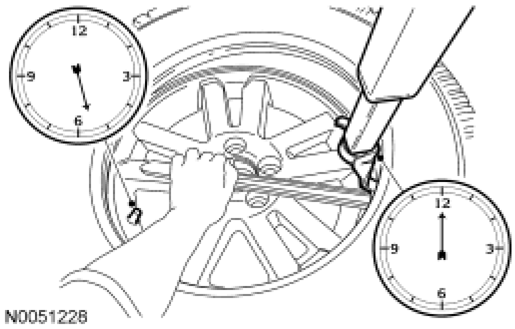

Fig. 22: Resetting Wheel And Tire Assembly On Turntable Of Tire Machine
Courtesy of FORD MOTOR CO.

5. Inspect the TPMS sensor, cradle and strap for damage. Install new parts as necessary.
   - For information on removal and installation of the TPMS sensor, refer to **Tire Pressure Monitoring System (TPMS) Sensor**.
   - When installing a new wheel, reuse the TPMS sensor from the previous wheel if possible. The TPMS will not have to be trained if the sensor is reused. The new wheel will not come with a sensor strap. A sensor strap kit will need to be ordered with the new wheel.

ASSEMBLY

NOTE: Damage to the Tire Pressure Monitoring System (TPMS) sensor may result if the tire mounting is not carried out as instructed.

NOTE: Use only a soap and water solution to lubricate the tire. Use of anything other than soap and water may result in damage to the Tire Pressure Monitoring System (TPMS) sensor.

NOTE: Do not mount the tire at this time.

NOTE:

1. Position the wheel on the turntable of the tire machine, then lubricate and position the bottom bead of the tire on the wheel.
2. Position the wheel to align the valve stem with the machine arm at the 12 o'clock position and mount the bottom bead of the tire.

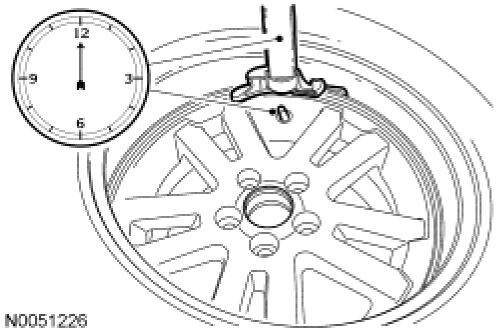

Fig. 23: Identifying Alignment Position Of Valve Stem With Machine Arm (Bottom Bead Of Tire)
Courtesy of FORD MOTOR CO.

3. Reposition the wheel to align the valve stem with the machine arm at the 12 o'clock position and mount the top bead of the tire.

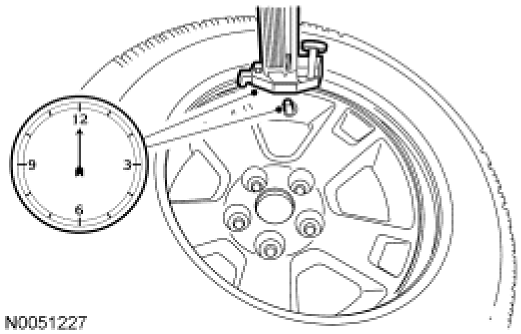

Fig. 24: Identifying Alignment Position Of Valve Stem With Machine Arm (Top Bead)
Courtesy of FORD MOTOR CO.

NOTE: Use only the Digital Tire Gauge any time tire pressures are measured to make sure that accurate values are obtained.

4. Using the Digital Tire Gauge, inflate the tire to the pressure specified on the Vehicle Certification (VC) label located on the driver door or door pillar.
   - Proceed to Step 5 if the tire beads do not seat at the specified inflation pressure.

   WARNING: If there is a need to exceed the maximum pressure indicated on the sidewall of the tire, in order to seat the beads, follow ALL the steps listed below. Failure to follow these steps may result in serious personal injury.

5. **The following steps should only be carried out if the tire beads cannot be seated by inflating the tire up to the maximum inflation pressure listed on the tire sidewall.**
   1. Re-lubricate the tire bead and wheel bead seat area.
   2. Install a remote valve and pressure gauge.
   3. Wear eye and ear protection and stand at a minimum of 3.65 m (12 ft) away from the wheel and tire

assembly.

4. Inflate tire using the remote valve and pressure gauge until the beads have seated or until the pressure gauge is 138 kPa (20 psi) more than maximum inflation pressure on tire sidewall. If beads have not seated, deflate the tire and proceed to the next step.
5. Place the wheel and tire assembly in an OSHA-approved tire safety cage.
6. Inflate the tire using the remote valve and pressure gauge until the beads have seated or until the pressure gauge is 276 kPa (40 psi) more than maximum inflation pressure on the tire sidewall. **Do not exceed 276 kPa (40 psi) above the maximum pressure on tire sidewall. Install a new tire if the beads do not seat at this pressure.**

6. Install the wheel and tire. For additional information, refer to **Wheel and Tire**.

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES

TIRE PRESSURE MONITORING SYSTEM (TPMS) SENSOR

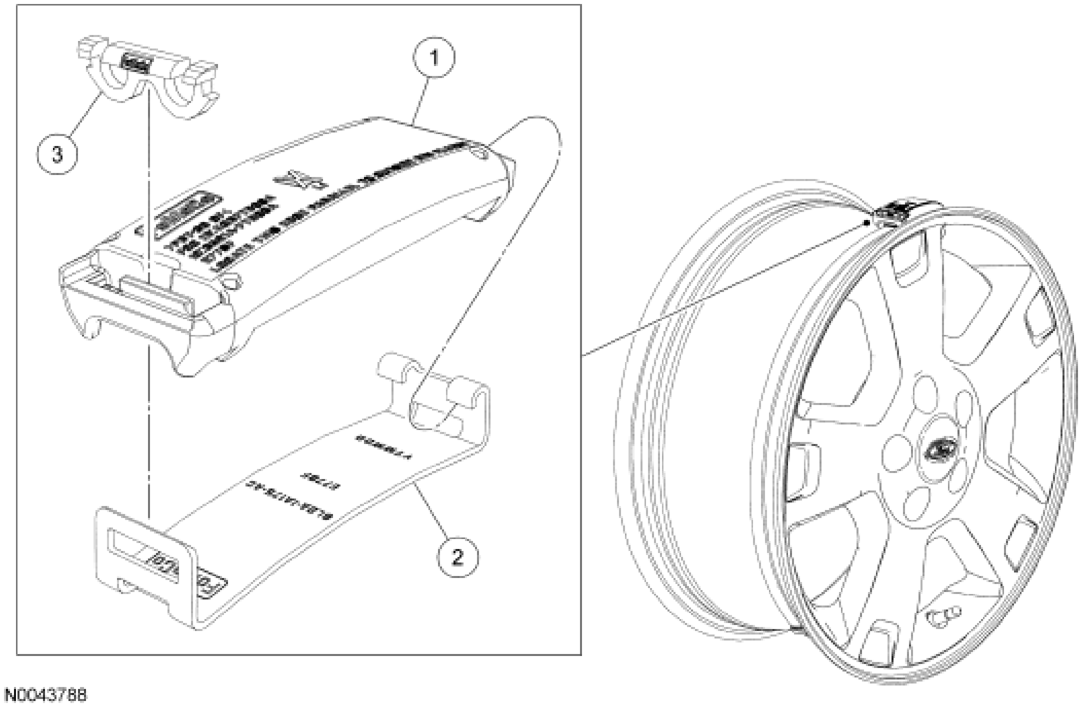

Fig. 25: Exploded View Of Tire Pressure Monitoring System (TPMS) Sensor
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	1A150/1A189	Tire pressure sensor/sensor kit
2	1A175	Sensor cradle
3	14C202	Locking clip (also part of 1A189)

DISASSEMBLY

WARNING: The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor can be removed and installed without removing the strap or the cradle.

NOTE: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Dismount the tire only as instructed.

1. Remove the tire from the wheel. For additional information, refer to **Wheel and Tire**.

NOTE: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor locking clip may occur.

2. Using a pocket screwdriver or similar tool, remove the sensor locking clip.

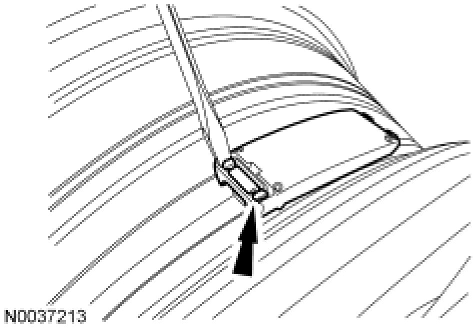

Fig. 26: Locating Sensor Locking Clip
Courtesy of FORD MOTOR CO.

NOTE: Do not use a large screwdriver. Apply minimum force during removal or damage to the sensor may occur.

3. Using a pocket screwdriver or similar tool, detach the sensor from the cradle.

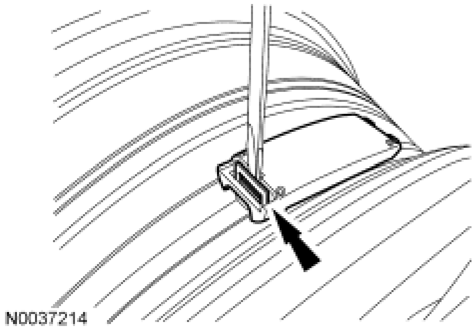

Fig. 27: Removing Sensor From Cradle
Courtesy of FORD MOTOR CO.

4. Remove the sensor.

ASSEMBLY

NOTE:	**Damage to the sensor may occur if excessive force is applied during sensor installation.**

NOTE:	**Make sure the sensor is fully seated into the cradle. The sensor will make a "click" noise when correctly seated.**

1. Position the sensor into the cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

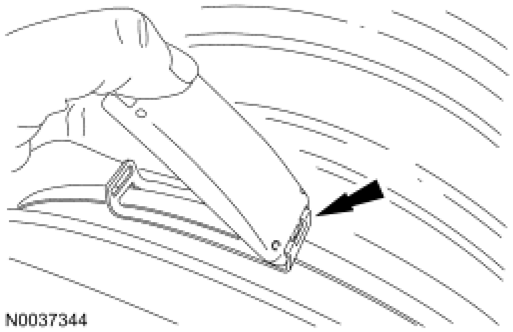

Fig. 28: Positioning Sensor Into Cradle
Courtesy of FORD MOTOR CO.

NOTE:	**The locking clip can only be fully seated when installed in the correct orientation. If the sensor locking clip cannot be fully inserted, then the sensor may not be fully seated on the cradle or the locking clip may be inserted backward.**

2. Insert a new locking clip into the sensor.

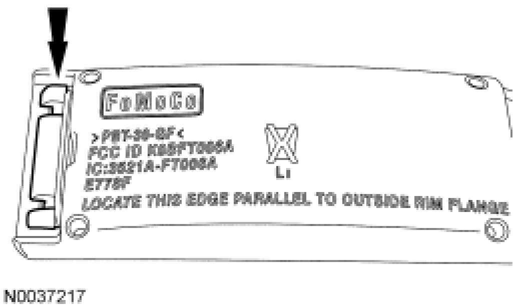

Fig. 29: Locating Locking Clip
Courtesy of FORD MOTOR CO.

NOTE: The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.

3. Install the tire onto the wheel. For additional information, refer to **Wheel and Tire**.

NOTE: A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.

4. Train the tire pressure sensor(s). For additional information, refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.

TIRE PRESSURE MONITORING SYSTEM (TPMS) STRAP AND CRADLE

Material

Item	Specification
Wheel and Tire Cleaner ZC-37-A	-

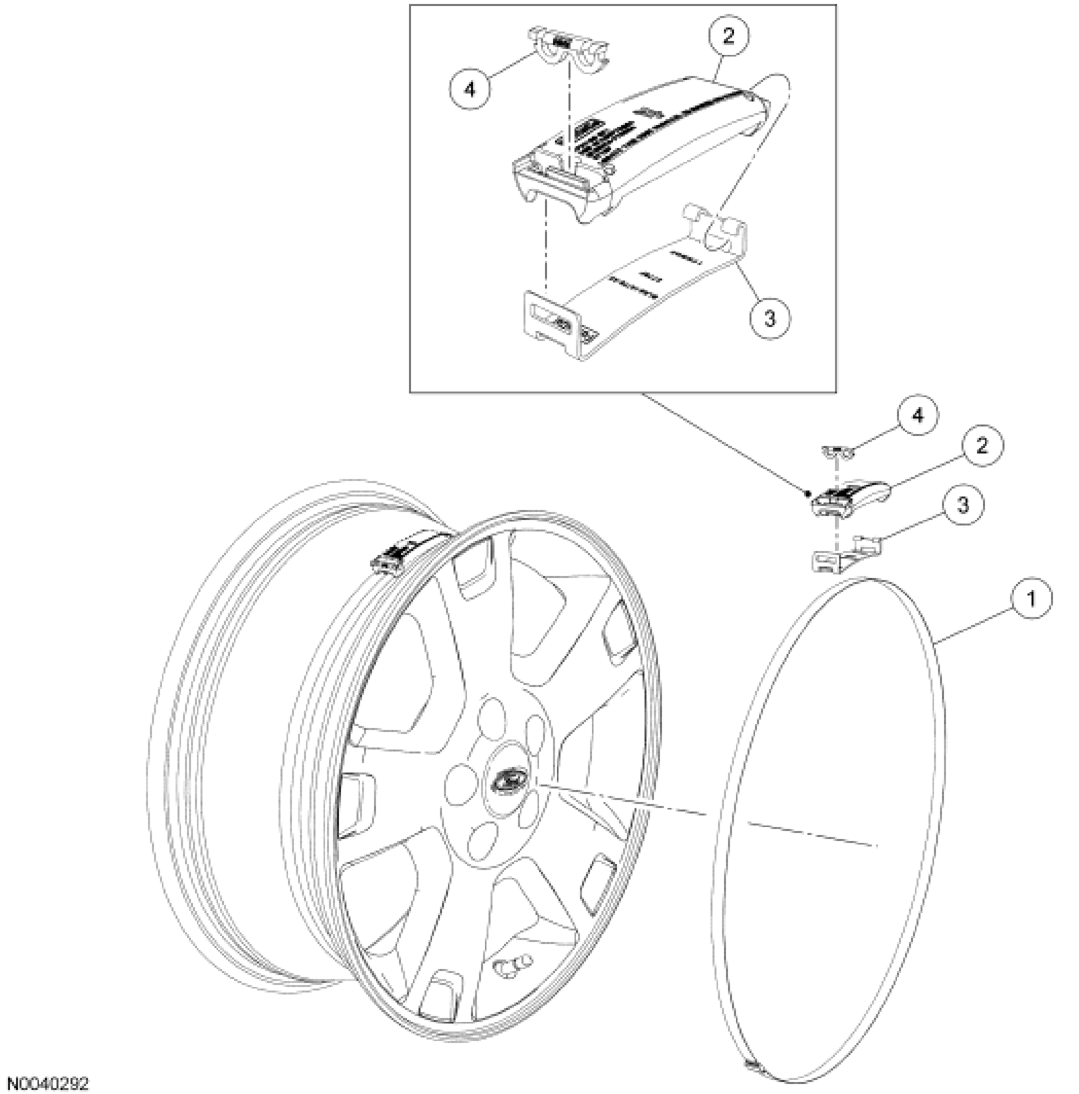

Fig. 30: Exploded View Of Tire Pressure Monitoring System (TPMS) Strap & Cradle
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	1A177/1A193	Strap/strap kit
2	1A150/1A189	Tire pressure sensor/sensor kit
3	1A175	Sensor cradle (also part of 1A193)
4	14C202	Locking clip (also part of 1A189)

DISASSEMBLY

WARNING: **The tire pressure monitoring system (TPMS) sensor battery may release hazardous chemicals if exposed to extreme mechanical damage. If these chemicals contact the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If any part of**

the battery is swallowed, contact a physician immediately. When disposing of TPMS sensors, follow the correct procedures for hazardous material disposal. Failure to follow these instructions may result in serious personal injury.

NOTE: Tire pressure sensors are equipped with Lithium-ion batteries and must be disposed of accordingly.

NOTE: Tire pressure sensors are manufactured in multiple colors based on their application. When installing a new sensor, make sure the color of the sensor being installed matches the color of the sensor that was removed. The different colored sensors are not interchangeable.

NOTE: The sensor is available separately, the cradle and strap are available as a strap kit. There are several different strap kits available based on wheel diameter, but all strap kits share the same base part number.

1. Remove the Tire Pressure Monitoring System (TPMS) sensor. For additional information, refer to **Tire Pressure Monitoring System (TPMS) Sensor**.

   WARNING: **Always wear eye protection when servicing a vehicle. Failure to follow this instruction may result in serious personal injury.**

   WARNING: **Wear protective gloves when handling components or parts that have pointed or sharp edges. Failure to follow this instruction may result in serious personal injury.**

2. Remove a factory-installed strap in the following sequence:
   1. Locate the strap buckle and secure the strap to the wheel using duct tape or a similar item on both sides of the buckle, approximately 25 mm (0.98 in) from the buckle.
   2. Using a large screwdriver and a twisting motion, unbuckle the strap.
   3. Discard the strap.

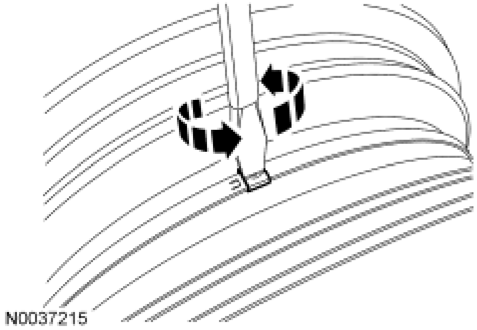

Fig. 31: Identifying Twisting Motion Using Large Screwdriver To Unbuckle Strap

Courtesy of FORD MOTOR CO.

3. To remove a dealer-installed strap, turn the worm gear screw until the strap is fully released from the worm gear.
    - Discard the strap.

NOTE: To aid assembly, mark the location of the cradle prior to disassembly.

4. Using a screwdriver, or similar tool, remove the cradle by inserting the screwdriver under the cradle and prying up.

ASSEMBLY

NOTE: Make sure the sensor is fully seated into the new cradle. The sensor will make a "click" noise when fully seated.

1. Position the sensor into the new cradle by inserting the hinge end of the sensor into the hook end of the cradle and pushing the opposite end of the sensor down onto the cradle.

NOTE: Metal scrapers may damage the wheel. Use only plastic or non-metallic scrapers to remove the cradle adhesive strip residue.

NOTE: The sensor and cradle must be installed in the drop well of the wheel, 180 degrees from the valve stem.

2. Using wheel and tire cleaner, clean the area where the sensor and cradle are to be installed.

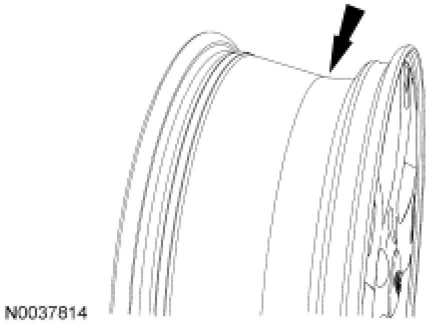

Fig. 32: Locating Sensor & Cradle Area
Courtesy of FORD MOTOR CO.

NOTE: The sensor and cradle must be positioned with the hinge side of the sensor on the RH side when viewed from the curb side (beauty side) of the wheel.

NOTE: The sensor has raised markings indicating how to position the sensor.

3. Remove the adhesive tape liner from the cradle and position the sensor and cradle into the wheel drop well 180 degrees from the valve stem.

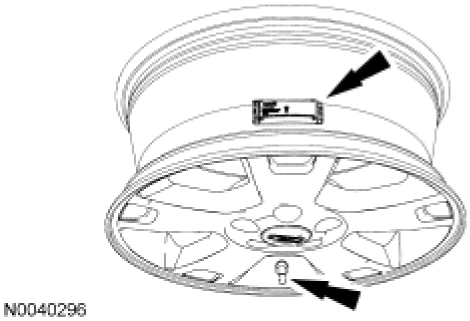

Fig. 33: Locating Sensor & Cradle Into Wheel Drop Well
Courtesy of FORD MOTOR CO.

4. Install the tapered end of the strap through the opening of the cradle on the hinge side of the sensor. This will position the worm gear on the locking clip side of the sensor.

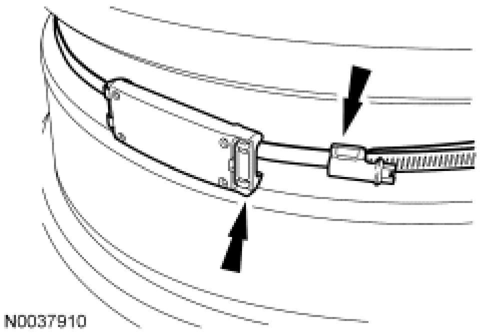

Fig. 34: Locating Worm Gear And Locking Clip
Courtesy of FORD MOTOR CO.

NOTE: **Steel wheels have a "high spot" along their circumference. Make sure the strap and sensor are mounted at the lowest spot possible to avoid damaging the sensor during wheel and tire disassembly and assembly.**

NOTE: **Keep the strap parallel with the wheel flange while tightening the worm gear.**

5. Position the worm gear 13-26 mm (0.5-1.0 in) away from the sensor and tighten the worm gear.
    - Tighten to 3 Nm (27 lb-in).

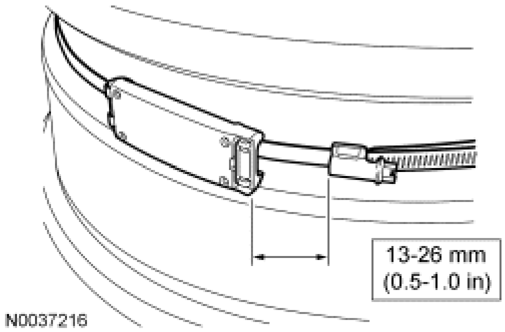

Fig. 35: Identifying Worm Gear Distance From Sensor With Specifications
Courtesy of FORD MOTOR CO.

NOTE:	**The sensor, cradle and strap may be damaged by incorrect tire mounting or dismounting. Mount the tire only as instructed.**

6. Install the tire onto the wheel. For additional information, refer to **Wheel and Tire**.

NOTE:	**A new tire pressure sensor is shipped in an off mode (or battery saver mode) and must be turned on before it can be trained. To turn the sensor on, install it on a wheel, mount the tire and inflate the tire to the recommended inflation pressure. Wait at least 2 minutes, then continue with the sensor training procedure.**

7. Train the tire pressure sensor(s). For additional information, refer to **Tire Pressure Monitoring System (TPMS) Sensor Training**.

Wiper pivot arm nuts	20	15	-
Wiper motor-to-wiper mounting arm bolts	8	-	71

DESCRIPTION AND OPERATION

WIPERS AND WASHERS

NOTE: The smart junction box (SJB) may also be identified as the generic electronic module (GEM).

The windshield wiper and washer system consists of the following:

- Windshield wiper blade
- Windshield wiper pivot arm
- Windshield wiper mounting arm and pivot shaft
- Windshield wiper motor
- Windshield washer reservoir
- Windshield washer pump
- Multi-function switch

- SJB

The washer system consists of the washer reservoir and washer pump. When the multi-function switch is placed into the wash mode, the SJB integral electronics activate the washer pump to direct washer fluid to the windshield. When the front windshield washer system is activated, the wipers will cycle 3 times with washer fluid followed by one final courtesy wipe a few seconds later to clear any remaining fluid that is dripping down from the top of the windshield.

If equipped with automatic headlamps, the SJB will illuminate the exterior lamps, including the parking lamps, when the front wipers are on for more than 10 seconds.

When the wiper control is set on any intermittent setting except INT 1, the speed dependent wipers will automatically adjust with the vehicle speed. This feature decreases the time between wipes when the vehicle speed increases.

DIAGNOSTIC TESTS

WIPERS AND WASHERS

Special Tools

Illustration	Tool Name	Tool Number
 ST2574-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST1137-A	73III Automotive Meter	105-R00057 or equivalent
 ST1138-A	Flex Probe Kit	105-R025B or equivalent

Principles of Operation

Windshield Wiper Operation

NOTE: **The smart junction box (SJB) may also be identified as the generic electronic module (GEM).**

The multi-function switch controls the front wiper/washer portion and is wired to the SJB. When the switch is moved to the desired position, one or more of circuits CRW18 (VT/WH), CRW19 (BU/OG), CRW08 (VT/OG) or CRW17 (GN/VT) is grounded through circuit CD116 (BK/VT). This will provide the necessary inputs for the SJB to control the run/park relay and the high/low relay (integral to the SJB) coils. In order to achieve high-speed operation, both relays are energized. The SJB will respond to the multi-function switch inputs only when the ignition lock cylinder is in RUN or ACC.

The SJB includes a speed dependent feature which compensates for the extra moisture that accumulates on the windshield at higher vehicle speeds when the multi-function switch is in any intermittent setting except the INT 1 position. As vehicle speed increases, the speed dependent feature gradually shortens the delay between wipes.

The speed dependent feature is easiest to verify in the INT 2 position. With the vehicle at a standstill and the multi-function switch in the INT 2 position, the wipers should operate once every 10 seconds. As vehicle speed increases, the delay between wipes will gradually shorten. For example, by the time the vehicle reaches 100 km/h (62 mph), the wipers should operate every 5 seconds. Speed dependent operation is similar in INT 3, INT 4 and INT 5 modes.

Windshield Washer System

The washer pump relay is hard-wired to the SJB. The washer switch portion of the multi-function switch will ground circuit CRW07 (GY/BN) which will signal the SJB to energize the washer pump relay (integral to the SJB). The relay will then provide voltage to the windshield washer pump through circuit CRW14 (BU/WH). The windshield washer pump is grounded through circuit GD123 (BK/GY).

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical

• Windshield washer hoses
• Wiper linkage
	• Battery junction box (BJB) fuse 9 (20A)
	• SJB fuse(s):
	  ○ 23 (7.5A)
	  ○ 14 (15A)
	• Circuitry
	• Multi-function switch
	• Windshield wiper motor
	• Windshield washer pump
	• SJB

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool still does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the SJB.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB and the Wiper Control Test.
9. If the DTCs retrieved are related to the concern, go to Smart Junction Box (SJB) DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

SMART JUNCTION BOX (SJB) DTC CHART

DTC	Description	Action
B1432	Wiper Brake/Run Relay Circuit Short to Battery	Go to **Pinpoint Test A**.
B1433	Wiper Brake/Run Relay Circuit Short to Ground	Go to **Pinpoint Test B**.
B1447	Wiper Park Sense Circuit Open	Go to **Pinpoint Test F**.
B2179	Front Wiper Select Switch "A" Short to Ground	Go to **Pinpoint Test B**.
B2180	Front Wiper Select Switch "B" Short to Ground	Go to **Pinpoint Test B**.
B2181	Front Wiper Select Switch "C" Short to Ground	Go to **Pinpoint Test B**.
B2183	Front Wiper Select Switch "H" Short to Ground	Go to **Pinpoint Test C**.
	Front Wiper Select Switch "W"	

B2184	Short to Ground	Go to **Pinpoint Test E**.
U1900	CAN Communication Bus Fault - Receive Error	**NOTE:** **Do not install a new SJB module as part of a repair for a SJB DTC U1900 fault.** The SJB is not the source of the fault when DTC U1900 is present. REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the medium-speed controller area network (MS-CAN) network concern.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The wipers are inoperative	• Fuse(s) • Relay • Circuitry • Multi-function switch • Windshield wiper motor • Smart junction box (SJB)	• Go to **Pinpoint Test A**.
• The wipers stay on continuously	• Relay • Circuitry • Windshield wiper motor • Multi-function switch • SJB	• Go to **Pinpoint Test B**.
• The high speed wipers do not operate correctly	• Circuitry • Multi-function switch • Windshield wiper motor • SJB	• Go to **Pinpoint Test C**.
• The low speed and intermittent wipers do not operate correctly	• Circuitry • Multi-function switch • Windshield wiper motor • SJB	• Go to **Pinpoint Test C**.
	• Fuse	

• The washer pump is inoperative	• Circuitry • Windshield washer pump • Multi-function switch • SJB	• Go to **Pinpoint Test D**.
• The wash and wipe function does not operate correctly	• Circuitry • Multi-function switch • SJB	• If the LOW speed wiper is inoperative, go to **Pinpoint Test C**. If the washer pump is inoperative, go to **Pinpoint Test D**.
• The wipers do not park at the correct position	• Pivot arm adjustment • Linkage	• ADJUST/REPAIR as necessary.
	• Relay • Circuitry • Multi-function switch • Windshield wiper motor	• Go to **Pinpoint Test F**.
• The speed dependent interval mode does not operate correctly	• SJB • Instrument cluster (IC)	• Go to **Pinpoint Test G**.
• The headlamps do not illuminate when the wipers are on	• Circuitry • SJB	• VERIFY the automatic headlamps operate correctly. If the automatic headlamps do not operate correctly, REFER to **EXTERIOR LIGHTING** article to diagnose the autolamp system. If the automatic headlamps do operate correctly, and no other DTCs are present in the SJB, INSTALL a new SJB. TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: The Wipers are Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Wipers and Washers for schematic and connector information.

Normal Operation

When the smart junction box (SJB) receives input from the multi-function switch to activate the wipers, the SJB activates the RUN/PARK relay through circuit RRW24 (GN/VT). When the RUN/PARK relay is activated, voltage is supplied back to the SJB through circuit CRW03 (VT/WH) into the (integral) HIGH/LOW relay. The windshield wiper motor receives power from the HIGH/LOW relay (integral to the SJB) through circuit

CRW16 (GY/BN) for low speed and circuit CRW15 (BN/WH) for high speed. The windshield wiper motor is grounded through circuit GD121 (BK/YE). The multi-function switch is grounded through circuit GD116 (BK/VT).

- DTC B1432 Wiper Brake/Run Relay Circuit Short to Battery - Output shorted to battery when output is active.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- RUN/PARK relay
- Multi-function switch
- Windshield wiper motor
- SJB module

PINPOINT TEST A: THE WIPERS ARE INOPERATIVE

A1 RETRIEVE THE RECORDED SJB DTCs FROM THE WIPER CONTROL SELF-TEST

- Use the recorded SJB DTCs from the Wiper Control Self-Test.
- **Are any DTCs recorded?**

  YES : For DTC B1432, go to A7.

  NO : Go to A2.

A2 CHECK THE MULTI-FUNCTION SWITCH INPUTS TO THE SJB - MONITOR SJB PIDS FRNWIPER_A, FRNWIPER_B, FRNWIPER_C AND FRNWIPER_H

- Enter the following diagnostic mode on the scan tool: SJB DataLogger.
- Monitor the SJB PIDs FRNWIPER_A, FRNWIPER_B, FRNWIPER_C and FRNWIPER_H while turning the multi-function switch through all positions.
- Refer to table.

Multi-function Switch Position	FRN-WIPER_A	FRN-WIPER_B	FRN-WIPER_C	FRN-WIPER_H
INT 1	Active	Inactive	Inactive	Inactive
INT 2	Active	Active	Inactive	Inactive
INT 3	Inactive	Active	Inactive	Inactive
INT 4	Inactive	Active	Active	Inactive
INT 5	Inactive	Inactive	Active	Inactive
LOW	Active	Inactive	Active	Inactive
HIGH	Inactive	Inactive	Inactive	Active

- **Do the PID values agree with the multi-function switch positions?**

YES : Go to A5.

NO : Go to A3.

A3 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

YES : Go to A4.

NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article.

A4 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

- Key in OFF position.

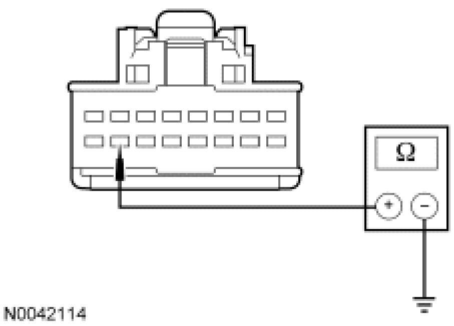

Fig. 1: Checking Circuit GD116 (BK/VT) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between multi-function switch C202-15, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to A5.

NO : REPAIR the circuit. TEST the system for normal operation.

A5 CHECK THE WINDSHIELD WIPER MOTOR CIRCUIT GD121 (BK/YE) FOR AN OPEN

- Disconnect: Windshield Wiper Motor C125

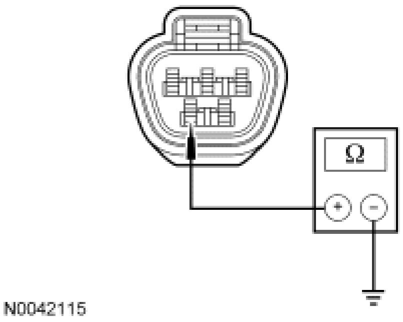

Fig. 2: Checking Windshield Wiper Motor Circuit GD121 (BK/YE) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between windshield wiper motor C125-4, circuit GD121 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to A6.

  NO : REPAIR the circuit. TEST the system for normal operation.

A6 CHECK CIRCUIT CRW16 (GY/BN) FOR VOLTAGE

- Key in ON position.
- Place the multi-function switch into the low speed position.

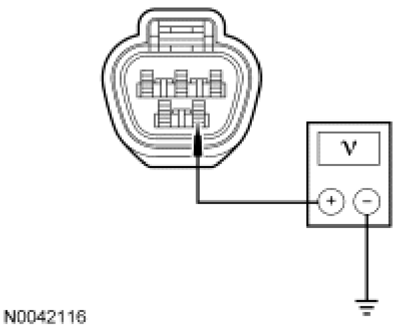

Fig. 3: Checking Circuit CRW16 (GY/BN) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between windshield wiper motor C125-5, circuit CRW16 (GY/BN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new windshield wiper motor. REFER to **Wiper Motor**.

  NO : Go to A7.

A7 CHECK THE WIPER RUN/PARK RELAY

- Disconnect: Windshield Wiper RUN/PARK Relay
- Carry out the Run/Park Relay Component Test. Refer to COMPONENT TESTING.
- **Did the RUN/PARK relay pass the component test?**

  YES : Go to A8.

  NO : INSTALL a new RUN/PARK relay. TEST the system for normal operation.

A8 CHECK CIRCUIT SBB09 (RD) FOR AN OPEN

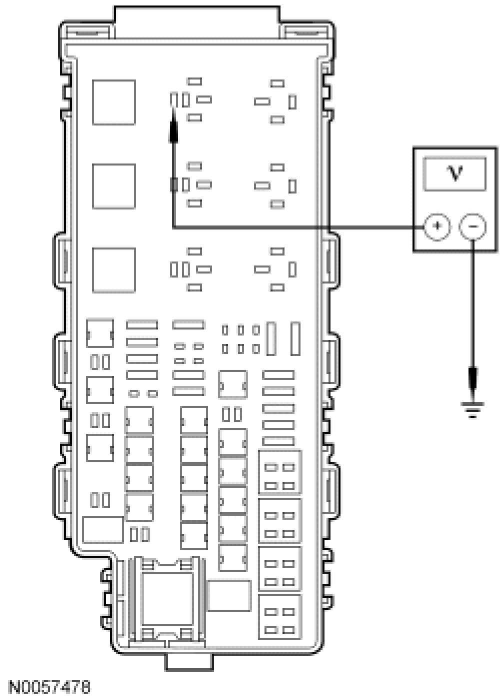

Fig. 4: Checking Circuit SBB09 (RD) For Open - MKZ
Courtesy of FORD MOTOR CO.

- Measure the voltage between windshield wiper RUN/PARK relay pin 87, circuit SBB09 (RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A9.

  NO : VERIFY the battery junction box (BJB) fuse 9 (20A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

A9 CHECK CIRCUIT CBP23 (BN/YE) FOR AN OPEN

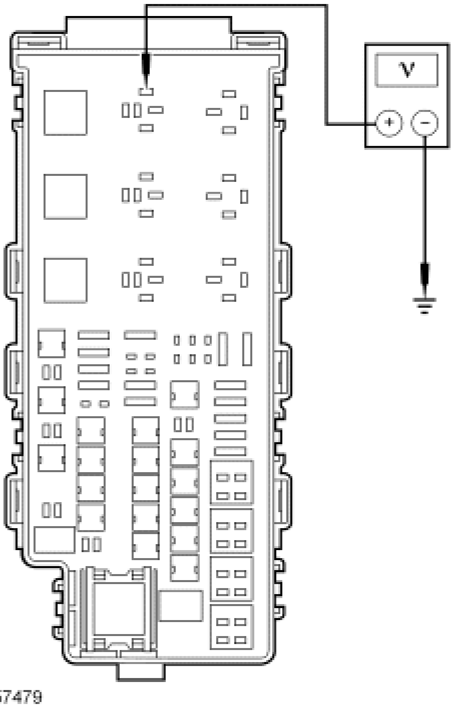

Fig. 5: Checking Circuit CBP23 (BN/YE) For Open - MKZ
Courtesy of FORD MOTOR CO.

- Measure the voltage between windshield wiper RUN/PARK relay pin 86, circuit CBP23 (BN/YE), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A12.

  NO : Go to A10.

A10 CHECK CIRCUIT CBP23 (BN/YE) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280a

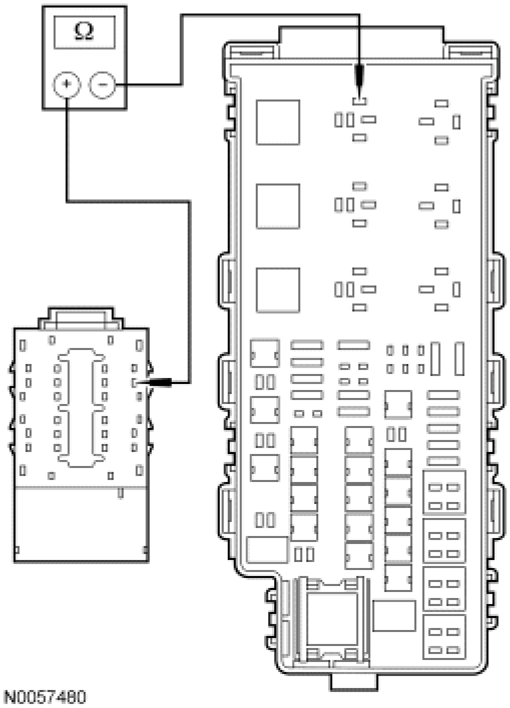

Fig. 6: Checking Circuit CBP23 (BN/YE) For Open - MKZ
Courtesy of FORD MOTOR CO.

- Measure the resistance between windshield wiper RUN/PARK relay pin 86, circuit CBP23 (BN/YE), harness side and SJB C2280a-24, circuit CBP23 (BN/YE), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A11.

  NO : REPAIR the circuit. TEST the system for normal operation.

A11 CHECK CIRCUIT CDC33 (VT/GN) FOR AN OPEN

- Disconnect: SJB C2280b
- Key in ON position.

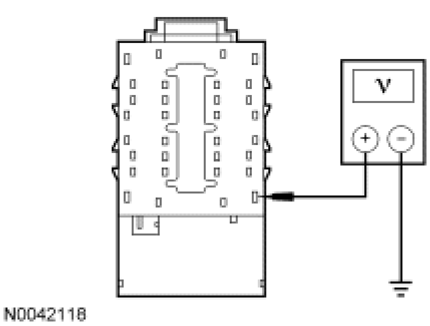

Fig. 7: Checking Circuit CDC33 (VT/GN) For Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between SJB C2280b-4, circuit CDC33 (VT/GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : VERIFY SJB fuse 23 (7.5A) is OK. If OK, go to A14.

  NO : DIAGNOSE the ignition switch circuit. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

A12 CHECK CIRCUIT RRW24 (GN/VT) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280a

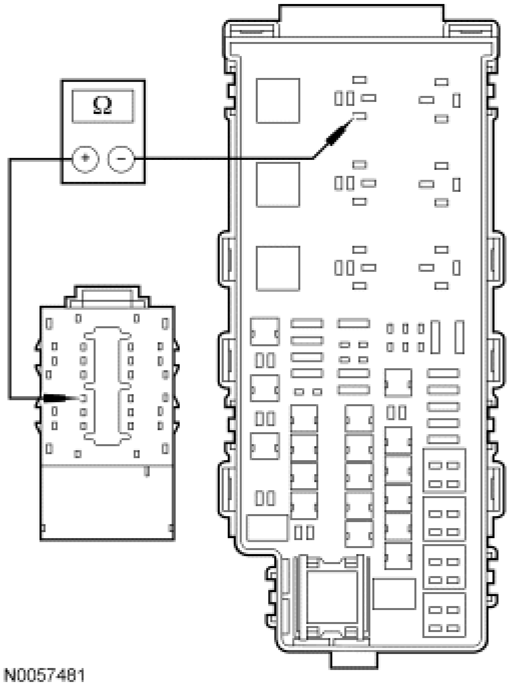

Fig. 8: Checking Circuit RRW24 (GN/VT) For Open - MKZ
Courtesy of FORD MOTOR CO.

- Measure the resistance between windshield wiper RUN/PARK relay pin 85, circuit RRW24 (VT/GN), harness side and SJB C2280a-14, circuit RRW24 (VT/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A13.

  NO : REPAIR the circuit. TEST the system for normal operation.

A13 CHECK CIRCUIT CRW03 (VT/WH) FOR AN OPEN

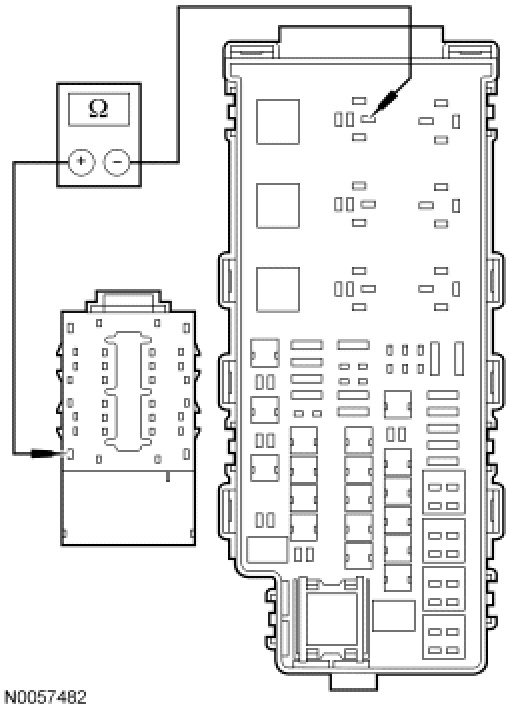

Fig. 9: Checking Circuit CRW03 (VT/WH) For Open - MKZ
Courtesy of FORD MOTOR CO.

- Measure the resistance between windshield wiper RUN/PARK relay pin 30, circuit CRW03 (VT/WH), harness side and SJB C2280a-1, CRW03 (VT/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to A14.

  NO : REPAIR the circuit. TEST the system for normal operation.

A14 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: The Wipers Stay On Continuously

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for

Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Wipers and Washers for schematic and connector information.

Normal Operation

The smart junction box (SJB) receives input from the multi-function switch through circuits CRW18 (VT/WH), CRW19 (BU/OG), CRW08 (VT/OG) and CRW17 (GN/VT). To enable the wipers, the SJB activates the RUN/PARK relay through circuit RRW24 (GN/VT). When the RUN/PARK relay is activated, voltage is supplied back to the SJB through circuit CRW03 (VT/WH) into the (integral) HIGH/LOW relay. The windshield wiper motor receives power from the HIGH/LOW relay (integral to the SJB) through circuit CRW16 (GY/BN) for low speed and circuit CRW15 (BN/WH) for high speed. The windshield wiper motor is grounded through circuit GD121 (BK/YE). The multi-function switch is grounded through circuit GD116 (BK/VT).

DTC Description	Fault Trigger Conditions
B1433 - Wiper Brake/Run Relay Circuit Short to Ground	Output shorted to ground or open circuit when output is off.
B2179 - Front Wiper Select Switch "A" Short to Ground	Switch input shorted to ground.
B2180 - Front Wiper Select Switch "B" Short to Ground	Switch input shorted to ground.
B2181 - Front Wiper Select Switch "C" Short to Ground	Switch input shorted to ground.

This pinpoint test is intended to diagnose the following:

- RUN/PARK relay
- Wiring, terminals or connectors
- Multi-function switch
- Windshield wiper motor
- SJB module

PINPOINT TEST B: THE WIPERS STAY ON CONTINUOUSLY

B1 RETRIEVE THE RECORDED SJB DTCs FROM THE WIPER CONTROL SELF-TEST

- Use the recorded SJB DTCs from the Wiper Control Self-Test.
- **Are any DTCs recorded?**

  YES : For DTC B1433, go to B4.

  NO : Go to B2.

B2 CHECK THE MULTI-FUNCTION SWITCH INPUTS TO THE SJB - MONITOR SJB PIDS FRNWIPER_A, FRNWIPER_B, FRNWIPER_C AND FRNWIPER_H

- Key in ON position.
- Enter the following diagnostic mode on the scan tool: SJB DataLogger.
- Monitor the SJB PIDs FRNWIPER_A, FRNWIPER_B, FRNWIPER_C and FRNWIPER_H while

turning the multi-function switch through all positions.

- Refer to table.

Multi-function Switch Position	FRN-WIPER_A	FRN-WIPER_B	FRN-WIPER_C	FRN-WIPER_H
INT 1	Active	Inactive	Inactive	Inactive
INT 2	Active	Active	Inactive	Inactive
INT 3	Inactive	Active	Inactive	Inactive
INT 4	Inactive	Active	Active	Inactive
INT 5	Inactive	Inactive	Active	Inactive
LOW	Active	Inactive	Active	Inactive
HIGH	Inactive	Inactive	Inactive	Active

- **Do the PID values agree with the multi-function switch positions?**

  YES : Go to B5.

  NO : Go to B3.

B3 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

  YES : Go to B4.

  NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article.

B4 CHECK CIRCUITS CRW17 (GN/VT), CRW18 (VT/WH) AND CRW19 (BU/OG) FOR SHORT TO GROUND

- Disconnect: SJB C2280d

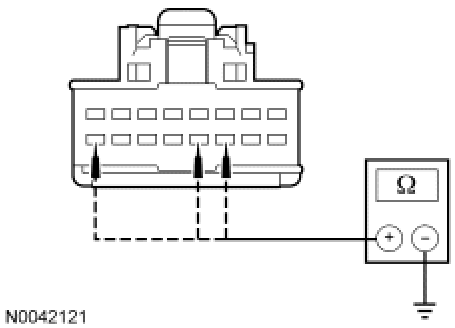

Fig. 10: Checking Circuit CRW17 (GN/VT), CRW18 (VT/WH) And CRW19 (BU/OG) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between multi-function switch C202-16, circuit CRW19 (BU/OG), harness side and ground; and between C202-11, circuit CRW18 (VT/WH), harness side and ground; and between C202-12, circuit CRW17 (GN/VT), harness side and ground.
- **Is the resistance for all measurements greater than 10,000 ohms?**

  YES : Go to B11.

  NO : REPAIR the circuit. TEST the system for normal operation.

B5 CHECK WIPER OPERATION WITH THE PARK RELAY REMOVED

- Disconnect: Wiper PARK Relay
- Observe the wiper operation with the PARK relay removed.
- **Are the wipers still operating?**

  YES : Go to B6.

  NO : INSTALL a new windshield wiper motor. REFER to **Wiper Motor**.

B6 CHECK WIPER OPERATION WITH THE RUN/PARK RELAY REMOVED

- Disconnect: Wiper RUN/PARK Relay
- Observe the wiper operation with the RUN/PARK relay removed.
- **Are the wipers still operating?**

  YES : Go to B9.

  NO : Go to B7.

B7 CHECK THE WIPER RUN/PARK RELAY

- Carry out the Run/Park Relay Component Test. Refer to COMPONENT TESTING.
- **Did the RUN/PARK relay pass the component test?**

  YES : Go to B8.

  NO : INSTALL a new RUN/PARK relay. TEST the system for normal operation.

B8 CHECK CIRCUIT RRW24 (GN/VT) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280a

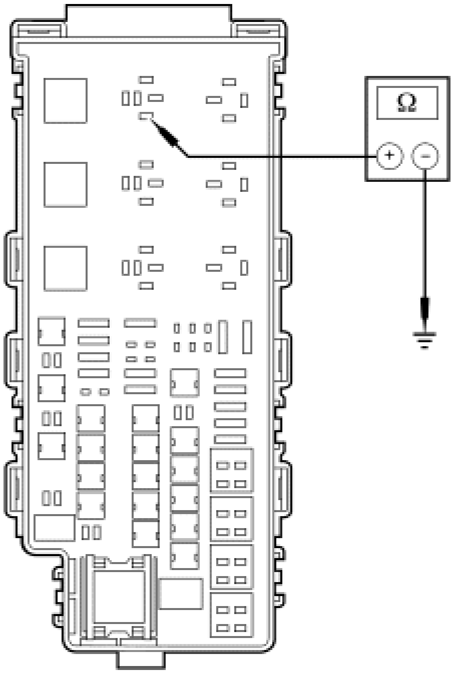

Fig. 11: Checking Circuit RRW24 (GN/VT) For Short To Ground - MKZ
Courtesy of FORD MOTOR CO.

- Measure the resistance between windshield wiper RUN/PARK relay pin 85, circuit RRW24 (GN/VT), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B11.

  NO : REPAIR the circuit. TEST the system for normal operation.

B9 CHECK CIRCUIT CRW03 (VT/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: SJB C2280a
- Key in ON position.

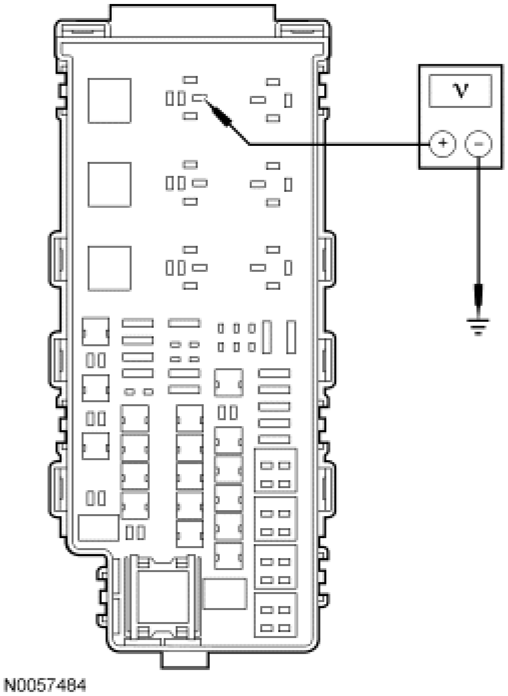

Fig. 12: Checking Circuit CRW03 (VT/WH) For Short To Voltage - MKZ
Courtesy of FORD MOTOR CO.

- Measure the voltage between wiper RUN/PARK relay pin 30, circuit CRW03 (VT/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to B10.

B10 CHECK CIRCUITS CRW15 (BN/WH) AND CRW16 (GY/BN) FOR A SHORT TO VOLTAGE

- Disconnect: Wiper Motor C125

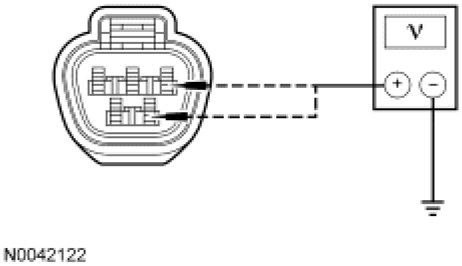

Fig. 13: Checking Circuit CRW15 (BN/WH) And CRW16 (GY/BN) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between wiper motor C125-3, circuit CRW15 (BN/WH), harness side and

ground; and between C125-5, circuit CRW16 (GY/BN), harness side and ground.

- **Is the voltage greater than 10 volts for either measurement?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to B11.

B11 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: The High/Low Wiper Speeds Do Not Operate Correctly

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Wipers and Washers for schematic and connector information.

Normal Operation

The smart junction box (SJB) receives input from the multi-function switch through circuits CRW18 (VT/WH), CRW19 (BU/OG), CRW08 (VT/OG) and CRW17 (GN/VT). To enable the wipers, the SJB activates the RUN/PARK relay through circuit RRW24 (GN/VT). When the RUN/PARK relay is activated, voltage is supplied back to the SJB through circuit CRW03 (VT/WH) into the (integral) HIGH/LOW relay. The windshield wiper motor receives power from the HIGH/LOW relay (integral to the SJB) through circuit CRW16 (GY/BN) for low speed and circuit CRW15 (BN/WH) for high speed. The windshield wiper motor is grounded through circuit GD121 (BK/YE). The multi-function switch is grounded through circuit GD116 (BK/VT).

- DTC B2183 Front Wiper Select Switch "H" Short to Ground - Switch input shorted to ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multi-function switch
- Windshield wiper motor
- SJB module

PINPOINT TEST C: THE HIGH/LOW WIPER SPEEDS DO NOT OPERATE CORRECTLY

C1 RETRIEVE THE RECORDED DTCs FROM THE WIPER CONTROL SELF-TEST

- Key in ON position.
- Use the recorded SJB DTCs from the Wiper Control Self-Test.
- **Are any DTCs recorded?**

  YES : For DTC B1432, go to **Pinpoint Test A**.

  For DTC B1433, go to **Pinpoint Test B**.

  For DTC B1447, go to **Pinpoint Test F**.

  Go to C2.

  NO : Go to C2.

C2 CHECK THE MULTI-FUNCTION SWITCH INPUT TO THE SJB - MONITOR SJB PIDS FRNWIPER_A, FRNWIPER_B, FRNWIPER_C AND FRNWIPER_H

- Key in ON position.
- Enter the following diagnostic mode on the scan tool: SJB DataLogger.
- Monitor the SJB PIDs FRNWIPER_A, FRNWIPER_B, FRNWIPER_C and FRNWIPER_H while turning the multi-function switch through all positions.
- Refer to table.

Multi-function Switch Position	Wiper_A	Wiper_B	Wiper_C	Wiper_H
INT 1	Active	Inactive	Inactive	Inactive
INT 2	Active	Active	Inactive	Inactive
INT 3	Inactive	Active	Inactive	Inactive
INT 4	Inactive	Active	Active	Inactive
INT 5	Inactive	Inactive	Active	Inactive
LOW	Active	Inactive	Active	Inactive
HIGH	Inactive	Inactive	Inactive	Active

- **Do the PID values agree with the multi-function switch positions?**

  YES : Go to C5.

  NO : Go to C3.

C3 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

  YES : Go to C4.

  NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article.

C4 CHECK CIRCUIT CRW17 (GN/VT), CRW18 (VT/WH), CRW08 (VT/OG) AND CRW19 (BU/OG) FOR AN OPEN OR SHORT TO GROUND

- Disconnect: SJB C2280d
- Measure the resistance between multi-function switch and SJB; and between the multi-function switch and ground as follows:

Multi-function Switch	SJB Connector	Circuit
C202-16	C2280d-21	CRW19 (BU/OG)
C202-11	C2280d-22	CRW18 (VT/WH)
C202-9	C2280d-32	CRW08 (VT/OG)
C202-12	C2280d-23	CRW17 (GN/VT)

- **Is the resistance between the multi-function switch and SJB less than 5 ohms; and greater than 10,000 ohms between the multi-function switch and ground?**

  YES : Go to C9.

  NO : REPAIR the circuit in question. TEST the system for normal operation.

C5 CHECK CIRCUIT CRW15 (BN/WH) FOR VOLTAGE

- Disconnect: Windshield Wiper Motor C125
- Place the multi-function switch to the HIGH speed position.

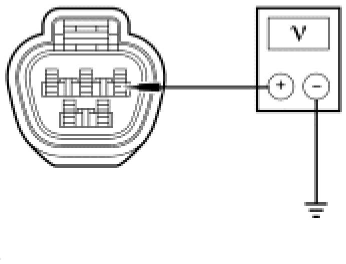

Fig. 14: Checking Circuit CRW15 (BN/WH) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between wiper motor C125-3, circuit CRW15 (BN/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C7.

  NO : Go to C6.

C6 CHECK CIRCUIT CRW15 (BN/WH) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280a

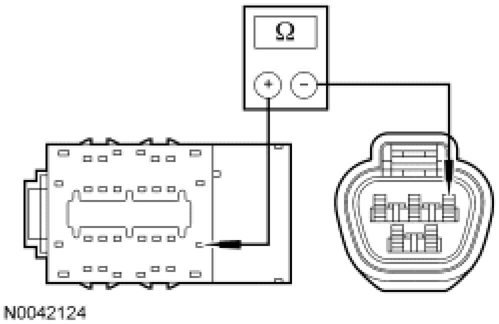

Fig. 15: Checking Circuit CRW15 (BN/WH) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between wiper motor C125-3, circuit CRW15 (BN/WH), harness side and SJB C2280a-2, circuit CRW15 (BN/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to C9.

  NO : REPAIR the circuit. TEST the system for normal operation.

C7 CHECK CIRCUIT CRW16 (GY/BN) FOR VOLTAGE

- Disconnect: Windshield Wiper Motor C125
- Place the multi-function switch to the LOW speed position.

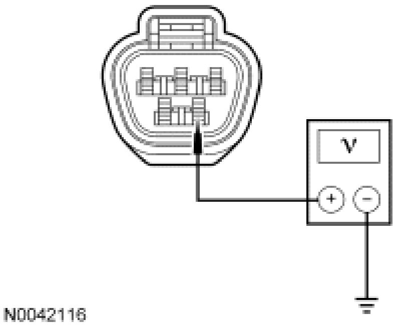

Fig. 16: Checking Circuit CRW16 (GY/BN) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between wiper motor C125-5, circuit CRW16 (GY/BN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new windshield wiper motor. REFER to **Wiper Motor**.

  NO : Go to C8.

C8 CHECK CIRCUIT CRW16 (GY/BN) FOR AN OPEN

- Key in OFF position.
- Disconnect: SJB C2280a

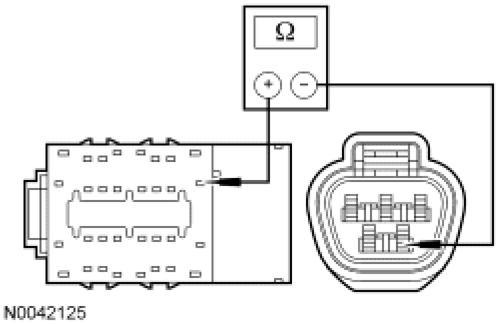

Fig. 17: Checking Circuit CRW16 (GY/BN) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between wiper motor C125-5, circuit CRW16 (GY/BN), harness side and SJB C2280a-3, circuit CRW16 (GY/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to C9.

  NO : REPAIR the circuit. TEST the system for normal operation.

C9 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Washer Pump is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Wipers and Washers for schematic and connector information.

Normal Operation

The windshield washer pump is grounded at all times through circuit GD123 (BK/GY). When WASH mode is

selected, the smart junction box (SJB) receives input from the multi-function switch through circuit CRW07 (GY/BN). The SJB then activates the washer pump relay (integral to SJB) which supplies voltage to the washer pump through circuit CRW14 (BU/WH).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multi-function switch
- SJB module
- Windshield washer pump

PINPOINT TEST D: THE WASHER PUMP IS INOPERATIVE

D1 CHECK THE MULTI-FUNCTION SWITCH INPUT TO THE SJB - MONITOR SJB PID FRNWIPER_W

- Key in ON position.
- Enter the following diagnostic mode on the scan tool: SJB DataLogger.
- Monitor the SJB PID FRNWIPER_W while moving the multi-function switch to the WASH position.
- **Does the PID value agree with the multi-function switch position when WASH is selected?**

  YES : Go to D4.

  NO : Go to D2.

D2 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

  YES : Go to D3.

  NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

D3 CHECK CIRCUIT CRW07 (GY/BN) FOR AN OPEN

- Disconnect: SJB C2280d
- Key in OFF position.

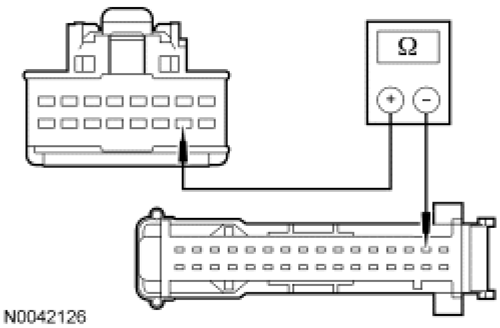

Fig. 18: Checking Circuit CRW07 (GY/BN) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between multi-function switch C202-10, circuit CRW07 (GY/BN), harness side and SJB C2280d-31, circuit CRW07 (GY/BN), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to D6.

NO : REPAIR the circuit. TEST the system for normal operation.

D4 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN

- Key in OFF position.
- Disconnect: Washer Pump C137

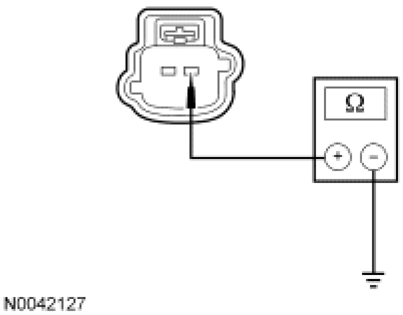

Fig. 19: Checking Circuit GD1230 (BK/GY) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between washer pump C137-2, circuit GD123 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to D5.

NO : REPAIR the circuit. TEST the system for normal operation.

D5 CHECK CIRCUIT CRW14 (BU/WH) FOR VOLTAGE

- Key in ON position.

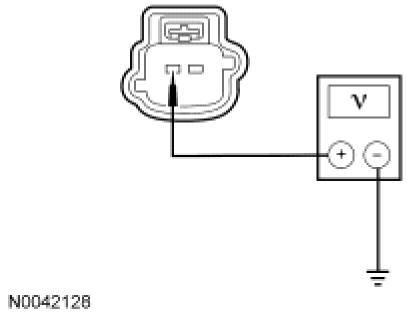

Fig. 20: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- While activating the front washer pump using the multi-function switch, measure the voltage between windshield washer pump C137-1, circuit CRW14 (BU/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new windshield washer pump. REFER to **Washer Pump**. TEST the system for normal operation.

  NO : VERIFY SJB fuse 14 (15A) is OK. If OK, go to D6.

D6 CHECK FOR CORRECT SJB OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: The Washer Pump is Inoperative - Continuously On

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Wipers and Washers for schematic and connector information.

Normal Operation

The windshield washer pump is grounded at all times through circuit GD123 (BK/GY). When WASH mode is selected, the smart junction box (SJB) receives input from the multi-function switch through circuit CRW07 (GY/BN). The SJB then activates the washer pump relay (integral to SJB) which supplies voltage to the washer pump through circuit CRW14 (BU/WH).

- DTC B2184 Front Wiper Select Switch "W" Short to Ground - Switch input shorted to ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Multi-function switch
- SJB module

PINPOINT TEST E: THE WASHER PUMP IS INOPERATIVE - CONTINUOUSLY ON

E1 CHECK THE MULTI-FUNCTION SWITCH

- Key in OFF position.
- Disconnect: Multi-function Switch C202
- Carry out the Multi-Function Switch Component Test. Refer to COMPONENT TESTING.
- **Did the multi-function switch pass the component test?**

YES : Go to E2.

NO : INSTALL a new multi-function switch. REFER to **STEERING COLUMN SWITCHES** article. TEST the system for normal operation.

E2 CHECK CIRCUIT CRW07 (GY/BN) FOR A SHORT TO GROUND

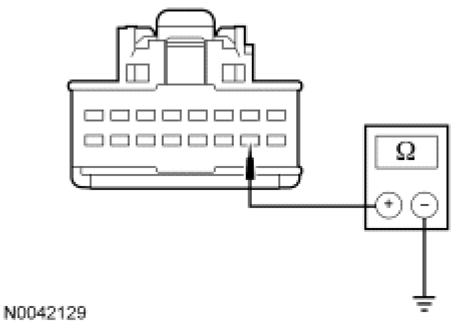

Fig. 21: Checking Circuit CRW07 (GY/BN) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between multi-function switch C202-10, circuit CRW07 (GY/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to E3.

NO : REPAIR the circuit. TEST the system for normal operation.

E3 CHECK CIRCUIT CRW14 (BU/WH) FOR A SHORT TO VOLTAGE

- Disconnect: SJB C2280a
- Disconnect: Washer Pump C137
- Key in ON position.

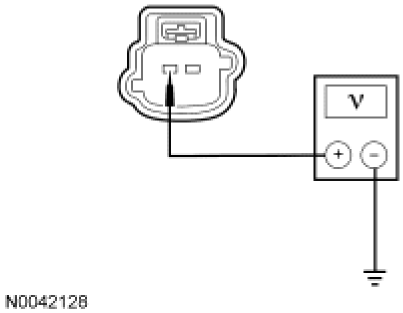

Fig. 22: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between washer pump motor C137-1, circuit CRW14 (BU/WH), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : REPAIR the circuit. TEST the system for normal operation.

  NO : Go to E4.

E4 CHECK FOR CORRECT SJB OPERATION

- Key in OFF position.
- Disconnect all the SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: The Wipers Do Not Park at the Correct Position

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Wipers and Washers for schematic and connector information.

Normal Operation

With the ignition key in RUN or ACC, the windshield wiper motor receives voltage at all times from the wiper PARK relay through circuit SBB09 (RD). When the wipers are commanded OFF, the smart junction box (SJB) deactivates the RUN/PARK relay. Voltage is supplied from the park switch (integral to the wiper motor) to the RUN/PARK relay through circuit CRW09 (BN/BU) to operate the wipers until they are parked. When the

wipers are parked, the park switch (integral to the wiper motor) supplies ground to the RUN/PARK relay and the wipers will stop. The SJB monitors circuit CRW09 (BN/BU) for voltage when wipers are not parked and ground when the wipers are parked.

- DTC B1447 Wiper Park Sense Circuit Open - Switch input open.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Windshield wiper motor
- PARK relay
- RUN/PARK relay
- SJB module

PINPOINT TEST F: THE WIPERS DO NOT PARK AT THE CORRECT POSITION

F1 RETRIEVE THE RECORDED DTCs FROM THE SJB WIPER CONTROL SELF-TEST

- Use the recorded SJB Wiper Control Self-Test DTCs.
- **Is DTC B1447 present?**

  YES : Go to F9.

  NO : Go to F2.

F2 CHECK CIRCUIT SBB09 (RD) FOR VOLTAGE

- Disconnect: Windshield Wiper Motor C125
- Key in ON position.

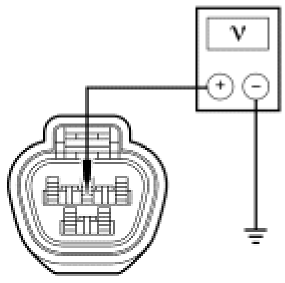

Fig. 23: Checking Circuit A_SBB09 (RD) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between wiper motor C125-2, circuit SBB09 (RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to F7.

  NO : Go to F3.

F3 CHECK THE WIPER PARK RELAY

- Disconnect: Windshield Wiper PARK Relay

- Carry out the Wiper Park Relay Component Test. Refer to COMPONENT TESTING.
- **Did the wiper PARK relay pass the component test?**

  YES : Go to F4.

  NO : INSTALL a new wiper PARK relay. TEST the system for normal operation.

F4 CHECK CIRCUIT SBB09 (RD) FOR VOLTAGE

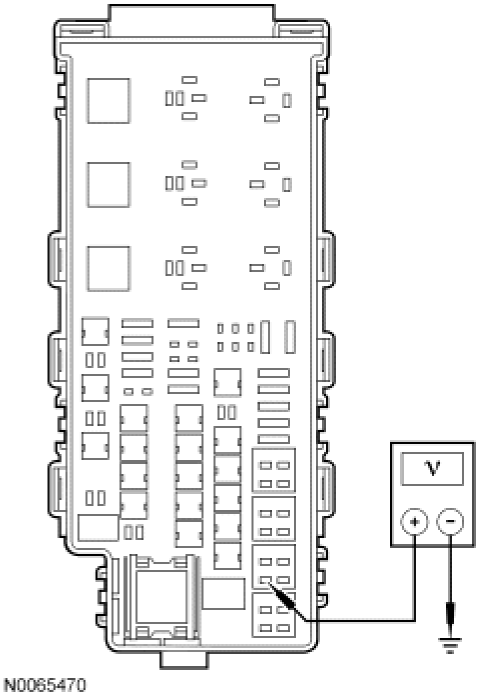

Fig. 24: Checking Circuit SBB09 (RD) For Voltage - MKZ
Courtesy of FORD MOTOR CO.

- Measure the voltage between windshield wiper PARK relay pin 30, circuit SBB09 (RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to F5.

  NO : VERIFY the battery junction box (BJB) fuse 9 (20A) is OK. If OK, REPAIR the circuit. TEST the system for normal operation.

F5 CHECK CIRCUIT CBP23 (BN/YE) FOR VOLTAGE

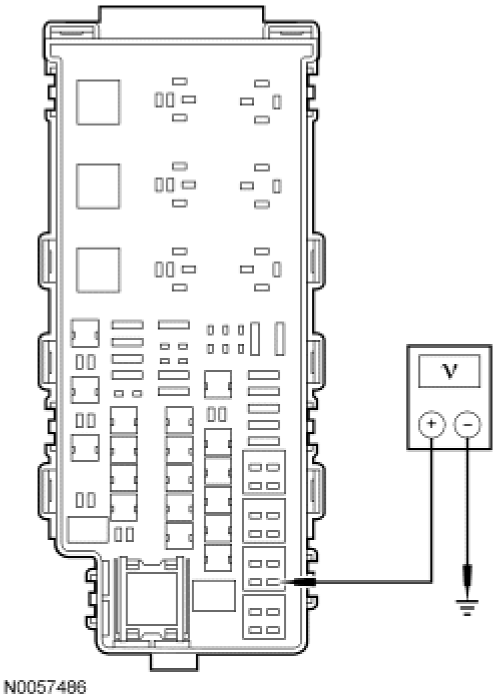

Fig. 25: Checking Circuit CBP23 (BN/YE) For Voltage - MKZ
Courtesy of FORD MOTOR CO.

- Measure the voltage between the windshield wiper PARK relay pin 86, circuit CBP23 (BN/YE), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to F6.

  NO : REPAIR the circuit. TEST the system for normal operation.

F6 CHECK CIRCUIT GD121 (BK/YE) FOR GROUND

- Key in OFF position.

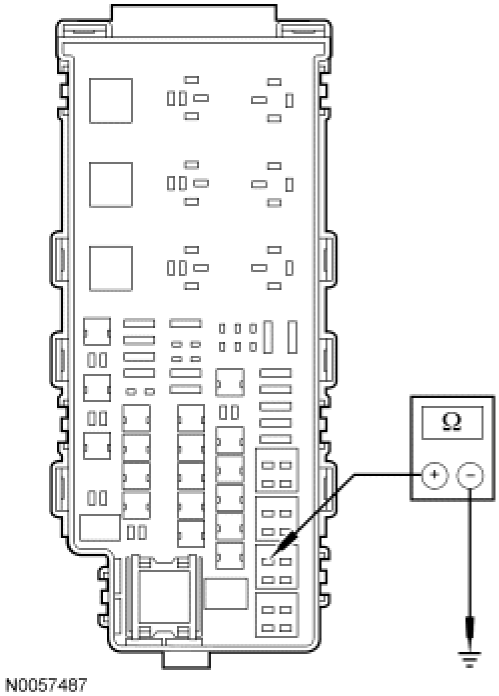

Fig. 26: Checking Circuit GD121 (BK/YE) For Ground - MKZ
Courtesy of FORD MOTOR CO.

- Measure the resistance between windshield wiper PARK relay pin 85, circuit GD121 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : REPAIR open in circuit SBB09 (RD). TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

F7 CHECK THE WIPER RUN/PARK RELAY

- Disconnect: Windshield Wiper RUN/PARK Relay
- Carry out the Wiper Run/Park Relay Component Test. Refer to COMPONENT TESTING.
- **Did the RUN/PARK relay pass the component test?**

  YES : Go to F8.

  NO : INSTALL a new RUN/PARK relay. TEST the system for normal operation.

F8 CHECK CIRCUIT CRW09 (BN/BU) FOR AN OPEN

- Key in OFF position.

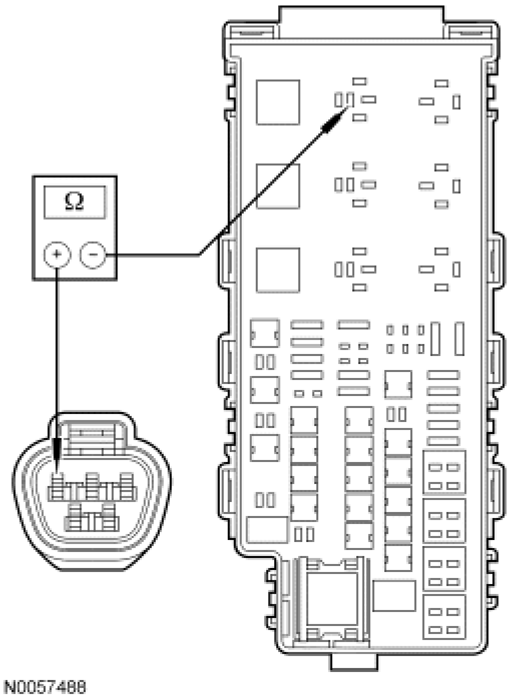

Fig. 27: Checking Circuit CRW09 (BN/BU) For Open - MKZ
Courtesy of FORD MOTOR CO.

- Measure the resistance between the windshield wiper RUN/PARK relay pin 87A, circuit CRW09 (BN/BU), harness side and wiper motor C125-1, circuit CRW09 (BN/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new windshield wiper motor. REFER to **Wiper Motor**.

  NO : REPAIR the circuit. TEST the system for normal operation.

F9 CHECK CIRCUIT CRW09 (BN/BU) FOR AN OPEN

- Key in OFF position.
- Disconnect: Windshield Wiper Motor C125
- Disconnect: SJB C2280a

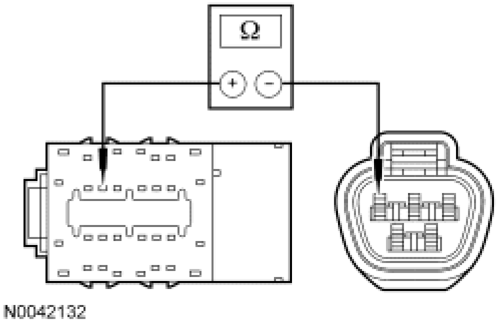

Fig. 28: Checking Circuit CRW09 (BN/BU) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between SJB C2280a-23, circuit CRW09 (BN/BU), harness side and windshield wiper motor C125-1, circuit CRW09 (BN/BU).
- **Is the resistance less than 5 ohms?**

  YES : If wipers park correctly but DTC B1447 was present, go to F10.

  If wipers do not park correctly, INSTALL a new windshield wiper motor. REFER to **Wiper Motor**.

  NO : REPAIR the circuit. TEST the system for normal operation.

F10 CHECK FOR CORRECT SJB OPERATION

- Key in OFF position.
- Disconnect all the SJB connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: The Speed Dependent Interval Mode Does Not Operate Correctly

Normal Operation

The smart junction box (SJB) receives vehicle speed information from the instrument cluster (IC) over the communication network. When any intermittent wiper mode is selected except INT 1, the SJB will gradually increase or decrease the delay between wipes based on vehicle speed.

The speed dependent feature is easiest to verify in the INT 2 position. With the vehicle at a standstill and the multi-function switch in the INT 2 position, the wipers should operate once every 10 seconds. As vehicle speed increases, the delay between wipes will gradually shorten. For example, by the time the vehicle reaches 100 km/h (62 mph), the wipers should operate every 5 seconds. Speed dependent operation is similar in INT 3, INT 4 and INT 5 modes.

This pinpoint test is intended to diagnose the following:

- IC
- SJB

PINPOINT TEST G: THE SPEED DEPENDENT INTERVAL MODE DOES NOT OPERATE CORRECTLY

G1 CHECK FOR RELATED DTCs

- Carry out a self-test on the PCM, IC and SJB module.
- **Are any DTCs present?**

  YES : For PCM-related DTCs, REFER to the **Introduction - Gasoline Engines** article.

  For IC related DTCs, REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

  For SJB-related DTCs, REFER to the **Inspection and Verification**, Smart Junction Box (SJB) DTC Chart.

  NO : Go to G2.

G2 CHECK SPEEDOMETER OPERATION

- Verify the speedometer operates correctly.
- **Does the speedometer operate correctly?**

  YES : Go to G3.

  NO : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnose the IC.

G3 CHECK THE SJB VSS_GEM PID

- Enter the following diagnostic mode on the scan tool: SJB DataLogger.
- While driving the vehicle at various speeds while monitoring the SJB module VSS_GEM PID and comparing with what is observed on the speedometer.
- **Does the VSS_GEM PID value agree with the observed speedometer readings?**

  YES : INSTALL a new SJB. TEST the system for normal operation.

  NO : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the IC communication fault.

GENERAL PROCEDURES

WIPER BLADE AND PIVOT ARM ADJUSTMENT

1. Cycle and park the windshield wipers.
2. Verify that the RH and LH wiper blades are located at the alignment marks on the glass.

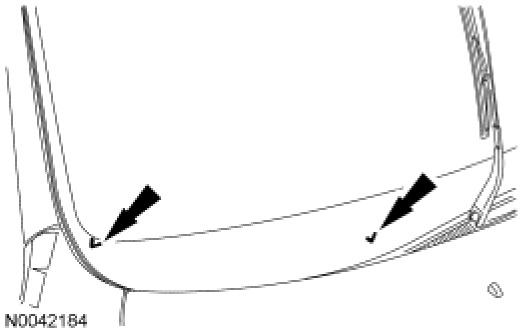

Fig. 29: Locating RH & LH Wiper Blade Alignment Marks
Courtesy of FORD MOTOR CO.

3. If necessary, remove the nuts and the windshield wiper pivot arms and reposition them to the correct locations.
   - To install, tighten to 20 Nm (15 lb-ft).

WASHER HOSE REPAIR

1. Locate and verify the leaking washer hose.
2. Cut the hose cleanly and remove the damaged portion of the washer hose.

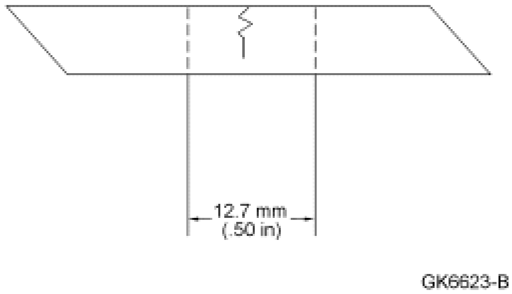

Fig. 30: Cutting Hose With Specifications
Courtesy of FORD MOTOR CO.

3. Install a windshield washer hose adapter between the cut ends of the hose.

NOTE: In difficult cases, clamping may be required.

4. Install a segment of 6.4 mm (0.25 in) inside diameter black rubber hose over the ends of the washer hose, and clamp both ends of the rubber hose using spring clamps.

REMOVAL AND INSTALLATION

WIPER AND WASHER SYSTEM - EXPLODED VIEW

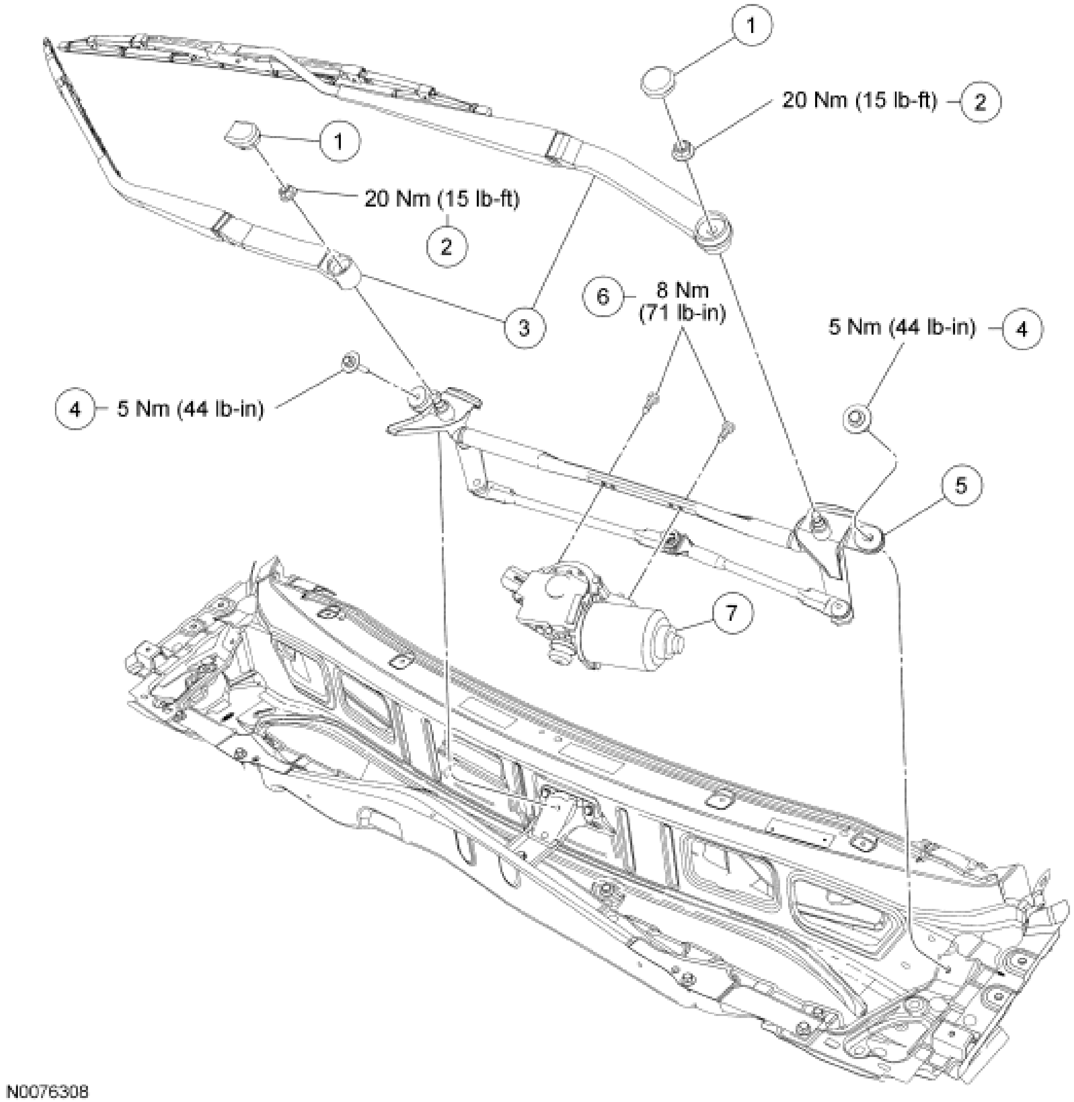

Fig. 31: Exploded View Of Windshield Wipers With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	17C526	Wiper pivot arm caps (2 required)
2	17D592	Wiper pivot arm nuts (2 required)
3	17C495 LH/ 17B589 RH	Wiper pivot arm assembly
4	W701121	Windshield wiper mounting arm and pivot shaft assembly bolts (2 required)
5	-	Windshield wiper mounting arm and pivot shaft assembly
6	-	Wiper motor-to-wiper mounting arm bolts (2 required)
7	-	Wiper motor assembly

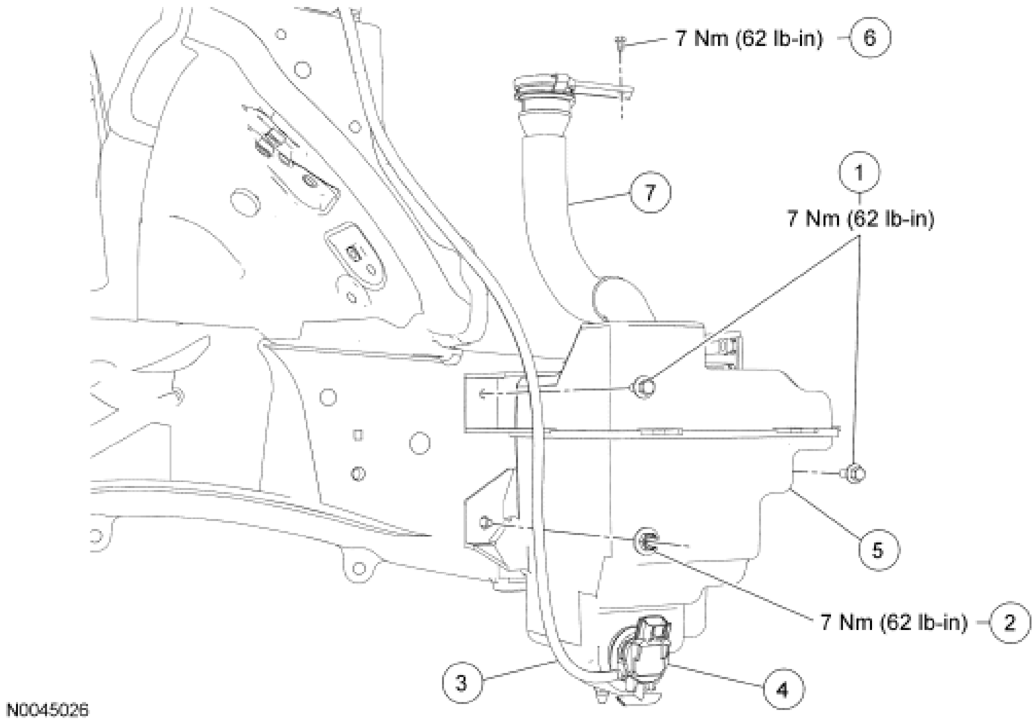

Fig. 32: Exploded View Of Washer Pump & Reservoir With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W505252	Windshield washer reservoir bolts (2 required)
2	W702751	Windshield washer reservoir nut
3	17A605	Windshield washer reservoir hose
4	-	Windshield washer pump
5	17618	Windshield washer reservoir
6	W500214	Windshield washer reservoir filler neck retaining bolt
7	N623332	Windshield washer reservoir filler neck

1. For additional information, refer to the procedures.

WIPER PIVOT ARM

REMOVAL AND INSTALLATION

1. Remove the wiper pivot arm cap.

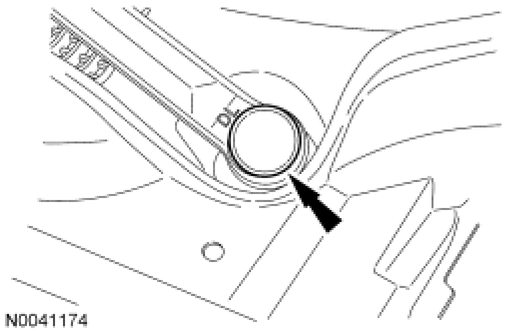

Fig. 33: Locating Wiper Pivot Arm Cap
Courtesy of FORD MOTOR CO.

2. Remove the wiper pivot arm retaining nut and the wiper pivot arm.
   - To install, tighten to 20 N.m (15 lb-ft).

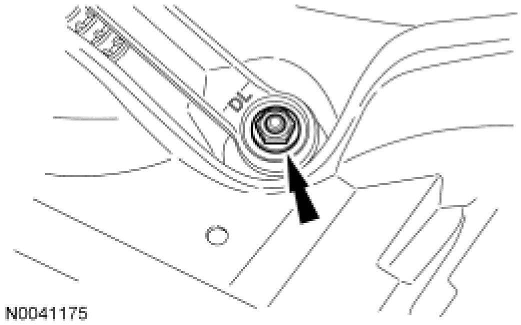

Fig. 34: Locating Wiper Pivot Arm Retaining Nut
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.

WIPER MOUNTING ARM AND PIVOT SHAFT

REMOVAL AND INSTALLATION

1. Remove the upper cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.
2. Disconnect the windshield wiper motor electrical connector.
3. Remove the 2 windshield wiper mounting arm and pivot shaft assembly bolts and the windshield wiper mounting arm and pivot shaft assembly.
   - To install, tighten to 5 Nm (44 lb-in).

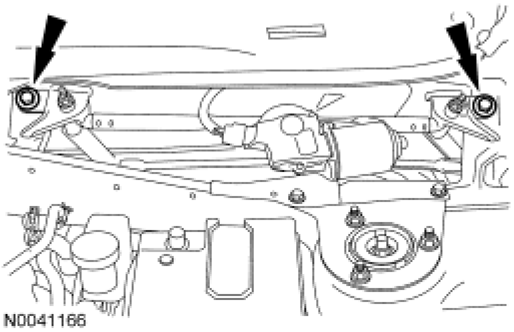

Fig. 35: Locating Pivot Shaft Assembly Bolts
Courtesy of FORD MOTOR CO.

4. To install, reverse the removal procedure.

WIPER MOTOR

REMOVAL AND INSTALLATION

1. Remove the wiper pivot arms. For additional information, refer to **Wiper Pivot Arm**.
2. Remove the windshield wiper mounting arm and pivot shaft. For additional information, refer to **Wiper Mounting Arm and Pivot Shaft**.
3. Remove the 2 drive rods from the motor crank arm ball joint.

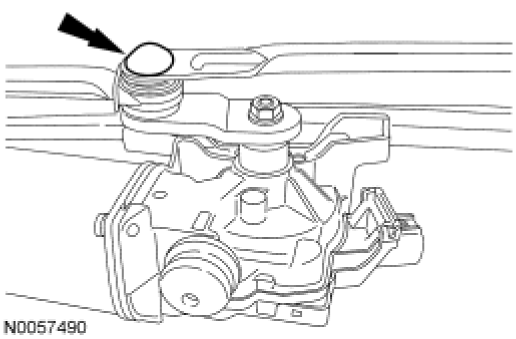

Fig. 36: Locating Motor Crank Arm Ball Joint
Courtesy of FORD MOTOR CO.

4. Remove the wiper motor-to-wiper mounting arm bolts and the wiper motor.
   - To install, tighten to 8 Nm (71 lb-in).
5. To install, reverse the removal procedure.

WASHER PUMP

Material

Item	Specification
Premium Quality Windshield Washer Fluid	

(Canada) CXC-37-(A, B, C, D, E, F, G, H) (Canada)	-
Premium Windshield Washer Concentrate (US) ZC-32-A or B (US)	WSB-M8B16-A2

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the RH front fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

CAUTION: When installing the windshield washer pump, be careful not to damage the rubber grommet.

NOTE: To prevent spilling windshield washer fluid, drain the windshield washer reservoir before washer pump removal.

3. Remove the windshield washer pump.
    1. Disconnect the electrical connector.
    2. Disconnect the hoses.
    3. Remove the windshield washer pump.

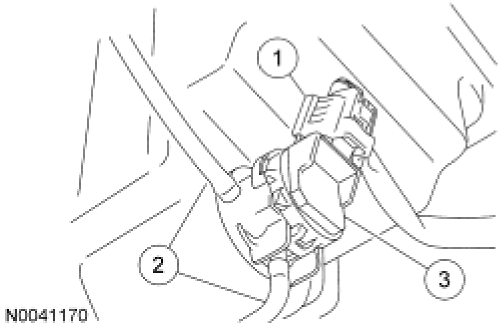

Fig. 37: Identifying Electrical Connector, Hoses And Windshield Washer Pump
Courtesy of FORD MOTOR CO.

CAUTION: Do not operate the windshield washer pump prior to filling the

windshield washer reservoir. Failure to follow these instructions may result in premature pump failure.

4. To install, reverse the removal procedure.
    - Fill the windshield washer reservoir with windshield washer fluid.

WASHER RESERVOIR

Material

Item	Specification
Premium Quality Windshield Washer Fluid (Canada) CXC-37-(A, B, C, D, E, F, G, H) (Canada)	-
Premium Windshield Washer Concentrate (US) ZC-32-A or B (US)	WSB-M816-A2

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the RH front fender splash shield. For additional information, refer to **FRONT END BODY PANELS** article.
3. Disconnect the windshield washer pump electrical connector.

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

NOTE: **To prevent spilling windshield washer fluid, drain the windshield washer reservoir before removal.**

4. Disconnect the washer pump hose.
5. Remove the bolt and the windshield washer reservoir filler neck.
    - To install, tighten to 7 N.m (62 lb-in).
6. Remove the windshield washer reservoir fasteners and the windshield washer reservoir.
    - To install, tighten to 7 N.m (62 lb-in).

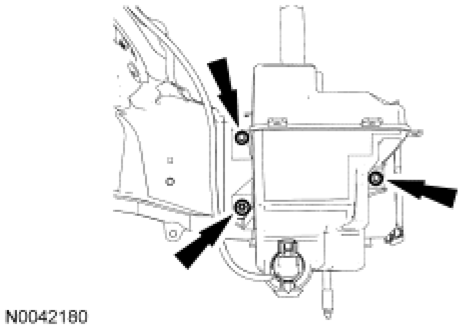

Fig. 38: Locating Windshield Washer Reservoir Fasteners
Courtesy of FORD MOTOR CO.

> **CAUTION: Do not operate the windshield washer pump prior to filling the windshield washer reservoir. Failure to follow these instructions may result in premature pump failure.**

7. To install, reverse the removal procedure.
   - Fill the windshield washer reservoir with windshield washer fluid.
